12d Model Reference Manual

12d Model

12d Model Reference Manual V8.00

This book is the reference manual for the software product 12d Model.

First Release Dates of Software and Manual

V2.0	July 1990
V3.0	October 1995
V4.0	April 1999
V5.0	December 2000
V6.0	September 2002
V7.0	January 2005
V8.0	March 2007

Disclaimer

12d Model is supplied without any express or implied warranties whatsoever.

No warranty of fitness for a particular purpose is offered.

No liabilities in respect of engineering details and quantities produced by 12d Model are accepted.

Every effort has been taken to ensure that the advice given in this manual and the program 12d MODEL is correct, however, no warranty is expressed or implied by 12D SOLUTIONS PTY LTD

Preface

Introduction

12d Model is an interactive graphics program designed to process survey data, quickly build terrain, conceptual and detail design models.

Data is easily read in, triangulated and contoured to build an initial terrain model. Roads, platforms, channels or other design features can be added interactively and a merged model containing the initial terrain and the new design features formed to produce conceptual design models.

All Models can be examined in plan, section or perspective views. The number and type of views displayed on the screen is totally user defined.

By using a mouse and flexible on-screen menus, **12d** Model is easy to use and requires a minimum of training.

This document is the *12d Model Reference* manual.

Reference Manual in PDF Form

12d Model V8.0 has an on-line help available for all panels and menus.

However, because Microsoft's Help system only allows individual topics to be printed, the entire 12d Model Reference manual has also been supplied as a PDF file. The PDF file can be used to print out large sections of the manual. Adobe's PDF format can be read by Adobe Acrobat or the free Acrobat Reader

The PDF file for the 12d Model Reference manual is called

12dm_8.0_ref.pdf

and is in the folder on the 12d Model CD called

Documentation\Reference_Manual

If you do not have an Acrobat Reader installed, it is available on the 12d Model CD under **Install**.

Training Manuals in PDF Form

12d Model is supplied with a very comprehensive on -line Reference manual which describes the function of each menu option in detail. It is a Reference manual however and makes no attempt to describe how to use 12d for production surveying and civil engineering work.

The 12d Model installation CD also contains two (2) Training manuals:

Getting Started for Design manual

Getting Started for Surveying manual

The *Getting Started for Design* manual is available as a printed manual and as a PDF file on the 12d

Model Installation CD.

The *Getting Started for Surveying* has the first seven chapters in common with the *Getting Started for Design* manual (installing 12d Model, on-line help and basic modelling) but then diverts to cover topics from the direction of a Surveying whereas the *Getting Started for Design* manual continues on with alignment design techniques.

The *Getting Started for Surveying* manual is available as a printed manual and as a PDF file on the 12d Model Installation CD. It is common to all 12d Model users.

Training Material

The training tutorials assumes that a series of files are already on your hard disk. These tutorial files are automatically installed from the CD during installation of the 12d Model software.

Using the Practise and Small Versions of 12d Model

The Practise version of 12d Model is limited to a maximum of 5,000 points. Following the procedures as stated in the training manuals may create projects with more than 5,000 points.

Where appropriate, the text will suggest how to vary the input for each instruction so that the example feature can be completed within the limits of the 12d Model Practise version.

The number of points used at any time in the Practise and small release versions can be displayed by the option

Projects => Check points

The easiest way to reduce the current point count is to delete any unwanted models with

Models => Delete

The installed icon on your desktop for running the practise version of 12d with these training files is labelled '12d v8.00 Practise Training'.

Please Note: Projects created by Practise versions of 12d Model cannot be accessed by Release versions of 12d Model and vice-versa.

1 Installation of 12d Model 8 Release Version

The *12d Model 8 Installation CD* can be used to install the *Release* and *Practise* versions of 12d Model 8.

The *Practise* version is limited to a maximum of 5,000 points and creates projects that cannot be accessed by the *Release* versions of 12d Model and vice-versa. However the *Practise* version can be used free of charge by 12D Solutions customers and registered *Practise* Users.

These notes are for installing the *Release version* of 12d Model 8. There are separate notes for installing the *Practise* version.

For a **new** installation of the **Release** version of 12d Model 8, the user is provided with

- one dongle
- one *12d Model 8 Installation CD*
- an email or a floppy with the file *nodes.4d* on it

Please check that you have all three items before commencing the installation.

For **existing** 12d Model 7.0 users, the user is provided with

- one *12d Model 8 Installation CD*
- an email or a floppy with the file *nodes.4d* on it

For existing users, the dongle you already have for *12d Model 7* will work with the new version of *12d Model 8*. If *12d Model 8* is **already** running on your computer, please **uninstall** it before installing a new version of *12d Model 8*.

Important Note on *Nodes.4d*

Because most new computers do not have a floppy disk drive, the *12d Model 8 nodes.4d* file will normally be emailed to you rather than sent on a floppy disk. Before installing *12d Model 8*, you must copy the *12d Model 8 nodes.4d* into a folder that can be accessed during the installation.

During the installation of *12d Model 8*, you will be asked to browse to the folder containing the *nodes.4d* file.

Please **do not change** the **name** of the *nodes.4d* file. The installation and 12d Model will only search for a file called *nodes.4d*.

Extra Notes for All Installations

1. A three-button mouse is essential.
2. The Installation CD contains extra information other than just the installation version of 12d Model. For example, documentation, source to macros and plot parameter files.

The extra data can be copied from the Installation CD but the copied files may only have a “read only” attribute set. This means that the files can not be edited or modified in any way.

To change the attribute so that a file can be modified, select the file in Explorer, bring up the Properties sheet and under the General tab sheet change the “read only” box so that it is not ticked on.

Selecting **OK** or **Apply** will then modify the attribute of the file.

Installing the Release Version of 12d Model 8

These notes are for installing the **Release** version of 12d Model 8. There are separate notes for installing the **Practise** version.

A. Disk Space required for installing 12d Model 8

Approximately 400 megabytes of disc space will be required for the installation to succeed. After installation this can be reduced to a minimum of 60 megabytes.

B. Before installing from the CD

For Windows 2000, XP:

Reboot the PC **before** installing 12d Model from the CD.

Your login must have Administrator privileges.

C. Do not attach the dongle before installing dongle drivers

USB dongles must not be attached to the computer before the dongle drivers are installed.

D. Using the email and/or floppy with the *nodes.4d* on it

If you have a *nodes.4d* floppy disk, it should be inserted into the floppy drive before 12d Model is installed. The 12d Model 8 installation program will copy the *nodes.4d* file from the floppy disk.

The *nodes.4d* file does not have to be on a floppy disk- it can be in any folder. This may be the case if you do not have a floppy drive or if the *nodes.4d* file was emailed to you.

If you don't have the *nodes.4d* file on a floppy disk but in a folder instead, then during the installation of 12d Model you will be asked to Browse to the folder containing the *nodes.4d* file. The *12d Model 8* installation program will copy the *nodes.4d* file from the selected folder.

E. Starting the Installation of 12d Model 8

Insert the *12d Model 8 Installation CD* into the CD drive.

On inserting the CD, the *12d Model Installation* program automatically begins.

If it doesn't, simply double click on the program "setup.exe" from the CD.

F. Installing

The *12d Model Release* screen will appear.

The Steps on the *12d Release* tab of the Installation CD will lead you through the installation of the Release version of 12d Model.

NOTE - If the dongle drivers and the Camtasia codec are already installed on your computer then you can proceed to **Install 12d Model 8 Release**.

Step 1. Install the Hardlock and Wibu Dongle Drivers

You need to have System Administrator rights to install the dongle drivers.

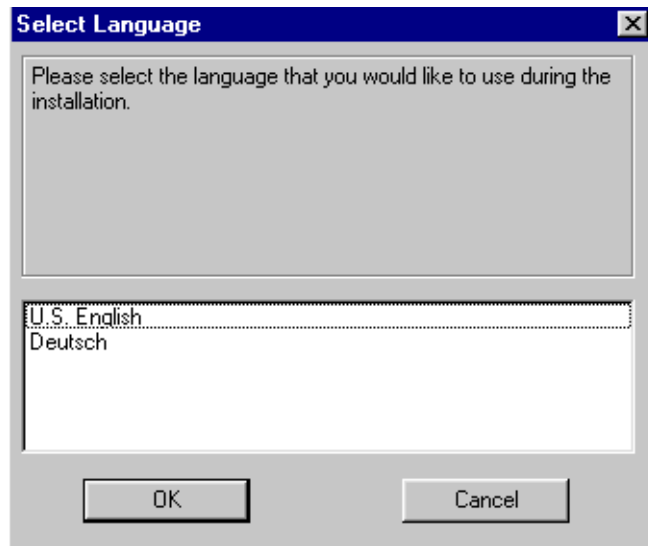

Both the *Hardlock* and the *Wibu* dongle drivers should be installed even if you only have one type of dongle.

On the **12d Model Release** screen, click on *Hardlock driver*.

The script to install the hardlock dongle drivers begins.

Select language

Language for hardlock installation

select **US English** and then **OK** to continue

Hardlock Device Driver Installation

Installing dongle drivers

select **Next** to continue

Hardlock Device Driver Installation

Finish installing dongle drivers

select **Finish** to continue

The Hardlock dongle drivers have now been installed.

The *12d Model Release* screen will then appear.

On the **12d Model Release** screen, click on *Wibu driver*.

The script to install the Wibu dongle drivers begins.

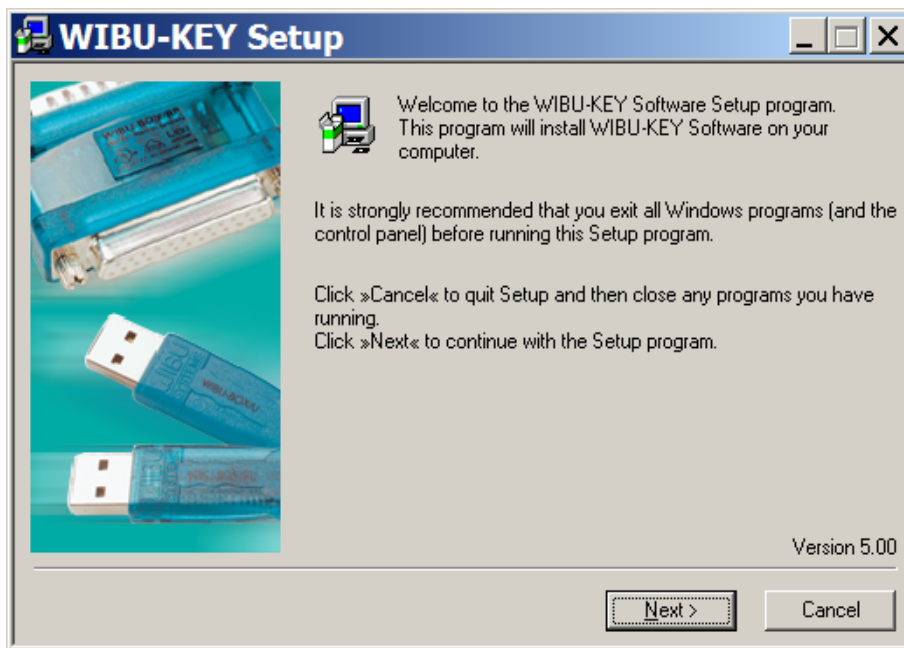

Under Windows XP you may get an *Open File - Security Warning*

select **Run** to continue

WIBU-KEY Setup

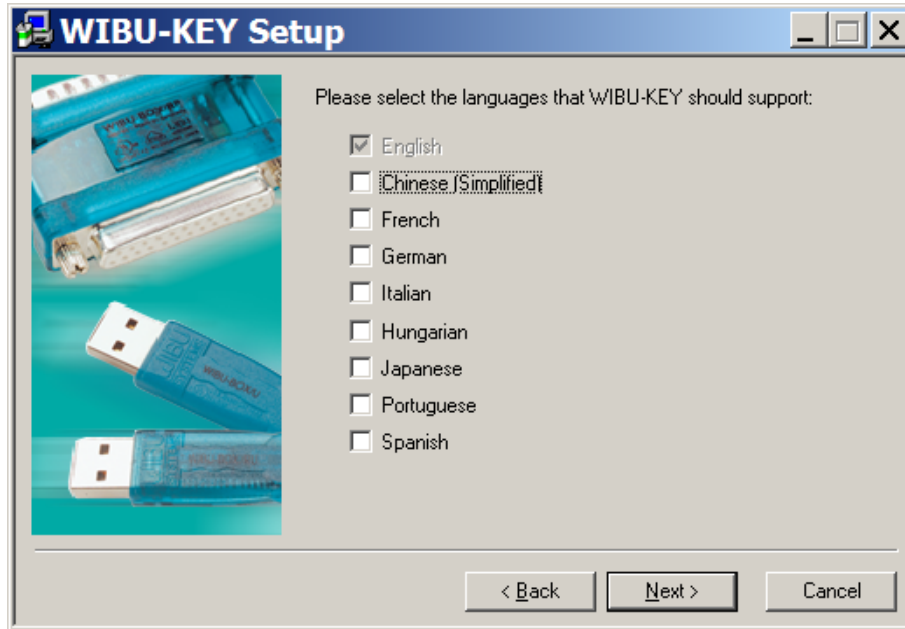

Welcome to WIBU-KEY Software Setup

select **Next** to continue

WIBU-KEY Setup

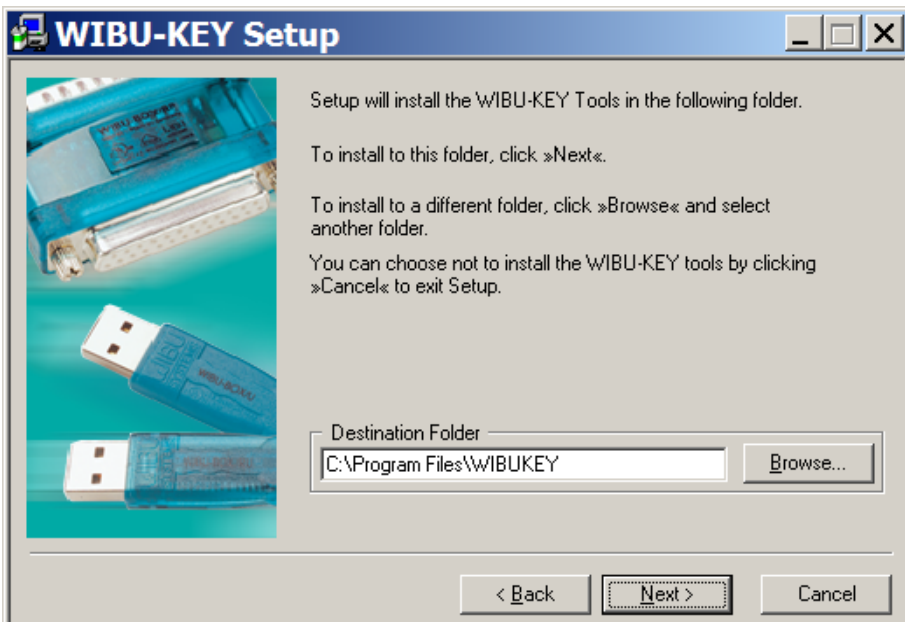

Language Selection

tick language and then select **Next** to continue

WIBU-KEY Setup

Installation folder

select **Next** to continue

WIBU-KEY Setup

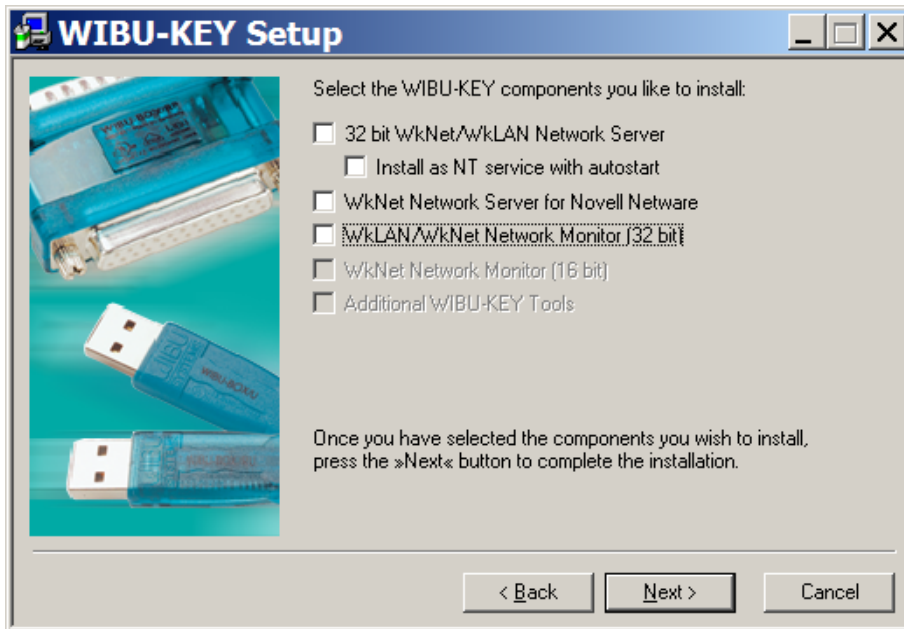

Installation folder doesn't exist

click **Yes** to continue

WIBU-KEY Setup

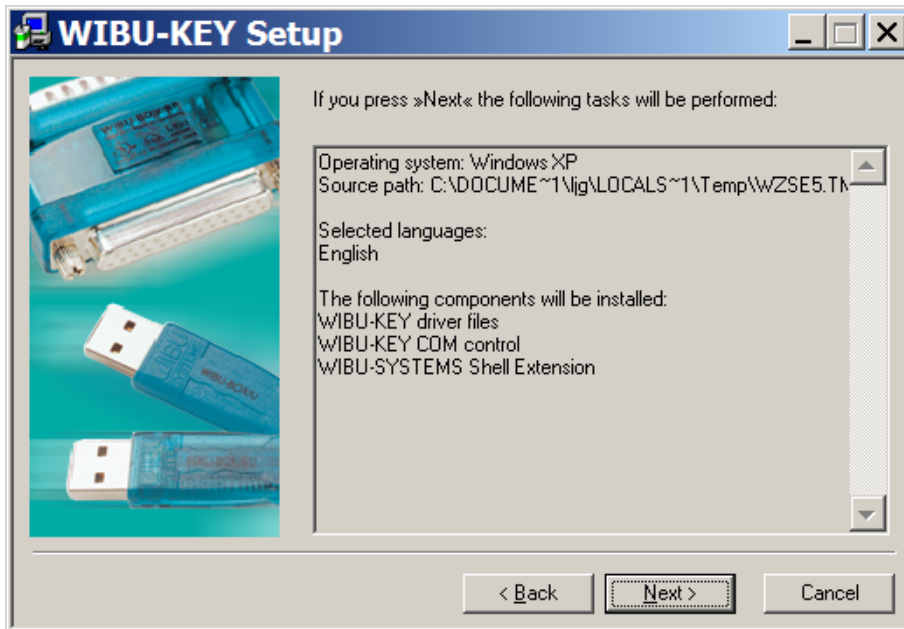

Component Selection

make sure nothing is ticked and then select **Next** to continue

WIBU-KEY Setup

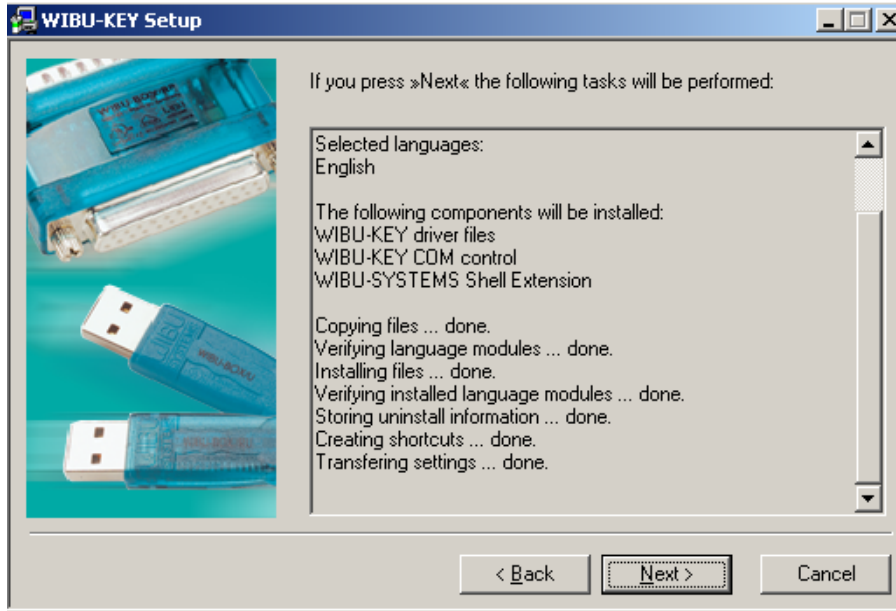

Tasks to be Performed

select **Next** to continue

WIBU-KEY Setup

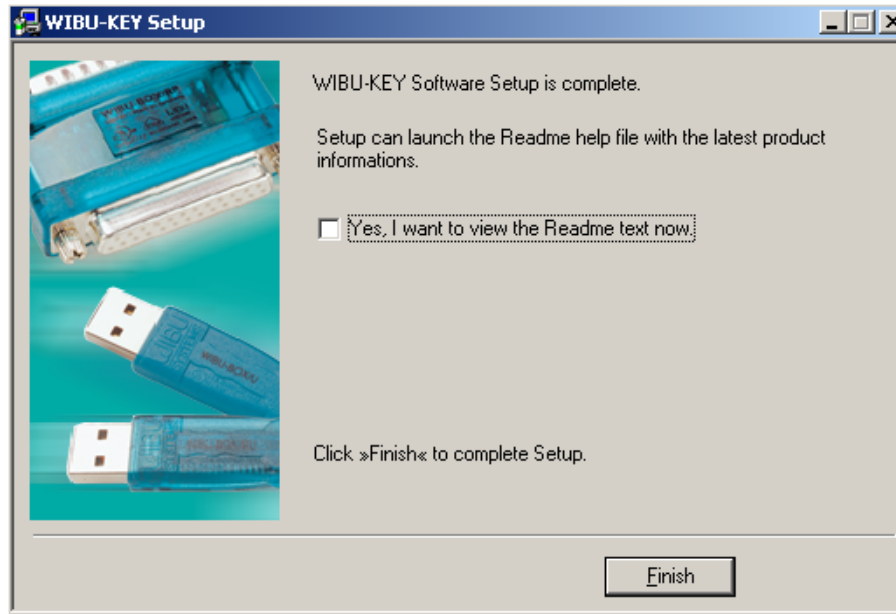

Tasks done

select **Next** to continue

WIBU-KEY Setup

Setup Complete

select **Finish** (leave "Yes, I want to view the Readme text now" unticked)

Setup OK

Setup OK

click **OK**

The WIBU dongle drivers have now been installed.

The *12d Model Release* screen will then appear.

Step 2. Check the dongle

The 12d Model dongle (Hardlock or Wibu) can now be attached to the computer.

For USB dongles:

Warning: you must have System Administrations rights the first time you attach a USB dongle to any USB port:

When a USB dongle is attached for the first time to any USB port, Windows will detect that it is new hardware and needs to load the dongle drivers for that USB port - this will require System Administration rights.

Since the dongle drivers have already been loaded onto your computer, when the USB dongle is attached to a new USB port, it will be recognised as new hardware

and Windows should automatically install the correct dongle driver.

IMPORTANT NOTE IF THE WIBU DONGLE IS NOT RECOGNISED:

If the WIBU dongle is not recognised and you get the "Found New Hardware" screen

please go to the section “Wibu XP SP2 Problems” on how to find the Wibu drivers

NOTE - even though your dongle is working on one USB port and then you no longer need System Administration rights to attach the dongle to that USB port, if you try and attach the dongle to a new USB port, you will need System Administration rights to install the dongle drivers on the new USB port.

The dongle must be attached to the USB port at all times, otherwise 12d Model will stop running.

For Parallel dongles:

Attach the dongle to the printer port. The dongle must be attached to the printer port at all times, otherwise 12d Model will stop running.

Important Note - the 12d parallel dongle must be **before** any Rainbow dongles (e.g. AutoCad).

On the **12d Model Release** screen, click on **Check**:

The dongle checking program begins.

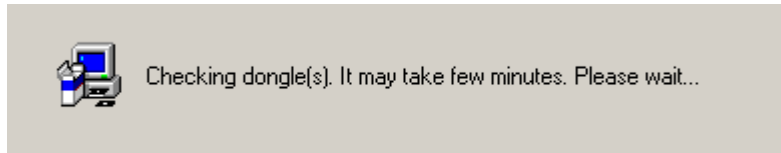

Installation

Installation message

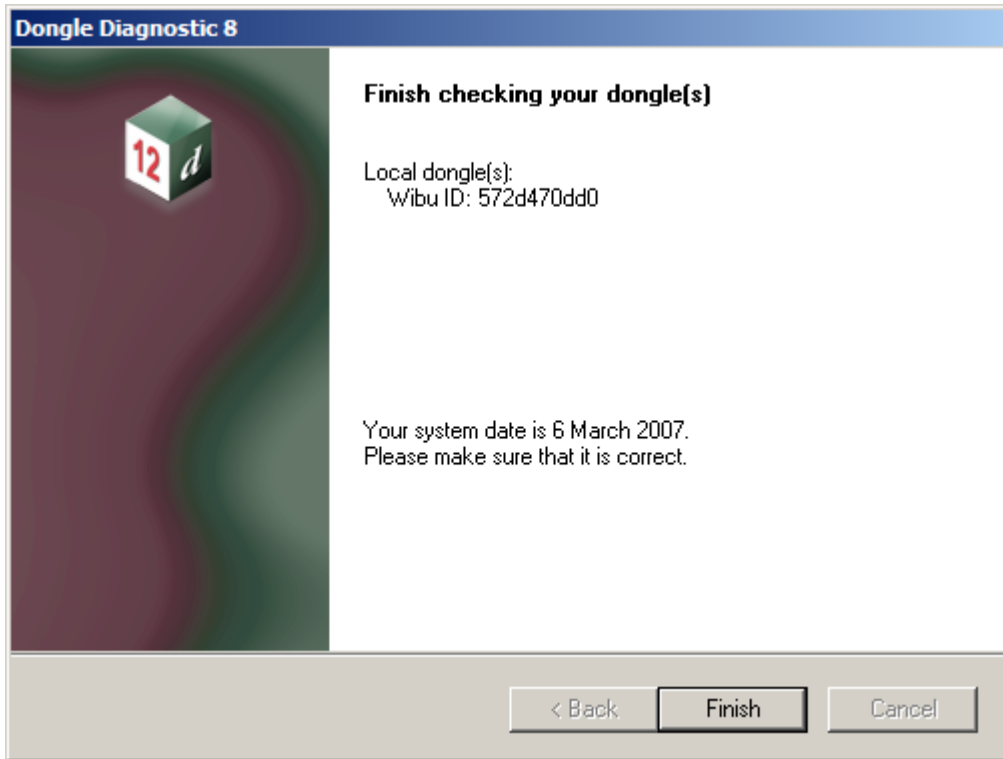

Tick "Local" and select **Next**

The computer/network will be checked for dongles.

Check Report

The correct dongle number should be displayed and also a check on the date in the computer is correct.

select **Finish**

This completes the dongle *Check*.

The *12d Model Release* screen will then appear.

Step 3. Install Camtasia Codec

You need to have System Administrator rights to install the dongle drivers.

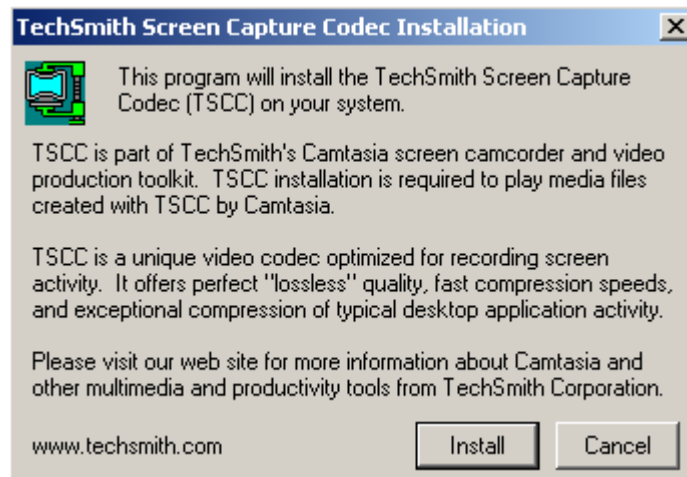

The Camtasia Codec is used for displaying the images on the *12d Model Training* CDs and DVDs.

On the *12d Model Release* screen, click on *Camtasia Codec*:

The Camtasia Codec installation begins.

Installation

Installation message

Select **Install** to continue with the installation

Installation Complete

Select **OK**.

This completes the installation of the *Camtasia Codec*.

The *12d Model Release* screen will then appear.

Step 4. Installing 12d Model 8 Release Program files

Insert the floppy disk with the *nodes.4d* file on it into the floppy drive.

During the installation, the *nodes.4d* file will be copied from the floppy disk, or if you do not have a floppy disk, from the folder on your computer containing the *nodes.4d* file.

Note that if you do not have a *nodes.4d* file, you can use a *Custom* install but you will need a *nodes.4d* file before 12d Model can be used.

On the **12d Model Release** screen, click on *Install 12d Model 8 Release*:

The 12d Model 8 installation begins.

Welcome

Welcome message

Select **Next** to continue with the installation

Software License Agreement

12D Solutions license agreement

If you agree with the License conditions, click on *I accept the terms in the license agreement*.

Select **Next** to continue with the installation

Setup Type

select **Complete**

select **Next** to continue with the installation

Authorisation file

Folder containing the authorisation file nodes.4d

select **Change**

Authorisation file

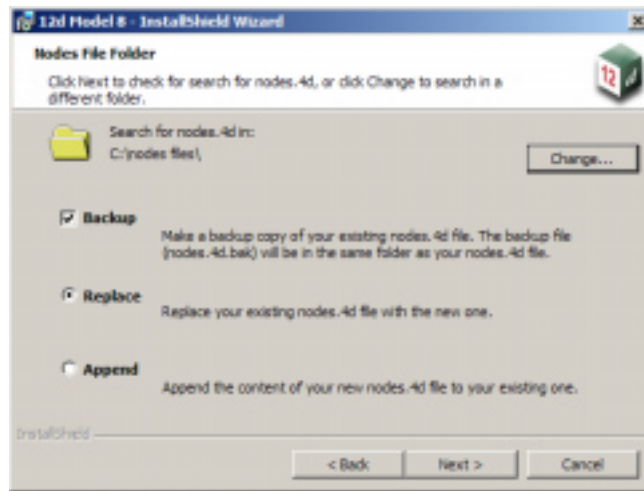

Browse to the Folder containing the file nodes.4d

select the folder containing the nodes.4d file and then select **OK**

Authorisation file

*Folder containing the authorisation file **nodes.4d***

select **Next** to continue with the installation

Start Copying Files

Begin the installation

select **Install** to continue the installation

The software will be copied and installed onto the computer.

Setup Complete

End of installation

Select **Finish** to complete the installation

The *12d Model Release* screen will then appear.

Select **Exit** at the bottom right hand corner of the screen to end the installation.

This completes the installation for **new Installations of 12d Model**.

Icons Created by Installing 12d Model

The installation loads the appropriate components and creates the icons

Release

12d Model 8

12d Model 8 Training

The *12d Model 8* icon attaches to the folder *12djobs*.

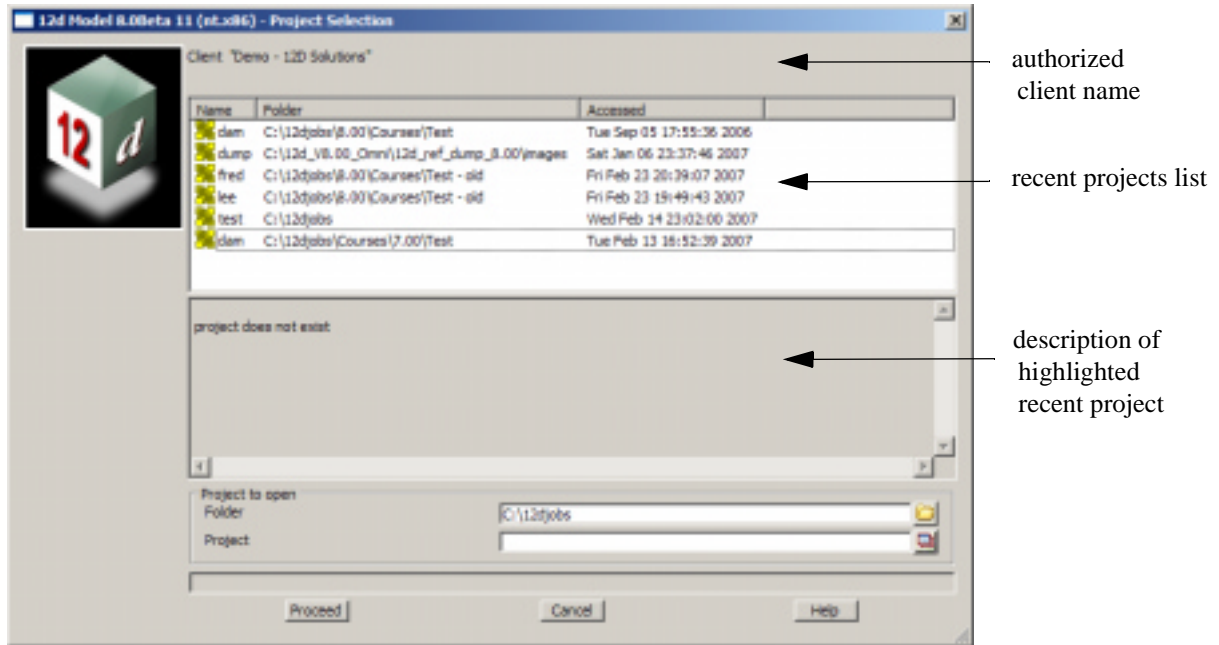

The *12d Model 8 Training* icon attaches to the folder containing the data to use with the *Getting Started for Design, Getting Started for Surveying* and other training manuals.

12d Model 8 Not Authorising

error_authorizing_release_version

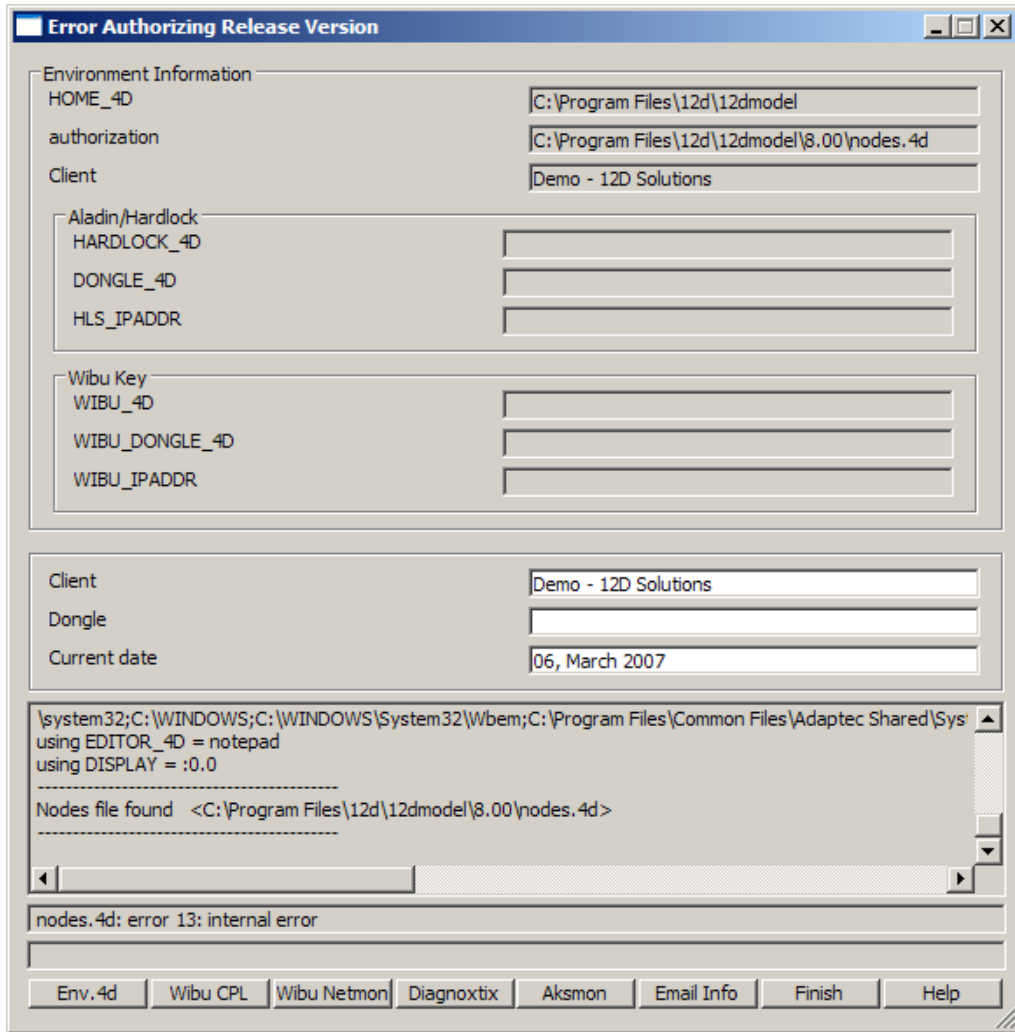

When installing the Release version of 12d Model on the computer, a *nodes.4d* is normally installed at the same time. The *nodes.4d* file must match the *dongle* attached to the printer/USB port and contains the codes for which modules are authorized for the user.

If the *nodes.4d* file is valid, then when 12d Model 8 is started by double clicking on the *12d Model 8* or the *12d Model 8 Training* icon, the 12d Model splash screen will appear and then the initial 12d Model screen with the **Project Selection** panel.

If the **Project Selection** panel appears, then 12d Model is authorized and ready to use.

If there is an **error** with the *nodes.4d* file, then the **Error Authorizing Release Version** panel appears with possibly an error message in the panel message area.

If there is no error message on the panel or it is still not obvious what the problem is, please check the list of possible errors in the next section, “Possible Problems When Authorizing the Release Version”

For example, in the above panel the dongle number is blank which means no dongle has been detected.

If there is still a problem, information can be recorded and emailed to 12D Solutions (to help debug the problem) by clicking on the **Email Info** button to bring up the **Email Information on 12d Model to 12D Solutions** panel.

Email Information on 12d Model to 12d Solutions

WARNING!

The 12d Model release version and all documentation is supplied by 12d Solutions Pty Ltd for the use of 12d Model customers and genuine prospects only. The use of 12d Model release version by commercial competitors to 12d Model is strictly prohibited. The Requester hereby acknowledges that they are not using 12d Model for competitive purposes or passing any information on to a third party that is using the information for competitive purposes. The Requester hereby acknowledges 12d Solutions copyright in the 12d Model software and documentation or whether it has been filed with the copyright office.

nodes.4d: error 13: internal error

Fill in all the fields and then click on **Email** to try and automatically send an email to 12D Solutions.

If the **Email** button does not send an email, the **Save** button can be used to write the information out to a file called **12d_auth.txt**. This file can then be emailed to **support@12d.com**.

Possible Problems When Authorizing the Release Version

1. There is no *nodes.4d* file in the correct area on your computer.
The *nodes.4d* file is normally in the folder *Program files\12d\12dmodel\8.00*
If you do not have the correct *nodes.4d* file. Contact your local distributor.
2. There is no dongle on your computer or on the network.
Please attached the dongle and retry starting up 12d Model.
3. The dongle number does not come up in the Dongle field of the **Error Authorizing Release Version** panel. Please check
 - (a) the dongle is firmly attached to the computer.
 - (b) if it is a parallel dongle, the dongle is before any Rainbow dongles. For example, before any AutoCAD dongle.
 - (c) your computer has the latest dongle drivers installed. These can be obtained from *Updates* section of the web site *www.12d.com*
If the dongle number still does not come up in the **Error Authorizing Release Version** panel, please click on the **Email info** button to bring up the **Email Information on 12d Model to 12D Solutions** panel. Fill in the panel and click on **Email** to send the information to 12D Solutions and then contact 12D Solutions or your local distributor.
4. The dongle number in the *nodes.4d* file does not match the dongle on the computer.
You do not have the correct *nodes.4d* file. Contact your local distributor.
5. The date on your computer is not the correct date.
Change the date on your computer and retry starting up 12d Model.
6. The date on your computer is the correct date but is not between the *start* and *end dates* given for your dongle in the *nodes.4d* file.
You do not have the correct *nodes.4d* file. Contact your local distributor.
7. 12d Model is still not running.
Please click on the **Email info** button to bring up the **Email Information on 12d Model to 12D Solutions** panel. Fill in the panel and click on **Email** to send the information to 12D Solutions and then contact 12D Solutions or your local distributor.

Wibu XP SP2 Problems

First we installed the WIBU drivers using the WIBU-KEY Setup (Version 5).

Now that the WIBU drivers have been successfully installed, the WIBU USB dongle is attached to the USB port.

Windows XP realises new hardware has been attached to the USB port and the *Found New Hardware* (WIBU-BOX/RU) message is displayed

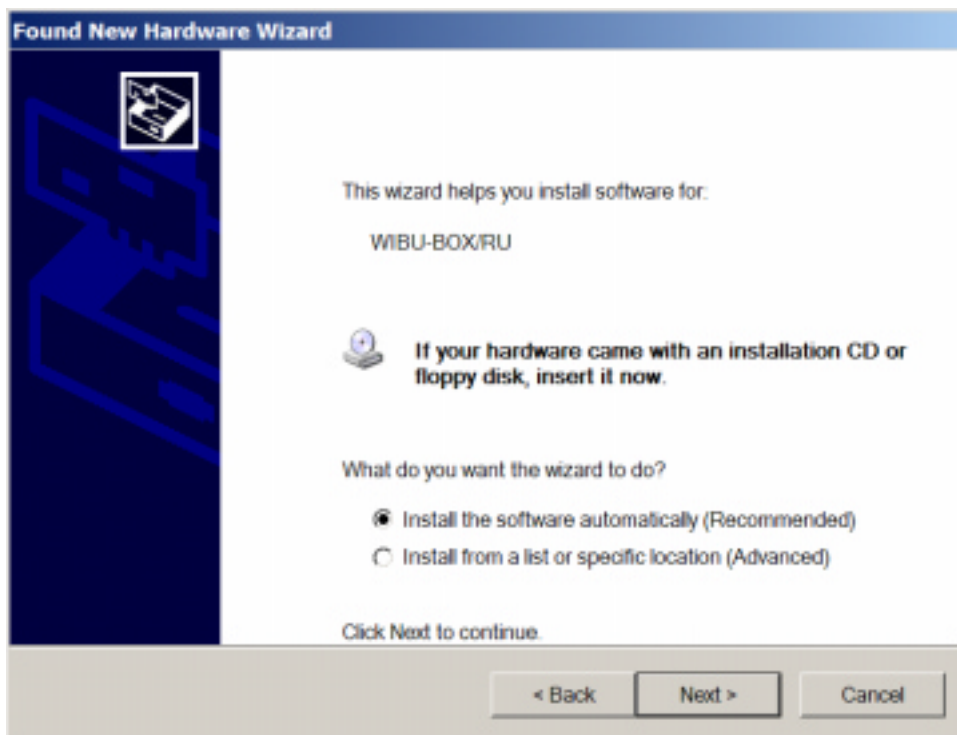

Unfortunately, XP SP2 does not find the WIBU-BOX/RU drivers and install them and you get the Found New Hardware Wizard instead:

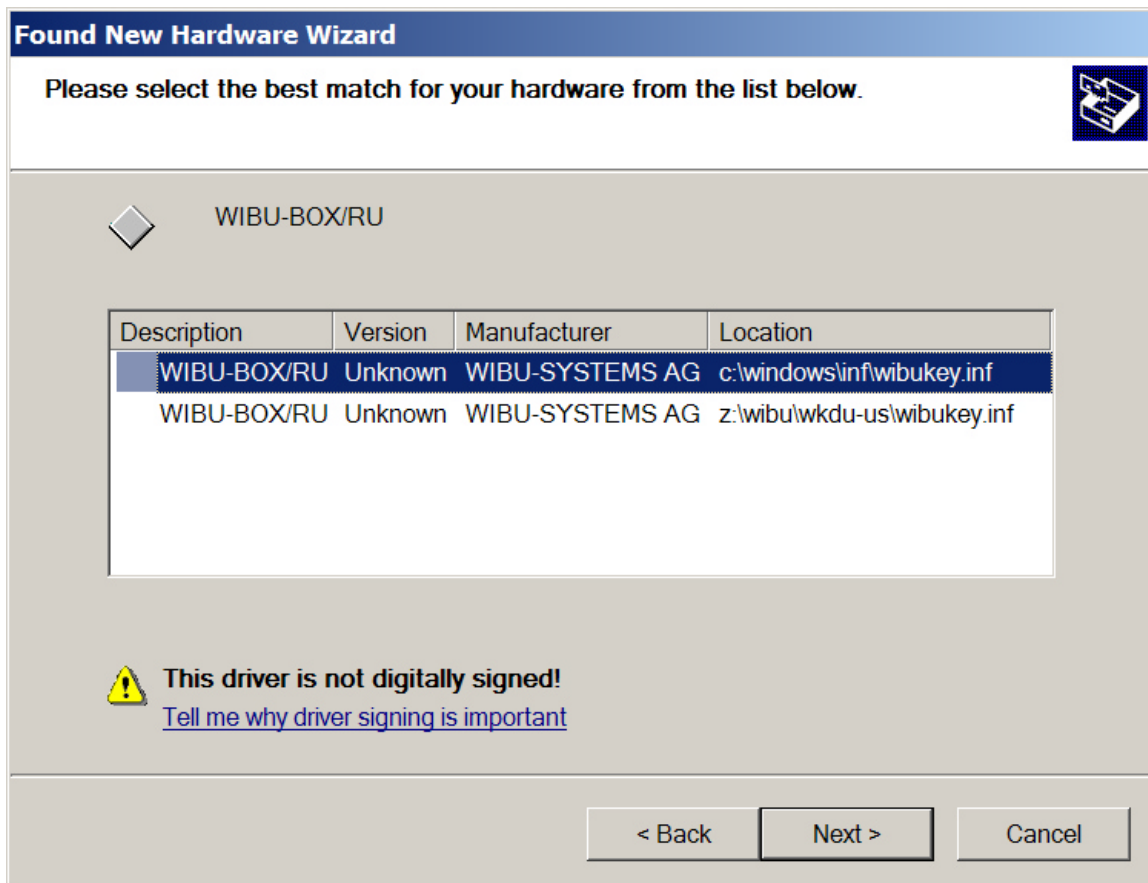

Click on "No, not this time" and select **Next** to continue

try "Install the software automatically" and select **Next** to continue

NOTE: XP now finds "C:\windows\inf" but for some reason can't when it first detects the new hardware (as it used to do in earlier XP's and Win 2000).

choose either location and select **Next** to continue

select **Finish**

The New hardware has now been installed

2 Installation of 12d Model 8 Practice Version

The *Practise* version is limited to a maximum of 5,000 points and creates projects that cannot be accessed by the *Release* versions of *12d Model* and vice-versa. However the *Practise* version can be used free of charge by 12D Solutions customers and registered *Practise* Users.

These notes are for installing the ***Practise version*** of 12d Model 8. There are separate notes for installing the *Release* version.

The *Practise* version must be Registered with 12D Solutions once it is installed on a computer. A new Registration is required for each computer that the *Practise* version is run on.

The *12d Model 8 Installation CD* can be used to install the *Practise* versions of 12d Model 8.

Or

The file *12dModel 8 Practise.exe* can be down loaded from the web site www.12d.com. The file *12dModel 8 Practise.exe* is a self-extracting file for installing the *Practise* version of 12d Model.

Extra Notes for All Installations

1. A three-button mouse is essential.
2. The *12d Model Installation CD* contains extra information other than just the installation version of *12d Model*. For example, extra documentation, course notes and source code to macros.

The extra data can be copied from the *12d Model Installation CD* but the copied files may only have a “read only” attribute set. This means that the files can not be edited or modified in any way.

To change the attribute so that a file can be modified, select the file in Explorer, bring up the Properties sheet and under the General tab sheet change the “read only” box so that it is not ticked on.

Selecting ***OK*** or ***Apply*** will then modify the attribute of the file.

Installing the Practise Version of 12d Model 8

These notes are for installing the **Practise** version of 12d Model 8. There are separate notes for installing the **Release** version.

A. Disk Space required for installing 12d Model 8

Approximately 200 megabytes of disc space will be required for the installation to succeed. After installation this can be reduced to a minimum of 60 megabytes.

B. Before installing from the CD or the Web

For Windows 2000, XP:

Reboot the PC **before** installing 12d Model from the CD or the Web.

Your login must have Administrator privileges.

C. Installing 12d Model from the Web

The self-extracting file *12dModel 8 Practise.exe* can be down loaded from the web site *www.12d.com* and used to install the *Practise* version of *12d Model*.

After down loading *12dModel 8 Practise.exe*, double-click on *12dModel 8 Practise.exe* and the installation software will be automatically extracted from the file and fires up the ***Install 12d Model Practise*** screen.

Please go to section "12d Model Practise" Screen"

D. Installing Using the 12d Model 8 Installation CD

Insert the ***12d Model 8 Installation CD*** into the CD drive.

On inserting the CD, the 12d Model Setup program automatically begins.

If it doesn't, simply double click on the program "setup.exe" from the CD.

The ***12d Model Release*** front screen will appear.

Click on the *12d Practise* tab

The *12d Model Practise* screen will appear.

E. 12d Model Practise" Screen

The *12d Model Practise* screen:

Note - when installing from the web, the *tabs* with "12d Release", "12d Practise", "Other Software" and "Documentation" will not appear. The extra tabs only appear if you are installing from the *12d Model Installation CD*.

The Steps on the *12d Practise* tab of the Installation CD will lead you through the installation of the *Practise* version of *12d Model*.

The names of each screen and the required response are given in the order in which the screens appear.

Step 1. Install Camtasia Codec

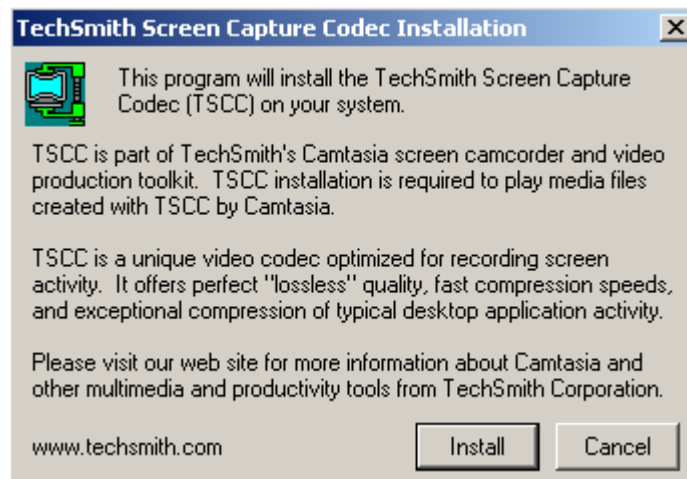

Install the drivers for use with displaying the 12d Model Training CDs and DVDs.

Note - you need Administrator rights to install the Camtasia Codec.

Click on *Camtasia codec*:

Installation

Installation message

Select **Install** to continue with the installation

Installation Complete

Select **OK**.

This completes the installation of the *Camtasia Codec*.

The *12d Model Practise* screen will then appear.

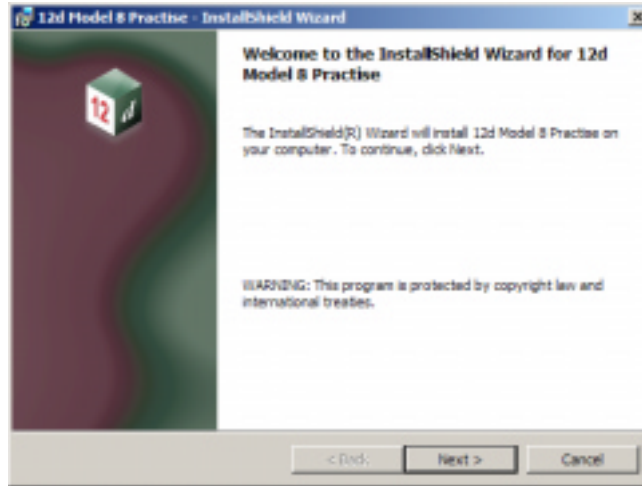

Step 2. Install 12d Model 8 Practise

Install the 12d Model Practise software and Training area.

Click on *12d Model 8 Practise*:

Welcome

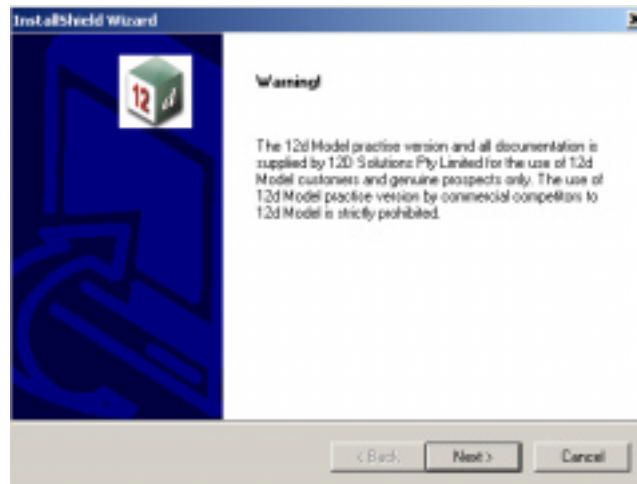

Welcome message

Select **Next** to continue with the installation

Warning for commercial competitors

12D Solutions warning

The 12d Model Practise version and all documentation are supplied by 12D Solutions Pty Limited for the use of 12d Model Customers and genuine prospects only. The use of the 12d Model practise versions by commercial competitors to 12d Model is strictly prohibited.

Select **Next** to continue if you are a 12d Model Customers or a genuine prospect

select **Complete**

select **Next** to continue with the installation

Ready to Install

Begin the installation

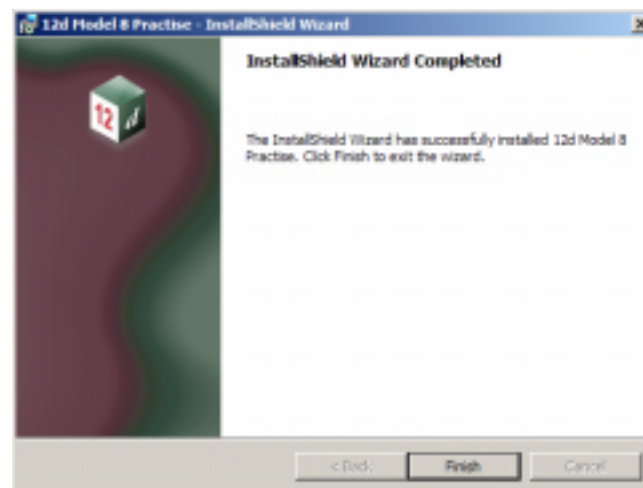

select **Install** to continue the installation

The software will be copied onto the computer and installed.

Setup Complete

End of installation

Select **Finish** to complete the installation

The *12d Model Practise* screen will then appear.

Select **Exit** at the bottom right hand corner of the screen to end the installation.

For *Practise* versions, the software needs to be authorised by emailing information about your computer to 12d Solutions.

The form for the required information is automatically created when an unauthorised 12d Model Practise version is started up. The form can be emailed to 12D Solutions from the 12d software.

Icons Created by Installing 12d Model Practise

The installation loads the appropriate components and creates the icons

Practise

12d Model 8 Practise

12d Model 8 Practise Training

The *12d Model 8 Practise* icon attaches to the folder *12d Model 8 Practise*.

The *12d Model 8 Practise Training* icon attaches to the folder containing the data to use with the *Getting Started for Design*, *Getting Started for Surveying* and other training manuals.

Authorizing the Practise Version of 12d Model 8

[authorization_request_form](#)

[accept_code](#)

Warning

The *12d Model Practise* version and all documentation is supplied by 12D Solutions Pty Ltd for the use of 12d Model Customers and genuine prospects only. The use of the *12d Model Practise* version by commercial competitors to 12d Model is strictly prohibited.

The Practise version is limited to a maximum of 5,000 points and creates projects that cannot be accessed by the Release versions of 12d Model and vice-versa. However the Practise version can be used free of charge by 12D Solutions customers and registered Practise Users.

The Practise version needs to be Registered with 12D Solutions once it is installed on a computer and a new Registration is required for each computer the Practise version is run on.

The installation creates the two icons

Practise

12d Model 8 Practise

12d Model 8 Practise Training

The *12d Model 8 Practise* icon attaches to the folder *12d Model 8 Practise*.

The *12d Model 8 Practise Training* icon attaches to the folder containing the data to use with the *Getting Started for Design*, *Getting Started for Surveying* and other training manuals.

After installing the Practise version of 12d Model on the computer, fire up **12d Model Practise** by double clicking on the *12d Model 8 Practise* icon

12d Model Practise will then start up and the **Authorize Request Form** panel will be displayed.

WARNING!

The 12d Model practise version and all documentation is supplied by 12d Solutions Pty Ltd for the use of 12d Model customers and genuine prospects only. Connected to the internet ?

practise.4d: error -1:

Fill in the details (all those in black type must be filled in) and then either

(a) click on the **Email** button to send the information to 12D Solutions Pty Ltd.

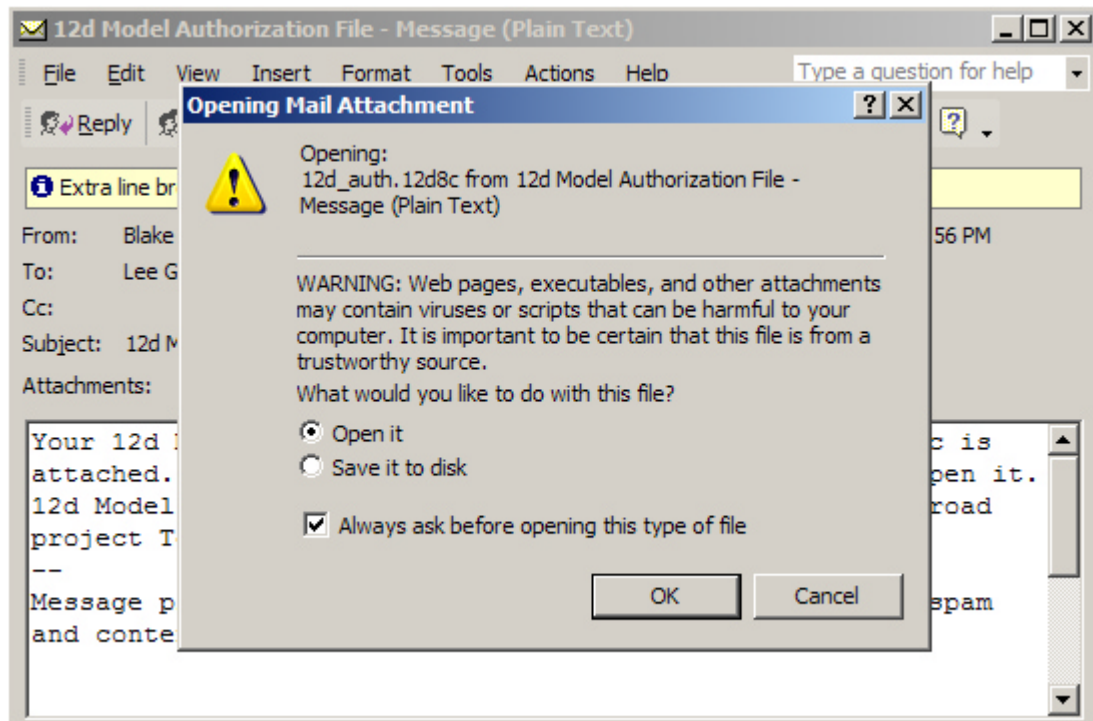

or if this fails

(b) click on the **Save** button. A file called *12d_auth.12d8r* is then written out. Please email this file (as an attachment) to authorize@12d.com

Then click on the **Finish** to exit *12d Model*.

On receiving your request, 12D Solutions will generate an authorization code and send an email back to you with an attachment called *12d_auth.12d8c*

When you receive the email with the file *12d_auth.12d8c* attached to it, double click on the attached file *12d_auth.12d8c*, click on **Open it** and finally click on **OK**.

12d Model Practise will then start up and

validate the *12d_auth.12d8c* file, and if it is valid

save the authorization code away as the file *practise.4d* in the folder

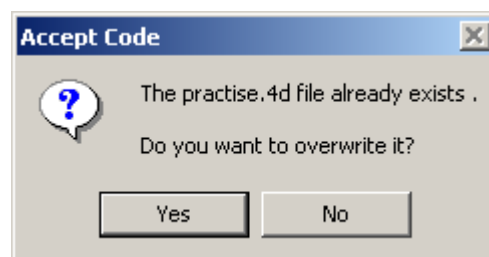

Program files\12d Model 8 Practise\12d model\8.00

and then bring up the **Accept Code** panel with the *practise.4d updated* message.

Click on **OK** and *12d Model Practise* will open and display the project *Road*.

*Note: if you already have a practise.4d file in the folder then the **Accept Code** panel will be brought up, stating that the practise.4d file already exists, and asking to overwrite it.*

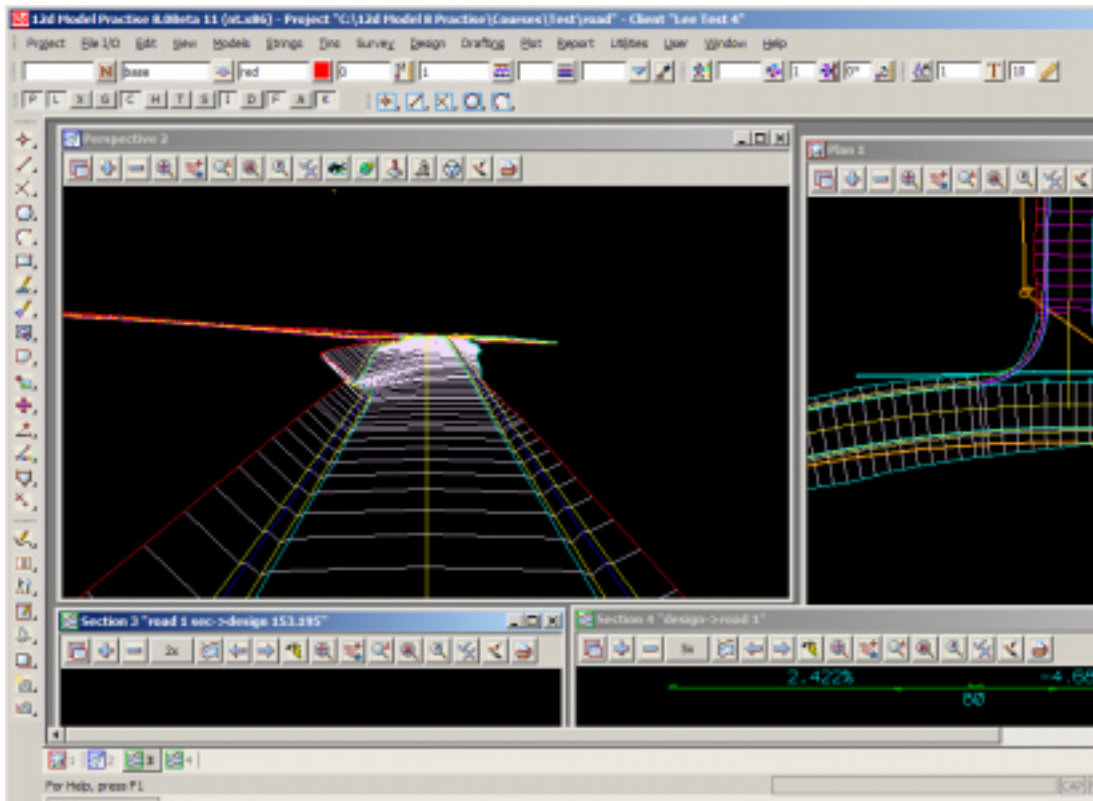

Click on **Yes** and the new authorization code will be saved away as the file *practise.4d* in the folder

Program files\12d Model 8 Practise\12d model\8.00

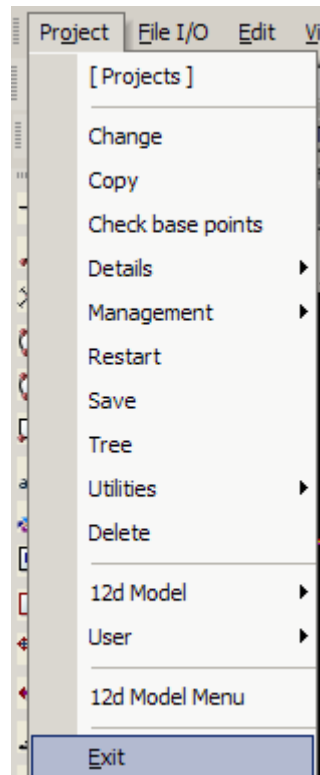

The *Accept Code* panel then comes up with the *practise.4d updated* message.

Click on *OK* and *12d Model Practise* will open and display the project *Road*.

To exit *12d Model Practise*, click on **Project =>Exit**

If *12d Model Practise* does not start up correctly, please go to the next section “Possible Problems When Authorizing the Practise Version”

Possible Problems When Authorizing the Practise Version

1. The date on your computer is not the correct date.
2. The computer your are authorizing is not the same one that the *Authorisation Request Form* was generated for.

The *12d_auth.12d8c* and the generated *practise.4d* file are only valid for the computer that the *Authorisation Request Form* was generated on. If you want the Practise version to run on another computer, you need to generate a new *Authorisation Request Form* on that computer and send it to 12D Solutions.

3. If you change your network card after generating the *Authorisation Request Form* then the authorization will stop working. A new *Authorisation Request Form* needs to sent to 12D Solutions.
4. If the file *12d_auth.12d8c* does not appear as an attachment then your email system can't handle MIME attachment. Please contact 12D Solutions at authorize@12d.com

3 Tools and Concepts

The Mouse

The mouse is used extensively in 12d Model.

12d Model can be operated with either a two or a three button mouse but a three button mouse is preferred.

In this manual the buttons will be denoted by

LB = the left button

MB = the middle button

RB = the right-button

12d Model monitors the mouse being pushed down and when it is subsequently released as separate events. Unless otherwise specified in the manual, **clicking** a button will mean **pressing the button down and releasing it again**. The **position of the mouse** is normally taken as being when the **button is released**.

In screen messages, the effect of pressing each button on the mouse is shown by enclosing the effect for each button in square brackets ([]) in left-to-right button order. That is

[left button effect] [middle button effect] [right button effect]

Empty brackets, [], indicate that pressing the button has no effect at that time.

NOTE: If the Middle button is also a wheel, then the wheel can be used in some 12d Model operations such as zoom.

Please continue to the next section “The Keyboard”.

The Keyboard

For clarity, the characters and special keys on the keyboard will be enclosed in the angle brackets < >. For example, the delete key is .

When two or more keys are to be pressed down together, they will be shown in angle brackets

separated by a plus sign (+).For example, <ctrl> + <d> means that the control key and d are pressed down together.

In 12d Model, the *escape* key (normally labelled "esc" on the keyboard and denoted by <esc> in this manual) is used to **stop drawing** in a view or to **break out** of computer intensive options ("escape" or "abort" the option) but still remain in 12d Model. Options which can be terminated by <esc> are noted in the manual.

Please continue to the next section "Screen Layout".

Screen Layout

Inside the 12d Model screen are six distinct areas (main menu, top tool bar area, side tool bar area, view area, output window and status bar) which create and control nine associated objects (panels, tool bars, control bars, floating menus, plan views, section views, perspective views, hidden perspective views and OpenGL perspective views) displayed on the screen.

The main areas and their purposes are:

(a) Main Menu

The **Main Menu** is at the top of the 12d Model screen and is a standard Microsoft type menu. Options are selected in the standard Microsoft way and bring up 12d Model **panels** and **floating menus**.

(b) Views Area

The **Views Area** displays the 12d Model drawing views for seeing and examining the data. There is no limit to the number of **plan**, **section** or **perspective** and **hidden perspective views** that can be created, overlapped or iconized.

(c) Output Window

The **Output Window** displays 12d Model system and error messages. The Output Window can be turned on/off from the Main menu.

(d) Status Bar

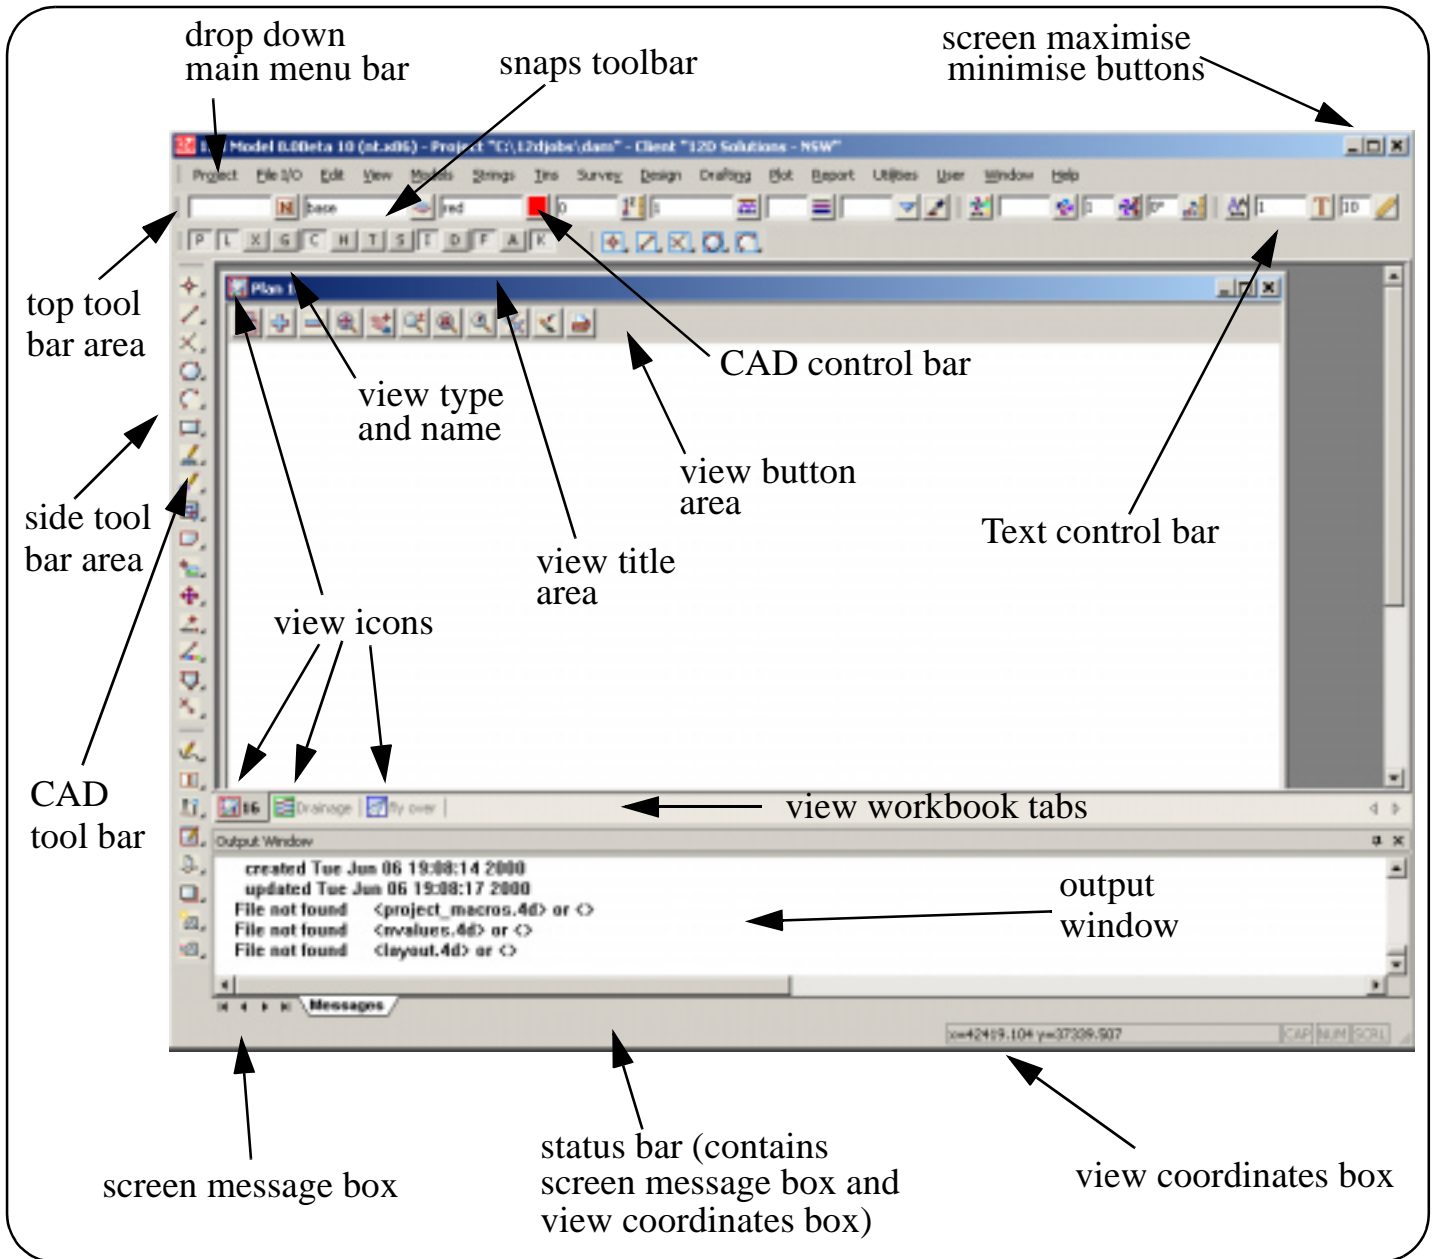

The **Status Bar** displays message prompts and the x, y and z co-ordinates of the cursor when it is in a drawing view. The Status Bar can be turned on/off from the Main menu.

(e) Top Tool Bar area

The **Top Tool bar area** is below the Main Menu and contains the CAD control bar, Text control bar and the snaps toolbar.

(f) Side Tool Bar area

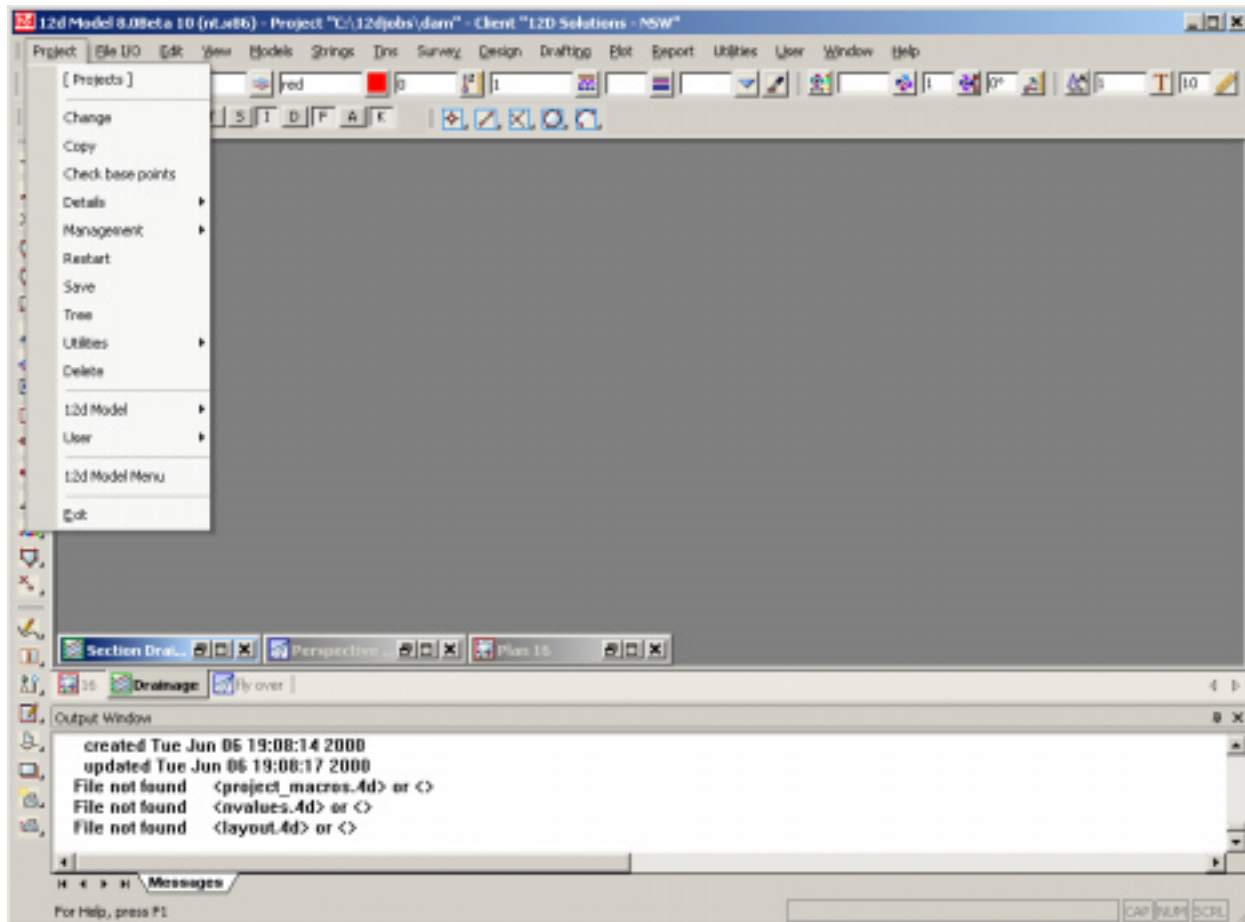

The **Side Tool bar area** is on the far left side and the CAD tool bar and other tool bars defined in *Toolbars.4d*

Please continue to the next section "Main Menu".

Main Menu

At the top of the 12d Model window is the Main menu, a standard Microsoft type menu.

Options can be selected in the standard Microsoft way and bring up 12d Model panels (dialogues) or create floating menus.

The Main menu can be moved around, or docked on any of the four sides of the window.

If the window is not wide enough, the Main menu will automatically wrap around onto two or more lines.

Please continue to the next section “Floating Menus”.

Floating Menus

As well as the standard Microsoft type menu, 12d Model has the concept of **floating (tear away) menus**.

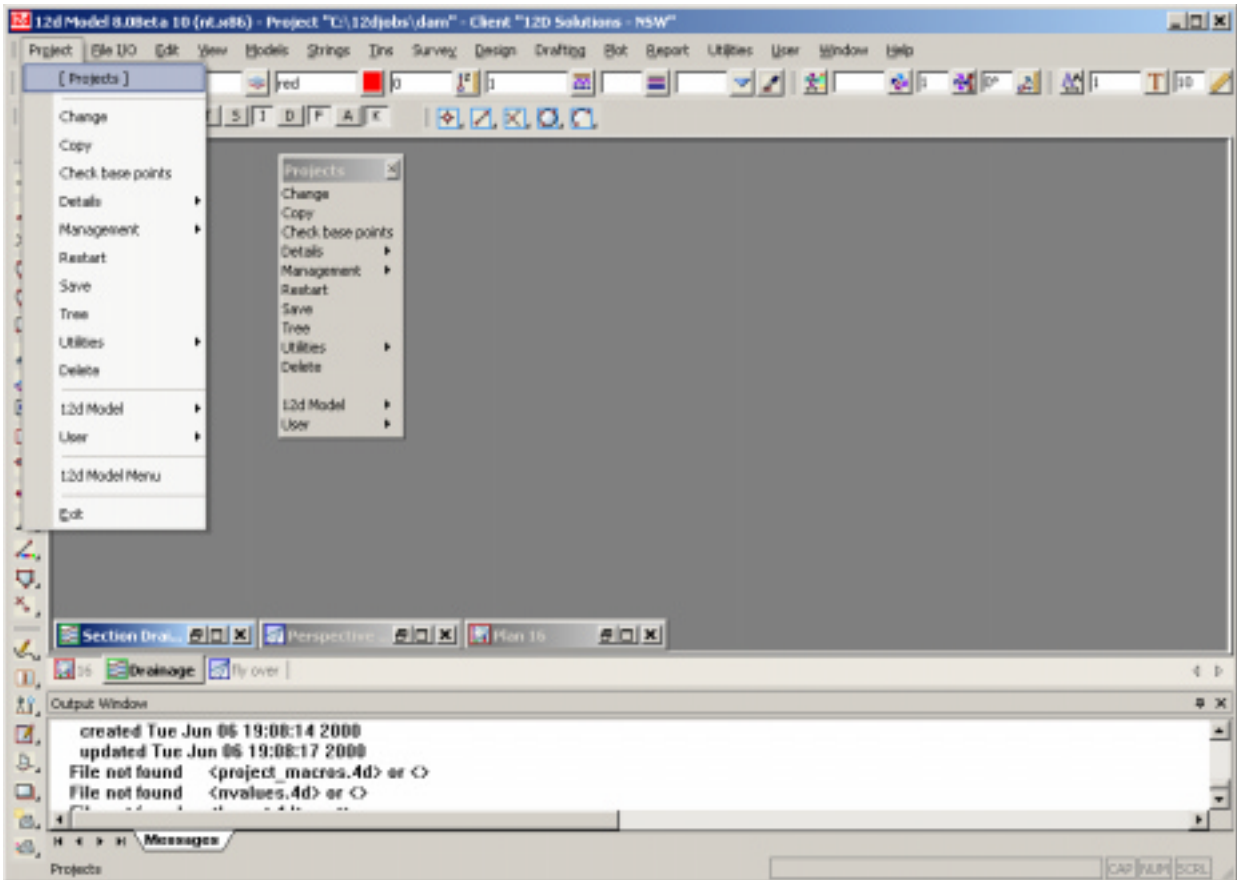

The presence of a floating menu on the Main menu is indicated by a menu item enclosed in square brackets []. Selecting a menu item in square brackets will create a floating menu of that name.

For example, selecting [Project] from the top menu Project creates the floating menu called Projects.

A floating menu can be moved around the screen, even outside the 12d Model window, and will stay up until the [X] button is selected on the top right hand side of the floating menu.

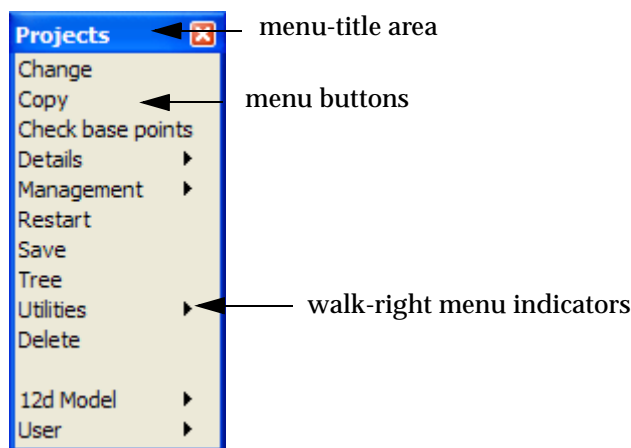

A floating menu created from the Main menu usually contains the same items and walk-right

menus as the Main menu but has the distinct advantage that it doesn't disappear when the cursor is moved to select other menus from the Main menu.

Floating menus or just Menus, consist of a menu title area and a series of options, called menu buttons, lined up under the menu title.

For example, the Projects menu looks like

no_option

An option on the menu is invoked (or selected) by clicking LB whilst over the option.

If no option exists, a **No Option** panel is placed on the screen. The panel will remain until the **OK** or **[X]** button is selected.

A ">" on a menu-option indicates that there is a walk-right menu attached to that button.

The walk-right menu only appears as the cursor **moves over** the >.

The walk-right menu can consist of further menu options and walk-rights.

If a walk-right menu is showing and the user wanders back into the menu where the walk-right originated, the walk-right menu will collapse back to the >.

Moving a Menu

A menu can be moved (dragged) by **holding down LB** anywhere in the menu title area (except on the [X] button) and then moving the cursor with the LB still depressed. A menu outline appears and moves with the cursor to indicate where the new menu position will be. The menu is finally positioned when LB is released.

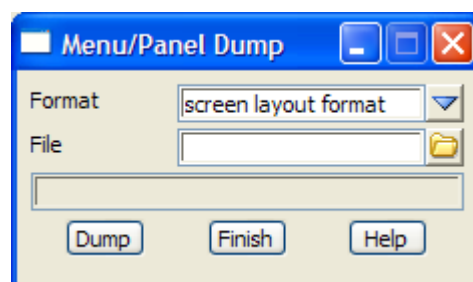

When an expanded walk-right menu is moved, a **copy** of the walk-right menu will be moved and placed on the screen as a new floating menu. The original menu still contains the walk-right menu.

Dumping a Menu

menu_panel_dump

An image of the menu can be written out to disk in either bmp, tif, colour postscript or a screen layout file. This is called dumping the menu.

The **dump** option is invoked by clicking the middle mouse button (MB) anywhere in the menu title area. The **Menu/Panel Dump** panel is then displayed

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	input	screen layout file	bmp, colour postscript, tif, screen layout file

format for writing the image to disk.

File input

disk file to write the dump image to.

Dump button

dump the menu image to disk.

Deleting a Menu

A floating menu is deleted by selecting the [X] button in the menu-title area.

Please continue to the next section “12d Model Menu”.

12d Model Menu

The **12d Model** menu familiar from 12d Model version 3.20 is available by selected **12d Model Menu** on the **Projects** menu.

Selecting **12d Model Menu** again will *remove* the **12d Model** menu.

All of the options down the **12d Model** menu are also available in the same order going across the Main menu.

Please continue to the next section “Toolbars and Controlbars”.

Toolbars and Controlbars

Toolbars

Options can be grouped together on *toolbars*. *Toolbars* are made up entirely of *icons* and each icon can have a 12d Model option attached to it.

Toolbars have unique names which are displayed on the top of the toolbar when it is not docked.

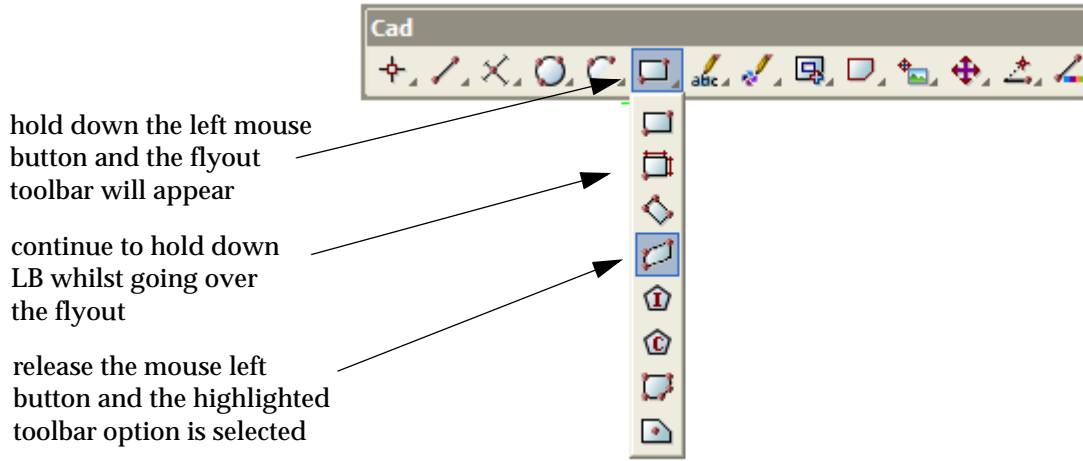

Toolbars can also have one level of **Flyouts** of other toolbars and when a flyout exists, there is a small arrow on the bottom right of the icon to indicate a flyout exist. The *tool tip* for the icon gives the *name* of the flyout toolbar. The actual icon itself is the icon of the *first item* on the *flyout* toolbar.

For example, the *CAD toolbar* is entirely made up of flyout toolbars.

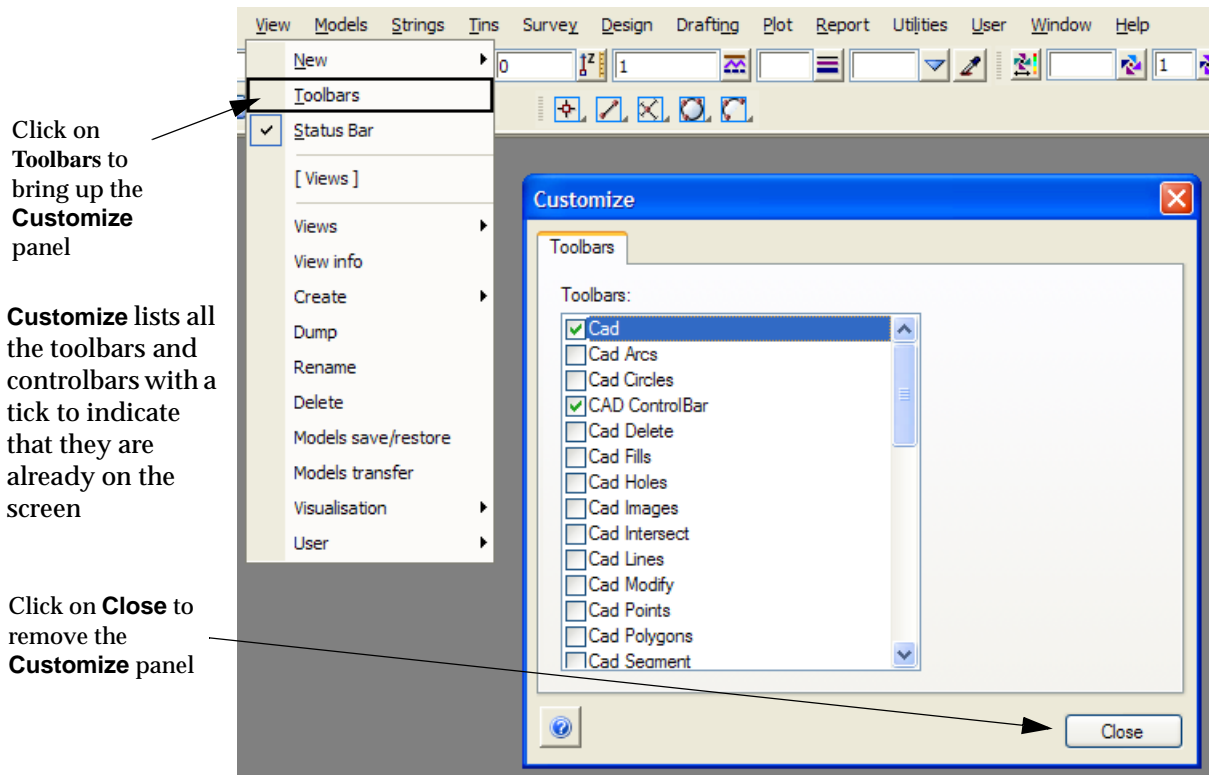

To display and select from a flyout toolbar, hold down LB whilst over the icon on a toolbar with a flyout menu and the flyout menu will appear. Whilst still holding down LB, move along the flyout toolbar to the appropriate option and then release LB. The option attached to the highlighted icon will then be selected.

Note - if LB is released whilst a icon with a flyout toolbar is highlighted, the first option on the flyout tool bar is selected.

All the toolbars in 12d Model are defined in a file with the default name *toolbars.4d* (for the definition of toolbars, see the section “User Defined Toolbars” in the Appendix “Functions Keys, Menus, Toolbars”).

The list of all defined toolbars is given by selecting **View =>Toolbars** from the main menu which brings up the **Customize** panel. A toolbar is shown with a tick if it is already on the screen.

Ticking **on** a toolbar in the list brings up the toolbar in the top left hand corner of the screen. The toolbar can then be moved or docked.

Ticking **off** a toolbar in the list removes the toolbar from the screen.

Important Note - the toolbars are not active whilst the **Customize** panel is on the screen. Close the **Customize** panel as soon as you finished with it.

What toolbars are on the screen and their position is recorded with the project so that when a project is existed and later started again, the final position of the toolbars is restored.

Also at any time, a workspace file can be read in and define a new setup and position of toolbars. For more information on using workspace files, please go to the section “Workspace” in the chapter “Projects”.

For links to the options on each *Toolbar*, go to “Options on Toolbars”

Controlbars

Controlbars can have icons on them but they also have controls such as a model box on them.

Controlbars are not user defined and there are only three of them in *12d Model* - the **Cad Controlbar**, **Symbol Controlbar**, and **Text Controlbar**.

This default position of the *controlbars* is on the top left hand side of the screen under the main menu.

Although not toolbars, the *Controlbars* do appear in the *Toolbars* list in the **Customize** panel and can be turned on/off and docked just like toolbars.

Important Note - the toolbars are not active whilst the **Customize** panel is on the screen. Close the **Customize** panel as soon as you finished with it.

The *controlbars* are used by *CAD toolbars* and the *Strings Create* options. *Strings* created by the *CAD toolbars* and *Strings Create* options use values in the *controlbars* to define string attributes such as name, model and colour.

Like toolbars, the type and position on the screen of controlbars is recorded with the project so that when a project is exited and then started later, the final position of the *controlbars* is restored.

Also at any time, a workspace file can be read in and define a new setup and position of the *controlbars*. For more information on using workspace files, please go to the section “Workspace” in the chapter “Projects”.

The three *Controlbars* will be described in detail in the section “CAD, Symbol and Text Controlbars” in the chapter “Strings”:

Snap Toolbar

The **Snaps (Horiz)** menu has been replaced by the **Snaps Toolbar** which has the default position at the top left hand side of the *12d Model* screen, under the controlbars.

snaps toolbar

Snaps are documented in the section “Snaps”.

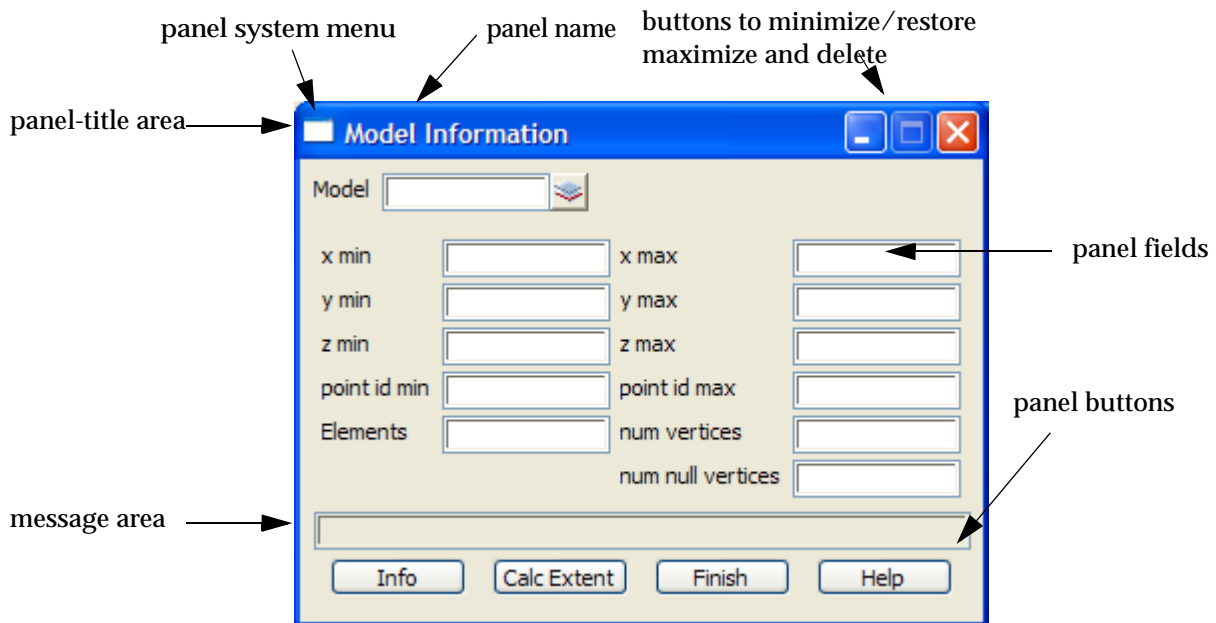

Panels

After a menu option has been selected, extra information is often required before the operation represented by the menu option can begin.

For example, before the contour option can proceed, the required contour interval must be supplied.

In 12d Model, an object called a **panel** is used to collect and validate any extra information required to run the option.

For example, the **Model Information** panel is

A Panel consists of four types of areas.

Panel title area

Contains the title (name) of the panel, the buttons to minimize and restore the panel, and the [X] button. In the example above, the panel title is **model information**.

Panel fields

These are both input and output areas for the panel. The user can type answers into some fields (input and output fields) or the program may display special information in the fields (output only fields). In the example, Model is an input/output field, xmin is only an output field.

If the panel field is *optional*, then the description text is greyed out - entering data into the field will cause the text to be redrawn in black.

If there are choices available to select from for the panel field, a + is displayed at the right hand side of the field. Selecting the + brings up a panel field pop-up (documented below).

Message area

Each panel has its own area where 12d Model displays messages for the option.

Messages are used for a variety of purposes including

- ▲ indicating the **next step** in a complex option
- ▲ reporting **errors**
- ▲ giving **progress** in time consuming operations

- ▲ informing that an option has **completed** successfully.

Most messages are sent to the panel message area but a few are displayed in the Status Bar.

Panel buttons

Buttons are used on the panel to select things or control the processing of the panel. Almost every panel has minimize and restore button, and a **Finish** and **[X]** buttons which when selected will end the option and remove the panel from the screen. All panels also has a **Help** button which brings up on-line help about the panel.

The minimize, restore, **Finish**, **[X]** and **Help** buttons will not be documented for each panel.

Data Entry in a Panel

To help save the user time, many panel fields have default answers.

However, any panel field value can be replaced by typing in new information (**typed input**) or when available, by selecting an answer from the **panel field pop-up** or using special name completion characters.

All panel fields are validated before the option runs and any error messages displayed in the panel message area.

Typed input

To type information into a panel field, move the cursor to the position for the information, left click to get focus in the panel field and then start typing. The information will go into the field starting at the input-position indicator (a upright bar in the panel field).

The input-position indicator can be moved by

- ▲ clicking LB when the cursor is at the new position for input
- ▲ using the keys `->`, `<-`, home and end

The **backspace** key, `<backspace>`, will delete one character before the input-position indicator and the **delete** key, ``, will delete one character after the input-position indicator.

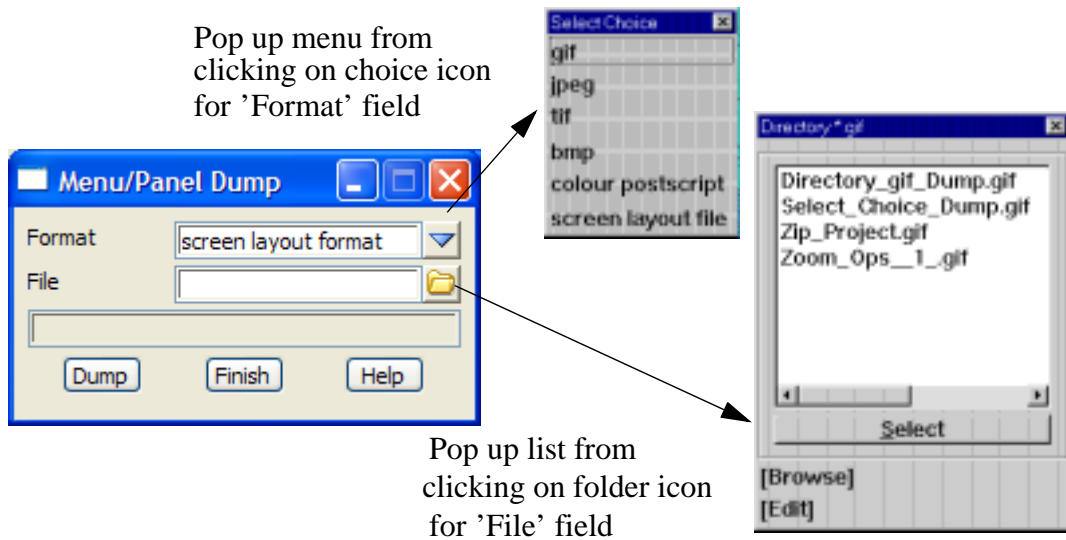

The user can move to any field in the panel by using the mouse. The `<tab>` key will move the cursor to the next panel field or button and `<shift>+< tab>` will move the cursor to the previous panel field or button.

Note - the entire field is used as the answer, not just up to the input-position indicator. The input-position indicator indicates where the characters will go when typing, not the end of the data.

Pop-Up Lists and Menus

The **panel field pop-up list** or **menu**, or panel field pop-up, is raised by clicking LB on the `[+]` or other choice icons at the right of the panel field.

A panel field pop-up consists of a list of choices which may be displayed as either a *menu* or a *list*.

For a pop-up list, an answer is chosen from the list by **double** clicking LB over the required answer. This answer is then displayed in the panel field and the pop-up list disappears.

For a pop-up menu, an answer is chosen from the pop-up menu by clicking LB over the required answer. This answer is then displayed in the panel field and the pop-up menu disappears.

The pop-up list or menu can also be removed without a selection by clicking LB on the [X] on the pop-up list or menu, by clicking LB again on the icon or [+] for the panel field, or by simply typing into any visible part of the panel field that the pop-up is for (some of the field may be obscured by the pop-up itself).

The pop-up lists and menus and the choice icons are described in more detail in the section on *Special Panel Fields*.

Name completion

To help speed data entry a process called **name completion** is available in most panel fields. <ctrl> + <d> is the special key combination used for name completion and how it works will now be described.

If one or more characters have been typed into a panel field and the <ctrl> + <d> combination is pressed, then 12d Model checks to see how many answers in the available pop-up start with the same typed characters. If a unique match exists, then it will be placed into the panel field. If more than one match exists, a pop-up menu with all the matches will be presented for the user to select from.

Name mapping

When typing a string name into a panel field, a **name mapping file** can be specified and is used to fill out information such as colour, model etc. for given string names.

The name mapping works in two ways. After typing part or all of a string name,

- (a) if <enter> is entered, the name map file is searched for a match in the first column (the key). If a match is found, the name, colour, model, style etc. from the other columns in the name mapping file are used to fill out the panel fields. The key can contain wild cards and/or characters.
- (b) if <ctrl> + <d> is entered, the **second** column of the name mapping file is searched for a list of completions which is written to the field if it is unique or displayed in a pop-up if there is more than one match. If a * is found in the second column, the first column is used for matching. When an entry is selected from the completion list, the name, colour, model, style etc. from the columns in the name mapping file are used to fill out the panel fields.

If a name mapping file exists, then the [+] for the *name* panel field will include the entries from

the first column of the name mapping file. If an item is selected from the list, then the name, colour, model, style etc. from the columns in the name mapping file are used to fill out the panel fields

The name mapping file is pointed to by the environment variable

NAME_MAPPINGS_4D

or is if the environment variable is not set, the default name is **names.4d**.

During a 12d Model session, the name mapping file can be changed by the *Name Settings* tab on the option **Utilities=>Defaults**. Note that this new name mapping file is not saved with the project.

Validation

After the panel field information is entered, an <enter> key requests that the panel field information be validated. Any error message will be displayed in the panel's message area. If there is no error, the cursor will move onto the next panel field. If an error occurs, the cursor will remain in the invalid panel field.

New panels or menus can be fired up before completing panels or menus already on the screen. This gives the user full control over the work flow, rather than being locked in by fixed sequences in a program.

Panel System Menu

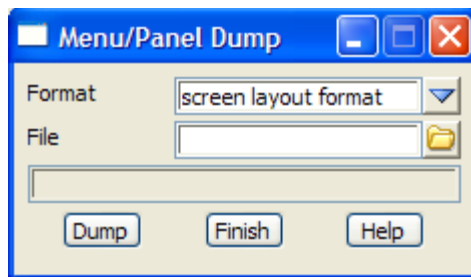

The Panel System menu is brought up by clicking LB on the windows icon on the left hand corner of the panel title area.

The Panel System menu has options to move, minimize, close and dump the panel.

Dumping a Panel

An image of the panel can be written out to disk in either bmp, tif, jpeg, postscript or as a screen layout file or a dialog default file. This is called dumping the panel.

The **dump** option is selected from the **panel system** menu which is invoked by clicking the left mouse button (LB) on the Windows icon on the left of the panel title area. The **Menu/Panel Dump** panel is then displayed

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	input	screen layout file	bmp, tif, jpeg, postscript, screen layout file, dialog default file

format for writing the image to disk.

File input
disk file to write the dump image to.

Dump button

dump the panel image to disk.

Moving a Panel

A panel can be moved (dragged) by **holding down LB** anywhere in the menu title area (except over the windows icon on the left and the minimize, restore and **[X]** buttons on the right) and then moving the cursor with the LB still depressed. A panel outline appears and moves with the cursor to indicate where the new panel position will be. The panel is finally positioned when LB

Minimizing and Maximizing a Panel

The panel can be minimized (iconized)/restored and maximized using the standard Windows minimize/restore and maximize buttons on the top right hand corner of the panel.

Resizing Some Panels

Some panels can be resized in *width* and have a *Resize motif* on the bottom right hand corner. For example

Deleting a Panel

Three methods are available for deleting a panel - picking the **[X]** button in the panel title area, using the **finish** button or by selecting close from the panel system menu.

ok_panel

OK Panel

The **OK** panel requires the selecting of the button **OK**.

yes_no_panel

Yes-No Panel

The **yes no** panel requires the selecting of the button **yes** or **no**.

yes_no_cancel_panel

Yes-No-Cancel Panel

The **yes no cancel** panel requires the selecting of the button **yes**, **no** or **cancel**.

yes_no_all_cancel_panel

Yes-No-All-Cancel Panel

The **yes no all cancel** panel requires the selecting of the button **yes**, **no**, **all** or **cancel**.

The next section is “Views”.

Views

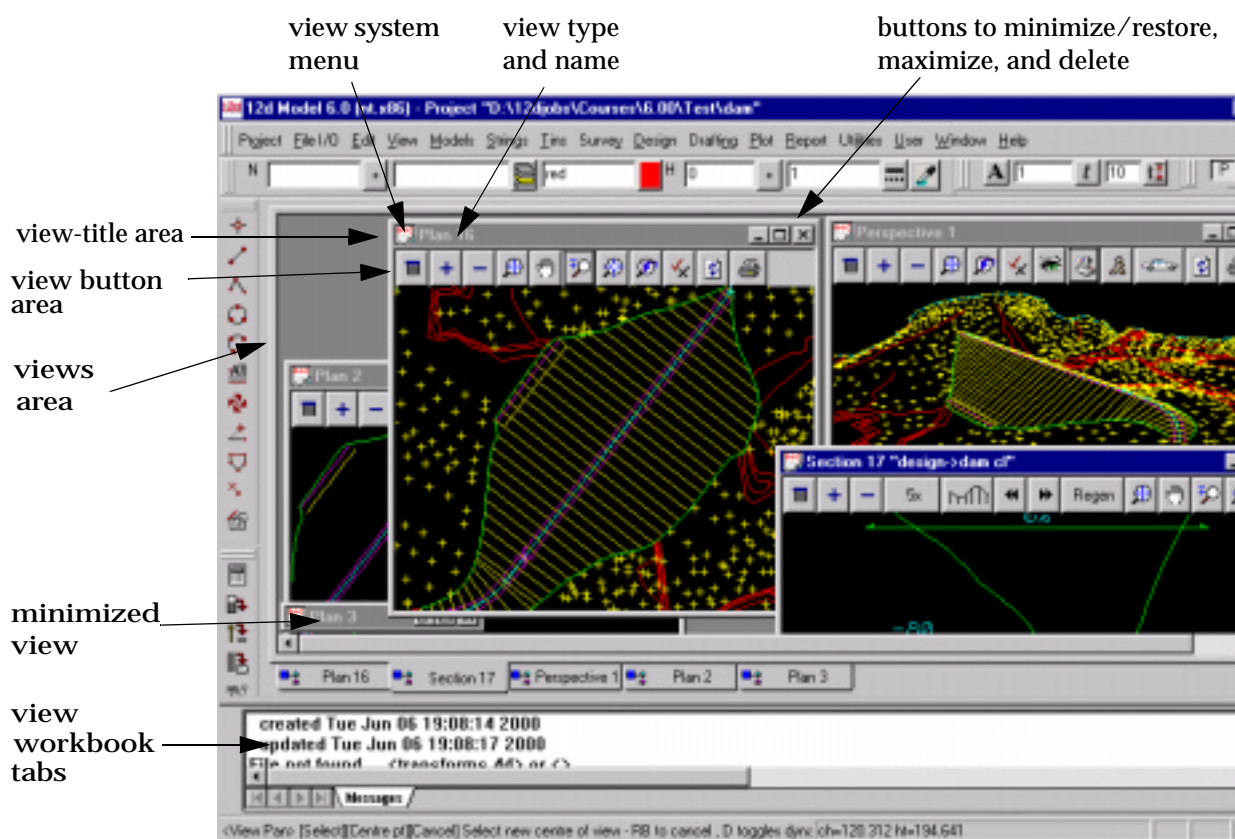

Views are the screen drawing areas for 12d Model and come in three flavours - plan, perspective and section.

Views can be created and deleted as required by the user and there is no limit to the number of views on the screen. Views can be overlapped and minimized.

Each view has a unique name of up to two hundred characters. The view type and name are displayed on the top left corner of the view in what is called the **view-title area**.

There is an option to list all the views available in a 12d Model session (the view list). The view list (or a restriction to those of a specific view type) is also used in various pop-ups and walk-right menus.

As for menus and panels, each view has a *view title area* which is used to display the view type and name.

View System Menu

The view system menu is brought up by clicking LB on the windows icon on the left hand corner of the *view title area*.

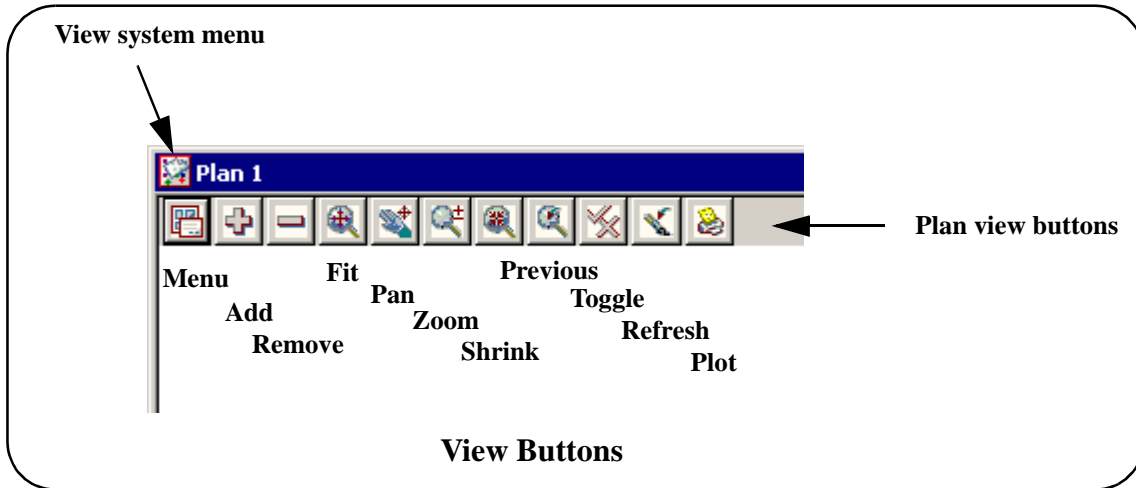

The view system menu has options to move, minimize, close and dump the view.

View Buttons

On the row under the view type and name, are a number of options called **view buttons**.

The view buttons act like menu items and are activated by clicking LB when the cursor is above the button.

The function of each view button will be described elsewhere in this manual.

View Workbook

If the **View workbook mode** is turned on, a workbook tab for each view is created at the bottom of the Views Area.

If the view is not minimized, then selecting the workbook tab for the view will bring the view to the top of the other views. If any of the views are maximized, then selecting any of the workbook tabs will bring that view to the top already maximized.

The View Workbook Mode toggles is toggled on/off by the option View => Workbook Mode on the Main menu.

Dumping a View

view_dump

An image of the view can be written out to disk in either bmp, tif, postscript format or as a screen layout file. This is called dumping the view.

The **Dump** option is selected from the **view system menu** which is invoked by clicking the left mouse button (LB) on the Windows icon on the left of the view-title area. The **View Dump** panel is then displayed

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input	view option is picked from	available views

the view to dump out in the specified format.

Include title tick-cross

if tick, the view title area is included in the dump.

Format input gif bmp, tif, jpeg, postscript

the format to dump the view out in.

File input *.gif

the file to dump the view images out to

Dump button

dump in the given format the image of the view given in the view field to the file given in the file field.

Moving a View

A view can be moved (dragged) by **holding down LB** anywhere in the view-title area (except over the windows icon on the left and the minimize, restore and **[X]** buttons on the right) and then moving the cursor with the LB still depressed. A view outline appears and moves with the cursor to indicate where the new view position will be. The view is finally positioned when LB is released.

Resizing View

A view can be resized using the standard Windows resize methods.

Minimizing and Maximizing a View

A view can be minimized (iconized), restored and maximized using the standard Windows minimize/restore and maximize buttons on the top right hand corner of the view.

Deleting a View

Picking the **[X]** button in the *view-title area* or selecting close from the view system menu will delete the view.

View Menu

If RB is clicked in the *view title area* or the *view buttons area*, a new menu called the View menu will appear. To remove the View menu, select **[X]** from the View menu or click RB again in the *view title area* or the *view button area*.

Because of the differences between plan, perspective and section views, the options on the View menu vary for each view type. For example, the perspective View menu is

The View menus will be discussed in the chapter “View Menus”.

Please continue to the next section “Status Bar”.

Status Bar

The Status Bar is used to display many of the messages generated by 12d Model options (each panel also has its own special message area) and the dynamic co-ordinate position of the cursor as it moves around in any view on the screen.

The co-ordinate values displayed depends on the view type. For example, the world co-ordinate (x,y) position of the cursor is displayed when inside plan views, and a (chainage,height) position when in a section view.

The messages are displayed on the left hand side of the Status Bar and the view co-ordinates on the right hand side of the Status Bar.

The Status Bar is toggled on/off by the option View => Status Bar on the Main menu.

Please continue to the next section “Output Window”.

Output Window

The **Output Window** displays 12d Model system and error messages.

The Output Window is toggled on/off by the option *Window => Output Window* on the Main menu.

If an error message is sent to the Output Window and the Output Window it is turned off, then the Output Window is automatically toggled on to indicate an error has occurred.

Hence the Output Window can be left turned off and it will reappear when an error message occurs.

Please continue to the next section “Data Types”.

Data Types

Strings

12d Model uses the string as one of its basic modelling elements.

A string is simply an *ordered* series of vertices or points.

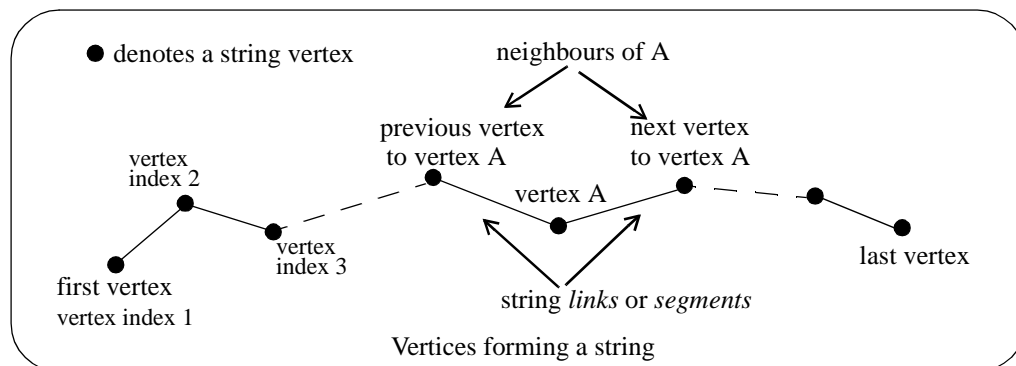

Apart from the first and last vertex in a string, each vertex in a string has a unique previous vertex (predecessor) and a unique next vertex (successor). The previous and next vertices for a vertex are called its string neighbours.

The lines joining a vertex with its neighbours are called string links or segments. Segments may be straight or arcs, visible or invisible.

The string has an implied **direction** starting from the first vertex of the string and always proceeding to the successor vertex in the string.

The ordering along a string allows each vertex to be given a vertex index where the first vertex has vertex index **1**. Note that if additional vertices are inserted or vertices deleted then the vertex indices will change. Also note that for super strings, a vertex may have a *point id* (*vertex id*, *point number*) which is **not** the same thing as the vertex index.

A string which has the same first and last vertex is called a closed string otherwise a string is said to be open.

Strings are very useful in the modelling of terrain and design surfaces. 12d Model uses a number of different **types** of strings and they are defined as:

2d or contour string

the z-value is the same at every vertex in the string.

3d string

the z-value can vary for each vertex in the string.

4d string

the string has (x,y,z) values at each vertex plus text defined at each string vertex. Useful for such things as survey stations.

alignment string

this string holds both the horizontal and vertical information needed in defining entities such as the centre line of a road. Horizontal intersection points (HIP's), circles and leading and trailing spirals are stored to define the plan geometry. Vertical intersection points (VIP's) and parabolic curves are stored to define the vertical geometry of the string. Alignment strings are essential for

describing roads.

arc string

an arc in a plan projection but with a linearly varying z-value on the circumference. So the arc string is actually a 3d helix. The centre point of the arc is for display purposes only.

circle string

a circle with a constant z-value around the circumference. The centre point of the circle is for display purposes only.

drainage and sewer string

special string made up of straights, arcs and manholes.

feature string

a circle with a z-value at the centre point but only null values on the circumference.

If a feature string is given a **world** line style, then the style is centred on the centre point of the feature string and scaled up to the radius of the feature string.

If a feature string is given a **screen** or **paper** line style, then the style is wrapped around the circumference of the feature string.

interface string

an interface string is a special string constructed from a string and a surface. Each vertex of the interface string records whether the corresponding vertex on the original string was above or below the surface.

pipe string

a 3d string with a diameter.

pipeline string

an alignment string with a diameter.

polyline string

similar to a 3d string except that there can be straights or arcs joining the string vertices.

super string

a super string is a general purpose string. Each link has visibility, colour and breakline flags and values for diameter, radius, text and an unlimited number of user definable attributes. Each vertex has tinability, symbol with its own size and rotation, z-value, text and an unlimited number of user definable attributes. Segments can be lines, arcs or spirals. Each segment has colour, diameter, visibility, tinability, text and an unlimited number of user defined attributes.

super alignment string

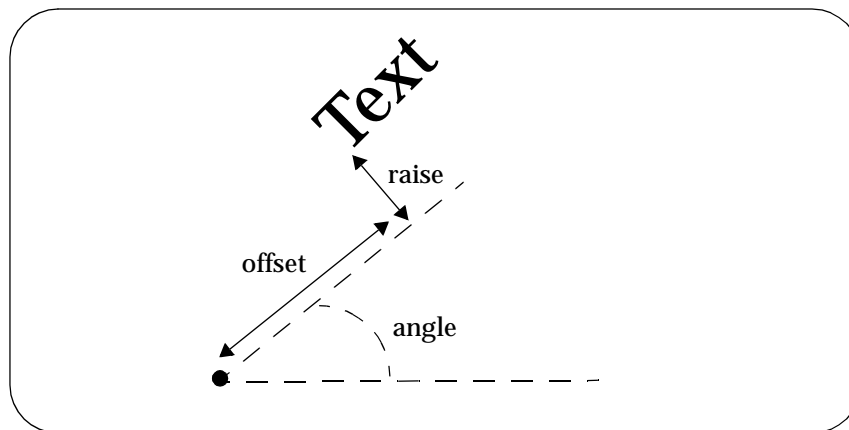

like an alignment string, this string holds both the horizontal and vertical information needed in defining entities such as the centre line of a road. However the super alignment is not restricted to just IP methods for constructing the horizontal and vertical geometry of the string.

control station

control stations are used in the survey reduction option where a name of a station can be given in the 12d survey field file and the co-ordinates of the station can given by the control station of that name in the specified model of control points. In 12d Model, a Control station is represented by a one vertex 4d or super string and the name of the control station is the name of the one vertex string. Usually the point id for the vertex of the super string, or the text for the 4d string, is also the Control station name.

text string

a text string has an (x,y) position and contains characters and information about how the characters are displayed (textstyle, units, height, offset, raise, justification, angle, slant and x factor).

String Chainage

Every vertex along a string has a unique **chainage** value. This chainage is calculated by taking the start chainage defined for the first vertex of the string, and adding to it the plan distance along the string from the start vertex to the selected vertex on the string.

Breakline Type

When triangulating data, the sides of non-crossing strings can be preserved as the sides of triangles. Such strings in 12d Model are called **breakline** or **line** strings. Non-breakline strings are called point strings.

For triangulation purposes, each of the string types 2d, 3d, 4d and polyline can be used as **either** breaklines (line strings) or not (point strings).

Line strings are useful in describing terrain features such as ridge lines and creek beds or design features such as the edge of a building platform. Point strings can represent information such as spot heights.

Alignments, arcs, circles, pipelines, interfaces, drainage and sewer strings can only be breakline strings. Feature strings can only be point strings with a z-value at the centre of the circle.

Tinable

For a **super string**, the concept of breakline has been extended to a property called **tinable** which can be set *independently* for each vertex and each segment of the super string.

If a **vertex** is tinable, then the vertex is included in triangulations. If the vertex is not tinable, then the vertex is ignored when triangulating.

If a **segment** is tinable, then the segment is used as a side of a triangle during triangulation. That is, the segment is used as a breakline. This may not be possible if there are *crossing* tinable segments.

Note that for a segment to be used as a side of a triangle, then its end vertices must also be tinable.

Linestyle and Colour

All strings (except text) can be given a user defined **linestyle** or simply **style**. The style describes how the string is drawn on the screen and on plots. The default style is **1**.

A style can also be continuous or just at the vertices of a string, regardless of the breakline type of the string. A breakline string (line string) with default style **1** will be drawn with solid lines between the nodes, and a non breakline string (point string) with default style will be drawn with crosses at the string nodes with no visible lines between the nodes.

Strings have a default colour but how that colour is used depends on the breakline type and style of the string. For example, a line string with default style **1** is drawn with the string's links in the string colour and for a point string with default style **1**, crosses are drawn at each string point in the string colour. However, styles can have their own colours which override the default colour of the string. Interface strings have two colours (red and green) which are used to represent cut and fill information.

Hence, 2d, 3d and 4d strings with **default styles** appear on the screen as

point string (non breakline string)

each string link is considered to be an **invisible** line. String values are not defined along the string links.

line string (breakline string)

each string link is considered to be a **solid** line. String values are defined along the string links by linear interpolation between the end points of the string link.

Name and Model

Strings have a text name of up to two hundred alphanumeric characters, spaces and dots (.). The string name does not have to be unique and can be blank. When strings are created, they are stored in **models**. A string is in one and only one model. Models are discussed in the next section.

Models

Within a 12d Model project, information is collected in units called **MODELS**. Models contain strings and tins (see the next section).

Each model has a unique user-defined text name of up to two hundred alphanumeric characters and spaces.

For convenience, model names should reflect the nature of the information in the model. For example, a model containing terrain data could be called **terrain**. **design** could be another model containing design data.

Each model has minimum and maximum x, y and z values which define a bounding box which encloses all the data in the model (the model bounding box). The size of the model bounding box is automatically updated as new data is added to the model, but not adjusted as data is deleted. A re-calculation of the model bounding box is performed by the **calc extents** buttons on the model and view information panels.

There is an option to list all the models available in a 12d Model session (the model list). The model list is also used in various pop-ups and walk-right menus.

Displaying Models

The screen display areas in 12d Model are the views. Models are displayed in views by "adding" the model to the view. Similarly, when a model is "removed" from a view, it is no longer displayed in that view.

There are options in the 12d Model menu and on each view to add and remove models from views.

Tins

To form a continuous surface representing the data in a model, a process called triangulation is used. Triangulation creates a web of non-overlapping triangles whose nodes are the model data points. Because the data points are normally irregularly spaced, the triangulation is referred to as a **TIN** - a **Triangulated Irregular Network**.

For 2d, 3d, 4d and interface strings, all non null points are included in the triangulation. For super strings, only vertices that are tinable are included in a triangulation.

To allow the triangulation to accurately represent features such as ridge lines and creek beds, the links of breakline strings (line strings) are preserved as edges of triangles in the tin.

For a super string, only segments that are tinable and whose end vertices are also tinable, are included as break lines.

Each tin is given a unique user-defined name of up to two hundred alphanumeric characters and spaces.

Unlike strings, tins can be in more than one model, or even no model at all. However, to be **displayed** in a view or used for **profiling** on a section view, tins need to be in at least one model. It is suggested that each tin be in its own model called "tin **tin_name**". This makes it easy to know the model a tin is in, and also to see which models contain tins and obtain lists of all tins when using <ctrl> + <d> for name completion.

There is an option to list all the tins available in a 12d Model session (the tin list) which also displays the models the tin is in as a walk-right. The tin list is also used in various pop-ups and walk-right menus.

Tins can be "added" and "removed" from models with options in the triangles option in the 12d Model menu. If a tin is to be displayed in a view, it must be "added" to a model that is being displayed in that view.

Tins can only be **deleted** by using the Triangles=>Delete options - for safety, they are **not** deleted when any model containing them is cleaned or deleted.

WARNING

Tins are stored with **copies** of the points that were triangulated. If the original points are then modified, the triangulation will not reflect this change.

Templates

Templates are used as a quick and easy method for defining design details along a string for use in conceptual and detail designs, and visualizations. Templates are stored with each project but can be written out and read in using a readable file format.

Projects

In 12d Model, information is organised into **projects**.

When 12d Model begins, the user specifies the name of the project to work on. A project name can be up to two hundred alphanumeric characters and spaces.

All the information created for that project is kept together in a special folder called the **project area**.

The project area contains all the models, templates and tins associated with the project. Copies of models and tins created in other projects can be added to another project from within 12d Model.

External data files can be read into the project (imported) using special input options. Similarly,

output options are provided to write data out for use in other software packages (exported).

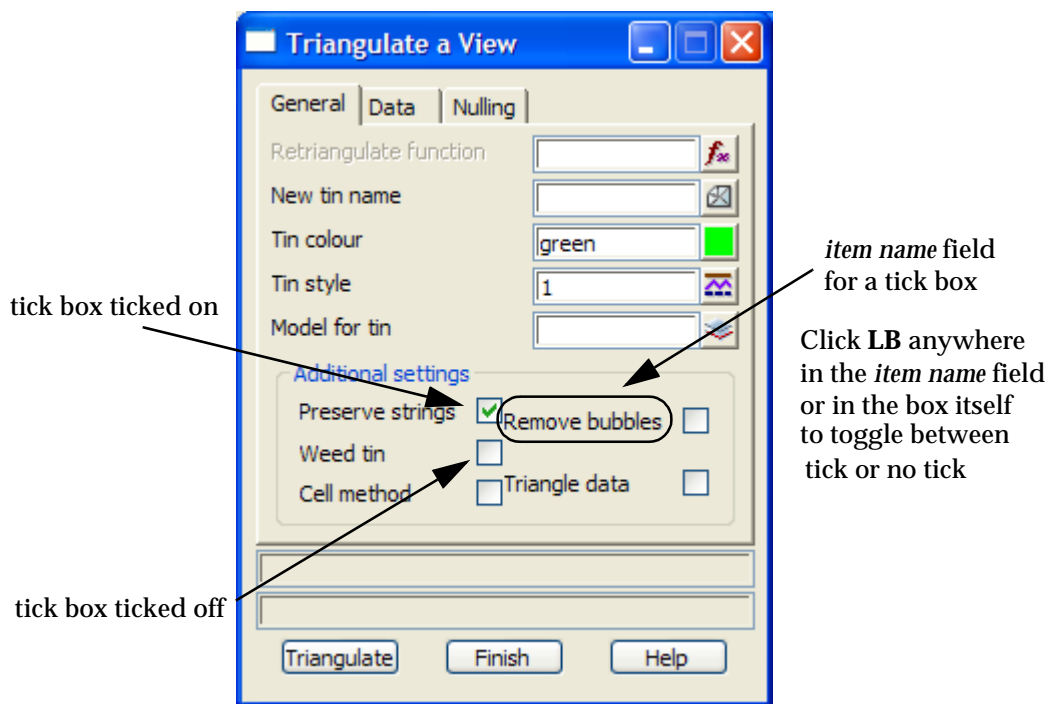

Please continue to the next section “Tick Box”.

Tick Box

Many items require a mode to be either on or off.

In **12d Model**, there is a special box with a **tick** to indicate that the setting is **on** and **nothing** to indicate that the setting is **off**.

In a **tick** box, the tick is changed to the nothing state by clicking LB in the box surrounding the tick or clicking LB on the **item name** field for the tick box.

Please continue to the next section "Picking Strings".

Picking Strings

In many 12d Model options, the user is required to “pick” the string to be used in the option, or to get information about a string.

After any option requiring a pick is selected, a message regarding the function of the mouse buttons is written to the screen message area.

<option> [picks][fast][menu]

There are three picking method available in 12d Model:

- (a) fast pick where the pick and the accept occur as one operation
- (b) fast accept where the if there is only one item satisfying the snap conditions then it is automatically accepted but if there is more than one, the tentative pick mechanism is used and
- (c) tentative picks with a separate pick and accept mechanism

Fast pick will be documented first, followed by **fast accept** and **tentative pick** (pick and accept).

Fast Pick

To **fast pick** a string, simply move the cursor near the string and **click MB** or type <enter>. The nearest string to the cursor satisfying the snap conditions is selected.

Fast pick is used when the **F** snap is on.

Various snap modes can be set for the fast pick. The available snaps are point (vertex), line, grid, tin and cursor. One or more snaps can be set simultaneously. The snaps are described in more detail in the section “Snaps”.

Fast Accept

To **fast accept** a string, simply move the cursor near the string and **click LB** or type <enter>. If there is only one string satisfying the snap conditions, then it is automatically accepted.

If there is more than one string satisfying the snap conditions, the nearest string to the cursor satisfying the snap conditions highlighted and an information menu containing information about the selected string is displayed.

If the correct string has been tentatively picked, **click MB** or **type <enter>** accepts the string. If the incorrect string is tentatively picked, click LB and the next closest string satisfying the snap conditions will be highlighted. See the section “Tentative Pick” for more information on tentative picking.

Fast accept is used when the **A** snap is on.

Various snap modes can be set for the fast pick. The available snaps are point (vertex), line, grid, tin and cursor. One or more snaps can be set simultaneously. The snaps are described in more detail in the next major section “Snaps”.

Tentative Pick

information_al information_poly

To **tentatively pick** (or tentatively select) a string, move the cursor near the string and **click LB**. The nearest string to the cursor satisfying the snap conditions (see the next section on Snaps) is highlighted and an information menu containing information about the selected string is displayed (the information varies for each string type- see the section “String Information” in the chapter “Strings”).

The information menu disappears if the cursor is moved slightly.

The string name, the string model and the mouse button functions are also displayed in the Status Bar when the picked string is highlighted:

<option> [selects][accepts][menu] “model->string name”

If the correct string has been tentatively picked, **click MB** or **type <enter>** to accept the string. If the information menu was still up, it disappears when the string is accepted.

Note - if the information menu does not appear when a string is highlighted, then the *information snap* may be set to off. See the section “Snaps”.

Tentative Picking and Repicking

If one string is tentatively picked (and highlighted) but another string was intended to be picked, click LB again without moving the cursor and the next nearest string to the current cursor position will be selected, highlighted and an information menu put up for it. Any strings already rejected during the pick will be ignored. Continuing to click LB again without moving the cursor will sequentially pick the next nearest string and ignore the earlier rejected strings.

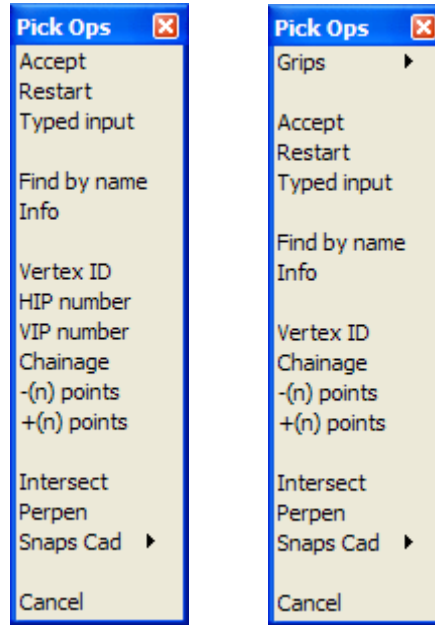

To allow **all** strings to be eligible for picking again, simply move the cursor a small distance (the reset distance - default five pixels) and start picking again. This will automatically **reset** the rejection list.

Pick Ops Menu

pick_ops

Options to allow all strings to be eligible for picking again, to cancel the pick operation and to accept a picked string are all available from the Pick Ops menu.

The Pick Ops menu appears whenever RB is clicked whilst in the pick option. The Pick Ops menu is

Alignment and Pipeline strings

For most other string types

To allow all strings to be eligible for picking again, select **Restart** from the Pick Ops menu. This has the same effect as moving the cursor the reset distance.

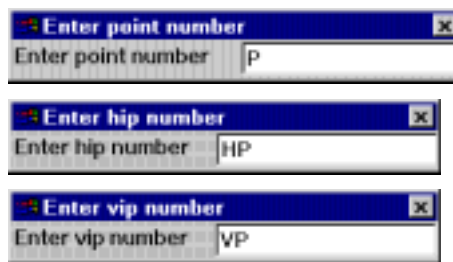

To cancel the pick without selecting any string, select **Cancel** from the Pick Ops menu.

Selecting **Accept** from the Pick Ops menu, accepts the current picked string. This is the same as clicking MB without calling up the Pick Ops menu.

The **Find by name** option allows the user to specify a string name to restrict the pick by. This options is also available in the snap option and will be described there.

Selecting **Info** will redisplay the information menu for the string.

If Vertex/HIP/VIP number, is selected, the **enter vertex/hip/vip number** box is displayed.

Typing the number into the box terminated by <enter> will move the pick position to that vertex or IP point.

If Chainage is selected, the **Enter Chainage** box is displayed.

Typing a chainage into the box terminated by <enter> will move the pick position to that chainage on the tentatively selected string.

enter_relative_vertex_index

If -(n) vertices or +(n) vertices is selected, the **Enter relative vertex index** box is displayed.

Typing a positive/negative number into the box terminated by <enter> will move the pick vertex to that many vertices after/before the selected position on the tentatively selected string.

The left and right arrow keys (<-, ->) can also be used to move the pick position to the previous or following vertex respectively.

To remove the Pick Ops menu without selecting an option, either select the **[X]** button from the Pick Ops menu title area or simply click RB again whilst the cursor is in a view.

Various snap modes can be set for the pick. The available snaps are point, line, grid, tin and cursor. One or more snaps can be set simultaneously. The snaps are described in more detail in the next section.

Picking with Direction

Picking a string is one operation where 12d Model is monitoring the cursor position when button LB (or MB for fast pick) is pushed down and also the cursor position when button LB (MB) is subsequently **released**.

The **pick position** is taken as the cursor position when button LB (MB) is released, but the difference between the down and up positions for button LB (MB) defines a **direction** vector or **sense** to the pick. This direction is called the **picking direction** or **picking sense**.

The **picking direction** is used in a number of 12d Model options.

For example, in the information panel displayed for any picking operation, if the picking direction is the same as the string direction, a **+ve** is displayed at the bottom of the panel. If the directions are opposite, then a **-ve** is displayed in the panel.

Important Note

If a string was picked with direction, then to automatically reset the rejection list, the cursor must be move fifty (50) pixels rather than the five required for a non-directional pick.

Summarising the 12d Model Picking Mechanisms

Tentative picking - pick and accept as separate operations

LB - left button	select the next nearest string. moving the cursor more than five pixels resets the rejection list for a non-directional pick. moving the cursor more than fifty (50) pixels resets the rejection list for a directional pick.
MB - middle button	accept the current selected (highlighted) string - ends the pick.
RB - right button	brings up the Pick Ops menu.
Typing <enter>	same as MB: accepts the current selected (highlighted) string - ends

the pick

Fast accepting - pick and accept in one operation if there is only one item satisfies the snap conditions or a tentative pick if more than one item.

LB - left button select the next nearest string. If there is only one item possible then it is automatically accepted. Otherwise it is the same as for a tentative pick.
moving the cursor more than five pixels resets the rejection list for a non-directional pick.
moving the cursor more than fifty (50) pixels resets the rejection list for a directional pick.

MB - middle button accept the current selected (highlighted) string - ends the pick.

RB - right button brings up the Pick Ops menu.

Typing <enter> same as MB: accepts the current selected (highlighted) string - ends the pick

Fast picking - pick and accept in one operation

MB - middle button pick and accepts the nearest string.
or

Typing <enter> same as MB: pick and accepts the nearest string - ends the pick.

Please continue to the next section "X Y Z and Ch Ht Typed Input Box".

X Y Z and Ch Ht Typed Input Box

Many **12d Model** options use a *cursor select* (picking) in a view to pick strings, obtain information about a string, get an x, y and z co-ordinates for a new vertex etc.

In most cases, **typed input** can also be used to enter the information instead of using the cursor select. For example, an exact values for the x, y (and possibly z) co-ordinates could be typed in or a chainage and a height typed in rather than picking a position on a view.

Typed input is available in 12d Model whenever a *cursor select* is used.

To use *typed input*, simply begin typing the values. As soon as a character is typed, a special *typed-input* box appears on the screen and the typed characters are automatically placed in it.

Alternatively, instead of clicking **LB** to select a string, click **RB** to bring up the **Pick Ops** menu and then select Typed Input from the Pick Ops. This will also bring up the *typed input* box.

Depending on the view type that the cursor is over, the *typed input* box will be either an *Enter X Y Z* or an *Enter Ch Ht* box. If the focus is on a Plan or Perspective view, then an **Enter X Y Z** box comes up. If the focus is on a Section view, then an **Enter Ch Ht** box appears. These are also called the *XYZ typed input* box and the *Chainage Height typed input* box respectively.

The x, y (and possibly z) co-ordinate values or chainage height required by the box are simply typed in, each value being separated by **one or more spaces**.

An <enter> terminates the typed input and sends the entered values to the option. The typed-input box then disappears.

If the user wishes to **abort** the typed input and return to mouse input, simply select the **[X]** button on the typed input box, or type <enter> with no values in the typed input box.

The *Enter X Y Z/Ch Ht* box can be **moved** (dragged) to a new position on the screen in the standard way.

The default mode for the **Enter X Y Z** box is to receive absolute x, y and z values.

However, by typing special character codes before the values, the **Enter X Y Z** box can be used to enter data in a variety of formats including relative co-ordinates and bearing-distance combinations.

The full list of typed input codes now follows (the text will be given in lower case, but it can be typed in either upper or lower case).

▲ *actual x actual y actual z*

x y z

or

a *x y z*

▲ *relative x relative y relative z*

r *x y z*

▲ bearing in degrees-minutes-seconds distance actual z

bd ddd.mmssfff distance

where ddd.mmssfff is the bearing expressed in degrees, minutes and seconds as

ddd	whole degrees
.	separator between degrees and minutes
mm	whole minutes
ss	whole seconds
fff	fractions of seconds (as many as required)
▲ bearing in decimal degrees	distance actual z
dbd	ddd.dd distance z
▲ angle in degrees-minutes-seconds	distance actual z
ad	ddd.mmss distance z
▲ angle in decimal degrees	distance actual z
dad	ddd.dd distance z

The default mode for the **Enter Ch Ht** box is to receive *chainage* and *height* values.

However, by typing special character codes before the values, the **Enter Ch Ht** box can be used to enter data in a variety of formats including grade distance and slope distance.

The full list of typed input codes now follows (the text will be given in lower case, but it can be typed in either upper or lower case).

▲ actual <i>chainage</i>	actual <i>height</i>
	<i>chainage height</i>
or	
a	<i>chainage height</i>
▲ relative <i>chainage</i>	relative <i>height</i>
r	<i>chainage height</i>
▲ <i>slope</i> and <i>distance</i>	
sd	<i>slope distance</i>
	where slope is 1 vertical in slope horizontal units
▲ <i>grade</i> and <i>distance</i>	
gd	<i>grade distance</i>
	where grade is 1/slope as a percentage

Please continue to the next section “Tentative Typed Inputs”.

Tentative Typed Inputs

If the string has been **tentatively** selected (by clicking LB and highlighting the string but not yet accepting it), then further typed inputs are available which then work for the **highlighted** string only.

The **Tentative typed inputs** are:

CH <i>chainage</i>	go to the given chainage
V <i>vertex-index</i>	go to vertex index

HP <i>number</i>	go to horizontal IP number " <i>number</i> "
VP <i>number</i>	go to vertical IP number " <i>number</i> "
+	go to the next vertex
-> (right arrow)	go to the next vertex
+ <i>number</i>	go forward <i>number</i> vertices
-	go back to the previous vertex
<- (left arrow)	go back to the previous vertex
- <i>number</i>	go backward <i>number</i> vertices

When a string is *tentatively* selected, the above *typed input* options are also available as *menu items* from the Pick-Ops menu. This has been documented in the section "**Pick Ops Menu**" in this chapter.

Please continue to the next section "Picking Point Ids (Point Numbers, Vertex ids)".

Picking Point Ids (Point Numbers, Vertex ids)

When a **12d Model** option uses a *cursor select* (picking) in a plan view to pick strings, then *typed input* can be used to select a point id (point number, vertex id) which exists in any model on the view (note that a point id can be numeric or alphanumeric).

When over the plan view, instead of clicking **LB** to select a string, simply type:

number to select a *numeric* point id

or

P*text* to select an *alphanumeric* point id of name *text*.

This will bring up the **Enter X Y Z** box and the typed information will go into the box. Type <enter> and the view will then be searched for the given point number.

If the point id exists, then a large cross will be drawn over the vertex on the view and the string containing the point id will be highlighted.

Note that if a string is *tentatively* selected (i.e. highlight but not yet accepted), then

Vn will select the nth vertex of the tentatively selected string (vertex index of n)

Please continue to the next section "Snaps".

Snaps

In most 12d Model options, the mouse is used to pick data from a string displayed on the screen. Unfortunately different options usually require different data so an easy method is needed to help select from all the strings on the screen, a specific string or part of a string.

In 12d Model, **Snaps** are used as part of the string picking mechanism (discussed in the previous sections) to help filter out what data is interactively selected on a view.

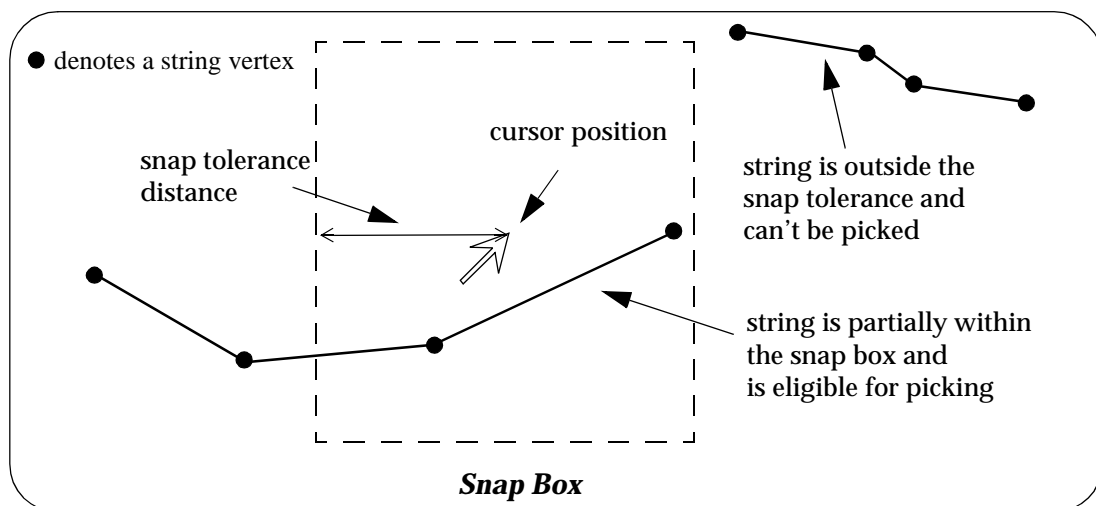

Using the 12d **snaps** it is possible to

- ▲ restrict any string picks to selected string names and/or models
- ▲ set modes which are used to determine what parts of strings are used for picking
- ▲ set the search distance for picking vertices (point snap tolerance)
- ▲ set the search distance for picking (snap tolerance)
- ▲ give the name of a tin to be used to set z-values at a (x,y) position
- ▲ set whether the user is prompted for a new height (z-value) after every point edit
- ▲ turn off the information menu when picking

Point and Line Snaps

When trying to interactively pick a string in 12d Model, the user moves the cursor near the string in a view and clicks LB (or the MB for a fast pick). 12d Model then makes a search of all the strings on the view to make a selection.

The help restrict the search, only strings that are partially or totally within an x and y distance called the **snap tolerance** of the cursor are eligible for picking. That is, only strings that have part, or all, of them within the **snap box** can be selected.

For strings inside the snap box, 12d Model has two snap modes, *point* and *line*, to specify which parts of the strings can be selected.

If **point** snap is set on, the vertices (points) of a string can be selected. If only *point* snap is on, then the string containing the **closest vertex** to the cursor is selected.

If **line** snap is set on, then the position on the string that is determined by dropping the cursor perpendicularly onto the string, can be selected. Note that there is usually no string vertex at the perpendicular position (line snap position). If only *line* snap is on, then the string containing the closest perpendicular position to the cursor is selected.

Since in general it is rare for a vertex of a string to be closer to the cursor than the line snap position, then with only the above definitions and *point* and *line* snap both on, the line snap position usually wins. Hence to pick a vertex, line snap would have to be turned off. Since this can lead to line snap being regularly toggled on and off, another distance called the **point snap tolerance** has been introduced to give vertices **priority** over line snaps when both snaps are on.

When *point snap* is set on, any vertex of a string that is within an x and y distance called the **point snap tolerance** of the cursor when LB is clicked, is considered for selection **before** any other type of snap is considered. That is, any vertices in the **point snap box** are selected before any line snap positions.

In the area between the point snap box and the snap box, vertices and line snap positions are treated equally and the closest one to the cursor is selected.

The other types of snaps are not as complicated and will be discussed in the following sections.

Setting Snaps

Snaps can be toggled on and off from the snaps tool bar, or the snap settings can be set from the Snaps menu under *Utilities* on the Main menu.

The menu *Utilities* => *Snaps* is:

The *Snaps (Vert)* option brings up a Snaps toggle menu similar to the *Snaps* toolbar except that the *Snaps (Vert)* runs vertically rather than horizontally. Either can be used to toggle the snaps on and off.

Snaps toolbar

The Snaps (Vertical) menu

Point
Line
TeXt
Grid
Cursor
Height
Tin
Segment
Info
Data tip
Fast pick
fast Accept
Konstruction

The option *Utilities* => *Snaps* => *Snaps* option brings up a menu that provides tick boxes to turn the various snap modes on or off plus it is used to set the snap tolerance value, the point snap tolerance value, the tin for tin snaps and string and/or model names for restricting the snaps.

Any combination of snap modes and names can be set.

The Snaps menu is

Snaps		
Point	<input checked="" type="checkbox"/>	point snap on/off
Line	<input checked="" type="checkbox"/>	line snap on/off
Text	<input type="checkbox"/>	text snap on/off
Grid	<input type="checkbox"/>	grid snap on/off
Cursor	<input checked="" type="checkbox"/>	allow cursor point on/off
Height	<input type="checkbox"/>	ask for z value at each point in edits
Tin ""	<input type="checkbox"/>	name of tin to snap to
Tin	<input type="checkbox"/>	tin snap on/off
Segment	<input type="checkbox"/>	turn segment snap on/off
Name ""	<input type="checkbox"/>	restriction on string names
Model ""	<input type="checkbox"/>	restriction on model names
Tolerance 50		set snap tolerance
Pt tolerance 10		set point snap tolerance
Info	<input checked="" type="checkbox"/>	bring up info panel on/off
Data tip	<input type="checkbox"/>	turns data tips on/off
Fast pick	<input checked="" type="checkbox"/>	turns fast pick snap on/off
Fast accept	<input type="checkbox"/>	turns fast accept snap on/off
Fast cad	<input checked="" type="checkbox"/>	turns fast construction snap on/off

The snaps point, line, grid, cursor, tin and info are all set on or off using the tick-cross boxes.

The *snap tolerance* is displayed on the Tolerance line of the menu.

The *point snap tolerance* is displayed on the Pt tolerance line of the menu.

When a select with snap is made, the type of snap is given in the **Information** panel and also graphically displayed by **changing the shape** of the snap cursor. The shape of the snap cursor is

- a **diamond** for a point snap
- square** for a line snap
- circle** for a cursor snap
- circle** for a grid snap
- squiggles under a line** for a tin snap.

Each of these snaps/settings will now be discussed.

Point Snap - diamond

When point snap is set on, any vertex of a string within the point snap box around the cursor when LB is clicked, is considered for selection before any other type of snap is considered. Centres of circles, centres of arcs and arc end points are considered to be vertices.

Note that if there are no vertices within the point snap box then any vertices within the snap box of the cursor are considered for selecting

Line Snap - square

When line snap is set on, the cursor only needs to be within the tolerance distance of any visible segment of a string when LB is clicked, and that string is considered for selection. Also arcs and circles are considered for selection.

Note that if a non-zero point snap tolerance is given and point snap is set on, then any vertices that are closer than the point snap tolerance to the cursor will be considered for snapping before any line snap is considered.

Grid Snap - circle

When grid snap is set on, the cursor will snap to the intersection of any grid lines that are displayed in a view.

Cursor Snap - circle

If cursor snap is set on and the other snaps are either not set on or have failed, the cursor position is used for the (x,y) and possibly the z value of the pick.

Tin Snap - squiggles under a line

Tin snap means that when an (x,y) point is selected, the z-value for the point is taken to be the z-value on the tin at the same (x,y) position.

To use tin snap, the name of the tin to snap to must first be given. Then, snapping to that tin is controlled by the state of the tin snap tick box.

If the tick box is **on** (a tick), snapping to the tin is used. If the tick box is **off**, no tin snaps are used.

The name of the tin to snap to is set by selecting the Tin " " item on the Snaps menu to bring up the **Snap Tin** panel.

Model

The user can restrict the snap to only strings from a specific model. The name of the model to restrict the snap to is set by selecting the Model " " item on the Snaps menu to bring up the **Snap Model** panel.

Name

The user can restrict the snap to only strings of a specific name. The name of the strings to restrict the snap to is set by selecting the Name " " item on the Snaps menu to bring up the **Snap Name** panel.

When **12d Model** creates a new project, **line** and **point** snap are set to **on** and all other snaps set off.

Point Snap Tolerance

Point snap tolerance is not a tick box but a menu item. The point snap tolerance value is the distance to be used for considering vertices over anything else when point snap is on.

The point snap tolerance distance is given in screen units (pixels). There are one thousand pixels per screen width, hence a point snap tolerance of say 10 means that the point snap distance about a vertex is one hundredth of the screen width.

The *point snap tolerance* is given in terms of screen units rather than world units because it is a distance on the screen, independent of any co-ordinate system being used in a view.

The current point snap tolerance value is displayed as **Pt tolerance** on the *Snap* menu.

The *Point snap tolerance* is modified by selecting the Pt tolerance item on the Snaps menu to bring up the **Point Snap Tolerance** panel.

Snap Tolerance

Snap tolerance is not a tick box but a menu item. The snap tolerance value is the distance to be used for considering data when snaps are on.

The snap tolerance distance is given in screen units (pixels). There are one thousand pixels per screen width, hence a snap tolerance of say 50 means that the snap distance about a point, line etc. is one twentieth of the screen width.

Snap tolerance is given in terms of screen units rather than world units because it is a distance on the screen, independent of any co-ordinate system being used in a view.

The current snap tolerance value is displayed as **Tolerance** on the *Snap* menu.

The *Snap tolerance* is modified by selecting the Tolerance item on the Snaps menu to bring up the **Snap Tolerance** panel.

Height

If *height* is set, then when creating and/or editing strings, the z-value for a vertex is displayed.

Info

If *info* is set, then the information panel comes up whenever a string is picked.

Data Tip

If *data tip* is set, then data tipping for strings occurs.

Fast Snap

If *fast snap* is set, then fast picking is allowed.

NOTE: The **Text** snap (X) and **Segment** snap (S) are currently under development.

Summarising, the available snap modes are

- ▲ point - diamond cursor
- ▲ line - square
- ▲ grid - circle
- ▲ cursor - circle
- ▲ tin - squiggles under a line
- ▲ name
- ▲ model

On starting up a new project, point and line snap are on, all others off, point tolerance is set to 10 and tolerance is set to 50.

When an existing project is saved, the snap settings, point snap tolerance, snap tolerance and positions of any snaps menus on the screen, are also saved.

Expressions in Panel Fields

Non Bearing/Angle Panel Fields

Whenever a real value such as height or width is required in a box (other than an angle or bearing panel field), mathematical expressions can be typed in and then evaluated by 12d Model when <enter> is pressed. See the section “Expressions in Bearing, Angle Panel Fields” for what is allowed in angle/bearing panel fields.

Expressions can be made up from the operators

*	multiply
/	divide
+	addition
-	subtraction

where * and / take precedence over + and -.

Nested brackets "(" and ")" are supported to any level.

The following functions are also supported

sin
cos
tan
sqrt
square
null

Note that for the trigonometric functions, the angle is in **degrees, minutes and seconds** (see section on Angles and Bearings) and is either a cartesian angle or a bearing depending on the setting of the Angle mode in the *System Settings* tab of **Utilities=>Defaults**.

For example, cos(90) is 0 for a Cartesian angle of 90 or 1 for a bearing of 90 degrees.

Examples of expressions are:

10.0 + 19.7
sin(90.30)
(10 + sin(45))/3.0

After the expression has been evaluated, it is still possible to bring back the last expressions, make modifications to the expression and then re-evaluate it.

To get the last expression, simply click on the [+] button at the end of the field to bring up the measures menu and select Last expression from it. The last expression is then returned to the panel field ready for modifications.

Warning

Expressions are not supported for bearing/angle boxes -

Please continue to the next section “Special Panel Fields”.

Special Panel Fields

Pre*Postfix Panel Fields

In many options in 12d Model, text needs to be added to the beginning (prefix) of a name and also added to the end (postfix) of a name. For example, the

Instead of needing a panel field for the prefixed text and another for the postfixed text, 12d Model often used a special shorthand notation called pre*postfix to combine the two into one text field.

When the word "pre*postfix" is used on a panel field, it has the special meaning that for any text type into the panel field, any text before the * is considered to be text for prefixing, and any text after the * is taken to be text for postfixing. Note that spaces are significant.

Hence "E * m" means that "E " is prefix text and " m" is postfix text.

If prefix text only is required, just give the text since the * is not required at the end of the text. For example "E " or "E *" will prefix the text "E ".

If postfix text only is required then the text must be preceded by a *. For example "* m" will postfix the text " m".

For example, if a panel field had

Pre*postfix for models new * data

then "new " would be added to the beginning of the model names and " data" would be added to the end of the model names.

Data Source

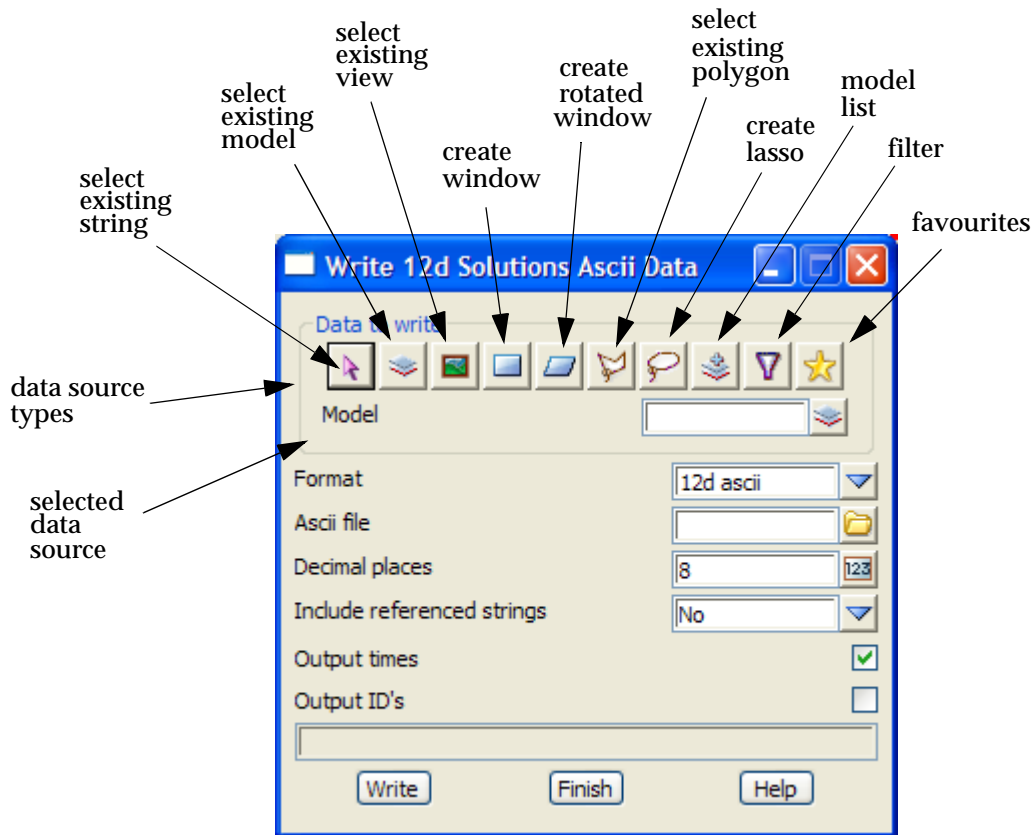

select_choice

Many options contain the panel field **Data source** which may have one or more of the selection choices:

string, model, view, window, rotated window, polygon, lasso, model list, filter, favourites

Depending on the choice, the next panel field will be changed to suite the choice.

For example, for the choice **Model**, the next field will be Model.

In the documentation for a panel with a data source, only the panel for **Data Source type Model** will be shown.

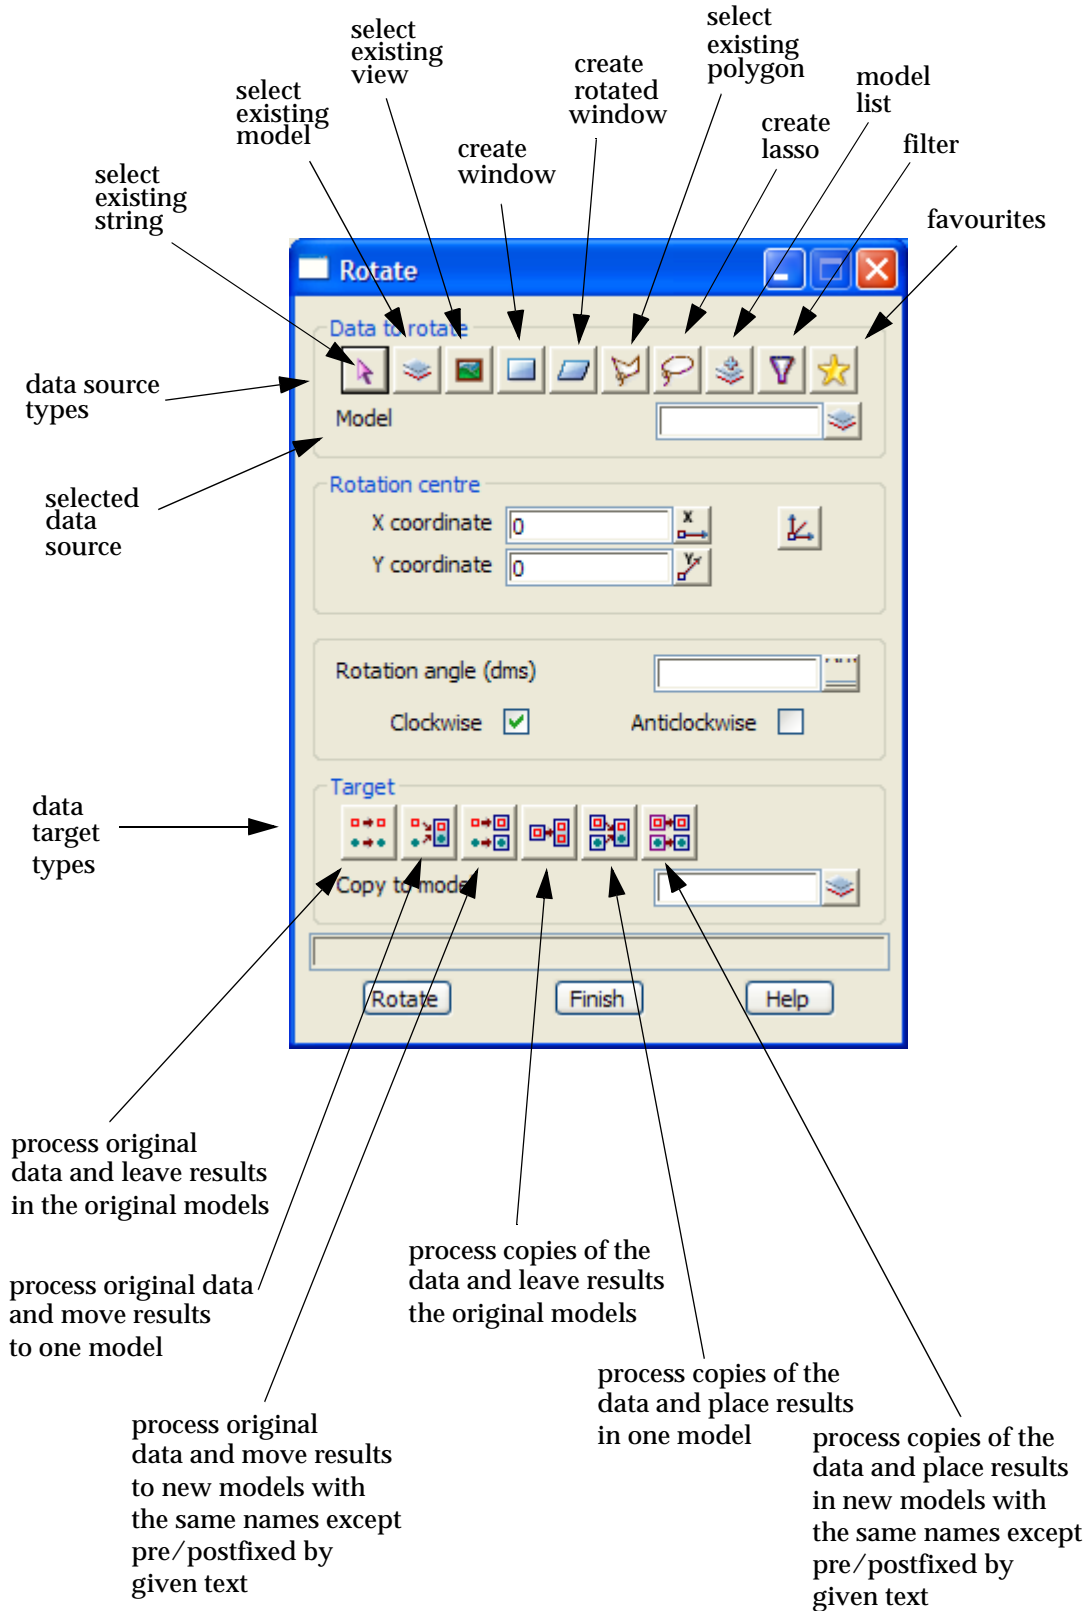

Data Target

Many options contain the panel field **Data target** which may have one or more of the selection choices:

move to original model(s)/replace	// process the original data and leave in models
move to one model	// move the processed data to one model
move to many models	// move processed data to models with the same
	// names as the original models except the model
	// names are pre/postfixed by given text.
copy to original model(s)/replace	// process copies of the data and leave in models
copy to one model	// process copies of the data and place in one model
copy to many models	// process copies of the data and place in models with
	// the same names as the original models except the
	// model names are pre/postfixed by given text.

Depending on the choice, the next panel field will be changed to suite the choice of target.

For example, for the choice **Copy to one model**, the next field will be Copy to model.

In the documentation for a panel with a data target, only the panel for **Data Target type Copy to Model** will be shown.

Pop-Up Lists and Menus

`select_colour` `select_linestyle` `select_model` `select_name` `select_text_style`
`select_tin` `select_choice` `choice` `choice_measure` `select_view` `select_symbol`

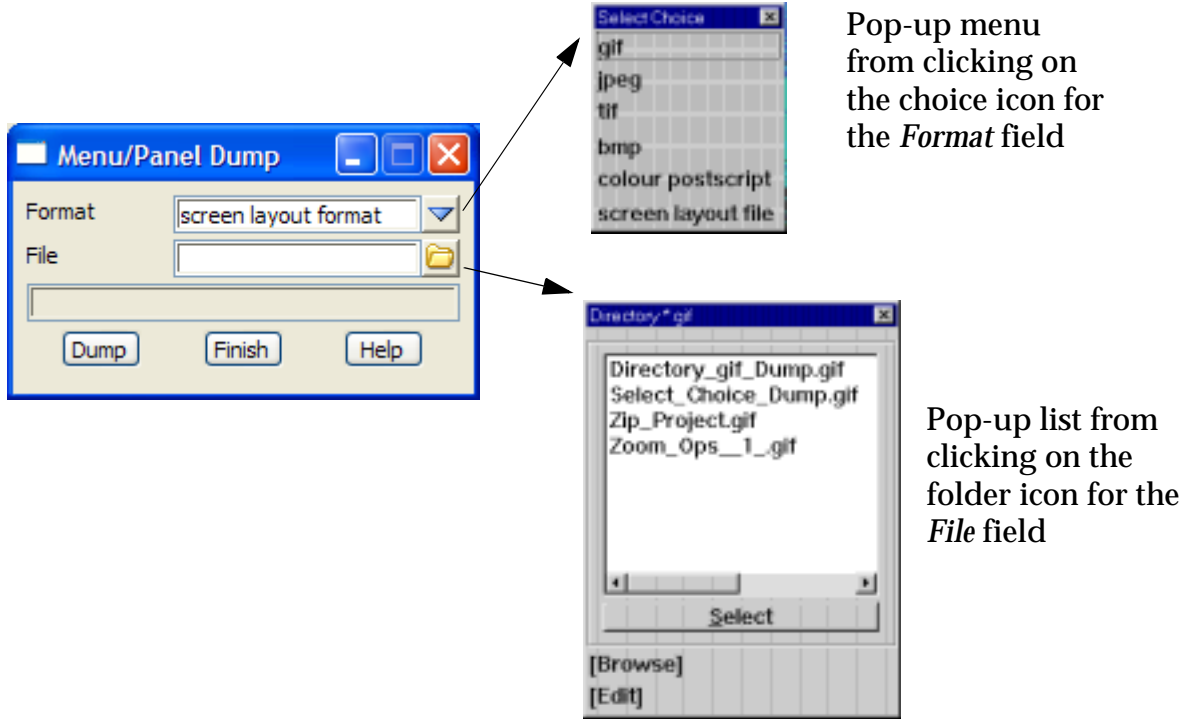

If there are *choices* available to select from for the panel field, there is a [+] or another special icon displayed at the right hand side of the panel field.

For example, icons that may be used in place of the + are:

 file	 tin	 textstyle info
 model	 choice	 line weight
 colour when none selected	 selected colour	 view
 line style	 polygon	 symbol
 project	 XYZ	 X
 Y	 Z	 chainage
 string name	 select	 angle
 date/time	 function	 typed input
 ID	 plotter/printer	 same as

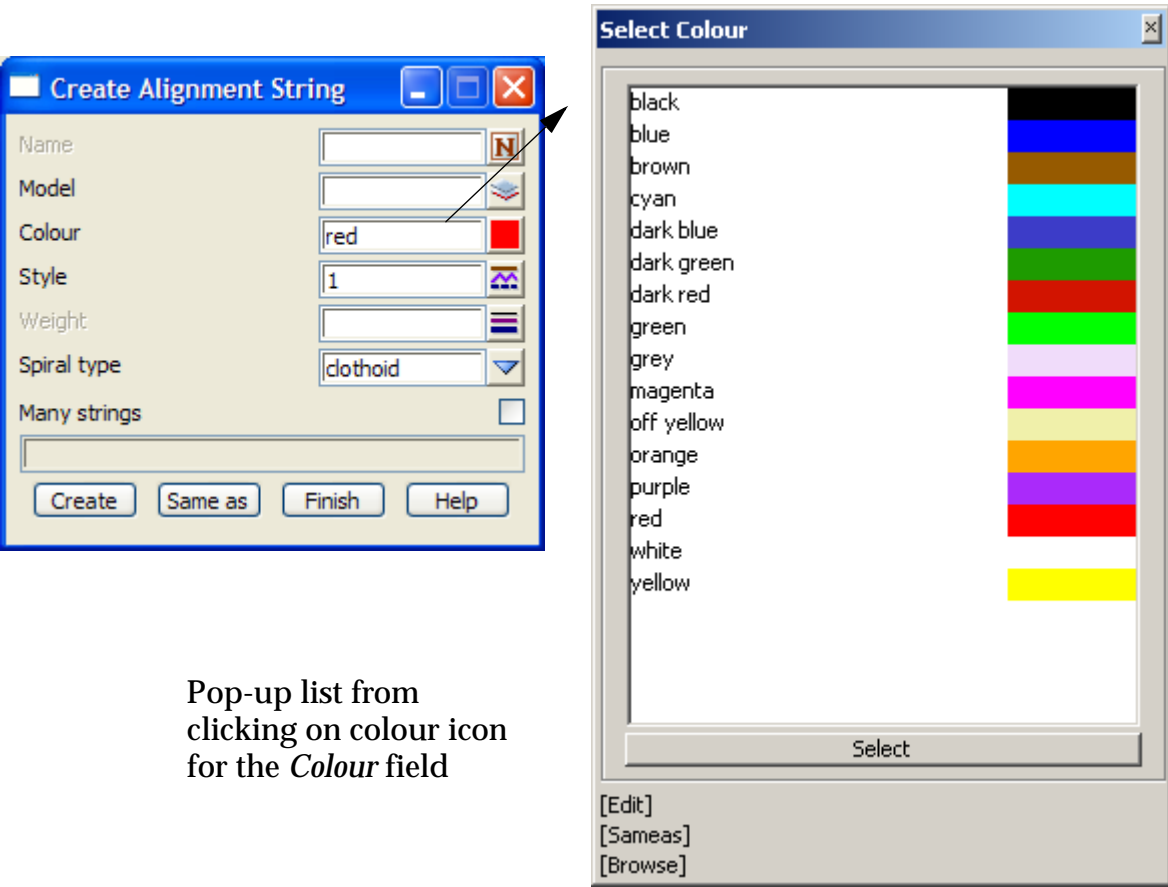

Clicking LB on the one of the above icons or a [+] brings up a the **panel field pop-up list** or **pop up menu**.

A panel field pop-up consists of a list of choices which may be displayed as either a *menu* or a *list*

Pop-up menu from clicking on the choice icon for the *Format* field

Pop-up list from clicking on the folder icon for the *File* field

Pop-up list from clicking on colour icon for the *Colour* field

For a *pop-up list*, an answer is chosen from the list by **double** clicking LB over the required answer. This answer is then displayed in the panel field and the pop-up list disappears.

At the bottom of some *pop-up lists* is a [Sameas] button. If [Sameas] is selected then an object with the require property is selected using the mouse and the value from the selected item is written to the panel field.

For some options, more than one selection from a list can be made. In that case, simply use the standard Microsoft methods for multiple selections and then click on **Select**.

For a *pop-up menu*, an answer is chosen from the pop-up menu by clicking LB over the required answer. This answer is then displayed in the panel field and the pop-up menu disappears.

If there are more than twenty five choices to be displayed in a pop-up menu (or the number Popup length in the panel Defaults), the list of choices will be split up alphabetically into sub-lists with walk-rights to access each of the sub-lists, A pop-up list has scroll bars on the list if it is longer than the pip-up length.

The pop-up list or menu can also be removed without a selection by clicking LB on the [X] on the pop-up list or menu, by clicking LB again on the choice icon or [+] for the panel field, or by simply typing into any visible part of the panel field that the pop-up is for (some of the field may be obscured by the pop-up itself).

textstyle_info
textstyle_data
select_textdata

Textstyle Info and Textstyle Data

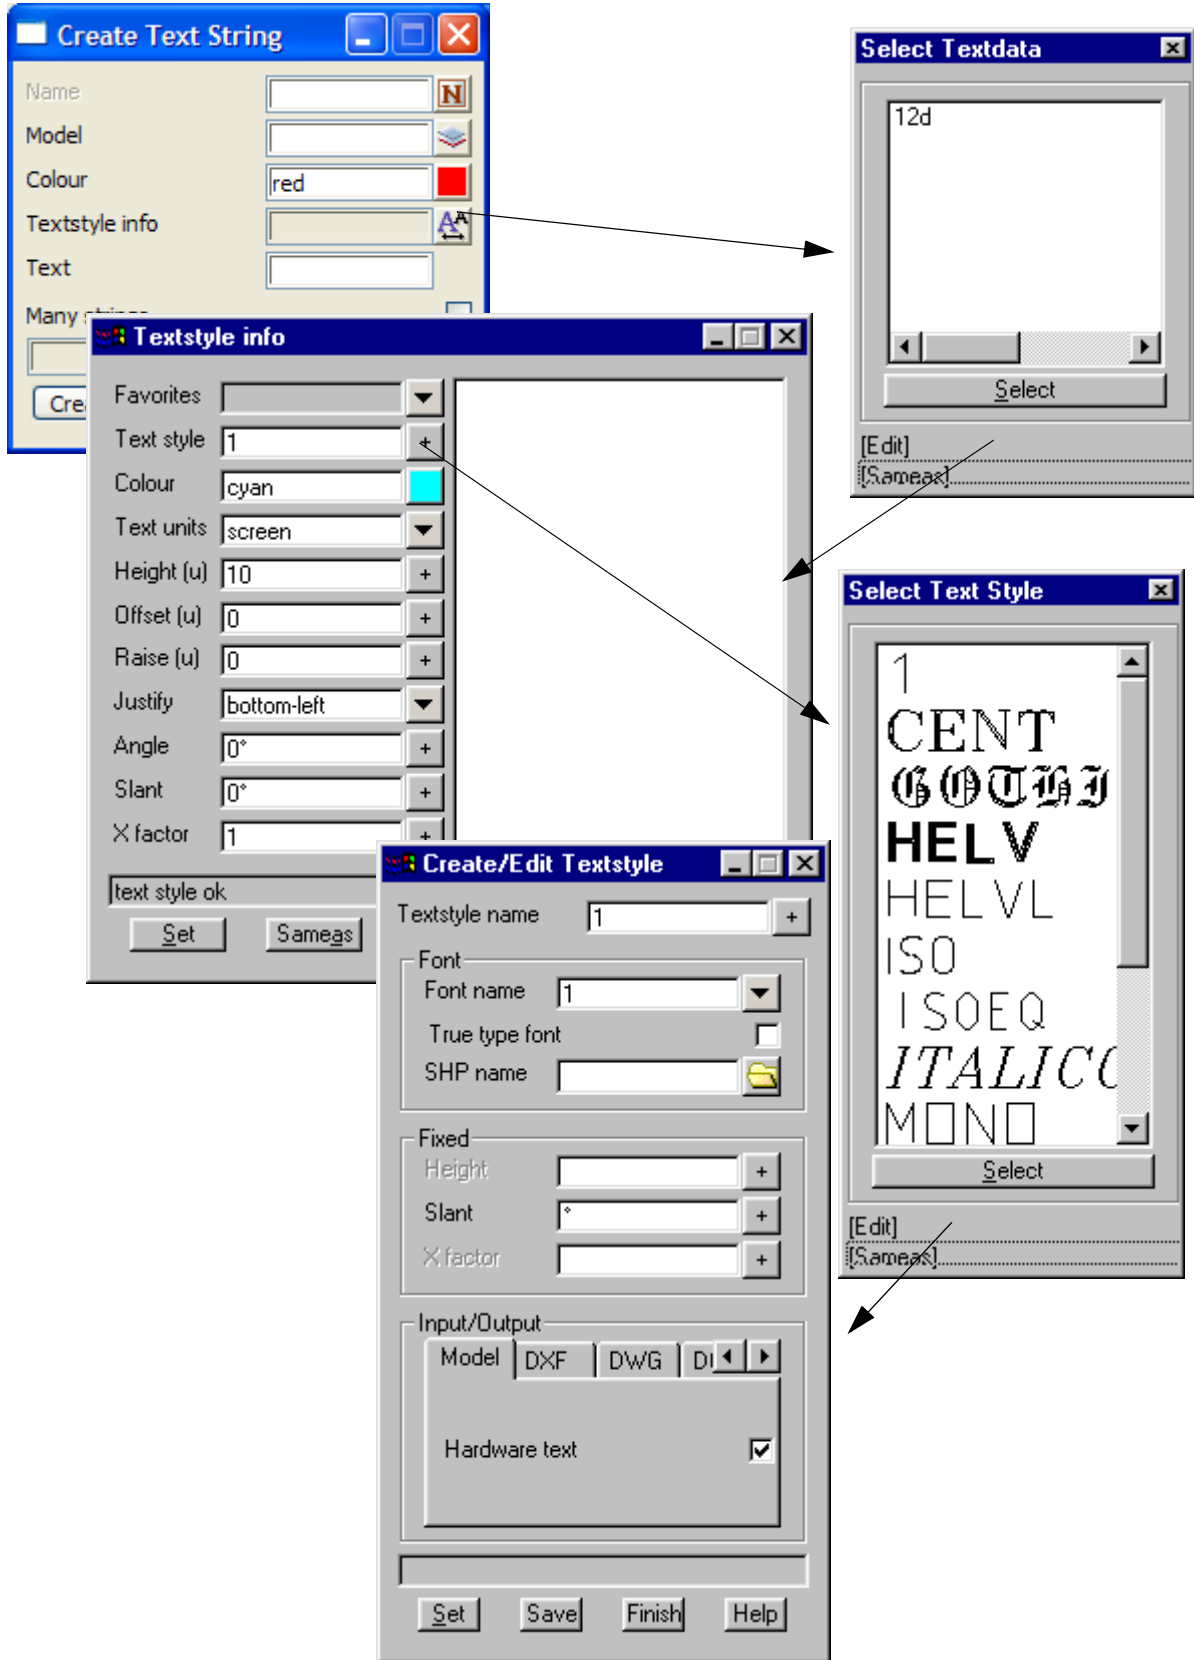

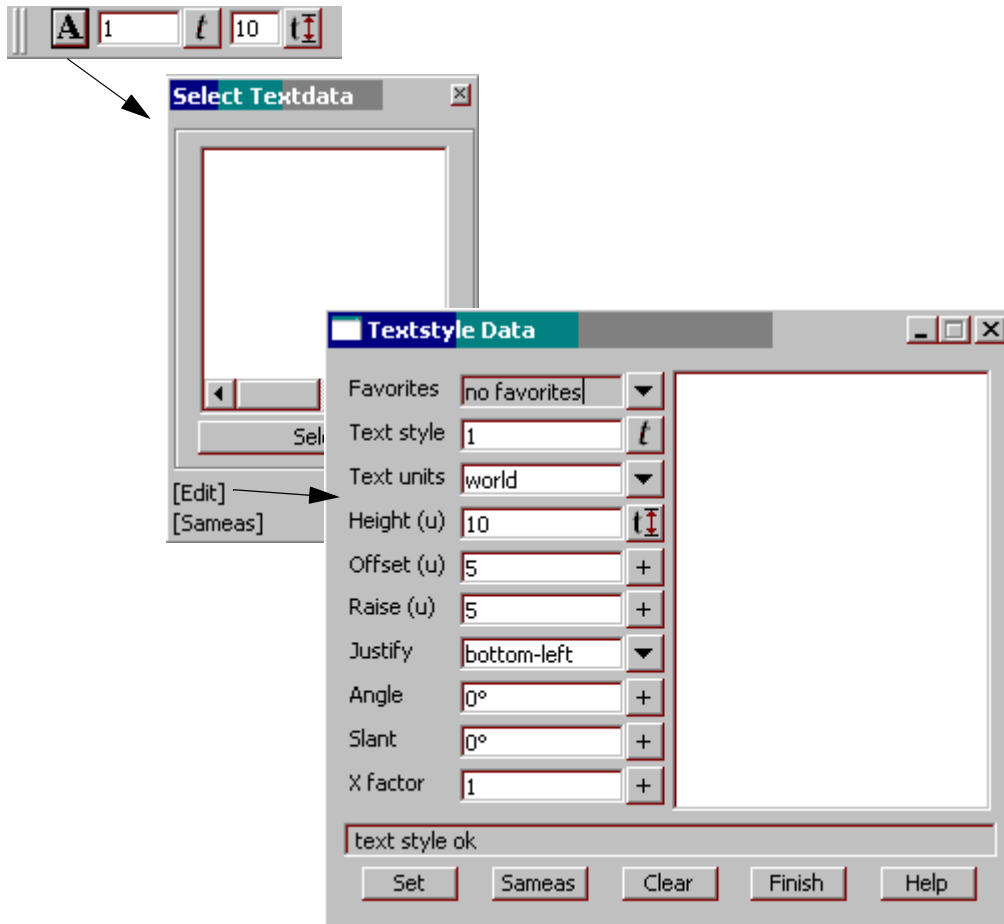

There is now a textstyle info panel field for defining the text parameters. Clicking on the textstyle info icon brings up the Select

Textdata pop-up menu which lists the textstyle favourites. By clicking on [Edit], the **Textstyle Info** panel is brought up and all the definitions for the text style can be modified and written to the textstyle info panel field by clicking on **Set**.

Textstyle favourites are defined in the Browse option *Projects=>Browse=>Textstyle data favourites* and documented in the section “Textstyle Data Favourites” in the chapter “Projects”.

Note that there is a **Textstyle Data** panel that is identical to the **Textstyle Info** panel except that it doesn't have the Colour field. The Textstyle Data panel is brought up by clicking on the **A** on the Text toolbar.

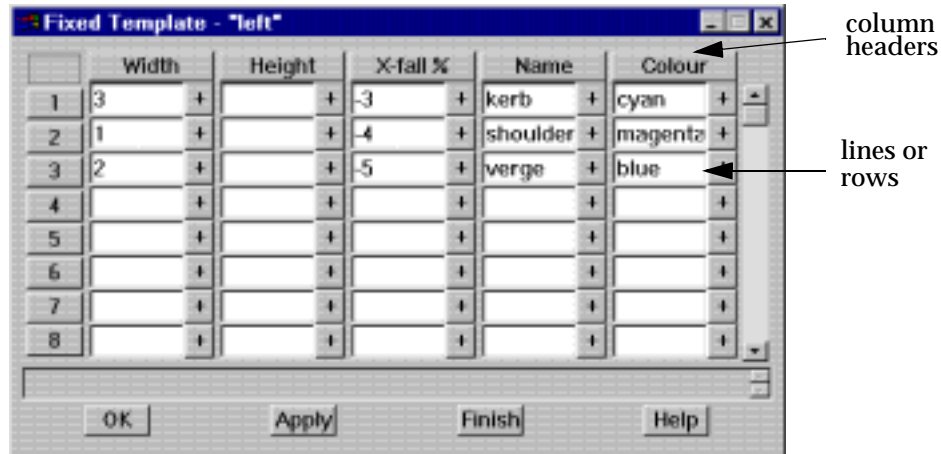

Scrolling Panel Tables

Many **12d Model** panels include tables or lists of information which hold an unlimited number of lines or **rows**. The tables may have more than one **column** but the number of columns is fixed for that table.

Such tables are displayed and edited in a **scrolling panel table**.

For example, the **Fixed Template** panel can contain an unlimited number of lines (rows) defining fixed links for the template.

Normally a set number of lines of the table are displayed in the **scrolling panel table** and once the number of lines exceeds the set number, the up and down arrows on the right hand side of the scrolling panel table are needed to scroll the lines up or down to see the extra information.

Each column of the panel table normally has a **column header** such as **width** and **height** in the above example of the **Fixed Template** scrolling panel table.

The **numbers** on the left hand side of the scrolling panel table indicate the line (row) numbers of the information being displayed and the line numbers are also buttons which when selected, bring up the **Edit Line n** panels. For example

The options on the **Edit Line n** panel have the following functions:

- clear clear the current line
- copy copy the current line into the next line; all following lines are pushed down
- delete delete the current line
- insert insert a blank line; the current line and all following lines are pushed down
- up swap the current line with the preceding line
- down swap the current line with the following line

Also, when the **number** on the left is selected, typing will **delete** the line
<insert> will **insert** a line.

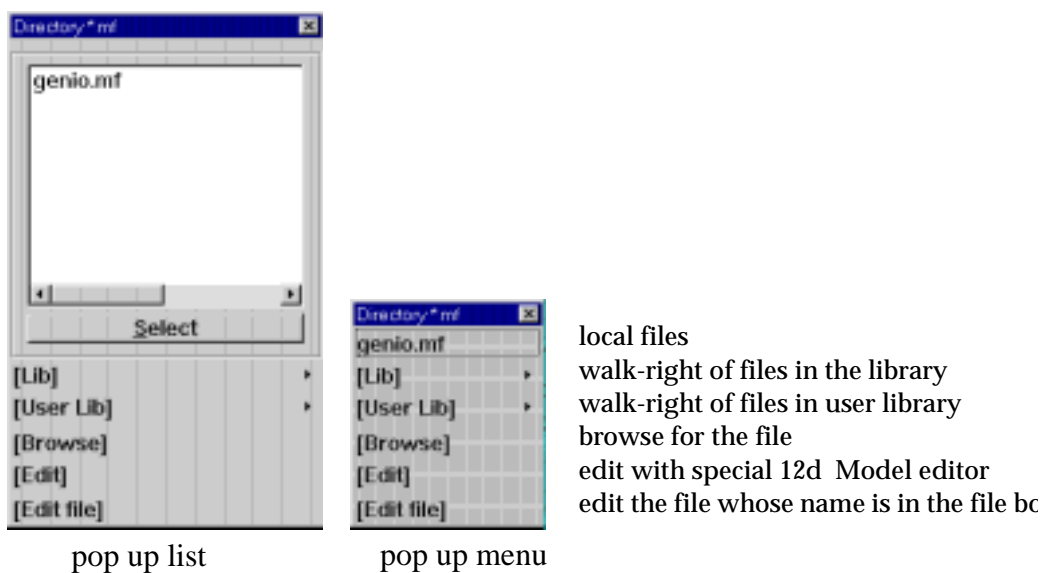

File Box

12d Model panels frequently include a field for entering a **file** name. This type of panel field is called a **file panel** field or box, or simply **file box**.

When RB is clicked on the [+] at the right of the panel field to bring up the list of available files, the pop-up menu can contain up to five different types of items:

- (a) list of **local** files satisfying the file ending for the file box
- (b) [Lib] button
- (c) [User lib] button
- (d) [Browse] button
- (e) [Edit] button for some special files which have an internal 12d Model editor
- (f) [Edit file]

For example,

The special menu items, [Lib], [User Lib], [Browse], [Edit] and [Edit file], in the file box pop-up list and menu have the following meanings:

- [Lib]** the walk-right lists all files satisfying the file box ending, in the library pointed to by the environment variable LIB_4D (see Appendix A)
- [User Lib]** the walk-right lists all the files satisfying the file box ending, in the user library pointed to by the environment variable USER_LIB_4D (see Appendix A)
- [Browse]** selecting browse brings up the **Microsoft File Browser** which can be used to search for a file with a specified ending in the local or other directories.

[Edit] selecting edit will bring up the special 12d Model editor for the file. For example, for map file. The edit only exists when a special 12d Model editor exists for the file type.

[Edit file] selecting edit file when there is a file name already in the file box, will edit the file using the editor pointed to by the EDITOR_4D environment variable.

Model Panel Field

12d Model panels frequently include a field for entering the name of a model. These fields are called **model panel** fields or simply model fields.

Because models are often required to be displayed on views and hence, need to be **added** to a view, there is a short-hand method for adding models to views when using a model field.

After the model name is entered into the model field, the name of the view that the model is to be added to is typed in, preceded by a comma. If the model is to be added to more than one view, simply type in each of the view names separated by commas.

For example, to add the model **fred** to the views **1**, **3**, and **5**, type

fred,1,3,5

into the model field.

Alternatively, the view names can be enclosed in round brackets.

For example,

fred (1,3,5)

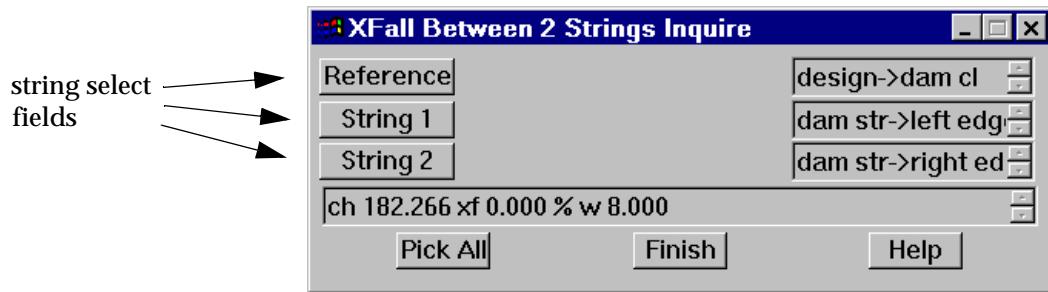

String Select Panel Field

There is a special panel field called a **string select** panel field, which consists of a button and an information area. It is used for **selecting** a string and **recording** the string name in the panel field.

The **field name** is raised slightly acts as a button which highlights as the cursor moves over it. Like a button, it is activated by clicking LB on the highlighted **field name** and a string select operation then begins (see the section on picking strings).

Once a string is selected, the name of the string is written into the information area of the string select panel field.

Same As for Panel Fields

For most panel fields/ input boxes, clicking the middle mouse button (MB) in the field will activate a **same as** pick which allows the user to get information from other objects.

After clicking MB, simply select a string, plot frame etc. from a view and the appropriate value will be extracted from the selected item and piped into the panel field.

At present **same as** picks works for

- models
- colours
- justify
- text styles
- text units
- names
- plotter (from plot frames)
- sheet size (from plot frames)
- line styles

Please continue to the next section “Measures”.

Measures

measures

measure_x

measure_y

measure_z

Whenever a real value is required in a box (e.g. height, width), the pop-up menu on the [+] button includes a measures menu.

The measures menu allows the user to pick a selected measure value from existing strings, and the picked value is displayed and piped into the panel field.

For example, the x, y, or z coordinate of a point or the plan distance between two points.

If default values already exist for the pop-up menu, the options on the measures menu will be added to the bottom of the default list.

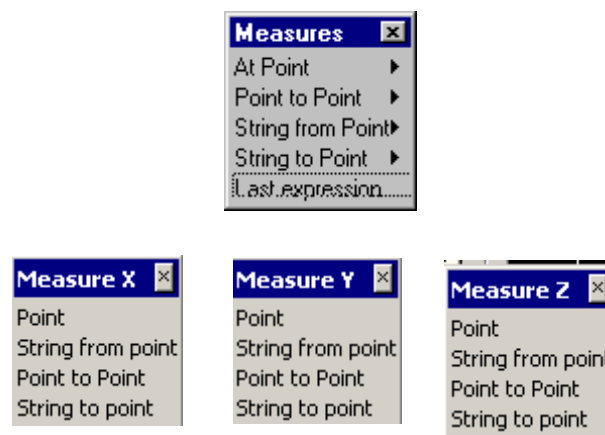

The measures functions support dynamic measures to give the user more visual feedback. This includes the drawing of a rubber line in the case of **Point Point** and **String to Point** measures, or a cross in the case of **At Point**.

The measures and their dynamic aspect can be easily explored via the option

Utilities=>Measure=>Value

The walk-right Measure menus are documented in the next four sections.

The stand alone measures menus is

For the option *At point*, go to section “Measure At Point”

Point to point

“Measure Point to Point”

String from point

“Measure String from Point”

String to point

“Measure String to Point”

Last expression

“Last Expression”

If information on measures is not required, please continue to the next section “Text Units”.

Measure At Point

measure_point

get x co-ordinate of selected point
 y co-ordinate
 z co-ordinate
 chainage at the point
 instantaneous angle
 instantaneous bearing
 cross-fall of selected point
 slope at the point
 radius (0 if no curve)

The At Point measures calculate and display the picked measure at a selected point.

For example, **X** gets the x-coordinate of a selected point.
Bearing gets the instantaneous bearing of a selected point.

The dynamic aspect of the at point measures is as follows:

after the desired at point option is picked and the string for the **at point** measure is tentatively selected but not yet accepted, and if the cursor is moved around, then the cursor position is dynamically dropped perpendicularly onto the highlighted string and a cross displayed on the string at the dropped point, and the picked measure value is dynamically displayed in the panel field.

For example, if the x measure was picked from the Measure Point menu and a string highlighted but not yet accepted, then as the cursor is moved around the screen, the cursor position is dropped perpendicularly onto the highlighted string and displayed as a cross and the x-coordinate of the cross is displayed in the panel field.

Measure Point to Point

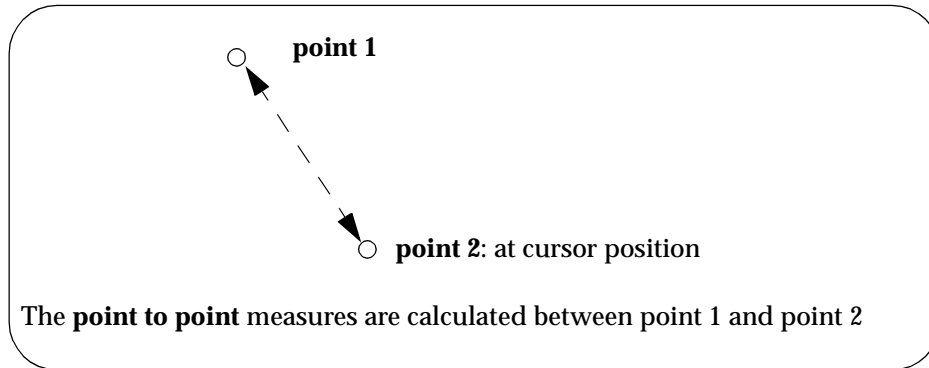

measure_point_to_point

get 2d length between selected points
 3d length
 delta x
 delta y
 delta z
 delta chainage
 angle of line joining selected points
 bearing of line
 cross-fall of line
 slope of line

The Point to Point measures calculate and displayed the picked measure between two selected points.

For example, **Length** gets the plan distance between two selected points.
X-fall % gets the % cross fall of the line joining two selected points.

The dynamic aspect of the point to point measures is as follows:

after the desired point to point measure is picked, and the first point for the **point to point** measure is selected, then a rubber line is dynamically drawn between the selected point and the current cursor position and the picked measure value is dynamically displayed in the panel field.

Further, if the selected string for the **second** point is tentatively selected but not yet accepted, and if the cursor is moved around, then the cursor position is dynamically dropped perpendicularly onto the highlighted string and the picked measure value to the second string is dynamically displayed in the panel field.

For example, if the length measure was picked from the Measure Point to Point menu and the first point selected, then a rubber line is dynamically drawn between the selected point and the cursor position and the plan length from the selected point to the current cursor position is dynamically displayed in the panel field.

If a string is selected for the second point but not yet accepted, the cursor position is dynamically dropped onto the highlighted string and the plan distance from the first point to the dropped point is dynamically displayed in the panel field.

Measure String from Point

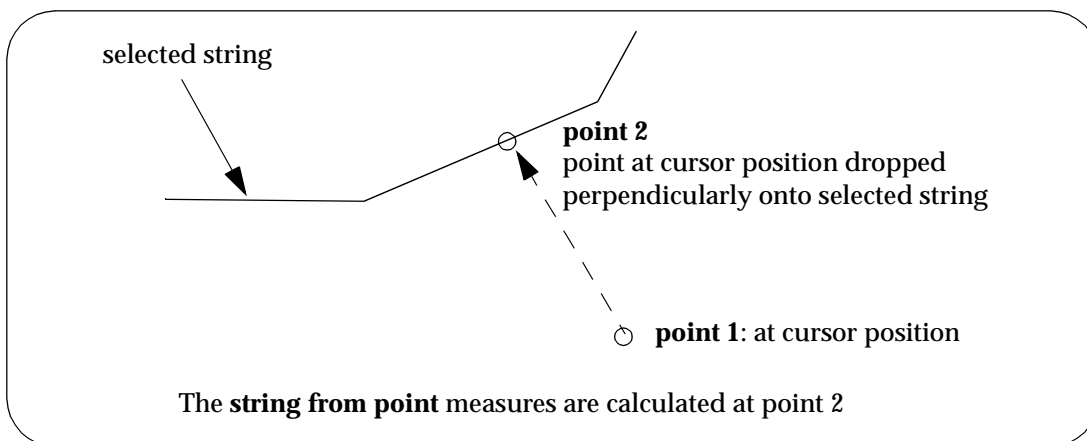

measure_string_from_point

get x co-ordinate of point dropped onto string
 y co-ordinate
 z co-ordinate
 chainage at the point
 instantaneous angle
 instantaneous bearing
 cross-fall of selected point
 slope at the point
 radius (0 if no curve)

The String from Point measures calculate the picked measure *from the selected string* by taking the current cursor position and dropping it perpendicularly onto the selected string and using the dropped point on the string to get the measure value.

For example, **X** gets the x-coordinate from the string of the cursor dropped onto the selected string.
Z gets the z-coordinate from the string of the cursor dropped onto the selected string
Bearing gets the instantaneous bearing from the string of the cursor dropped onto the selected string.

The dynamic aspect of the string from point measures is as follows:

after the desired string from point measure is picked and the string for the **string from point** measure is selected, then as the cursor is moved around, a rubber line is dynamically drawn between the cursor and the cursor position dropped perpendicularly onto the selected string, and the picked measure value of the dropped cursor position is dynamically displayed in the panel field.

For example, if the z measure was picked from the Measure String from Point menu and a string selected, then as the cursor is moved around the screen, the cursor position is dropped perpendicularly onto the selected string. The perpendicular line is dynamically redrawn and the z-coordinate of the dropped point on the string is dynamically displayed in the panel field.

Measure String to Point

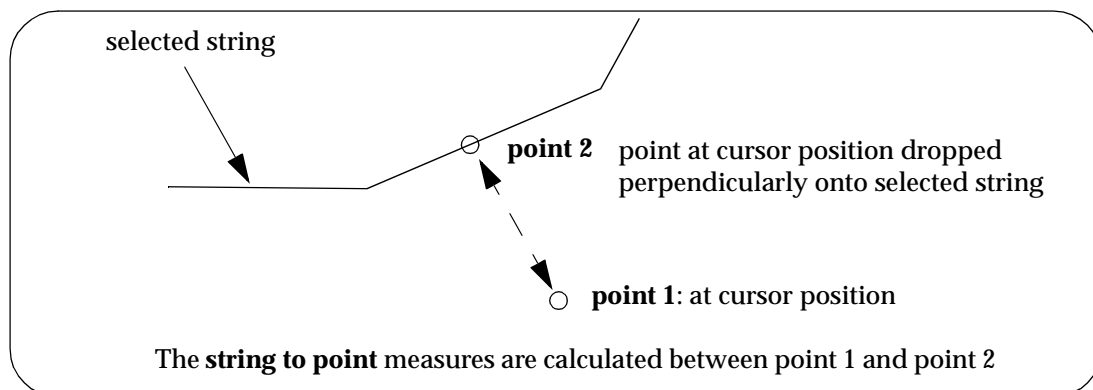

`measure_string_to_point`

get 2d length between selected points
 3d length
 delta x
 delta y
 delta z
 delta chainage
 angle of line joining selected points
 bearing of line
 cross-fall of line
 slope of line

The String to Point measures are similar to the *point to point* measures and calculate the picked measure from a point and the point **dropped perpendicularly** onto the selected string.

For example, **Length** gets the plan distance between the point and the point dropped perpendicularly on a selected string.
Bearing gets the bearing of line joining the point and the point dropped perpendicularly onto a selected string

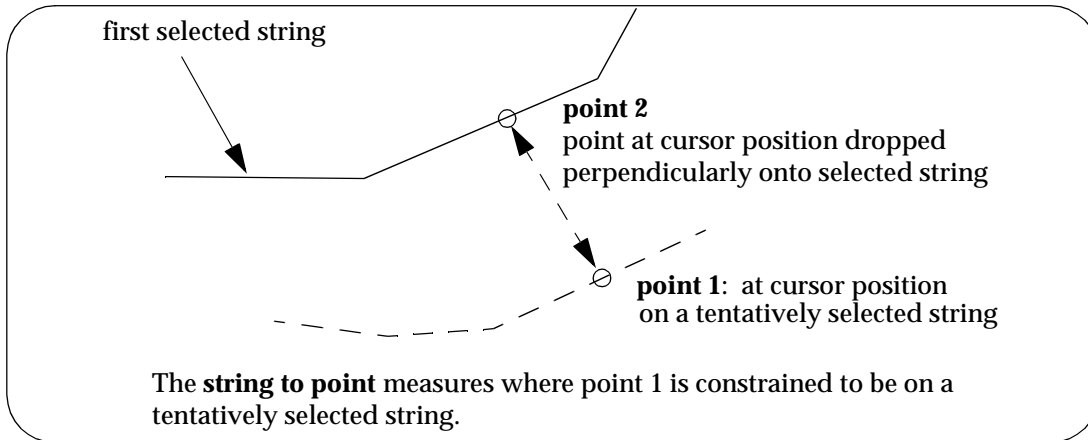

The dynamic aspect of the string to point measures is as follows:

after the desired string to point measure is picked, and a *string* selected, then a line is dynamically drawn between the cursor position and the cursor position *dropped perpendicularly* onto the selected string. The **string to point** value is dynamically displayed in the panel field as the cursor is moved around.

Further, if the cursor position is on a string which has been selected but not accepted and the cursor is moved around, then the cursor is *constrained* to remain on the tentatively selected string. It is dynamically dropped perpendicularly onto the original string and the measure value to the dropped point displayed in the panel field.

Hence the selected point is **constrained** to remain on the tentatively picked string and the measure dynamically calculated and displayed.

For example, if the length measure was picked from the Measure String to Point menu and the first string selected, then a line is dynamically drawn perpendicularly between the selected string and the current cursor position and the plan length from the string to the current cursor position is dynamically displayed in the panel field.

If a string is tentatively selected (picked but not yet accepted), the cursor position is dynamically dropped onto the first string and the plan distance measured perpendicularly from the point to the first string is dynamically displayed in the panel field.

Last Expression

Brings up the last expression or real value typed into the box. For example, if $3*4$ was typed and <enter> pressed, 12 will be displayed. The Last Expression pop-up will bring back the $3*4$.

Text Units

Text occurs in 12d Model in three ways -

- ▲ user defined **text strings**
- ▲ automatic text such as grid values, x-section and long-section plot annotation.
- ▲ text within linestyles.

The most difficult thing about text is that because of the different uses of text, there needs to be more than one systems of **units** to define text heights.

The height of text for a given textstyle is defined to be the height of a capital A. However, in 12d Model, there are three methods of defining the units for measuring this height.

- ▲ world units - the units used for data
- ▲ screen units - pixels (the screen is 1000 pixels wide)
- ▲ plot paper units - millimetres.

World Units

World units are the units of user data. For most users, the base unit for user data is metres. However 12d Model is a dimensionless system and the base unit is totally dependent on the user.

The height of world text when displayed in a view depends upon on the text height and the scale of the view.

When plotted, the height that world text appears on a plot sheet is the same as for any data defined in world units - the height depends on the **scale** used for the plot.

Text heights that are only given in world units have **(w)** after them.

For some text, the choice of units is either world or pixels. The text parameters then have a **(u)** after them.

Screen Units - pixels

When screen units (pixels) are used, the text is a fixed height on the screen. If the user zooms in on text given in pixels, the text remains the same height.

To have a height on a plot, screen unit text needs a height defined in millimetres.

For some screen text, both a pixel and a millimetre height is supplied when the text is defined.

For text with only a pixel height, there is a plotting multiplication parameter called **pixels-to-millimetres** which is used to convert pixel heights to plot paper heights. The value of pixels-to-millimetres is set using the **plots=>pixels to mm** option and is stored for the project.

Text heights that are only given in pixels have a **(pix)** or **(p)** after them.

For some text, the choice of units is either world or pixels. These text parameters then have a **(u)** after them.

Plot Paper Units - millimetres

Text defined in plot paper units (millimetres) has a well defined height on a plot sheet. When a view scale is set for a plan view, then paper text will draw at the correct size for that scale.

Text heights that are only given in millimetres have **(mm)** after them.

Special Text Characters

There are special text characters that do not appear on the standard keyboard but can still be entered into text strings with textstyles using true type fonts.

The special characters are entered by holding down the Alt key and typing in certain numbers on the *number pad* whilst the Alt key is still being held down). The character will appear when the Alt key is released.

Some commonly used special characters and their Alt codes are

Squared character	²	Alt 0178
Cubed character	³	Alt 0179
Middle dot character	·	Alt 0183
Large diameter character	Ø	Alt 0216
Small diameter character	ø	Alt 0248
Degree character	°	Alt 0176
Copyright character	©	Alt 0169
Registered character	®	Alt 0174
British Pound character	£	Alt 0163
Japanese Yen character	¥	Alt 0165

The Alt values come from the character map for Windows. This can be quickly viewed by
run charmap.

NOTE - these values may depend on the true typed font used in the textstyle.

Please continue to the next section “Bearings and Angles”.

Bearings and Angles

Many panels and options take angles or bearings as input. The 12d Model default for angles or bearings is in degrees, minutes and second (dms).

To save typing, this is written in the form

ddd.mmssfff

where **ddd.mmssfff** is the angle or bearing expressed in degrees, minutes and seconds as

ddd	whole degrees
.	separator between degrees and minutes
mm	whole minutes
ss	whole seconds
fff	fractions of seconds (as many as required)

Notes

1. the decimal point . indicates where the degrees stops and the minutes begin
2. if there is only whole degrees, the .mmssfff can be omitted. However, if there are any minutes, seconds or fractions of seconds, there must be **two digits** of whole minutes
3. if there are no seconds or fractions of seconds, then the ssfff can be omitted. However, if there are any seconds or fractions of seconds, there must be **two digits** of whole seconds
4. there are as many digits of fractions of seconds as required (possibly none).

For example

35	is 35 degrees
35.09	is 35 degrees and nine minutes
35.0901	is 35 degrees, nine minutes and one second
35.090107	is 35 degrees, nine minutes and 1.07 seconds

Expressions in Bearing, Angle Panel Fields

Because bearings (angles) and numbers **can not** be used interchangeably in mathematical expressions, only a limited number of expressions can be supported in a bearing or angle panel field.

Bearings (angles) can be added or subtracted from other bearings (angles) but a number can not be added or subtracted from a bearing (angle). So the addition and subtraction of bearings (angles) is supported but addition/subtraction of a bearing (angle) and a number is invalid.

Bearings (angles) can not be multiplied or divided by another bearing (angle) but a bearing (angle) can be multiplied or divided by a number. However because the input of a bearing (angle) in degrees, minutes and seconds looks like a decimal number (see the previous section "Bearings and Angles"), a rule must be made to distinguish between bearings (angles) and numbers for multiplication and division. In 12d Model, the bearing (angle) is on the left of the number it is being multiple or divided by.

So in a bearing (angle) panel field and grid, the following is supported:

- (a) add or subtract bearings (angles) i.e. bearing + bearing or bearing - bearing is allowed
- (b) type bearing*number + bearing *number - note that the number is on the right of the *
- (c) type bearing *number - bearing *number - note that the number is on the right of the *
- (d) type bearing /number + bearing *number - note that the number is on the right side of the /
- (e) type bearing /number + bearing *number - note that the number is on the right side of the /

Because a user often wishes to add or subtract 90 degrees from a bearing or angle, the Page Down/Page Up keys have a special meaning when the focus is on the bearing (angle) panel field. For a bearing (or angle) panel field (but **not for a grid**):

- | | |
|------------------------------|---|
| (f) Page up | - subtracts 90 degrees to the bearing/angle |
| (g) Ctrl + page up | - subtracts 15 degrees to the bearing/angle |
| (h) Shift + page up | - subtracts 10 degrees to the bearing/angle |
| (i) Shift + Ctrl + page up | - subtracts 6 degrees to the bearing/angle |
| | |
| (j) Page down | - adds 90 degrees to the bearing/angle |
| (k) Ctrl + page down | - adds 15 degrees to the bearing/angle |
| (l) Shift + page down | - adds 10 degrees to the bearing/angle |
| (m) Shift + Ctrl + page down | - adds 6 degrees to the bearing/angle |

Please continue to the next section "Precision".

Precision

Double precision variables are used throughout 12d Model for all co-ordinate values and calculations.

Although this increases the time taken for calculations, it is more than offset by the increase in the accuracy of the data and the results of any calculations.

Because of the accuracy of double precision variables (fourteen significant figures), there is no practical restriction on the co-ordinate area covered by projects.

The default number of decimal places for displaying values in the *information menu* is three (3). This number of decimal places is controlled by the display precision field in the **System Settings** tab of the **Defaults** panel (option Utilities=>Defaults).

The default number of decimal places for displaying values in *boxes* and *panels* is four(4). This number of decimal places is controlled by the box precision field in the **System Settings** tab of the **Defaults** panel (option Utilities=>Defaults).

Please continue to the next section "Colours".

Colours

edit_colours

The palette of colours available for elements drawn in a view depends on the 12d colour definition file, `colours.4d` (see section “Colours” in Appendix “Set Ups”). A default file is distributed with 12d Model and resides in the `set_ups` folder. Up to 10,240 colours can be defined.

In this manual, colours will be referred to by names. However, 12d Model stores colours by the **colour number**. This is independent of the colour names and if a different `colours.4d` is used, the colours on the screen may change.

Note: colour numbers can be used instead of a colour name in any panel fields.

Please check your `colours.4d` file if your screen colours do not match those mentioned in this manual.

The colour names are used (sorted into alphabetical order) in colour pop-ups. When a large number of colours have been defined, the pop-up list can get unwieldy so there is a default parameter, `display colours` (in the panel brought up by *Utilities =>Defaults*), which gives the number of colours to use in a pop-up.

The order that the colours are taken from the colour file for the pop-up is **not** the colour number but the *pop-up number order* which can be completely different. This means that the user can add extra colours after the standard 2000 12d Model colours number and easily have the new colours come up in the colours pop-up.

Hence it is possible to have thousands of defined colours for shades and plots, but still have only a selected sixteen displayed in colour pop-ups.

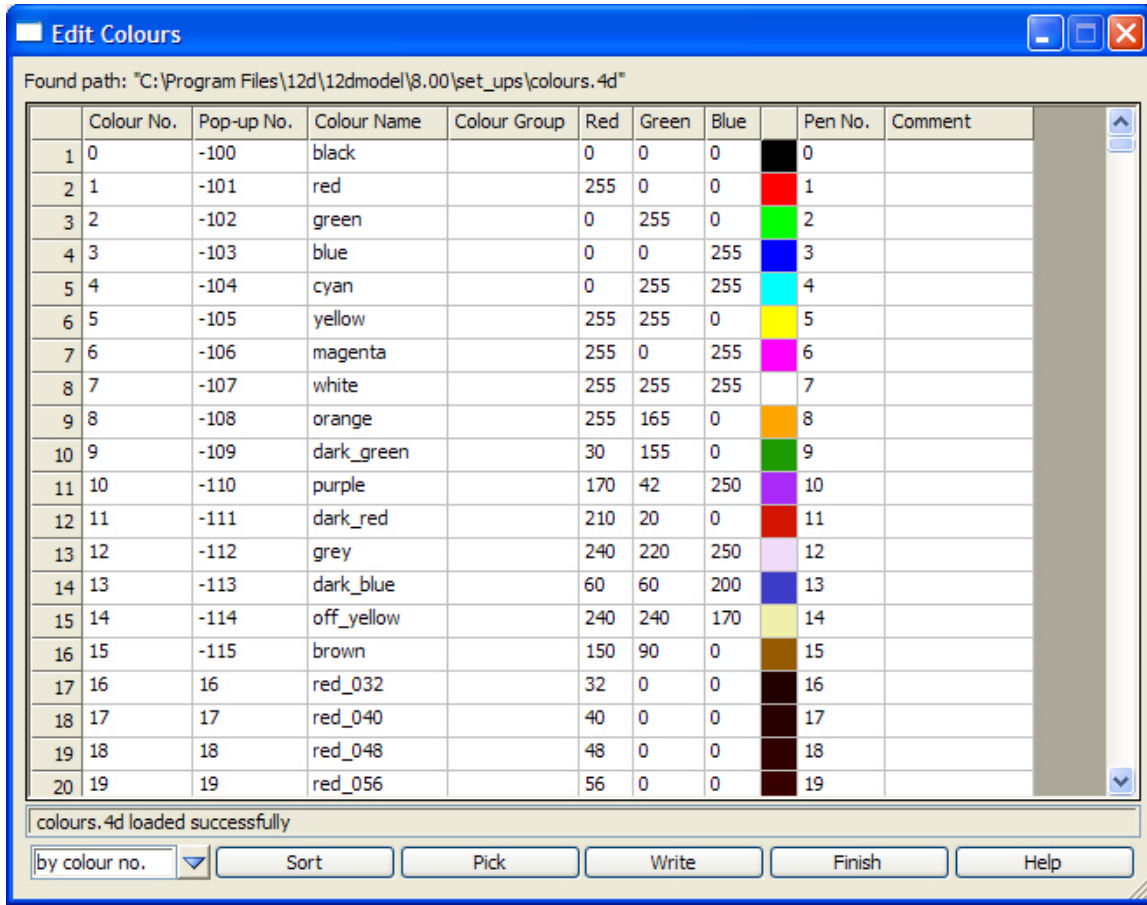

WARNING

Do not change the colour numbers and definitions for colour numbers 0 to 2000 - they are restricted for 12D Solutions use only.

In the 12d Model database, only the colour number is saved so if any of the first 2000 colour numbers are changed then the display of colours in existing projects may change.

Editing Colours

To add/modify colours to the 12d Model `colours.4d` file, bring up the **Edit Colours** panel by clicking on the [Edit] section of the Select Colours pop-up.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Grid Cells

Colour No. integer

number of the colour. A unique integer value between 0 and 10,239.

Pop-up No. integer

the colours are selected for the pop-up by this number. It is a unique integer - positive, 0 or negative.

Colour name text

text name for the colour.

Colour Group text

group for the colour.

Red/Green/Blue integer

amount of red/green/blue in the colour. Value is between 0 and 255.

Pen No. text box

pen number to map the colour to.

Comment text box

optional comment.

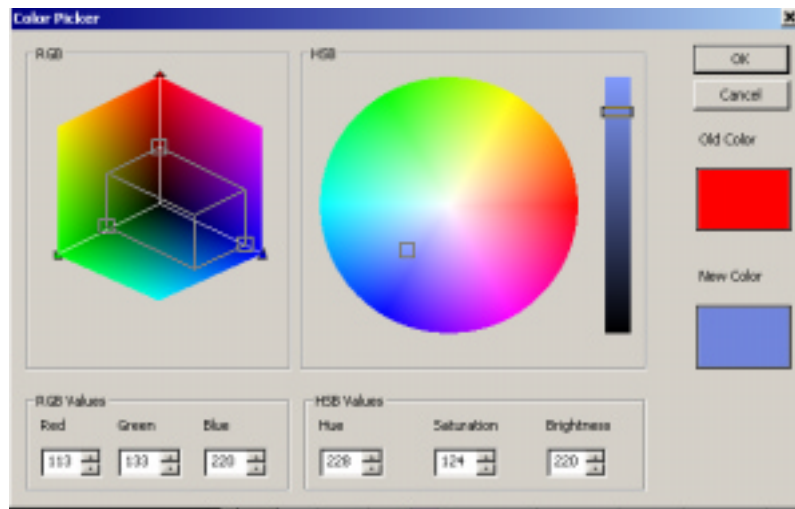

Buttons

Sort button

sort the table with respect to the column given in the adjacent field.

Picker button

if a row of the table is highlighted, selecting **Picker** brings up the **Color Picker** to interactive define the RGB for new colours.

Write button

write the table out to a *colours.4d* file.

Please continue to the next section “Defaults”.

Defaults

Default Panel Values

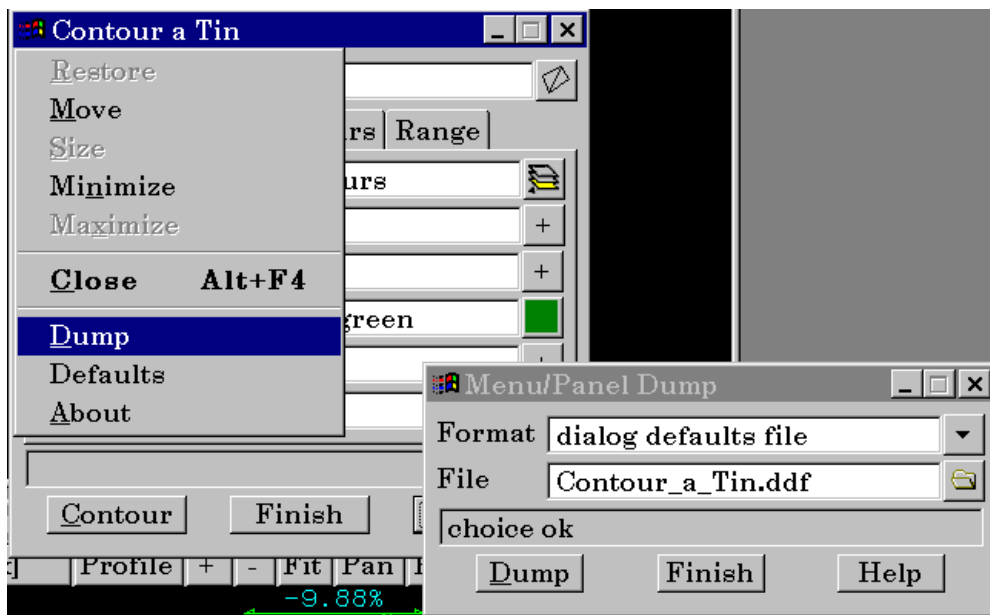

When a 12d Model panel starts up, the standard paths are searched for a *dialogue default file* to use to set default values for the panel fields. Not all the panel field values need to be in the ddf.

If a ddf file is not found, the 12d Model system defaults are used.

The *dialogue default file* has the same contents as a screen layout files but the file name ends in.ddf and must have the unique panel name as given by the panel dump option.

A *dialogue default file* can be created for a panel by using the panel *dump* option and selecting the format 'dialogue default file'. The ddf file is a text file and can be edited to add/change/remove information in the file.

The panel **dump** option is selected from the **panel system** menu which is invoked by clicking the left mouse button (LB) on the Windows icon on the left of the panel title area. The **Menu/Panel Dump** panel is then displayed. For example, for the **contour a tin** panel:

Defaults

Many panels and operations in 12d Model require settings which are almost always the same. To save repetitious typing, 12d Model provides a number of user defined defaults that are used throughout 12d Model.

For example, the chord to arc tolerance, point cross size and highlight cross size and colour.

Certain default values are read in from a file when a new project is created. These defaults can also be modified inside 12d Model using the **Defaults** panels.

The lay out of the file used to define the default values for a new project is given in the appendix **Set Ups**.

Default File Ending

In any panel pop-up requiring a file name, default file endings are used to restrict the names of the files selected from the current folder to be displayed in the pop-up.

The list of special file endings is given in the appendix **Special File Formats**

Please continue to the next section “Plotters”.

Plotters

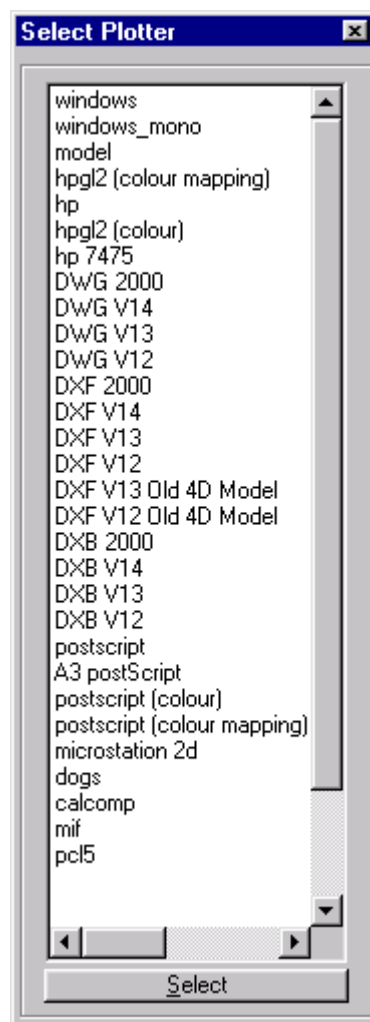

select_plotter

When creating a **plot**, 12d Model can either drive the plotter directly using Windows printer drivers or plot indirectly by creating a computer disk file (the plot file) containing the relevant plotter instructions for producing the plot, or in the case of the plotter type **model**, a 12d Model model is created.

If a plot file is created then there is a variety of formats available, each with its own special file ending.

In the plotting options, the choice of plotters that is available through the pop-up menu can be the default 12d Model list or a user defined list of plotters.

The default 12d Model list is

When the plot file is created, it can be passed to a user specified program or batch file which can automatically direct the plot file to a plotter.

See the appendices "Set Ups" and "Plotters and Plotting" for more information on plotters and defining plotters.

Miscellaneous Panels

enter_value

The value is entered into the typed-input box, terminated with <enter>.
The **Enter Value** typed-input box then disappears.

new_length

The length is entered into the typed-input box, terminated with <enter>.
The **New Length** typed-input box then disappears.

new_radius

The radius is entered into the typed-input box, terminated with <enter>.
The **New Radius** typed-input box then disappears.

No Option Available

`no_licence_available`

`no_license_available`

`visualisation_module`

12d Model consists of a base module of varying point sizes and optional modules.

If a module has not been purchased and any options included in that option are selected then a **No licence available** message will be displayed.

The missing module can be purchased by contacting your 12d Model distributor or 12D Solutions Pty Ltd.

No Information Available

Options on Toolbars

For general information *Toolbars* and *Controlbars*, go to “*Toolbars and Controlbars*”

Each *Toolbars* is described in detail in:

<i>Cad</i>	in the section “CAD Options”
<i>Cad Arcs</i>	“CAD Arcs”
<i>Cad Circles</i>	“CAD Circles”
<i>Cad Controlbar</i>	“CAD, Symbol and Text Controlbars”
<i>Cad Delete</i>	“CAD Delete”
<i>Cad Fills</i>	“CAD Fills”
<i>Cad Holes</i>	“CAD Holes”
<i>Cad Images</i>	“CAD Images”
<i>Cad Intersect</i>	“CAD Intersect”
<i>Cad Lines</i>	“CAD Lines”
<i>Cad Modify</i>	“CAD Modify”
<i>Cad Points</i>	“CAD Points”
<i>Cad Polygons</i>	“CAD Polygons”
<i>Cad Segment</i>	“CAD Segment Edits”
<i>Cad String</i>	“CAD Edit Strings”
<i>Cad Symbols</i>	“CAD Symbol”
<i>Cad Text</i>	“CAD Text”
<i>Cad Vertex</i>	“CAD Edit Points”
<i>H</i>	“Snap Toolbar”
<i>Measure edits</i>	“Measure Edits Toolbar”
<i>Menu Bar</i>	can't be turned off - all the options in <i>12d Model</i>
<i>Options</i>	turns off the area for docking toolbars on left hand side of 12d Model window
<i>Road</i>	“Road Toolbar”
<i>Snaps Cad</i>	
<i>Snaps Cad Arcs</i>	
<i>Snaps Cad Circles</i>	
<i>Snaps Cad Intersect</i>	
<i>Snaps Cad Lines</i>	
<i>Snaps Cad Points</i>	
<i>Strings Edits</i>	“String Edits Toolbar”
<i>Super alignment tools</i>	“Super Alignment Tools Toolbar”
<i>Survey reductions</i>	“Survey Reductions Toolbar”
<i>Symbol Controlbar</i>	“CAD, Symbol and Text Controlbars”
<i>Text Controlbar</i>	“CAD, Symbol and Text Controlbars”
<i>Tin Utility</i>	“Tin Utility Toolbar”
<i>Traverse Spreadsheet</i>	“Traverse Spreadsheet Toolbar”
<i>Visualisation</i>	“Visualisation Toolbar”

Measure Edits Toolbar

measure_edits

Position of option on menu: various

The Measure Edits toolbar is:

Options on Toolbar

- string inquire
- measure bearing/distance
- measure value
- measure plan area
- measure surface area
- measure xfall
- measure angle by 3 points
- match properties
- measure menu

For	<i>String inquire</i>	go to the section	"Inquire"
	<i>Measure bearing/distance</i>		"Bearing and Distance"
	<i>Measure value</i>		"Value"
	<i>Measure plan area</i>		"Plan Area"
	<i>Measure surface area</i>		"Surface Area"
	<i>Measure xfall</i>		"X Fall by Strings"
	<i>Measure angle</i>		"Angle by 3 Points"
	<i>Match properties</i>		"Match"
	<i>Measure menu</i>		"Measure"

Road Toolbar

road

Position of option on menu: various

The Road toolbar is:

Options on Toolbar	
	create pad
	edit pad
	special chainage file
	special chainage file for kerb returns
	set out points using super string
	label chainage and offset
	create/edit dimensions
	create/edit traffic island
	road widening with min/mac xfall
	convert polyline to alignment
	overlay design
	set up for create roads
	create roads
	modify kerb return chainages
	create kerb return using computators

For	<i>Create pads</i>	go to the section	"Allotment Pad Create"
	<i>Edit pads</i>		"Allotment Pad Edit"
	<i>Create special chainage file</i>		"Special Chainages File"
	<i>Special chainage file for kerb return</i>		"Kerb Special Chainages File"
	<i>Setout points using super string</i>		"Create Setout Points Using Super String"
	<i>Label chainage & offsets</i>		"Chainage/Offset Label Inquire"
	<i>Create/edit dimensions</i>		"Create/Edit Dimensions"
	<i>Create/edit traffic island</i>		"Create Combined Traffic Island"
	<i>Road widening min/max cross falls</i>	"Road Widening with Minimum and Maximum Crossfall"	
	<i>Convert polyline to alignment</i>		
	<i>Overlay design</i>		"Overlay Design"
	<i>Setup for create roads</i>		"Create Roads - Setup"
	<i>Create roads</i>		"Create Roads - Manager"
	<i>Modify kerb return chainages</i>		"Intersection MTF Update"
	<i>Create kerb return using computators</i>		

String Edits Toolbar

string_edits

Position of option on menu: various

The String edits toolbar is:

Options on Toolbar

	edit string
	edit vertex
	edit segment properties
	edit vertex properties
	change strings

For	<i>Edit string</i>	go to the section	“Editor”
	<i>Edit vertex</i>		“Edit Vertex”
	<i>Edit segment properties</i>		“Segment”
	<i>Edit vertex properties</i>		“Vertex”
	<i>Change string</i>		“Change”

Super Alignment Tools Toolbar

string_edits

Position of option on menu: various

The Super Alignment Tool toolbar is:

Options on Toolbar	
	create super alignment
	edit super alignment
	resolve a super alignment
	turn fixed/floating super alignment to IP super alignment
	dereference a super alignment
	parallel a super alignment
	split a super alignment
	join a super alignment
	change style of a super alignment
	explode the labelling of a super alignment
	constrain super alignment moves
	define road design parameters
	create/edit a super alignment style
	tabulate a super alignment

For	<i>Create super alignment</i>	go to the section	"Create - Super"
	<i>Edit super alignment</i>		
	<i>Turn fixed/float to IP</i>		
	<i>Dereference a super alignment</i>		
	<i>Parallel a super alignment</i>		
	<i>Split a super alignment</i>		
	<i>Join a super alignment</i>		
	<i>Change style of a super alignment</i>		
	<i>Explode labelling of a super alignment</i>		
	<i>Constrain super alignment moves</i>		
	<i>Define road design parameters</i>		
	<i>Create/edit a super alignment style</i>		"Super Alignment Style"
	<i>Tabulate a super alignment</i>		"Alignment & Super Alignment Table"

Survey Reductions Toolbar

survey_reductions

Position of option on menu: various

The Survey Reductions toolbar is:

Options on Toolbar	
	survey menu
	create control stations
	bearing/distance entry
	traverse adjustment
	horizontal least squares adjustment
	level nets adjustment
	set up data collector
	download survey data
	convert raw survey file to 12d field file
	survey data reduction function
	quick change code
	join surveyed strings
	insert target height
	start new survey strings
	auto order survey shots
	order by survey point ids
	reset order to original order
	edit survey data
	edit survey field data by string
	lock a function
	edit a text file

For	<i>Survey menu</i>	go to the section	"Survey"
	<i>Create control stations</i>		"Create - Control Stations"
	<i>Bearing/distance entry</i>		"Plane Bearing/Distance Entry"
	<i>Traverse adjustment</i>		"Traverse Adjustment"
	<i>Horizontal least squares</i>		"Least Squares Network"
	<i>Level network adjustment</i>		"Level Network"
	<i>Set default data collector</i>		"Setup"

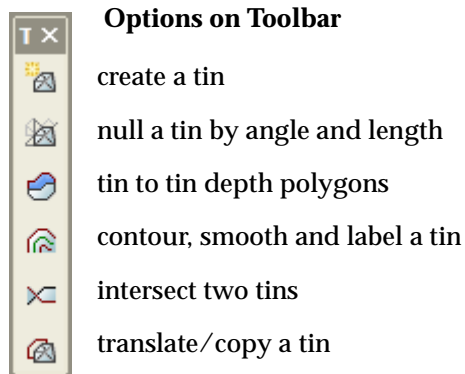

<i>Set default data collector</i>	"Setup"
<i>Download from data collector</i>	"Download Raw"
<i>Convert data collector file to field file</i>	"Convert Raw"
<i>Create survey data reduction function</i>	"Create Survey Function"
<i>Survey code change</i>	"Quick Change"
<i>Join strings</i>	"Join Two Strings of Same Feature Code"
<i>Insert target height</i>	"Insert Target Height"
<i>Start new string</i>	"New String"
<i>Auto order string points</i>	"Auto Order"
<i>Order by points</i>	"By Points"
<i>Remove ordering</i>	"Remove Order"
<i>Edit survey data</i>	"Field Data"
<i>Edit field data by picking a string</i>	"Field Data by String"
<i>Lock a function</i>	"Lock"
<i>Edit a report file</i>	"Edit"

Tin Utility Toolbar

tin_utility

Position of option on menu: various

The Tin Utility toolbar is:

For	<i>Create at tin</i>	go to the section	“Triangulate Data”
	<i>Null by angle and length</i>		“Null by Angle and Length”
	<i>Tin to tin depth polygons</i>		“Depth Range Polygons”
	<i>Contour, smooth and label</i>		“Contour, Smooth and Label”
	<i>Intersect two tins</i>		“Intersection”
	<i>Translate/copy a tin</i>		“Translate/Copy”

Traverse Spreadsheet Toolbar

traverse_spreadsheet

Position of option on menu: various

The Traverse spreadsheet toolbar is:

Options on Toolbar

-  edit traverse spreadsheet
-  create a traverse spreadsheet
-  traverse spreadsheet utilities
-  lot check for tss
-  New Zealand traverse spreadsheet report
-  standard traverse spreadsheet report
-  drafting of traverse spreadsheet
-  drafting of radiation tables
-  read a Landonline XML file
-  write a Landonline XML file
-  set up parameters for traverse spreadsheet

For	<i>Edit traverse spreadsheet</i>	go to the section	"TSS Edit"
	<i>Create a traverse spreadsheet</i>		"TSS Create"
	<i>Traverse spreadsheet utilities</i>		"TSS Utilities"
	<i>Lot check for traverse spreadsheet</i>		"Lot Check"
	<i>NZ traverse spreadsheet report</i>		"NZ TSS Report"
	<i>Traverse spreadsheet report</i>		"Standard TSS Report"
	<i>Traverse spreadsheet drafting</i>		"TSS Drafting"
	<i>TSS radiation tables drafting</i>		"TSS Radiation Table Drafting"
	<i>Read Landonline XML</i>		"Landonline XML Read"
	<i>Write Landonline XML</i>		"Landonline XML Write"
	<i>Set up tss parameters</i>		"TSS Parameters"

Visualisation Toolbar

visualisation

Position of option on menu: various

The Visualisation spreadsheet toolbar is:

Options on Toolbar	
	tin render settings
	create roadside furniture
	create trees and shrubs
	create houses
	create fences
	create forest
	create clouds
	create/edit a texture map file
	change polygon drape
	create and place billboards
	change super string billboards

For	<i>Tin render settings</i>	go to the section	"Render Settings"
	<i>Create roadside furniture</i>		"Roadside Furniture"
	<i>Create trees and shrubs</i>		"Trees/Shrubs as Faces and Billboards"
	<i>Create houses</i>		"Houses"
	<i>Create fences</i>		"Fences"
	<i>Create forest</i>		"Create Forest"
	<i>Create clouds</i>		"Clouds"
	<i>Create/edit texture map file</i>		"Texture Map Edit"
	<i>Change polygon drape</i>		"Render Drape"
	<i>Create and place billboards</i>		"Create Billboards"
	<i>Change super string billboards</i>		"Add and Remove Billboard from Super String"

3 Starting Up

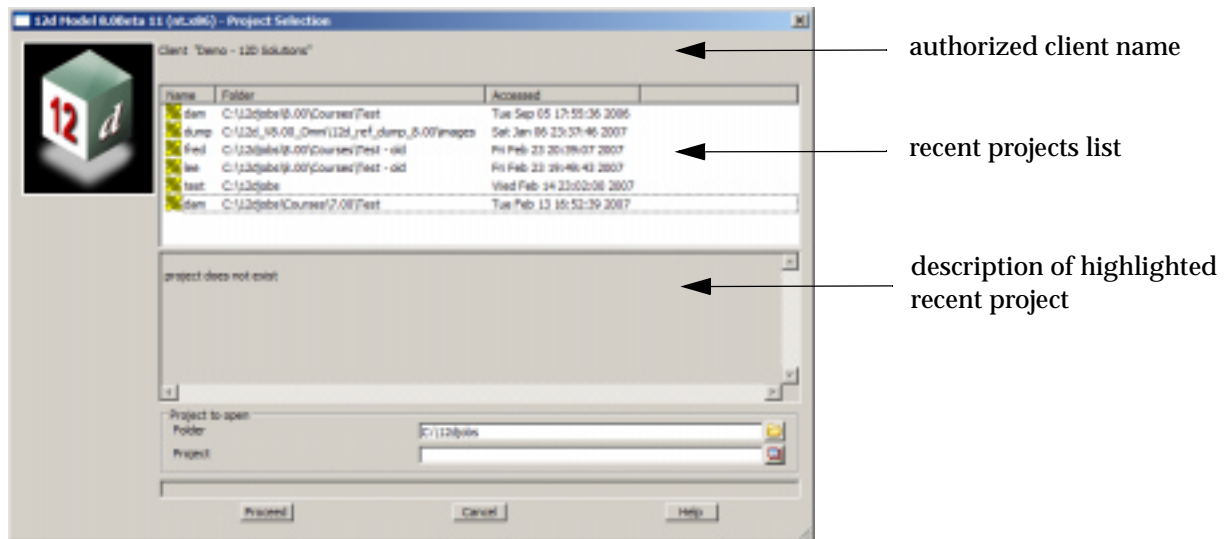

Initial Screens

When 12d Model is installed from the 12d Installation CD, the 12d icons **12d Model 8** and **12d Model 8 Training**.

The **12d Model** icons are **shortcuts** to start 12d Model and then attach to a particular **folder**. For example, 12d Model 8 starts 12d Model and attaches to the folder C:\12djobs
project_selection

Clicking on any of the 12d Model icons starts 12d Model. First the 12d Model splash screen will appear and then the initial 12d Model screen with the **Project Selection** panel.

Note

If this does not work, please contact your 12d Model administrator to check the procedure to be used on your system. For a detailed description on how to install 12d Model, please refer to the *Installing 12d Model* chapter in the *Getting Started* manuals.

The user specifies which project is to be worked on by providing

- the name of the folder that the project is to be placed in (working folder)

- (b) the name of the project inside the working folder (working project).
 If no folder is given, the project is assumed to be in the folder the user is currently in.
 If the project does not exist, a new project is created.

The description of the functions of the fields and buttons in the **Project Selection** panel are:

Field Description	Type	Defaults	Pop-Up
Client name <i>authorized 12d Model client.</i>	display only		
Recent projects list <i>names and folders of project recently select. Single clicking on an entry in the list displays the projects description in the Project description area. Double clicking on an entry in the list changes the project</i>	output	recent projects	
Project description <i>description of the project highlighted in the Recent projects list.</i>	output		
Folder <i>name of the folder to become the working folder.</i>	input	current folder	Microsoft browser
Project <i>name of the project to become the working project in the folder given in the folder field.</i>	input	none	projects in folder
Proceed <i>after selecting this button, the working folder is changed to the folder specified in the folder field. The working project is set to the project given in the project field. If the folder or project does not exist, it will be created.</i>	button		
Cancel <i>end the program.</i>	button		

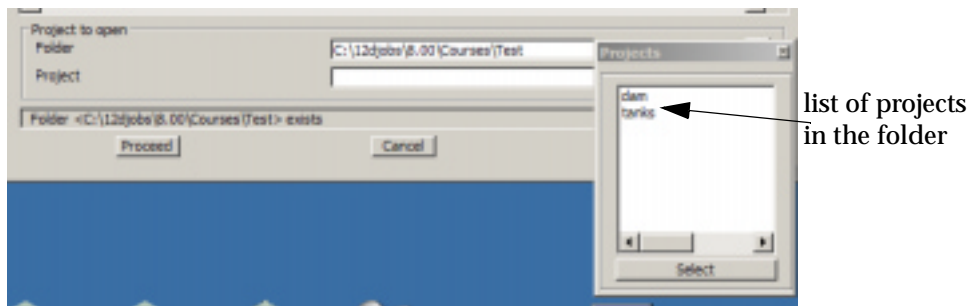

Note: This panel a resizable panel.

To select a project in the *Recent projects list*, simply double click on the entry in the list and 12d Model will open the project up.

Alternatively, the Folder and Project fields can be used to select another project. If the initial folder in the Folder field is not the required folder, clicking LB on the folder icon on the right side of the field will bring up the Microsoft browser which is used to navigate to the folder where either the new project is to be created, or an existing project resides.

If the folder containing existing projects is selected, then a list of projects in the folder is displayed and the required project can be selected from the list.

Alternatively, the actual project can be selected by double clicking on the project name in the browser.

In either case, selecting the project fills in the Project field. Selecting **Proceed** then opens the project.

If a new project is required, then after the folder to contain the project is selected, the name of the new project is typed into the Project field and **Proceed** selected.

Organizing Working Areas

For each project, 12d Model creates a unique sub-folder of the working folder with the name consisting of the project_name followed by ".project". For example, "Olympic.project".

This sub-folder is called the **project area**. All the internal 12d Model information for that project is kept inside the project area.

All outputs, reports and plots are written to the working folder and are **not** held inside the project area.

Hence to get a complete backup of the project and all associated information, it is best to backup the entire working folder.

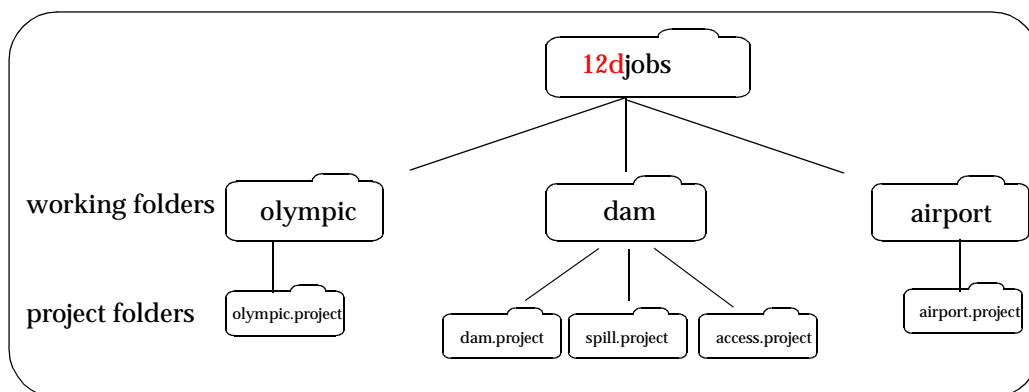

The project name, which can be up to 256 alphanumeric characters and can include spaces, must be unique within the working folder but other folders may include 12d Model projects with the same name - these projects are distinct and are not related in any way.

There is no limit to the number of projects in a particular working folder but because all the outputs, reports and plots for each project in the same working folder would be mixed in together, it is recommended to have each distinct project in its own working folder.

If unrelated 12d Model projects are going to be created, then it is suggested that they each have their **own working folder**. That way the inputs files, output files, plots, reports etc. from the separate projects do not end up in the same working folder. Each separate working folder can also then be easily backed up.

As an example, if three unrelated projects - olympics, airport, and dam - are to be created in a folder called 12djobs, it is suggested that three **sub folders** of 12djobs are first created to use as the working folders - e.g. olympics, airport and 'dam works'.

The 12d Model projects would then be created **inside** the appropriate working folder - e.g. the projects *dam*, *spill* and *access* relating to the job *dam works* would be created inside the folder *dam works*.

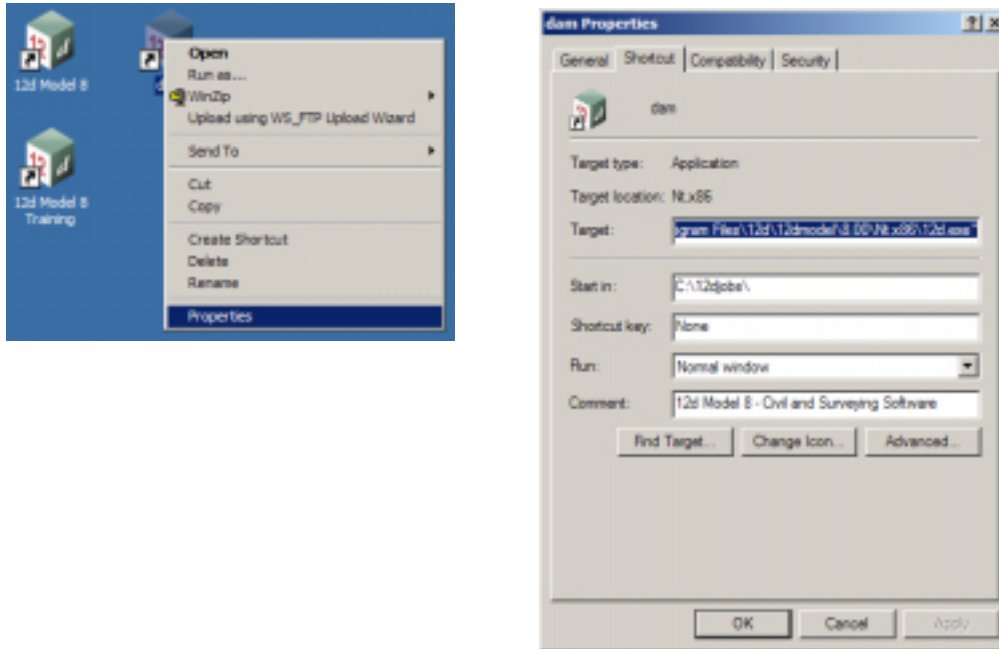

Project Shortcuts

The list of most recent projects makes it very easy for 12d operators to get into their projects.

However if there is a folder of projects, or even a particular project, that a user wants to get into by simply double clicking on an Icon on the screen, then a Windows shortcut can be used to do it.

To set up a 12d icon on the desktop, it is easiest to copy either the *12d Model 8* or *12d Model 8 Training* icons that are already on the screen. Rename the copied icon to say *dam*.

The Properties for the icon *dam* must now be modified. To display the properties of an icon, click RB over the icon and select *Properties* from the menu. Click on the *Shortcut* tab

The Properties for the icon *dam* can now be modified.

If an icon is to start in a given folder, then the **Start in** field is set to the desired folder.

For example, if the 12d Model project *dam* was in the folder "12djobs\dam works", set the **Start in** for the icon *dam* to:

"C:\12djobs\dam works"

The icon *dam* would then automatically start in the folder **C:\12djobs\dam works**.

Note that if the pathname for **Start in** contain spaces, then it must be enclosed in double quotes (").

If the *dam* icon was double clicked on, it would now attach to the working folder *dam works*

Only the appropriate project would then need to be selected from the project field of the 12d Model **Project Selection** panel

Further, if a project such as *dam* already exists in the folder, then by setting the **Target** field, the icon can be set so that 12d Model starts up in that existing project.

If the **Target** for the shortcut has the **project_name** added after the path to *12d.exe*, then 12d Model will actually start up with that project opened. The **project_name** can be a pathname.

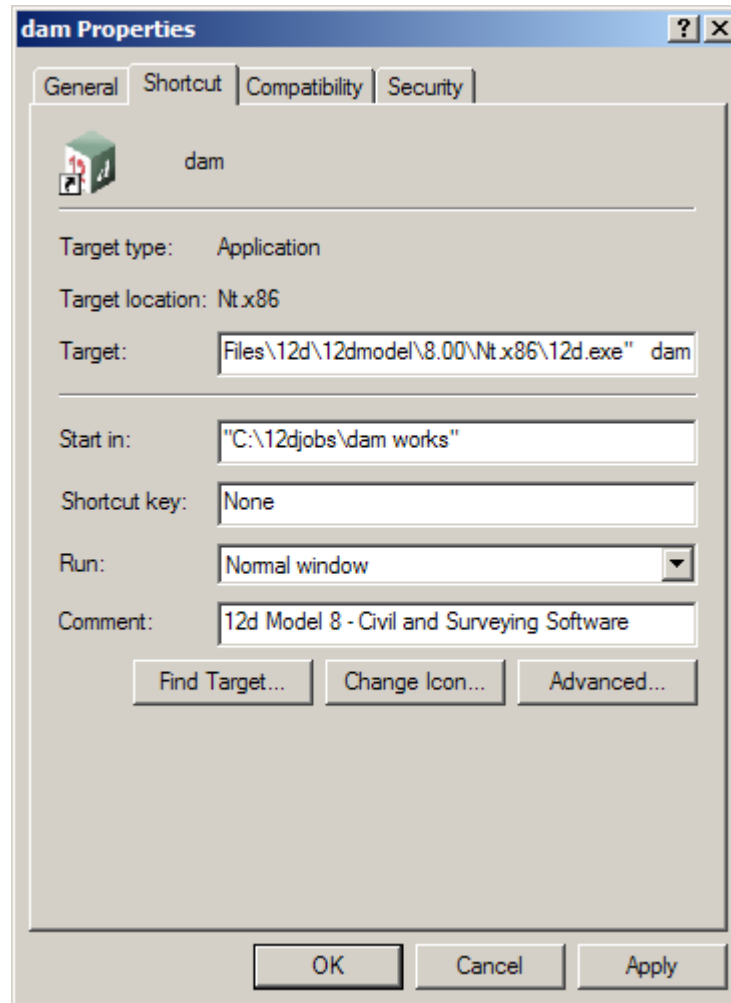

For example, the **Target**:

"C:\12d\12dmodel\8.00\nt.x86\12d.exe" dam

would automatically open the project **dam** in the **Start in** folder of the shortcut.

Note that if either the pathname for the **Target** or the **project_name** contain spaces, then they must be enclosed in double quotes (").

The following picture shows the Properties setting for **Target** and **Start in** for the *dam* icon so that double clicking on *dam* would automatically start 12d Model with the project *dam* in the folder *dam works*:

Environment Variables Shortcut

If a file of 12d Model environment variables has been set up by the user (see section “Environment Variables” in Appendix “Set Ups”), then instead of setting the environment variable ENVIRONMENT_4D to point to the file or setting it up with the default name, env.4d, the environment file can be passed to 12d Model using the **Target** of the icon properties.

For example, the **Target**:

```
C:\12d\12dmodel\8.00\nt.x86\12d.exe -env F:\12d\env.4d
```

would fire up 12d using the file of environment variables called F:\12d\env.4d

The **Target**:

```
C:\12d\12dmodel\8.00\nt.x86\12d.exe -env F:\12d\env.4d dam
```

would fire up 12d using the file of environment variables called F:\12d\env.4d **and** also automatically open the project **dam** in the **start in** folder of the shortcut.

Again if any of the pathnames contain spaces, then they must be enclosed in double quotes (“”).

Error Logging File

When 12d Model starts up, it tries to create an **error logging file**, called

log?????.4de

where ????? is a hashed number using your login name, process id & the current time.

When 12d Model terminates, the error log file is deleted if no errors were logged.

The **folder** that the error log file is created in is given by the environment variable LOG_DIR_4D

If LOG_DIR_4D is not used, 12d Model tries to create the log file in the current folder, the HOME folder, the TMP folder and the TEMP folder.

If creating a **error log file** fails in all these areas, 12d Model will not start up. This should never happen.

Running Macros and Chains on Start Up

To allow for tailoring *12d Model* when a new project is created or an existing project opened, *12d Model* runs user supplied files of macros and/or chains.

For **new** projects, the default name of the file is

macros.4d

This can be changed to a different file by setting the environment variable

`RUN_MACROS_4D` *file_of_macros_to_run*

For **existing** projects, the default name of the file is

project_macros.4d

This can be changed to a different file by setting the environment variable

`RUN_PROJECT_MACROS_4D` *file_of_macros_to_run*

(the environment variables can be set on the **Extra A** tab of the env.4d editor - see “env.4d”)

The files consist of macros and/or chains, one per line, where

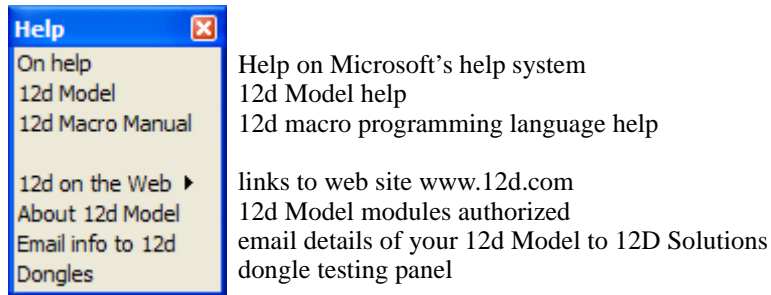

for macros, just the **name of the macro** is needed on the line

and for chains, the command **run_chain** *name_of_the_chain* is needed on the line.

The macros and chains are run in the order that they occur in the file.

4 12d Model Help

The 12d Help can be accessed by selecting *12d Model* on the *Help* menu item on the main 12d Model menu.

Alternatively, individual topics for a panel or menu can be invoked by using the F1 key or the Help button on any 12d Model panel.

More information on the Help system will now be given.

Contents

The **Contents** allows you to look at the overall structure of the Help and access any part of it.

Warning - only *topics* in the Help can be accessed through the *Contents* list so any folders in the Content folders must be expanded until topics are displayed. *Topics* can be easily identified because they have a question mark beside them indicating that Help is available.

For example, double clicking on '*Tools and Concepts*' expands the next level of '*Tools and Contents*'.

Double clicking on the topic 'Picking Strings' will then display the topic. The Contents then disappear leaving Help open at the selected topic.

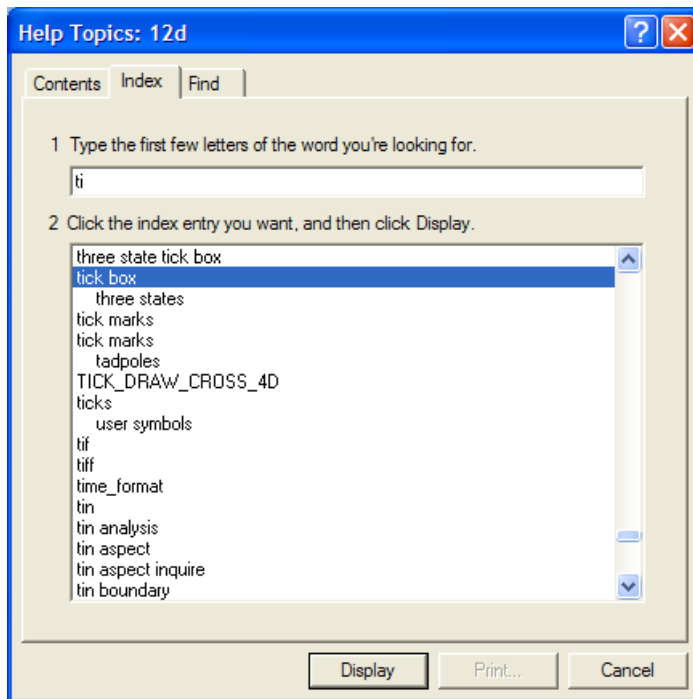

Double clicking on 'Contents' on the top of the Help will bring the Contents listing back up.

Index

The *Index* option searches through all entries in the Index of the Help.

As the first few characters of the required entry are typed in, the matching index entries are displayed.

Double clicking on the displayed entries will go to the topic in the Help containing the selected index entry. If more than one topic includes the index entry, then the list of topics is displayed.

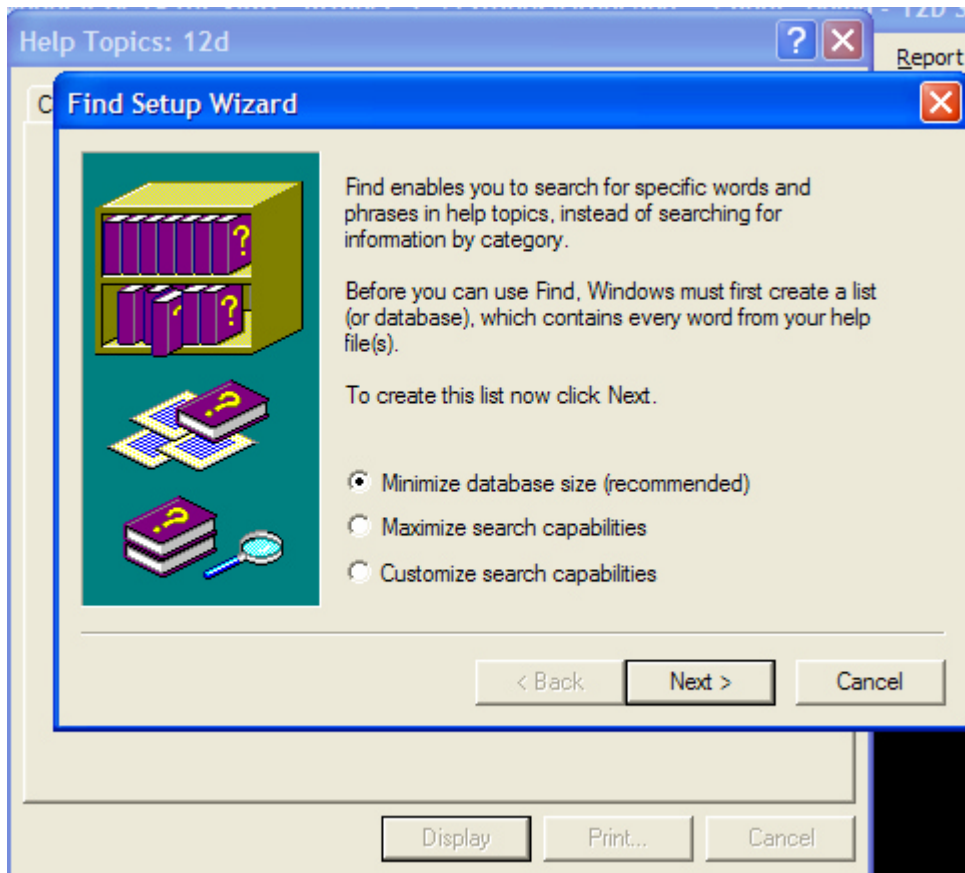

If the index has sub-indices, they can be searched by first typing in the main index followed by a comma, then a space and the first few characters of the sub-index.

Find

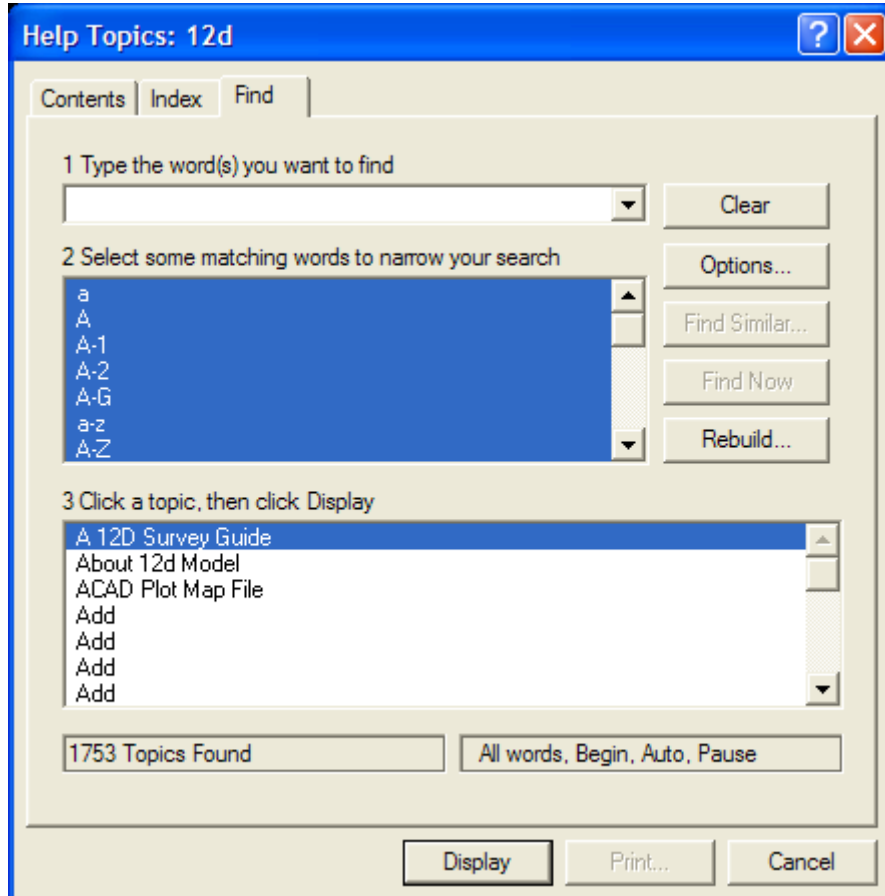

The most powerful searching method for the Help system is *Find*.

Simply click on the *Find* tab to search for words or phrases that may be contained in a Help topic.

If *Find* is being invoked for the first time, the 'Find Setup Wizard' runs to create an index of every word in the Help.

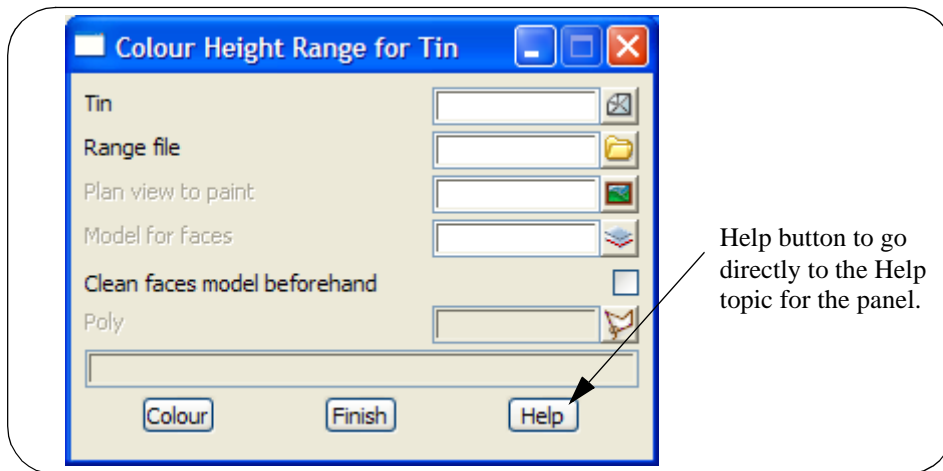

From then on, selecting the *Find* tab goes straight to the *Find* screen.

Panel Help Button

Every panel has a Help button which when selected goes to the *topic* describing that panel.

F1 Key

Another method of invoking Help is by using the F1 key as follows:

when a menu or panel is on the screen and has focus (the menu or panel title area will be highlighted), pressing F1 will bring up the help for that menu or panel.

Warning - some of the items on the *Strings* menu automatically start up a string select and change the focus from the panel to a View. This means that pressing F1 will bring up the Help for the View and not the Help for the panel.

To get Help for such a panel, click on the panel to bring the focus back to the panel before pressing F1. The top of the panel will highlight showing that it has focus.

Navigating in Help

Once at a *topic* in the Help, the << and >> buttons at the top of the Help topic will go to the previous and next Help topics respectively.

Individual Help topics can be printed by clicking **Print** at the top of the Help page.

Because it is difficult to print large sections of Microsoft's Help system, a PDF file of the entire 12d Model Reference Manual has been created and can be used to print out large sections of the manual.

The 12d Model Reference Manual PDF file is on the 12d Model 8 Installation CD in the folder Documentation\Reference_Manual.

5 View Menus

[perspective_opengl_view_help](#)

[section_view_help](#)

[perspective_view_help](#)

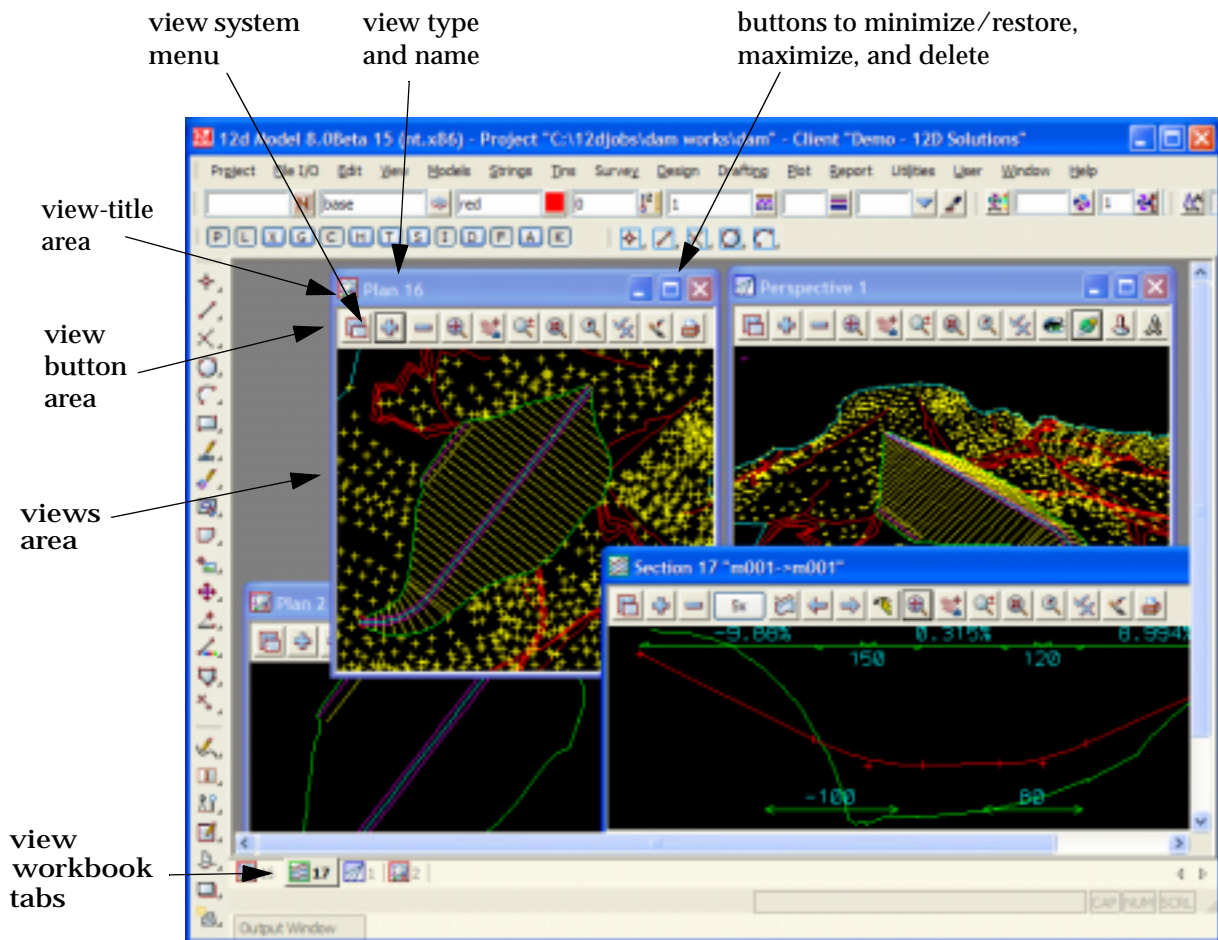

[hidden_perspective_view_help](#)

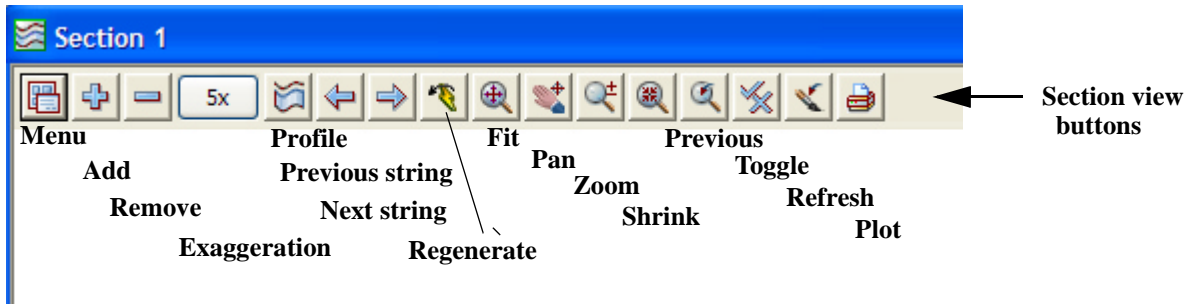

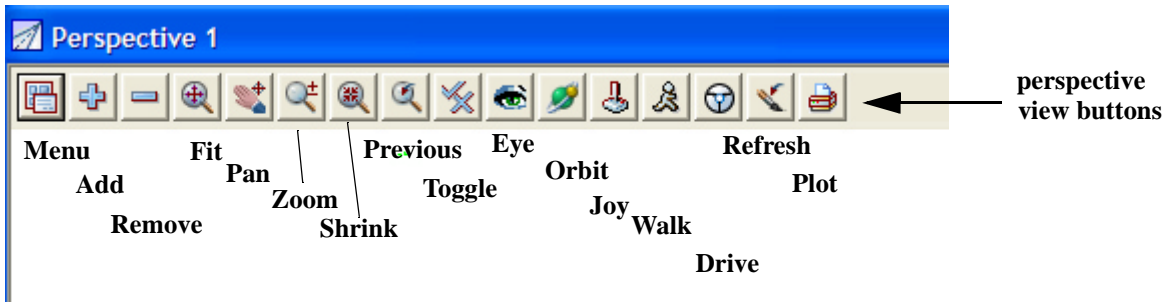

[plan_view_help](#)

Views are the screen drawing areas for 12d Model and come in three flavours - plan, perspective and section. Views can be created and deleted as required by the user and there is no limit to the number of views on the screen. The views can overlap and be minimized.

Each view has a unique name of up to two hundred characters.

Each view has a *view title area* which is used to display the view name and a *view button area* which displays the view buttons.

The *View Buttons* are documented in the section “View Buttons”

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the View menu appears.

Because of the differences between plan, perspective and section views, the options on the View menu vary for each view type. The plan, perspective and section View menus are

Plan View Menu

Perspective View Menu

Section View Menu

The View menu is removed by selecting the **[X]** button or if the View menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the View menu has been moved, clicking **RB** will warp the cursor to the moved View menu.

For further documentation on the options on the View menus, please see:

for the option *Models*, go to the section "Model Ops" .

<i>Settings,</i>	"Plan View Settings"
or "Perspective View Settings" or "Section View Settings" .	
<i>Redraw,</i>	"Redraw" .
<i>Fit,</i>	"Fit" .
<i>Previous,</i>	"Previous" .
<i>Zoom,</i>	"Zoom" .
<i>Joy,</i>	"Joy" .
<i>Profile,</i>	"Profile" .
<i>Regenerate,</i>	"Regenerate" .
<i>Pan,</i>	"Pan" .
<i>Utilities,</i>	"Plan Utilities"
or "Perspective Utilities" or "Section Utilities" .	
<i>Delete,</i>	"Delete" .

The option *Models* which is common to each menu will be discussed first, followed by the special options for each of the view menus.

Please continue to the next section "Model Ops" .

Model Ops

[view_model_ops_menu](#)

Position of menu: Plan View Menu View =>Models

Position of menu: Section View Menu View =>Models

Position of menu: Perspective View Menu View =>Models

Walking right on *Models* brings up the Model Ops walk-right menu which is used to add and remove models from the view.

These options are the same for Plan, Perspective and Section views.

The Model Ops walk-right is

For the option *Models*, go to the section "Models" .

<i>Add model</i>	"Add Model" .
<i>Add all models</i>	"Add All Models" .
<i>Remove model</i>	"Remove Model" .
<i>Remove all models</i>	"Remove All Models"
<i>Add tin models</i>	"Add Tin Models" .
<i>Remove tin models</i>	"Remove Tin Models" .
<i>Model order</i>	"Model Order" .
<i>Models to front</i>	"Models to Front" .
<i>Models to back</i>	"Models to Back" .
<i>Calc extents</i>	"Calc Extents" .

Models

models_to_add

Position of menu: Plan View Menu View => Models =>Models

Position of menu: Section View Menu View => Models =>Models

Position of menu: Perspective View Menu View => Models =>Models

Models is a walk-right option which lists the models currently attached to that view.

If a model is selected from the displayed list, the model will be redrawn on the view. It will also be brought to the top of the display list, i.e., it is in the foreground and all the other models on the view are drawn before it.

Add Model

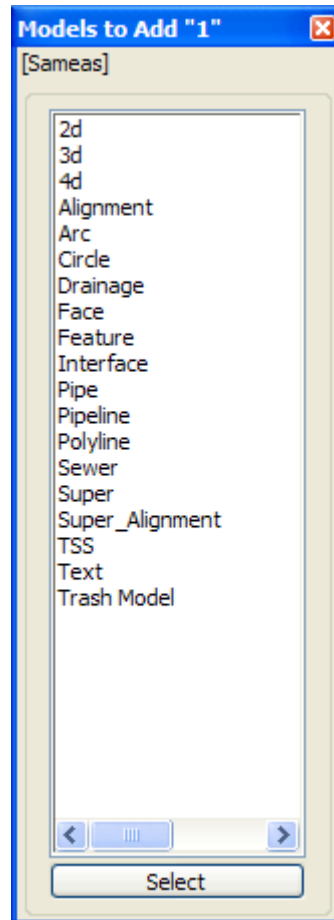

Position of menu: Plan View Menu View => Models =>Add model

Position of menu: Section View Menu View => Models =>Add model

Position of menu: Perspective View Menu View => Models =>Add model

The Add model menu item operates two ways.

The Add model walk-right brings up the Models to Add list which is a list of all the models not currently added to the view.

By double clicking on one of the models from the Models to Add list, it is added to the view. The list is then removed. To add a number of models from the list to the view, select the models in the list in the standard Microsoft way and then click on **Select**.

If the Models to Add list has been moved or pinned, models can be selected from the list and added to the view and the Models to Add list will remain with the selected models removed from the list. When all the required models have been added, delete the list using the [X] button.

If Add model itself is activated (by clicking LB when Add model is highlighted), the **Add Model to a View** panel appears. The **Add Model to a View** panel can be used to create new models as well as add existing models to any view. Wild cards and characters are allowed for adding models.

Any models added to a view are immediately drawn on the view.

Add All Models

Position of option on menu: Plan View Menu View => Models =>Add all models

Position of option on menu: Section View Menu View => Models =>Add all models

Position of option on menu: Perspective View Menu View => Models =>Add all models

The Add all models option adds all the models to the view.

Remove Model

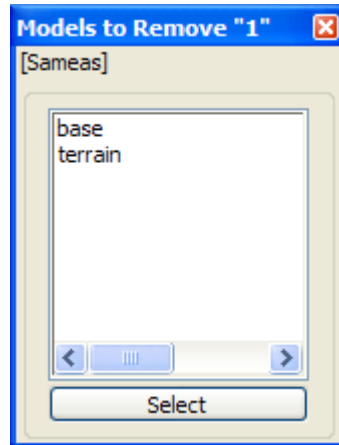

models_to_remove

Position of menu: Plan View Menu View => Models =>Remove model

Position of menu: Section View Menu View => Models =>Remove model

Position of menu: Perspective View Menu View => Models =>Remove model

The Remove model menu item also operates in two ways. The Remove model walk-right brings up the Models to Remove list which is a list of all the models currently added to the view.

By double clicking on one of the models from the Models to Remove list, it is removed from the view. The list is then removed. To remove a number of models on the list from the view, select the models in the list and then click on **Select**.

If the Models to Remove list has been moved or pinned, models can be selected from the list and removed from the view and the Models to Remove list will remain with the selected models removed from the list. When all the required models have been removed, delete the list using the [X] button.

If Remove model itself is activated, the **Remove Model from a View** panel appears. The **Remove Model from a View** panel can be used to remove any models from any view. Wild cards and characters are allowed for removing models.

NOTE

Models still exist after they are removed from a view. Models can only be deleted from 12d Model by using the Models=>Delete option.

Remove All Models

Position of option on menu: Plan View Menu View => Models =>Remove all models

Position of option on menu: Section View Menu View => Models =>Remove all models

Position of option on menu: Perspective View Menu View => Models =>Remove all models

The Remove all models option removes all the models from the view and clears the view.

Add Tin Models

tin_models_to_add

Position of menu: Plan View Menu View => Models =>Add tin models

Position of menu: Section View Menu View => Models =>Add tin models

Position of menu: Perspective View Menu View => Models =>Add tin models

The Add tin models walk-right brings up the Tin Models to Add list of all tins in the project whose models have not been added to the view

By double clicking on one of the tins from the Tin Models to Add list, all the models in the tin are added to the view. The list is then removed. To add the models from a number of tins from the list to the view, select the tins in the list in the standard Microsoft way and then click on **Select**.

If the Tin Models to Add list has been moved or pinned, tins can be selected from the list and their models added to the view and the Tin Models to Add list will remain with the selected tins removed from the list. When all the required tins have been added, delete the list using the [X] button.

Any models added to a view are immediately drawn on the view.

Remove Tin Models

tin_models_to_remove

Position of menu: Plan View Menu View => Models =>Remove tin models

Position of menu: Section View Menu View => Models =>Remove tin models

Position of menu: Perspective View Menu View => Models =>Remove tin models

The Remove tin models walk-right brings up the Tin Models to Remove list of all tins whose models are currently added to the view.

By double clicking on one of the tins from the Tin Models to Remove list, all the models in the tin are removed from the view. The list is then removed. To remove the models from a number of tins on the list from the view, select the tins in the list and then click on **Select**.

If the Tin Models to Remove list has been moved or pinned, tins can be selected from the list and removed from the view and the Tin Models to Remove list will remain with the selected tins

removed from the list. When all the required tins have been removed, delete the list using the [X] button.

Model Order

model_order

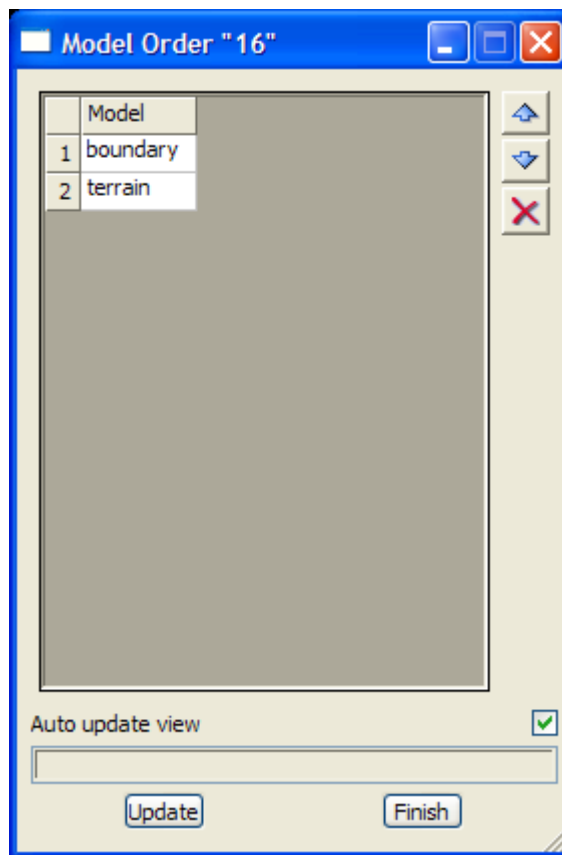

Position of menu: Plan View Menu View => Models =>Model order

Position of menu: Section View Menu View => Models =>Model order

Position of menu: Perspective View Menu View => Models =>Model order

The Model order options displays the list of all models on a view in the reverse model drawing order. That is, the first model on the list is the last model drawn and hence the most visible model.

Selecting Model order brings up the **Model Order** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Model

list of models on the view in the reverse drawing order. That is, the first model on the list is drawn last and so is the most visible.

Up Arrow, Down Arrow

when a model name is highlighted, clicking the Up/Down arrow will change the order of the model.

**Delete**

*when a model name is highlighted, clicking the Delete icon will remove the model from the view.
when a model name is highlighted, clicking on the Cross will remove the model from the view.*

Auto update view tick box tick

if tick then the view is redrawn each time a model is moved in the list or added/removed from the list.

Update button

redraws the view using the new model order.

Models to Front

models_to_front

Position of menu: Plan View Menu View => Models =>Models to front

Position of menu: Section View Menu View => Models =>Models to front

Position of menu: Perspective View Menu View => Models =>Models to front

Models to front is a walk-right option. When the walk-right is chosen, the list of models currently attached to that view is displayed.

If a model is selected from the displayed list, the model will be the last to be drawn on the view. Hence, it is in the foreground and all the other models on the view are drawn before it.

Models to Back

models_to_back

Position of menu: Plan View Menu View => Models =>Models to back

Position of menu: Section View Menu View => Models =>Models to back

Position of menu: Perspective View Menu View => Models =>Models to back

Models to back is a walk-right option. When the walk-right is chosen, the list of models currently attached to that view is displayed.

If a model is selected from the displayed list, the model will be the first to be drawn on the view. Hence, it is in the background and all the other models on the view are drawn after it.

Calc Extents

Position of option on menu: Plan View Menu View => Models =>Calc extents

Position of option on menu: Section View Menu View => Models =>Calc extents

Position of option on menu: Perspective View Menu View => Models =>Calc extents

For each model on the view, the size of the x, y, z box required to enclose the data in the model is calculated. That is, the option calculates the model bounding box for each model on the view.

Redraw

Position of option on menu: Plan View Menu View => Models =>Redraw

Position of option on menu: Section View Menu View => Models =>Redraw

Position of option on menu: Perspective View Menu View => Models =>Redraw

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

NOTES

1. When a model is removed from a view, it is “undrawn”, that is, drawn in black. This may also black out important details of other models still attached to the view. If this happens, use the redraw option to refresh the view.
2. Clicking MB in the view-title area is the easiest method of redrawing a view.

Fit

Position of option on menu: Plan View Menu View => Models =>Fit

Position of option on menu: Section View Menu View => Models =>Fit

Position of option on menu: Perspective View Menu View => Models =>Fit

When the fit option is chosen, 12d Model calculates viewing parameters which will allow all the models attached to the view to be fully displayed. The view is then redrawn using these new drawing parameters.

Note if the data does not fill the view after a fit, then a calc extents may be needed to re-calculate the model bounding boxes.

Previous

Position of option on menu: Plan View Menu View => Models =>Previous

Position of option on menu: Section View Menu View => Models =>Previous

Position of option on menu: Perspective View Menu View => Models =>Previous

Each time a view has its viewing parameters changed, the old set is recorded as the previous parameter set. The previous option sets the viewing parameters back to this previous parameter set.

The view is then redrawn using those settings. The last set then becomes the old set.

Delete

view_menu_delete_view

Position of option on menu: Plan View Menu View =>Delete

Position of option on menu: Section View Menu View =>Delete

Position of option on menu: Perspective View Menu View =>Delete

This option is used to delete the view and remove it from the screen. After selecting the Delete option, a **Delete View** yes-no panel appears. If **Yes** is selected, the view is deleted and removed from the screen. Selecting **No** removes the **Yes-No** pop-up and leaves the view as it is.

Plan View Menu

plan_view_menu

Position of menu: Plan View Menu View

The plan view menu is

For the option *Models*, go to the section

Settings

Redraw

Fit

Previous

Pan

Utilities

Delete

"Model Ops"

"Plan View Settings" .

"Redraw" .

"Fit" .

"Previous" .

"Pan" .

"Plan Utilities" .

"Delete" .

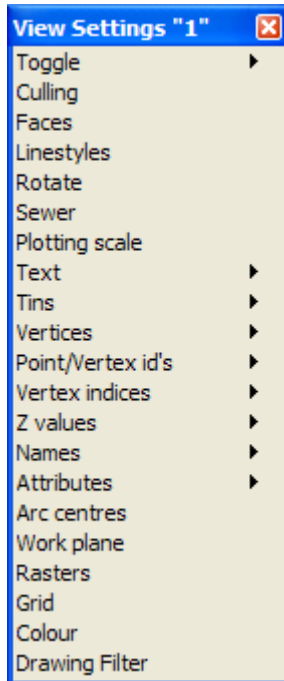

Plan View Settings

plan_view_settings_menu

Position of menu: Plan View Menu View => Settings

If the Settings option is picked rather than moving onto the walking right, then the toggle menu from the toggle walk-right menu is displayed on the screen. The toggle menu will be described in the next section.

The view settings walk-right menu for the plan view is

For the option <i>Toggle</i> , go to the section	"Plan Toggle"
<i>Culling</i>	"Culling"
<i>Faces</i>	"Faces"
<i>Linestyles</i>	"Linestyles"
<i>Rotate</i>	"Rotate"
<i>Sewer</i>	"Sewer"
<i>Plotting scale</i>	"Plotting Scale"
<i>Text</i>	"Text"
<i>Tins</i>	"Tins"
<i>Vertices</i>	"Vertices"
<i>Point/vertex id's</i>	"Point/Vertex Id's"
<i>Vertex indices</i>	"Vertex Indices"
<i>Z values</i>	"Z Values"
<i>Names</i>	"Names"
<i>Attributes</i>	"Vertex Attributes"
<i>Arc centres</i>	"Arc Centres"
<i>Work plane</i>	"Work Plane"
<i>Rasters</i>	"Rasters"
<i>Grid</i>	"Grid"
<i>Colour</i>	"Colour"
<i>Drawing filter</i>	"Drawing Filter"

Plan Toggle

plan_view_toggle_menu

Position of menu: Plan View Menu View => Settings =>Toggle

The toggle walk right brings up the **toggle** plan view menu.

Selecting any options from this menu will toggle the option on/off.

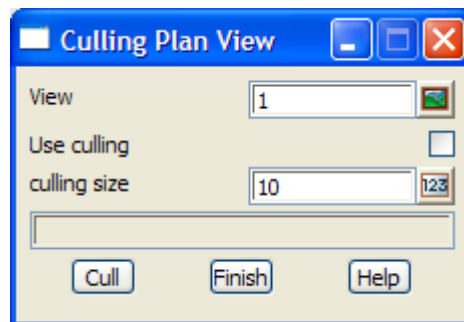

Culling

culling_plan_view

Position of option on menu: Plan View Menu View =>Settings => Culling

The culling option is used to suppress the drawing of strings whose on-screen extent is less than a user defined pixel size.

Selecting culling raises the **culling plan view** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set cutting for.</i>	input/output	current view	available views
Use culling	tick-cross		
<i>if tick, a string is not drawn on the plan view whenever the string's extent box when drawn on the view would be smaller than the culling size given in the culling size field.</i>			

Culling size input 10
pixel size used for culling

Cull button

record the culling size given in the culling field. If the use culling field is set to tick, the recorded culling size will be used whenever the plan view is redrawn.

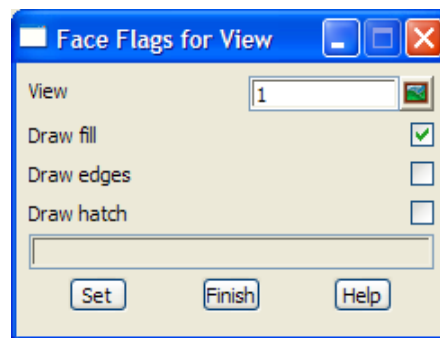

Faces

face_flags_for_view

Position of option on menu: Plan View Menu View =>Settings => Faces

The faces option allows the user to specify how faces are displayed in the plan view and on any plan view plots.

Selecting faces fires up the **face flags for view** panel.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set for drawing faces.</i>	input/output	current view	available views

Draw fill <i>if tick, all faces in the view are drawn in their fill colour.</i>	tick-cross	tick
---	------------	------

Draw edges <i>if tick, all face edges in the view are drawn.</i>	tick-cross	
--	------------	--

Draw hatch <i>if tick, all faces in the view are drawn in their hatch pattern.</i>	tick-cross	
--	------------	--

Set	button
------------	--------

set the draw fill/edges/hatch fields to the value in the panel fields. The plan view is then redrawn using this value.

Linestyles

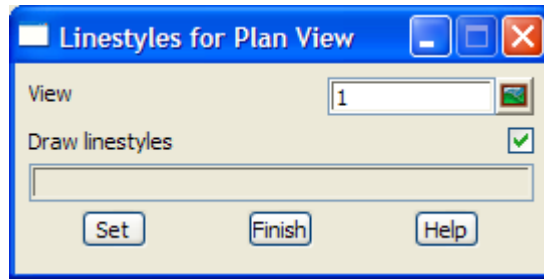

linestyles_for_plan_view

Position of option on menu: Plan View Menu View => Settings => Linestyles

The linestyles option allows the user to specify how linestyles (**styles**) are displayed in the plan view and on any plan view plots.

If linestyles are not used for drawing in a view then all strings are drawn according to their breakline type. That is, line strings are drawn with solid lines for each line in the string and point strings with only crosses at the string points. This style is the default style, 1.

Selecting linestyles fires up the **linestyles for view** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify draw linestyle flag for.</i>	input/output	current view	available views
Draw linestyles <i>if tick, all strings in the view are drawn with linestyles. If no tick, all lines strings are drawn as solid lines and point strings with crosses at their vertices.</i>	tick-cross	tick	
Set <i>set the draw linestyles field to the value in the panel field. The plan view is then redrawn using this value.</i>	button		

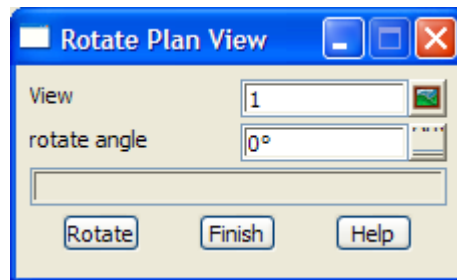

Rotate

rotate_plan_view

Position of option on menu: Plan View Menu View => Settings => Rotate

The rotate option is used to rotate a plan view through a user supplied angle about the centre point of the plan view.

After selecting the rotate option, the **rotate plan view** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set rotation angle for.</i>	input/output	current view	available views
Rotate angle <i>angle (in degrees) to rotate the view to.</i>	input	0	angles
Rotate <i>rotate the view about the view centre point until the angle the view makes with the positive x axis is the angle given in the rotate angle field.</i>	button		

Sewer

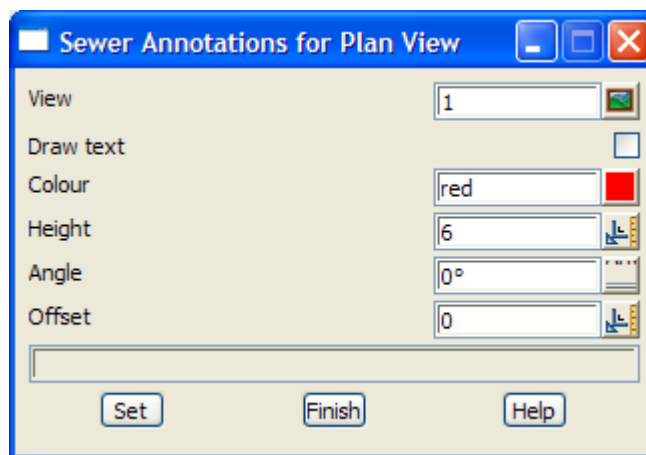

sewer_annotations_for_plan_view

Position of option on menu: Plan View Menu View => Settings => Sewer

This is part of the optional sewer module.

The sewer option allows the user to specify how sewer text is displayed in the plan view and on any plan view plots.

Selecting sewer fires up the **sewer annotations for plan view** panel.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set sewer annotation information for.</i>	input/output	current view	available views
Draw text <i>if tick, sewer text annotation will be drawn for any sewer strings in the plan view.</i>	tick-cross		
Colour <i>the colour for any sewer text annotation.</i>	input	red	available colours
Height <i>the height for any sewer text annotation.</i>	input	default text height	
Angle <i>the angle for any sewer text annotation.</i>	input	0	
Offset <i>the offset for any sewer text annotation.</i>	input	0	
Set <i>set the values in the panel fields and then redraw the view.</i>	button		

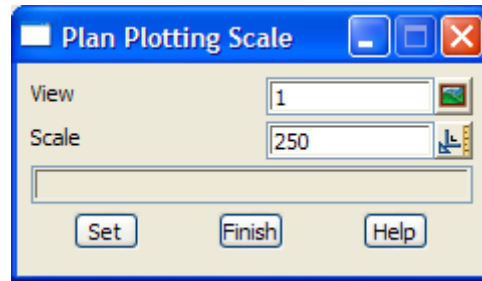

Plotting Scale

plan_plotting_scale

Position of option on menu: Plan View Menu View => Settings => Plotting scale

The plotting scale option is used to set a scale for the plan view which is used to determine the size to draw any *paper* text on the plan view.

After selecting the plotting scale option, the **plan plotting scale** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set the scale for.</i>	input/output	current view	available views
Scale <i>"1 in" to use to calculate a drawing size for any paper text on the view.</i>	input	250	
Set <i>set the plotting scale for the view.</i>	button		

Text

plan_view_text_settings_menu

Position of menu: Plan View Menu View => Settings =>Text

The text option allows the user to specify whether the text from any strings (text strings, 4d strings and survey strings) in models on the plan view is

- (a) not drawn at all
- or
- (b) if drawn and the text is defined in world units, then the text can be drawn in full, quick mode or not at all depending on the display size of the text on the screen. This stops the drawing of *world* text when its display size is **small** on the screen (e.g. when zooming out).
- (c) if drawn and the text is defined in pixel units, then when the screen scale is such that the height of the text in world units is too large, then the text is not drawn. This stops the drawing of *pixel* text when its displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the text option tries to control the drawing of *both* pixel and world text in models on the view so that the text stops displaying in the view as the user *zooms out*

The choice of drawing text in full, quick mode or not at all also applies to the Vertex numbers and Z values text turned on by view settings (view text).

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the Text option draws/doesn't draw text for *any* model on the view, or the drawing of text can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:

The options in the text walk-right are used to display/not display text for **all** models on the plan view and the walk-right menu only contains the two options, Text and Single.

Selecting Single brings up the **Model Text for Plan View** panel, without the Model field and is only used to set a maximum height, not parameters for individual models.

If *plan_table_settings_4d* is non-zero:

The options in the text walk-right can be used to specify for *individual* models if the text in the model is display/not display text on the plan view.

For any setting *plan_table_settings_4d*, if Text is selected without walking right, then the **Plan Text** panel is brought up (documented in the next section).

The text walk-right menu is

Text

plan_text

Position of option on menu: Plan View Menu View => Settings => Text => Text

The Text option allows the user to specify how text is displayed in the plan view and on any plan view plots. Text can be drawn in **full, quick mode** consisting of the bottom half of a rectangle

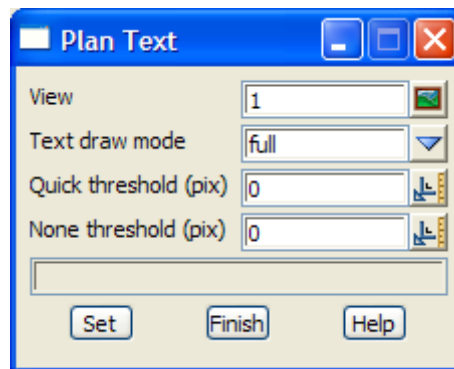

indicating the height and the length of the text, or **not drawn at all**.

This setting also applies to the z-values and vertex numbers controlled by view settings.

There are also two text threshold values (quick and none) designed for use with world text. When the *screen size* of text drops below the thresholds, the mode of display is automatically adjusted.

Hence when the *screen size* of **world** text gets small, the text can be drawn as quick text or even not displayed at all.

Selecting Text fires up the **Plan Text** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify text drawing flags for.</i>	input/output	current view	available views
Text draw mode <i>if full, any text in the plan view will drawn as expected. If quick, the text will not be drawn but replaced by a three sided box to indicate where the text is. If none, nothing is displayed where the text would have been.</i>	input	full	full, quick, none
Quick threshold (pix) <i>if the screen size of text displayed on the plan view goes below this pixel size, then the text is automatically drawn in quick mode.</i>	input	4.5	
None threshold (pix) <i>if the screen size of text displayed on the plan view goes below this pixel size, then the text is not drawn.</i>	input	2	
Set <i>set the text draw mode and thresholds to the values given in the panel fields. The plan view is then redrawn using the new values.</i>	button		

Note

The Text=>Text option applies to *all* text on the view. That is, for any text from strings in models on the view, or for the z-values and vertex numbers text controlled by view settings (view text). The Single and Table options of Text are *only* for text in models. There are Single and Table options for view text under the Vertex no.s and Z values Settings options.

Single

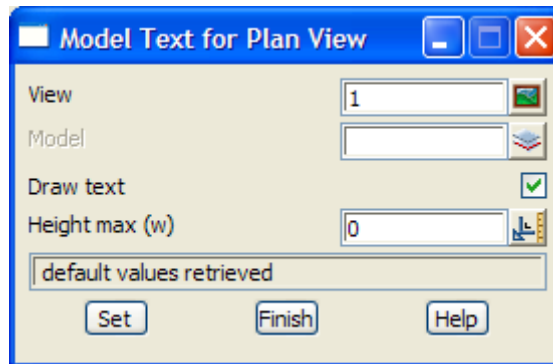

[model_text_for_plan_view](#)

Position of option on menu: Plan View Menu View => Settings => Text => Single

The Single option allows the user to stop drawing any text from models on the view (world or

pixel), or if text is drawn, set a maximum equivalent world size that is used as an upper limit for drawing *pixel* text in the model.

Selecting Single fires up the **Model Text for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify model text drawing flags for.</i>	input/output	current view	available views
Model <i>the model to set the Draw text and Height max parameters for.</i>	input		
Draw text <i>If not tick, then no text from strings in models (text, 4d and survey strings) is drawn. if tick, any text from strings in models (text, 4d and survey strings) will then be checked against the height max for pixel text, or text drawn mode for world text, to see if it is drawn.</i>	tick-cross	tick	
Height max (w) <i>if non-zero, then when the screen scale is such that the height of any string text defined in pixels converted to a world size is greater than height max (w), then the text is not drawn. Hence on zooming out, any pixel text in the models will eventually stop drawing.</i>	input	0	
Set <i>set the text draw mode and thresholds to the values given in the panel fields. The plan view is then redrawn using the new values.</i>	button		

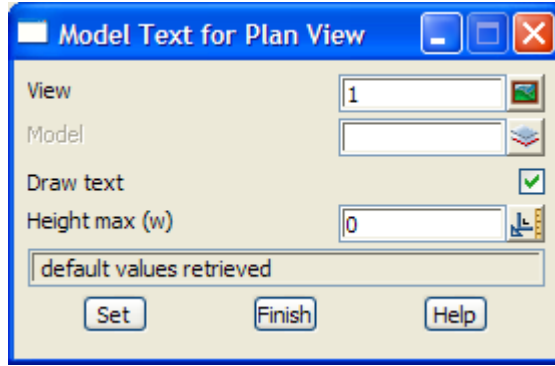

Table

[model_text_for_plan_view](#)

Position of option on menu: Plan View Menu View => Settings => Text => Table

The Table option displays a list a models on the view with their draw flag. The draw flag can be toggled to allow the drawing/stop drawing text from the model on the view (world or pixel).

Selecting Table fires up the **Model Text Table for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify model text table drawing flags for.</i>	input/output	current view	available views

Draw tick-cross
 If not tick, then **no** text from strings in models (text, 4d and survey strings) is drawn.
 if tick, any text from strings in models (text, 4d and survey strings) will then be checked against the height max for pixel text, or text drawn mode for world text, to see if it is drawn.

Model input
 the model to set the Draw flag for.

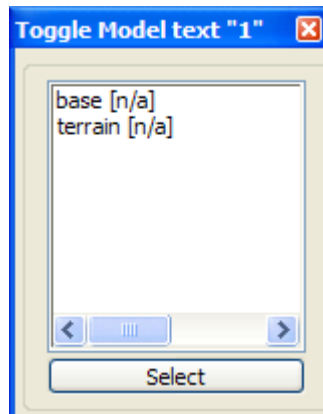

Set button
 set the text draw flags for the models in the table.

Toggle

plan_view_toggle_model_text

Position of menu: Plan View Menu View => Settings => Text => Toggle

Walking-right on the Toggle option displays a list a models on the view with their text draw flag. The text draw flag can be toggled on/off by selecting the model on the list. Note that [n/a] means that the model has *not* been individually set on or off and the general Text toggle is used for the model.

Tins

plan_view_tin_settings_menu

Position of menu: Plan View Menu View => Settings => Tins

The options on the tins walk-right menu control the display of tins on the view. The tins walk-right menu is

Contours

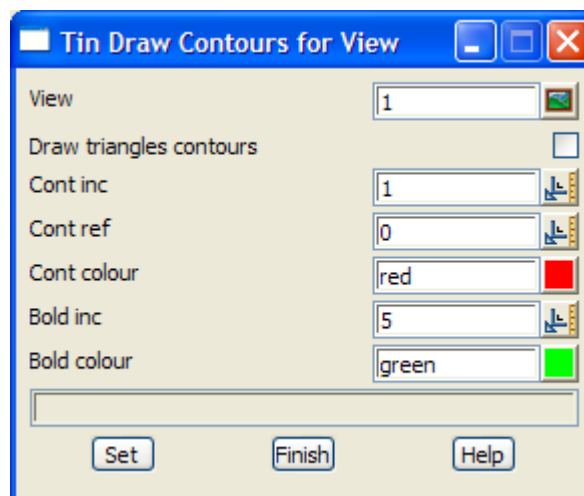

tin_draw_contours_for_view

Position of option on menu: Plan View Menu View => Settings => Tins => Contours

Position of option on menu: Perspective View Menu View => Settings => Tins => Contours

The Contours option defines contour and bold increments and colours, and also whether these contours are displayed for the triangles from any tins on the view. Because the contours are just drawn separately for each triangle, they are known as **quick** or **fast contours**.

Selecting Contours fires up the **Tin Draw Contours for View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify fast contour drawing parameters for.</i>	input/output	current view	available views
Draw triangles contours <i>if tick, the contours for any triangles in any tins on the view are displayed.</i>	tick-cross		
Cont inc <i>increment between contoured values.</i>	input	1.0	
Cont ref <i>reference value for the contour increments.</i>	input	0.0	
Cont colour <i>colour of the contours</i>	input	cyan	available colours

Bold inc input 5.0
increment for the bold contours. If the bold increment is blank or zero, then no bold contours are drawn. If the bold increment is non-zero, it must be an integer multiple of the contour increment

Bold colour input magenta available colours
colour of the bold contours

Set button
set the value in the panel and then redraw the plan view.

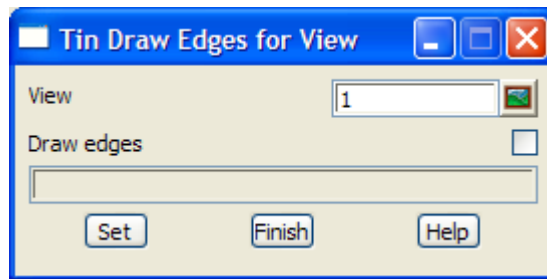

Edges

tin_draw_edges_for_view

Position of option on menu: Plan View Menu View => Settings => Tins => Edges

Position of option on menu: Perspectives View Menu View => Settings => Tins => Edges

The edges option allows the user to specify whether the edges of triangles from any tins on the view are displayed. Selecting edges fires up the **tin draw edges for view** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify tin edge drawing flag for.

Draw triangles edges tick-cross
if tick, the edges of any triangles in any tins on the view are displayed.

Set button
set the value and then redraw the plan view.

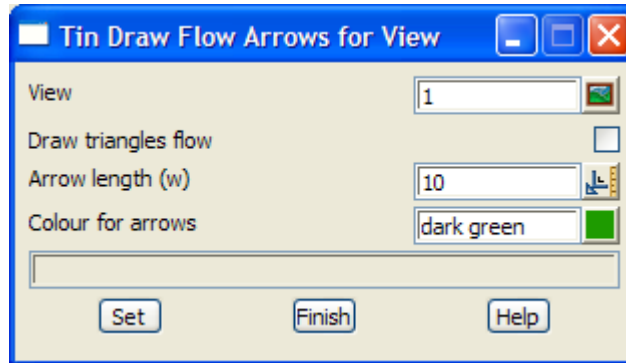

Flow Arrows

tin_draw_flow_arrows_for_view

Position of option on menu: Plan View Menu View => Settings => Tins => Flow arrows

Position of option on menu: Perspective View Menu View => Settings => Tins => Flow arrows

The flow arrows option defines the colour and length of flow arrows, and also whether the flow arrows are displayed for the triangles from any tins on the view. Selecting flow arrows fires up the **tin draw flow arrows for view** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify tin arrow drawing flag for.</i>	input/output	current view	available views
Draw triangles flow arrows <i>if tick, the flow arrows for any triangles in any tins on the view are displayed.</i>	tick-cross		
Arrow length (w) <i>length in world units to draw flow arrows.</i>	input		
Colour for arrows <i>colour for the arrows.</i>	input	cyan	available colours
Set <i>set the value in the panel and then redraw the plan view.</i>	button		

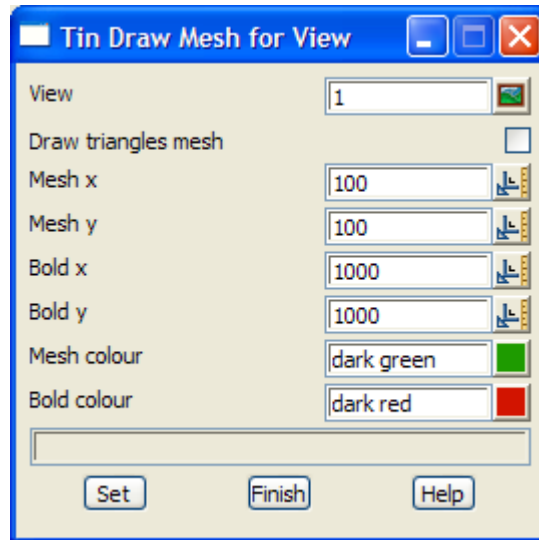

Mesh

tin_draw_mesh_for_view

Position of option on menu: Plan View Menu View => Settings => Tins => Mesh

Position of option on menu: Perspective View Menu View => Settings => Tins => Mesh

The mesh option defines a rectangular mesh, and also whether the mesh is displayed for the triangles from any tins on the view. Selecting mesh fires up the tin draw mesh for view panel.

The fields and buttons used in this panel have the following functions.

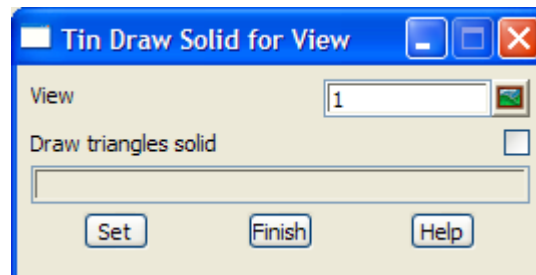

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify tin mesh drawing flag for.</i>	input/output	current view	available views
Draw triangles mesh <i>if tick, a rectangular mesh for any triangles in any tins on the view are displayed.</i>	tick-cross		
Mesh x <i>the distance between the x mesh lines. If this value is zero, the x mesh lines will not be drawn.</i>	input	100	
Mesh y <i>the distance between the y mesh lines. If this value is zero, the y mesh lines will not be drawn.</i>	input	100	
Bold x <i>the distance between the bold x mesh lines. If this value is zero, the bold x mesh lines will not be drawn.</i>	input	1000	
Bold y <i>the distance between the bold y mesh lines. If this value is zero, the bold y mesh lines will not be drawn.</i>	input	1000	
Mesh colour <i>colour that the mesh is drawn in.</i>	input	dark green	available colours
Bold colour <i>colour that the bold mesh is drawn in.</i>	input	dark green	available colours
Set <i>set the value in the panel and then redraw the plan view.</i>	button		

Solid

tin_draw_solid_for_view

Position of option on menu: Plan View Menu View => Settings => Tins => Solid

The solid option allows the user to specify whether the triangles from any tins on the view are displayed as solid colour. Selecting solid fires up the **tin draw solid for view** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify tin solid drawing flag for.</i>	input/output	current view	available views
Draw triangles solid <i>if tick, any triangles in any tins on the view are displayed in solid colour.</i>	tick-cross		
Set <i>set the value and then redraw the plan view.</i>	button		

Vertices

`plan_view_vertices_settings_menu`

Position of menu: Plan View Menu View => Settings => Vertices

The Vertices option allows the user to specify whether crosses at the vertices of strings are

(a) not drawn at all

or

(b) if set to draw, then only drawn if equivalent world size is not too large. This stops the drawing of *crosses* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the Vertices option tries to control the drawing of vertex crosses on the view so that the crosses stop displaying as the user *zooms out*

Depending on whether the environment variable `plan_table_settings_4d` is zero or not, the Vertices option draws crosses for string vertices for *any* model on the view, or the drawing of crosses can be set for individual models.

If the environment variable `plan_table_settings_4d` is set to `0`:

the Vertices option is used to display/not display crosses at the vertices of strings in **all** models on the plan view. For a text string, a cross is placed at the text justification position.

Selecting Vertices brings up the **Crosses at String Vertices for Plan View** panel, without the Model field.

If `plan_table_settings_4d` is non-zero:

the Vertices option then has a walk-right menu with options to specify for *each* model on the plan view whether crosses at the vertices of strings in the model are

(a) not drawn at all

or

(b) if set to draw, then the crosses are only drawn if equivalent world size is not too large. This stops the drawing of *crosses* when its displaying world size is large in proportion to other world units (e.g. when zooming out).

If Vertices is selected without walking right, the **Crosses at String Vertices for Plan View** panel is brought up (documented in the next section).

The Vertices walk-right menu is

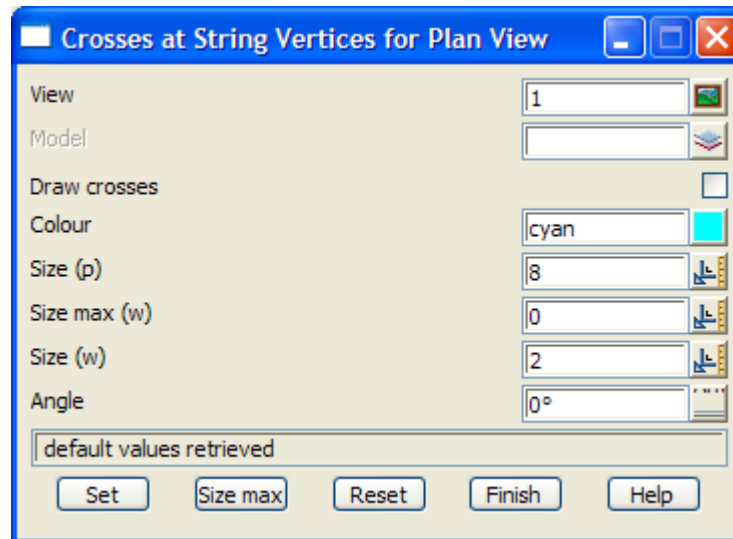

Single

`crosses_at_string_vertices_for_plan_view`

Position of option on menu: Plan View Menu View => Settings => Vertices => Single

The Single option is used to set parameters for drawing crosses at vertices of strings for all models not defined in the *Table* option or for a single model on the plan view. For a text string, a cross is placed at the text justification position.

After selecting the Single option, the **Crosses at String Vertices for Plan View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify string vertices drawing parameters for.</i>	input/output	current view	available views
Model <i>if blank, then all models not mentioned in the Table option use these parameters for drawing crosses on a view. If non blank, then this model only will be set to draw crosses with the parameters on this panel.</i>	input		
Draw crosses <i>If tick, vertex crosses for the model will be checked against the Size max (w) before being drawn. If not tick, then no vertex crosses for strings in the given model are drawn on the plan view.</i>	tick-cross		
Colour <i>colour of the crosses</i>	input	default pt colour	available colours
Size (p) <i>size in pixels that the crosses are drawn on a plan view</i>	input	default text height	
Size max (w) <i>if non-zero: when the cross is displayed on a plan view then there is an equivalent size of the cross in world units that matches the display size. If Size max (w) has a non-zero value, then if the equivalent world size of the cross on the plan view is greater than Size max (w), then the cross is not drawn. Hence zooming out will eventually stop the crosses from drawing.</i>	input	0	
Size (w) <i>size in world units of the cross when plotted or output.</i>	input	0	
Angle <i>angle in degrees that the cross is rotated about the (x,y) position of the string vertices.</i>	input	0	
Set <i>set the values in the panel and then redraw the plan view.</i>	button		
Size max (w) <i>sets Size max (w) to be the world size of crosses as they are currently displayed on the given plan view. Hence if any further zoom out is done, the crosses will stop drawing. The set button must then be clicked to set the values for the view.</i>	button		

Reset button
reset all the parameters so no models are individually set for the view.

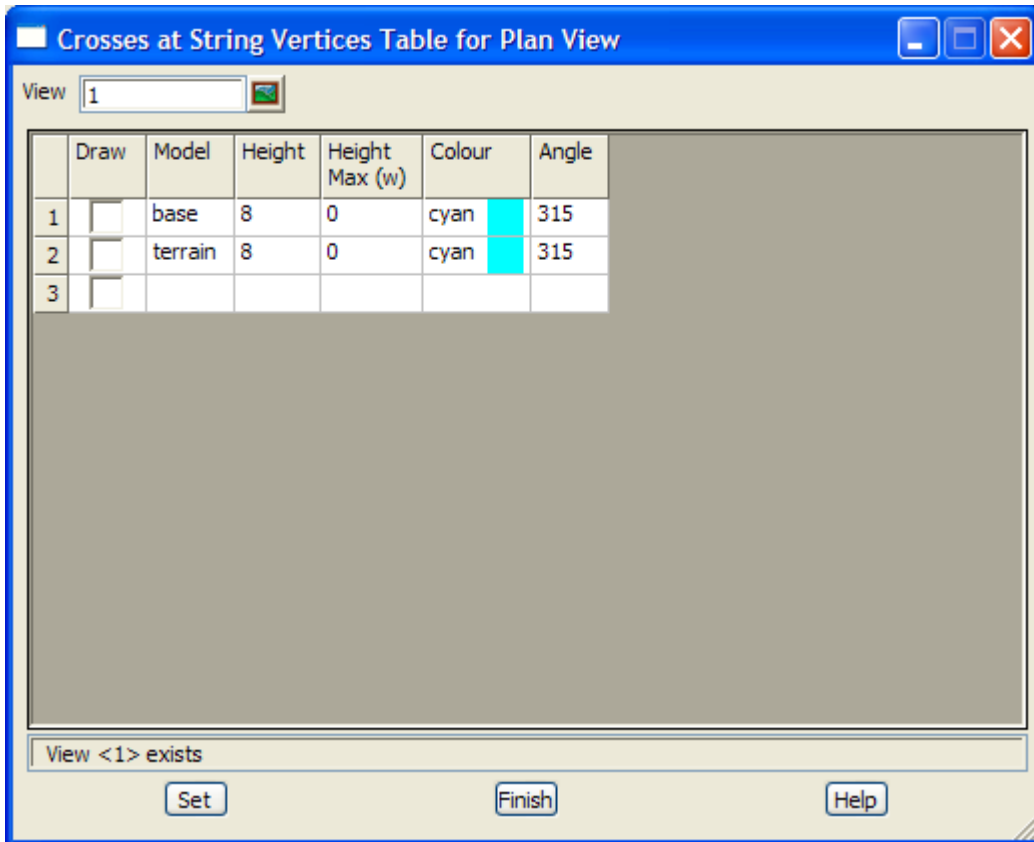

Table

crosses_at_string_vertices_table_for_plan_view

Position of option on menu: Plan View Menu View => Settings => Vertices => Table

The Table option displays a list of models on the view with their vertex drawing parameters which can then be modified from the table.

Selecting Table fires up the **Crosses at String Vertices Table for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify string vertices drawing parameters for.

Draw	tick-cross	
-------------	------------	--

*If not tick, then **no** vertex crosses from strings in the given model are drawn on the plan view.
 if tick, any cross for vertices in the model will be checked against the Sz max (w) to see if it is drawn.*

Model	input
--------------	-------

the model to set the parameters for.

Colour	input	default pt colour	available colours
---------------	-------	-------------------	-------------------

colour of the crosses at the vertices

Size	input	default text height
-------------	-------	---------------------

size in pixels that the crosses are drawn on a plan view.

Sz max (w) input 0

if non-zero:

the size of the crosses in world units is greater than Sz max (w), then the crosses are not drawn. Hence zooming out will eventually stop the crosses from drawing.

Angle input 0

angle in degrees that the cross is rotated about the (x,y) position of the string vertices.

Set button

set the vertex cross drawing parameters for the models in the table.

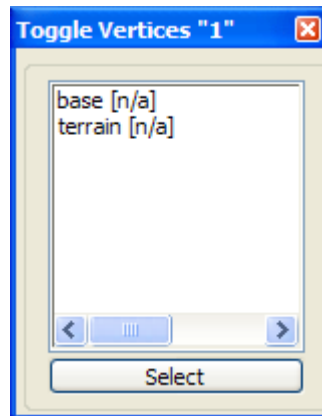

Toggle

plan_view_toggle_vertices

Position of option on menu: Plan View Menu View => Settings => Vertices => Toggle

Walking-right on the Toggle option displays a list of models on the view with their vertex cross draw flag. The vertex cross draw flag can be toggled on/off for the model by selecting the model on the list.

Note that [n/a] means that the model has *not* been individually set on or off and the general Vertex toggle is used for the model.

Point/Vertex Id's

plan_view_vertex_ids_settings_menu

Position of menu: Plan View Menu View => Settings => Point/Vertex id's

The Point/Vertex Id's option allows the user to specify whether the point/vertex id (a point number recorded for a vertex) for any super string vertex are

(a) not drawn at all

or

(b) if set to draw, then only drawn if the equivalent world size is not too large. This stops the drawing of *point/vertex id's* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the Point/Vertex id's option tries to control the drawing of point numbers on the view so that the numbers stop displaying as the user *zooms out*

Note - Point/Vertex id's (numbers) are not to be confused with *vertex indices* which are simply the position of the vertex in the string.

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the Point/Vertex Id's option draws point/vertex numbers for string vertices for *any* model on the view, or the drawing of vertex id's can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:

the Point/Vertex id's option is used to display/not display vertex numbers at the vertices of strings in **all** models on the plan view.

Selecting Point/Vertex id's brings up the **Vertex ID's for Plan View** panel, without the Model field.

If *plan_table_settings_4d* is non-zero:

the Point/Vertex id's option then has a walk-right menu with options to specify for *each* model on the plan view whether point numbers for strings in the model are

(a) not drawn at all

or

(b) if set to draw, then the point numbers are only drawn if the equivalent world size is not too large. This stops the drawing of *numbers* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

If Point/Vertex id's is selected without walking right, the **Vertex ID's for Plan View** panel is brought up (documented in the next section).

The Point/Vertex id's walk-right menu is

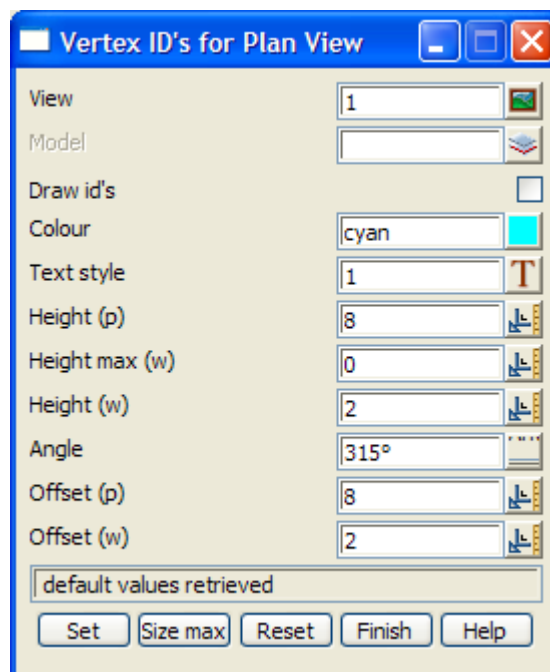

Single

[vertex_id_s_for_plan_view](#)

Position of option on menu: Plan View Menu View => Settings => Point/Vertex id s => Single

The Single option is used to set parameters for drawing point/vertex id's (numbers) of strings for all models not mentioned in the *Table* or set the parameters for an individual model on the plan view.

After selecting the Single option, the **Vertex ID's for Plan View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify point/vertex id's (number) drawing parameters for.</i>	input/output	current view	available views
Model <i>if blank, then all models not mentioned in the Table option use these parameters for drawing point numbers on a view. If non blank, then this model only will be set to draw point/vertex id's with the parameters on this panel.</i>	input		
Draw numbers <i>If tick, point/vertex id's (numbers) will be checked against the Height max (w) before being drawn. If not tick, then no point/vertex id's for strings are drawn on the plan view.</i>	tick-cross		
Colour <i>colour of the point/vertex id's (numbers)</i>	input	default pt colour	available colours
Text style <i>textstyle of the point/vertex id's (numbers)</i>	input	1	available text styles
Height (p) <i>height in pixels that the point/vertex id's (numbers) are drawn on a plan view.</i>	input	8	
Height max (w) <i>if non-zero: when the point/vertex id's (numbers) is displayed on a plan view then there is an equivalent height of the id's (numbers) in world units that matches the display size. If Size max (w) has a non-zero value, then if the equivalent world size of the id's (numbers) on the plan view is greater than Size max (w), then the id's (numbers) is not drawn. Hence zooming out will eventually stop the point/vertex id's (numbers) from drawing.</i>	input	0	
Height (w) <i>height in world units of the point/vertex id's (numbers) when plotted or output.</i>	input	2	
Angle <i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>	input	-45	
Offset (p) <i>distance in pixels that the text is drawn from the (x,y) position of the string vertices.</i>	input	default text height	
Offset (w) <i>distance in world units that the text is drawn from the (x,y) position of the string points when plotted</i>	input	default text height	
Set <i>set the values in the panel and then redraw the plan view.</i>	button		
Size max (w) <i>when clicked, size max (w) is set to be the world size of point id's (numbers) displayed on the given plan view. Hence if any further zoom out is done, the point id's (numbers) will stop drawing. The set button must then be clicked to set the values for the view.</i>	button		
Reset <i>reset all the parameters so no models are individually set for the view.</i>	button		

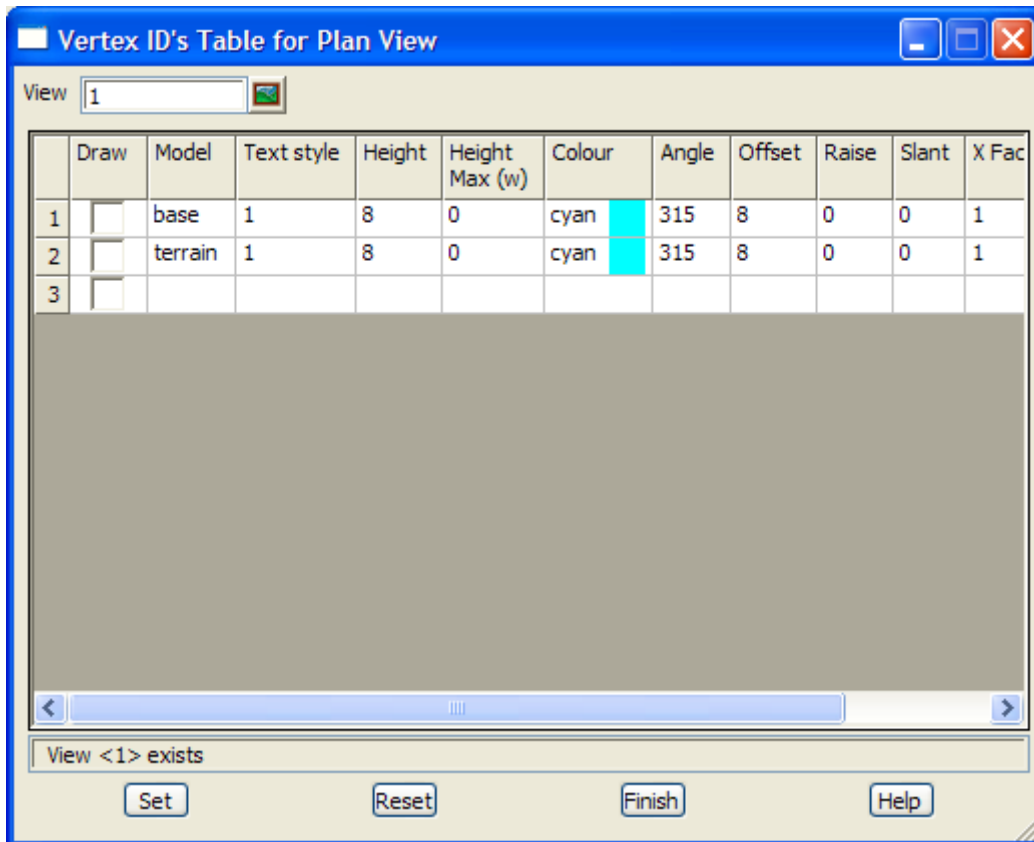

Table

[vertex_id_s_table_for_plan_view](#)

Position of option on menu: Plan View Menu View => Settings => Point/Vertex id's => Table

The Table option displays a list of models on the view with their point id's (numbers) drawing parameters which can then be modified from the table.

Selecting Table fires up the **Vertex ID's Table for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify point id's (numbers) drawing parameters for.</i>	input/output	current view	available views
Draw <i>If not tick, then no point numbers for strings in the given model are drawn on the plan view. if tick, point id's (numbers) for strings in the model will be checked against the Ht max (w) to see if they are drawn.</i>	tick-cross		
Model <i>the model to set the parameters for.</i>	input		
Colour <i>colour of the point id's (numbers)</i>	input	default pt colour	available colours
Text style <i>textstyle of the point id's (numbers)</i>	input	1	available text styles
Height <i>height in pixels of the point id's (numbers).</i>	input	8	
Ht max (w) <i>if non-zero: when the plan view is such that the height of the point id's (numbers) in world units is greater than Height max (w), then the point id's (numbers) are not drawn. Hence as one zooms out, the point id's (numbers) will eventually stop drawing.</i>	input	0	
Angle <i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>	input	-45	

Offset input default text height
distance in pixels that the text is drawn from the (x,y) position of the string vertices.

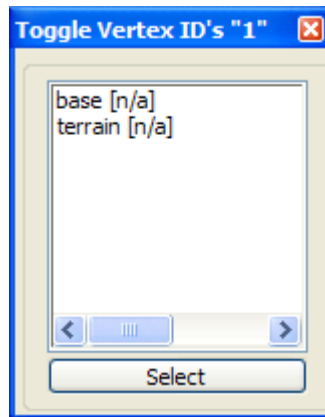

Set button
set the values in the panel and then redraw the plan view.

Toggle

[plan_view_toggle_vertex_id_s](#)

Position of menu: Plan View Menu View => Settings => Point/Vertex id's => Toggle

Walking-right on the Toggle option displays a list of models on the view with their point/vertex id's (numbers) draw flag. The point/vertex id's (numbers) draw flag can be toggled on/off for the model by selecting the model on the list. Note that [n/a] means that the model has *not* been individually set on or off and the general Point/vertex id's toggle is used for the model.

Vertex Indices

[plan_view_vertex_indices_settings_menu](#)

Position of menu: Plan View Menu View => Settings => **Vertex Indices**

The **Vertex Indices** option allows the user to specify whether the vertex indices (position of the vertex in the string) for all vertices of strings are

- (a) not drawn at all
- or
- (b) if set to draw, then only drawn if the equivalent world size is not too large. This stops the drawing of *vertex indices* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the **Vertex Indices** option tries to control the drawing of vertex indices on the view so that the indices stop displaying as the user *zooms out*

Note - vertex indices are not to be confused with *point/vertex numbers* which may not be defined for a vertex in the string.

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the Vertex indices option draws vertex indices for string vertices for *any* model on the view, or the drawing of vertex indices can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:

the **Vertex Indices** option is used to display/not display vertex indices at the vertices of strings in **all** models on the plan view.

Selecting Vertex Indices brings up the **Vertex Indices for Plan View** panel, without the Model field.

If *plan_table_settings_4d* is non-zero:

the Vertex Indices option then has a walk-right menu with options to specify for *each* model on the plan view whether vertex indices for strings in the model are

(a) not drawn at all

or

(b) if set to draw, then the vertex indices are only drawn if the equivalent world size is not too large. This stops the drawing of *indices* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

If Vertex Indices is selected without walking right, the **Vertex Indices for Plan View** panel is brought up (documented in the next section).

The **Vertex Indices** walk-right menu is

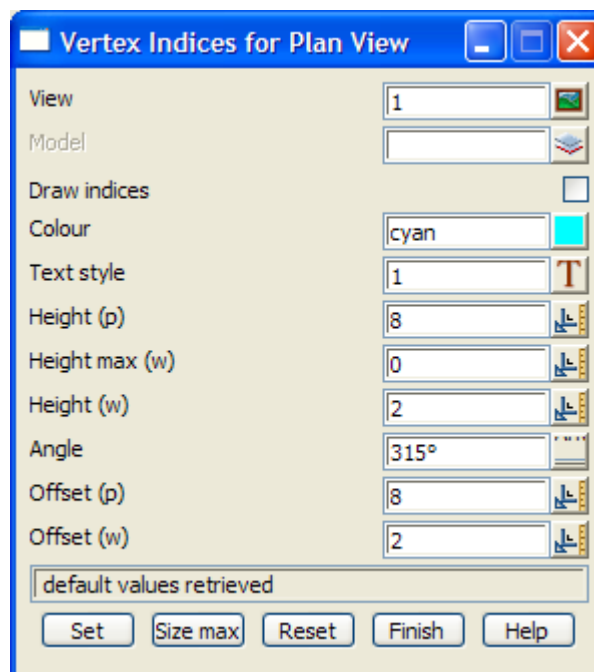

Single

[vertex_indices_for_plan_view](#)

Position of option on menu: Plan View Menu View => Settings => Vertex indices => Single

The Single option is used to set parameters for drawing vertex indices of strings for all models not mentioned in the *Table* or set the parameters for an individual model on the plan view.

After selecting the Single option, the **Vertex Indices for Plan View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify vertex indices drawing parameters for.</i>	input/output	current view	available views
Model <i>if blank, then all models not mentioned in the Table option use these parameters for drawing vertex indices on a view. If non blank, then this model only will be set to draw vertex indices with the parameters on this panel.</i>	input		
Draw numbers <i>If tick, vertex indices will be checked against the Height max (w) before being drawn. If not tick, then no vertex indices for strings are drawn on the plan view.</i>	tick-cross		
Colour <i>colour of the vertex indices</i>	input	default pt colour	available colours
Text style <i>textstyle of the vertex indices</i>	input	1	available text styles
Height (p) <i>height in pixels that the vertex indices are drawn on a plan view.</i>	input	8	
Height max (w) <i>if non-zero: when the plan view is such that the height of the vertex indices in world units is greater than Height max (w), then the vertex indices are not drawn. Hence as one zooms out, the vertex indices will eventually stop drawing. if non-zero: when the vertex indices are displayed on a plan view then there is an equivalent height of the number in world units that matches the display size. If Size max (w) has a non-zero value, then if the equivalent world size of the number on the plan view is greater than Size max (w), then the number is not drawn. Hence zooming out will eventually stop the vertex indices from drawing.</i>	input	0	
Height (w) <i>height in world units of the vertex indices when plotted or output.</i>	input	2	
Angle <i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>	input	-45	
Offset (p) <i>distance in pixels that the text is drawn from the (x,y) position of the string vertices.</i>	input	default text height	
Offset (w) <i>distance in world units that the text is drawn from the (x,y) position of the string points when plotted</i>	input	default text height	
Set <i>set the values in the panel and then redraw the plan view.</i>	button		
Size max (w) <i>when clicked, size max (w) is set to be the world size of vertex indices displayed on the given plan view. Hence if any further zoom out is done, the vertex indices will stop drawing. The set button must then be clicked to set the values for the view.</i>	button		
Reset <i>reset all the parameters so no models are individually set for the view.</i>	button		

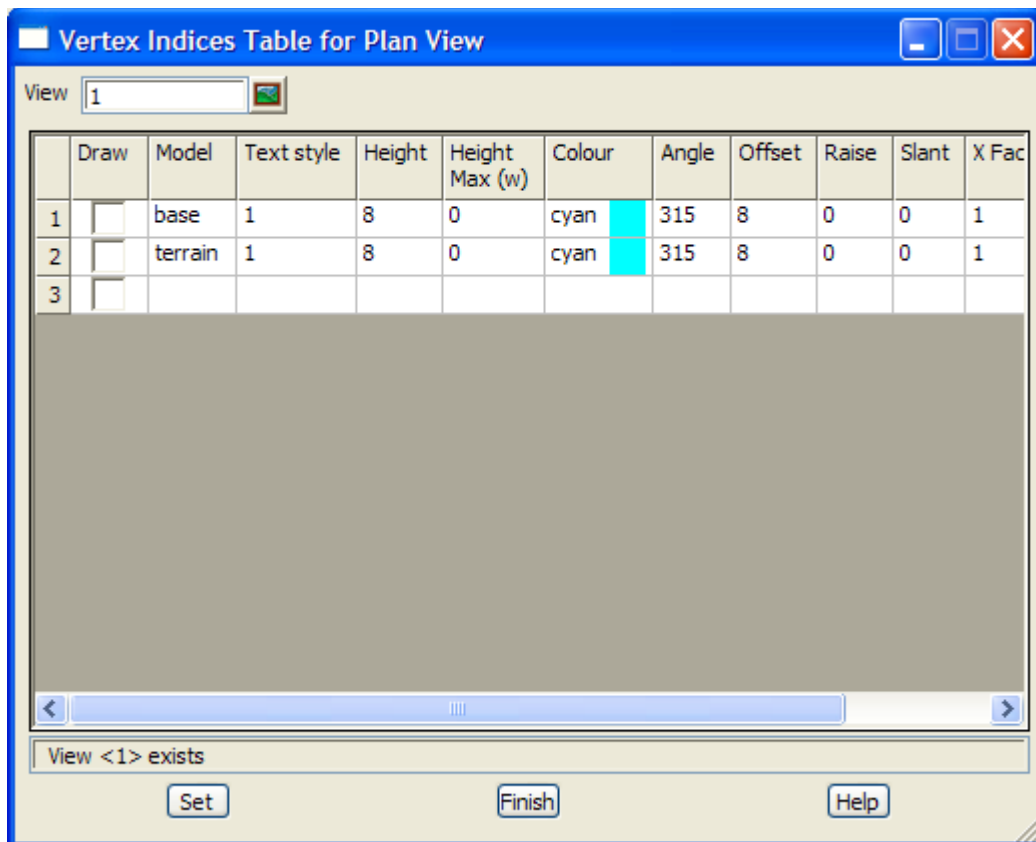

Table

[vertex_indices_table_for_plan_view](#)

Position of option on menu: Plan View Menu View => Settings => Vertex indices => Table

The Table option displays a list of models on the view with their vertex indices drawing parameters which can then be modified from the table.

Selecting Table fires up the **Vertex Indices Table for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify vertex indices drawing parameters for.</i>	input/output	current view	available views
Draw	tick-cross		
<i>If not tick, then no vertex indices for strings in the given model are drawn on the plan view. if tick, vertex indices for strings in the model will be checked against the Ht max (w) to see if it is drawn.</i>			
Model <i>the model to set the parameters for.</i>	input		
Colour <i>colour of the vertex indices</i>	input	default pt colour	available colours
Text style <i>textstyle of the vertex indices</i>	input	1	available text styles
Height <i>height in pixels of the vertex indices.</i>	input	8	
Ht max (w) <i>if non-zero: when the plan view is such that the height of the vertex indices in world units is greater than Height max (w), then the vertex indices are not drawn. Hence as one zooms out, the vertex indices will eventually stop drawing.</i>	input	0	
Angle <i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>	input	-45	

Offset input default text height
distance in pixels that the text is drawn from the (x,y) position of the string vertices.

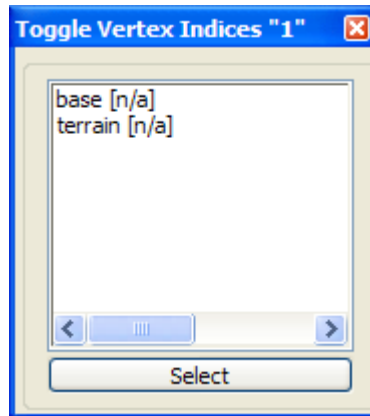

Set button
set the values in the panel and then redraw the plan view.

Toggle

plan_view_toggle_vertex_indices

Position of menu: Plan View Menu View => Settings => Vertex Indices => Toggle

Walking-right on the Toggle option displays a list of models on the view with their vertex indices draw flag. The vertex indices draw flag can be toggled on/off for the model by selecting the model on the list. Note that [n/a] means that the model has *not* been individually set on or off and the general Vertex Indices toggle is used for the model.

Z Values

plan_view_z_values_settings_menu

Position of menu: Plan View Menu View => Settings => Z values

The Z values option allows the user to specify whether the z co-ordinate for all vertices of strings are

(a) not drawn at all

or

(b) if set to draw, then only drawn if the equivalent world size is not too large. This stops the drawing of *z values* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the Z values option tries to control the drawing of vertex z values on the view so that the numbers stop displaying as the user *zooms out*

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the Z values option draws z values for string vertices for *any* model on the view, or the drawing of vertex z values can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:

the Z values option is used to display/not display vertex z values at the vertices of strings in **all** models on the plan view.

Selecting Z values brings up the **Z Values for Plan View** panel, without the Model field.

If *plan_table_settings_4d* is non-zero:

the Z values option then has a walk-right menu with options to specify for *each* model on the plan view whether vertex z values for strings in the model are

(a) not drawn at all

or

(b) if set to draw, then the z values are only drawn if the equivalent world size is not too large. This stops the drawing of *numbers* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

If Z values is selected without walking right, the **Z Values for Plan View** panel is brought up (documented in the next section).

The Z values walk-right menu is

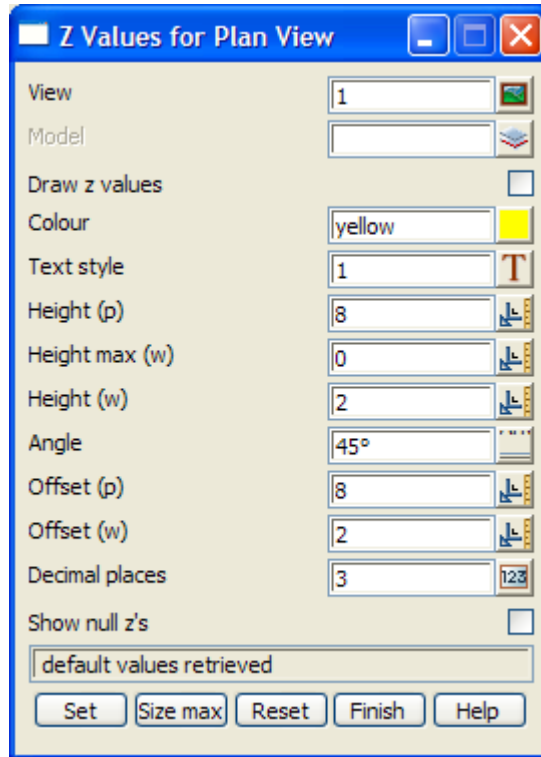

Single

z_values_for_plan_view

Position of option on menu: Plan View Menu View => Settings => Z values => Single

The Single option is used to set parameters for drawing vertex z values of strings for all models not mentioned in the *Table* or for an individual model on the plan view.

After selecting the Single option, the **Z Values for Plan View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify vertices z values drawing parameters for.</i>	input/output	current view	available views
Model <i>if blank, then all models not mentioned in the Table option use these parameters for drawing vertex z-values on a view. If non blank, then this model only will be set to draw vertex z-values with the parameters on this panel.</i>	input		
Draw z values <i>If tick, vertex z values will be checked against the Height max (w) before being drawn. If not tick, then no vertex z values for strings are drawn on the plan view.</i>	tick-cross		
Colour <i>colour of the z values</i>	input	default pt colour	available colours
Text style <i>textstyle of the z values</i>	input	1	available text styles
Height (p) <i>height in pixels of the z values.</i>	input	8	
Height max (w) <i>if non-zero: when the plan view is such that the height of the z values in world units is greater than Height max (w), then the z values are not drawn. Hence as one zooms out, the z values will eventually stop drawing.</i>	input	0	
Height (w) <i>height in world units of the z values when plotted or output.</i>	input	2	

Angle	input	-45	
			<i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>
Offset (p)	input	default text height	
			<i>distance in pixels that the text is drawn from the (x,y) position of the string vertices.</i>
Offset (w)	input	default text height	
			<i>distance in world units that the text is drawn from the (x,y) position of the string points when plotted or output.</i>
Decimal places	input	3	
			<i>number of decimal places when displaying the z value</i>
Show null z's	tick box		
			<i>if tick, null z values are displayed as null. If not tick, no z value is displayed at null z-values.</i>
Set	button		
			<i>set the values in the panel and then redraw the plan view.</i>
Size max (w)	button		
			<i>when clicked, size max (w) is set to be the world size of vertex z-values displayed on the given plan view. Hence if any further zoom out is done, the vertex z-values will stop drawing. The set button must then be clicked to set the values for the view.</i>
Reset	button		
			<i>reset all the parameters so no models are individually set for the view.</i>

Table

[z_values_table_for_plan_view](#)

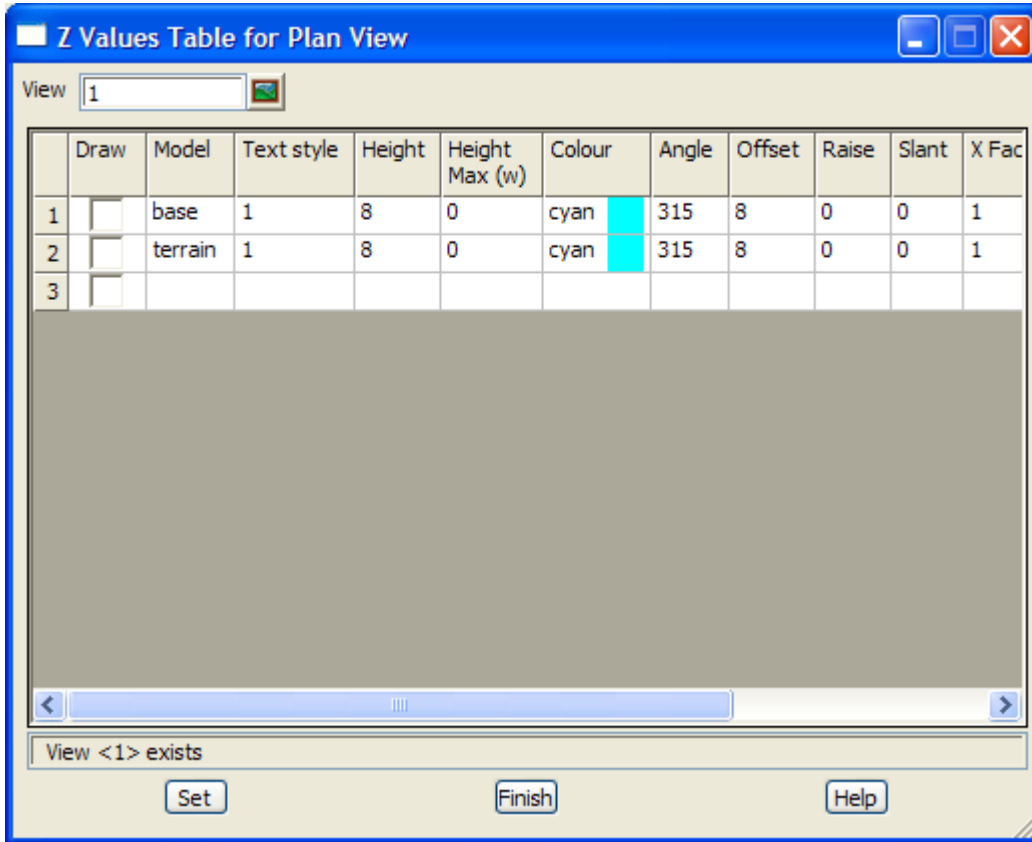

Position of option on menu: Plan View Menu View => Settings => Z values => Table

The Table option displays a list of models on the view with their vertex z value drawing parameters which can then be modified from the table.

Selecting Table fires up the **Z Values Table for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views
			<i>name of the view to modify vertices z values drawing parameters for.</i>
Draw	tick-cross		
			<i>If not tick, then no vertex z values for strings in the given model are drawn on the plan view. if tick, z values for strings in the model will be checked against the Ht max (w) to see if it is drawn.</i>
Model	input		
			<i>the model to set the parameters for.</i>
Colour	input	default pt colour	available colours
			<i>colour of the z values</i>
Text style	input	1	available text styles
			<i>textstyle of the z values</i>
Height	input	8	
			<i>height in pixels of the z values.</i>

Ht max (w) input 0
if non-zero: when the plan view is such that the height of the z values in world units is greater than Ht max (w), then the z values are not drawn. Hence as one zooms out, the z values will eventually stop drawing.

Angle input -45
angle in degrees that the text is rotated about the (x,y) position of the string points.

Offset input default text height
distance in pixels that the text is drawn from the (x,y) position of the string points

Decimal places input 3
number of decimal places when displaying the z value

Nulls yes-no no yes, no
if tick, null z values are displayed as null. If not tick, no z value is displayed at null z-values.

Set button
set the values in the panel and then redraw the plan view.

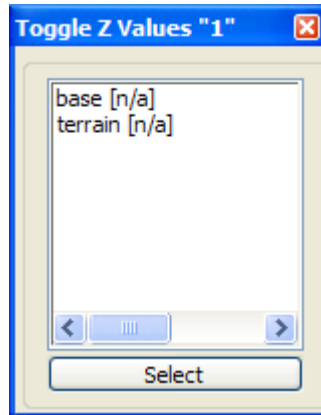

Toggle

[plan_view_toggle_z_values](#)

Position of menu: Plan View Menu View => Settings => Z values => Toggle

Walking-right on the Toggle option displays a list of models on the view with their vertex z values draw flag. The vertex z value draw flag can be toggled on/off for the model by selecting the model on the list.

Note that [n/a] means that the model has *not* been individually set on or off and the general Z values toggle is used for the model.

Names

`plan_view_string_names_settings_menu`

Position of menu: Plan View Menu View => Settings => Names

The names option allows the user to specify whether the string name is drawn at each string vertex. The string names can be

(a) not drawn at all

or

(b) if set to draw, then only drawn if the equivalent world size is not too large. This stops the drawing of *string names* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the Names option tries to control the drawing of string names on the view so that the numbers stop displaying as the user *zooms out*

Depending on whether the environment variable `plan_table_settings_4d` is zero or not, the names option draws string names for string vertices for *any* model on the view, or the drawing of string names at vertices can be set for individual models.

If the environment variable `plan_table_settings_4d` is set to 0:

the names option is used to display/not display the string name at the vertices of strings in **all** models on the plan view.

Selecting names brings up the **Plan String Names for Plan View** panel, without the Model field.

If `plan_table_settings_4d` is non-zero:

the names option then has a walk-right menu with options to specify for *each* model on the plan view whether string names are drawn at vertices for strings in the model are

(a) not drawn at all

or

(b) if set to draw, then the string names are only drawn if the equivalent world size is not too large. This stops the drawing of *names* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

If Names is selected without walking right, the **Plan String Names for Plan View** panel is brought up (documented in the next section).

The Names walk-right menu is

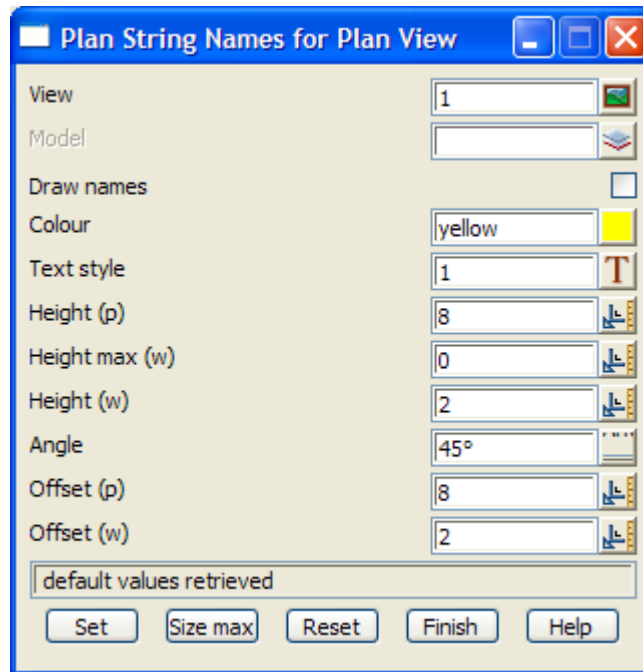

Single

`plan_string_names_for_plan_view`

Position of option on menu: Plan View Menu View => Settings => Names => Single

The Single option is used to set parameters for drawing the string name at each vertex of strings for any models not mentioned in the *Table*, or for an individual model on the plan view.

After selecting the Single option, the **Plan String Names for Plan View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify string name drawing parameters for.</i>	input/output	current view	available views
Model <i>if blank, then all models not mentioned in the Table option use these parameters for drawing the string name at each vertex on a view. If non blank, then this model only will be set to draw the string name at each vertex with the parameters on this panel.</i>	input		
Draw names <i>If tick, string names for the model will be checked against the Height max (w) before being drawn. If not tick, then no string names for strings in the given model are drawn on the plan view.</i>	tick box		
Colour <i>colour of the string names.</i>	input	default pt colour	available colours
Text style <i>textstyle of the string names.</i>	input	1	available text styles
Height (p) <i>height in pixels of the string names.</i>	input	8	
Height max (w) <i>if non-zero: when the plan view is such that the height of the string names in world units is greater than Height max (w), then the string names are not drawn. Hence as one zooms out, the string names will eventually stop drawing.</i>	input	0	
Height (w) <i>height in world units of the string names when plotted or output.</i>	input	2	
Angle <i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>	input	-45	

Offset (p) input default text height
distance in pixels that the text is drawn from the (x,y) position of the string vertices.

Offset (w) input default text height
distance in world units that the text is drawn from the (x,y) position of the string vertices when plotted or output.

Set button
set the values in the panel and then redraw the plan view.

Size max (w) button
when clicked, size max (w) is set to be the world size of string names as displayed on the given plan view. Hence if any further zoom out is done, the vertex string names will stop drawing. The set button must then be clicked to set the values for the view.

Reset button
reset all the parameters so no models are individually set for the view.

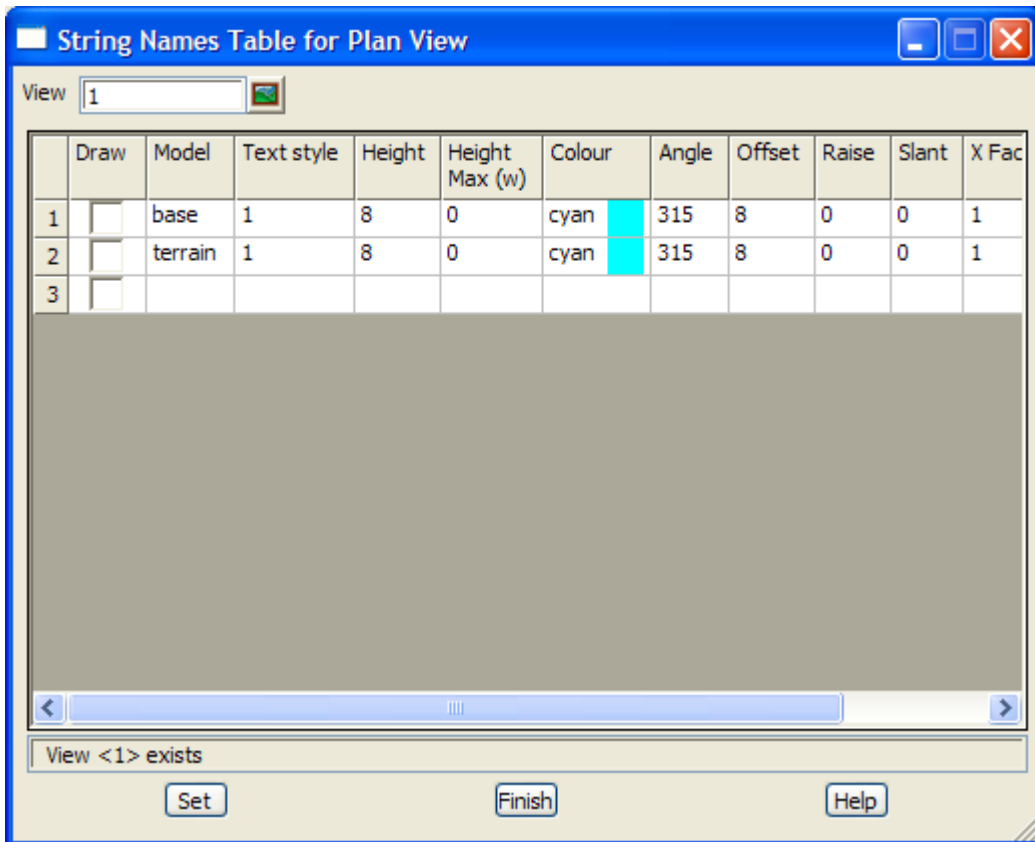

Table

string_names_table_for_plan_view

Position of option on menu: Plan View Menu View => Settings => Names => Table

The Table option displays a list of models on the view with their string names drawing parameters which can then be modified from the table.

Selecting Table fires up the **String Names Table for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify string names drawing parameters for.</i>	input/output	current view	available views
Draw <i>If not tick, then no string names for strings in the given model are drawn on the plan view. if tick, string names for strings in the model will be checked against the Ht max (w) to see if it is drawn.</i>	tick-cross		
Model <i>the model to set the parameters for.</i>	input		
Colour <i>colour of the string names</i>	input	default pt colour	available colours
Text style <i>textstyle of the string names</i>	input	1	available text styles
Height <i>height in pixels of the string names.</i>	input	8	
Ht max (w) <i>if non-zero: when the plan view is such that the height of the string names in world units is greater than Ht max (w), then the string names are not drawn. Hence as one zooms out, the string names will eventually stop drawing.</i>	input	0	
Angle <i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>	input	-45	
Offset <i>distance in pixels that the text is drawn from the (x,y) position of the string vertices</i>	input	default text height	
Set <i>set the values in the panel and then redraw the plan view.</i>	button		

Toggle

plan_view_toggle_string_names

Position of menu: Plan View Menu View => Settings => Names => Toggle

Walking-right on the Toggle option displays a list of models on the view with their string names draw flag. The string name draw flag can be toggled on/off for the model by selecting the model on the list.

Note that [n/a] means that the model has *not* been individually set on or off and the general names toggle is used for the model.

Vertex Attributes

`plan_view_attributes_settings_menu`

Position of menu: Plan View Menu View => Settings => Attributes

The **Attributes** option allows the user to specify whether the vertex attributes are drawn at each string vertex. The vertex attributes can be

(a) not drawn at all

or

(b) if set to draw, then only drawn if the equivalent world size is not too large. This stops the drawing of *attributes* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the **Attributes** option tries to control the drawing of attributes on the view so that the text stops displaying as the user *zooms out*

Depending on whether the environment variable `plan_table_settings_4d` is zero or not, the **attributes** option draws attributes string vertices for *any* model on the view, or the drawing of attributes at vertices can be set for individual models.

If the environment variable `plan_table_settings_4d` is set to 0:

the **Attributes** option is used to display/not display the attributes at the vertices of strings in **all** models on the plan view.

Selecting **Attributes** brings up the **Attributes for Plan View** panel, without the Model field.

If `plan_table_settings_4d` is non-zero:

the **Attributes** option then has a walk-right menu with options to specify for *each* model on the plan view whether attributes are drawn at vertices for strings in the model are

(a) not drawn at all

or

(b) if set to draw, then the attributes are only drawn if the equivalent world size is not too large. This stops the drawing of *attributes* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

If **Attributes** is selected without walking right, the **Attributes for Plan View** panel is brought up (documented in the next section).

The **Attributes** walk-right menu is

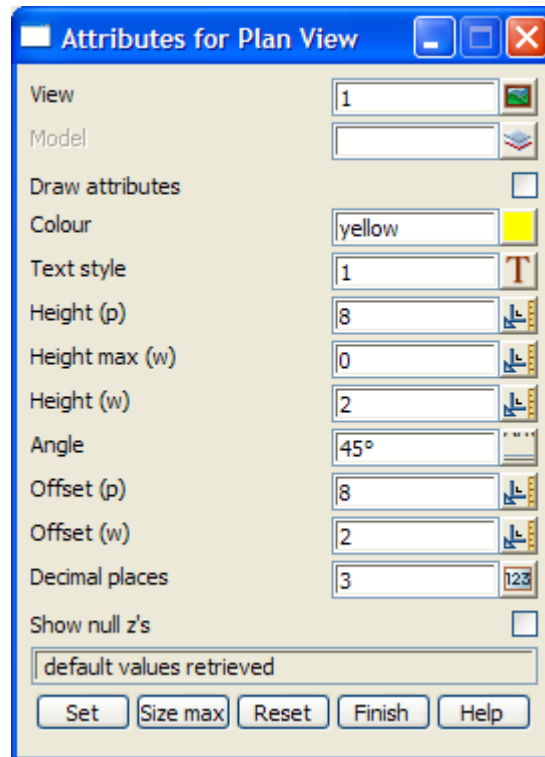

Single

Position of option on menu: Plan View Menu View => Settings => Attributes => Single

The **Single** option is used to set parameters for drawing the attributes at each vertex of strings for any models not mentioned in the *Table*, or for an individual model on the plan view.

After selecting the **Single** option, the **Attributes for Plan View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify attribute drawing parameters for.</i>	input/output	current view	available views
Model <i>if blank, then all models not mentioned in the Table option use these parameters for drawing the attributes at each vertex on a view. If non blank, then this model only will be set to draw the attributes at each vertex with the parameters on this panel.</i>	input		
Draw attributes <i>If tick, attributes for the model will be checked against the Height max (w) before being drawn. If not tick, then no attributes for strings in the given model are drawn on the plan view.</i>	tick box		
Colour <i>colour of the attributes.</i>	input	default pt colour	available colours
Text style <i>textstyle of the attributes.</i>	input	1	available text styles
Height (p) <i>height in pixels of the attributes</i>	input	8	
Height max (w) <i>if non-zero: when the plan view is such that the height of the attributes in world units is greater than Height max (w), then the attributes are not drawn. Hence as one zooms out, the attributes will eventually stop drawing.</i>	input	0	
Height (w) <i>height in world units of the attributes when plotted or output.</i>	input	2	

- Angle** input -45
angle in degrees that the text is rotated about the (x,y) position of the string vertices.
- Offset (p)** input default text height
distance in pixels that the text is drawn from the (x,y) position of the string vertices.
- Offset (w)** input default text height
distance in world units that the text is drawn from the (x,y) position of the string vertices when plotted or output.
- Decimal places** input 3
number of decimal places to use for real attributes.
- Show null z's** tick box
if tick, real attributes that are null z values are displayed as null. If not tick, no real attribute is displayed when it has a null z-value.
- Set** button
set the values in the panel and then redraw the plan view.
- Size max (w)** button
*when clicked, size max (w) is set to be the world size of attributes as displayed on the given plan view. Hence if any further zoom out is done, the vertex attributes will stop drawing. The **set** button must then be clicked to set the values for the view.*
- Reset** button
reset all the parameters so no models are individually set for the view.

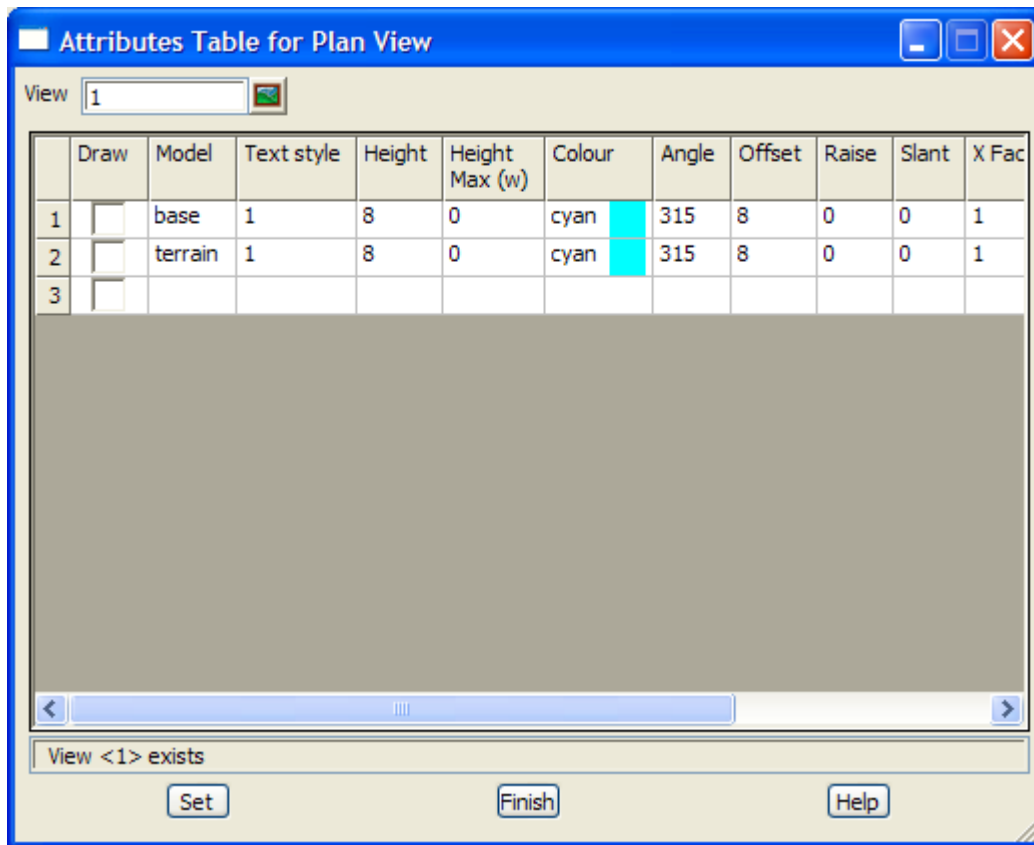

Table

[attributes_table_for_plan_view](#)

Position of option on menu: Plan View Menu View => Settings => Attributes => Table

The Table option displays a list of models on the view with their attributes drawing parameters which can then be modified from the table.

Selecting Table fires up the **Attributes Table for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify vertex attribute drawing parameters for.</i>	input/output	current view	available views
Draw <i>If not tick, then no attributes for strings in the given model are drawn on the plan view. if tick, vertex attributes for strings in the model will be checked against the Ht max (w) to see if it is drawn.</i>	tick-cross		
Model <i>the model to set the parameters for.</i>	input		
Colour <i>colour of the vertex attributes</i>	input	default pt colour	available colours
Text style <i>textstyle of the vertex attributes</i>	input	1	available text styles
Height <i>height in pixels of the vertex attributes</i>	input	8	
Ht max (w) <i>if non-zero: when the plan view is such that the height of the vertex attributes in world units is greater than Ht max (w), then the vertex attributes are not drawn. Hence as one zooms out, the vertex attributes will eventually stop drawing.</i>	input	0	
Angle <i>angle in degrees that the text is rotated about the (x,y) position of the vertex attributes.</i>	input	-45	

Offset	input	default text height
	<i>distance in pixels that the text is drawn from the (x,y) position of the string vertices</i>	
Precision	input	3
	<i>number of decimal places to use for any real attributes</i>	
Null	tick box	
	<i>if tick, real attributes that are null z values are displayed as "null". If not tick, no real attribute is displayed when it has a null z-value.</i>	
Set	button	
	<i>set the values in the panel and then redraw the plan view.</i>	

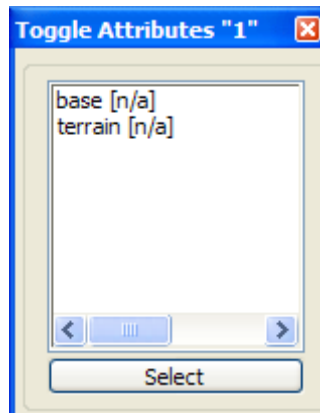

Toggle

plan_view_toggle_attributes

Position of menu: Plan View Menu View => Settings => Names => Toggle

Walking-right on the Toggle option displays a list of models on the view with their vertex attribute draw flag. The vertex attribute flag can be toggled on/off for the model by selecting the model on the list.

Note that [n/a] means that the model has *not* been individually set on or off and the general attributes toggle is used for the model.

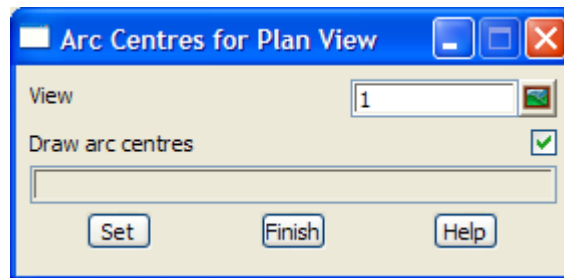

Arc Centres

arc_centres_for_plan_view

Position of option on menu: Plan View Menu View => Settings => Arc centres

The arc centres option allows the user to specify whether the centres of arcs and circles are displayed on the view.

Selecting Arc centres fires up the **Arc Centres for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify arc centres flag for.

Draw arc centres	tick-cross	tick
-------------------------	------------	------

if tick is selected, any arcs or circles on the view will also have their centres drawn. Otherwise the centres are not displayed.

Set	button
------------	--------

set the draw arc centres mode to the value in the draw arc centre tick-cross panel box. The plan view is then redrawn using the mode.

Work Plane

work_plane

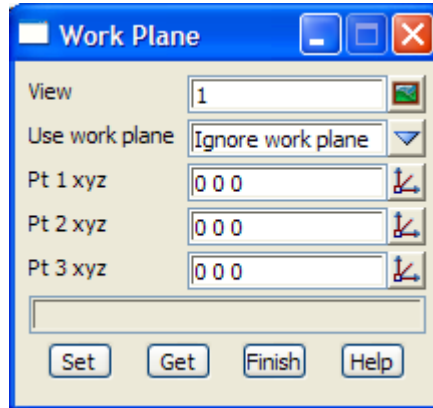

Position of option on menu: Plan View Menu View => Settings => Work plane

A plane not perpendicular to the (x,y) plane, can be used to define a unique z-value for any (x,y) co-ordinate pair. This fact is often invaluable when trying to defined three dimensional points using two-dimensional views.

In **12d Model**, a **work plane** can be defined by giving three non-colinear points. If the work-plane is used in a plan or perspective view, then the (x,y,z) values are restricted to lie in the defined work plane.

The work plane option is used to define and set work planes.

After selecting the work plane option, the **work plane** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to get or set the work plane in.</i>	input		available views
User work plane <i>the work plane is used or not depending on this field value.</i>	input	ignore work plane	ignore work plane use work plane
Pt 1/2/3 xyz <i>points in the work plane</i>	input/output	0 0 0	
Set <i>A plane is defined by the three points given in the Pt xyz fields. This plane is set as the work plane for the view given by the view field. Although the work plane is set, it is not active unless the use work plane field is set to use work plane.</i>	button		
Get <i>get the three points of the defined work plane for the view given in the view field. The points are displayed in the Pt xyz fields of the panel.</i>	button		

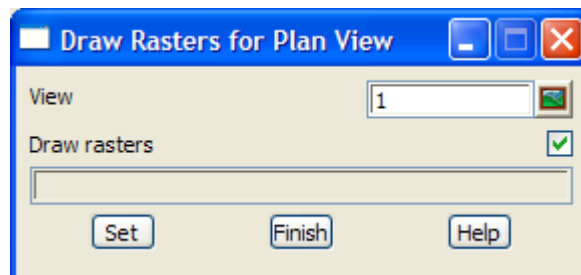

Rasters

draw_rasters_for_plan_view

Position of option on menu: Plan View Menu View => Settings => Rasters

The Rasters option is used to turn on or off the drawing of any rasters in models on the view.

After selecting the Rasters option, the Draw Rasters for Plan View panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to toggle the drawing of rasters on or off.</i>	input/output	current view	available views
Draw rasters <i>if tick, draw any rasters in any models on the view.</i>	tick box	tick	
Set <i>set the draw rasters mode.</i>	button		

Grid

grid_on_view

Position of option on menu:		
Plan View Menu		View => Settings => Grid
Section View Menu		View => Settings => Grid
Perspective View Menu		View => Settings => Grid

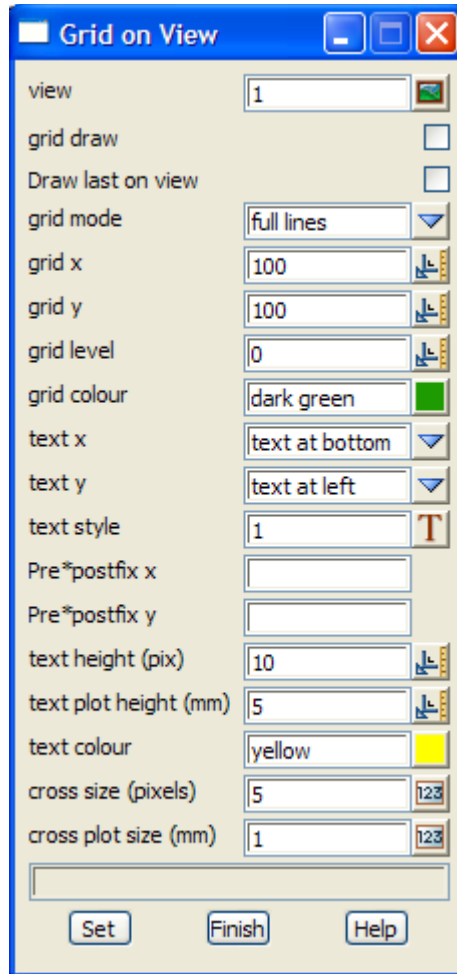

A regular grid of x (East) and/or y (North) lines can be displayed in a view. The grid is set in a plane of constant z (the level of the grid). The x and y spacing for the grid lines can be set and labelled independently.

For a plan or section view, the grid covers the entire view. However, for a perspective view, the grid only covers the maximum extents of the models in the view.

If the grid mode is set to

full lines	solid lines are drawn at the grid x (East) and y (North) spacing
crosses	crosses are drawn at the intersection of the grid x and y spacing
marks	lines are drawn at the beginning/end of the grid at x and y spacing

On selecting the option, the **Grid on View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>the name of the view to define a grid for.</i>	input/output	current view	available views
Grid draw <i>if tick, the grid is drawn according to parameters in the rest of the panel.</i>	tick-cross		
Grid mode <i>the style of the grid being drawn - full lines, crosses or marks. If full lines, then solid lines are drawn at the grid x and y spacing. If crosses, then crosses of size cross size are drawn at the intersection of the grid x and y spacing. If marks, then solid lines size cross size are drawn at the beginning/end of the grid at the x and y spacing.</i>	input	full lines	full lines, crosses, marks
Grid x <i>the distance between the x (East) grid lines. If this value is zero, the x grid lines will not be drawn.</i>	input	100	
Grid y <i>the distance between the y (North) grid lines. If this value is zero, the y grid lines will not be drawn.</i>	input	100	
Grid level <i>the (x,y) grid is set in a plane of constant z. The grid level is the value of the constant z. This will only be used for a perspective view.</i>	input	0	
Grid colour	input	dark green	available colours

colour that the grid is drawn in.

Text x	input	text at bottom	text off, text at top, text at bottom, text at top and bottom
---------------	-------	----------------	--

the x (East) grid lines can be labelled with their x value. If the grid lines are labelled, the labels can be drawn on the top, the bottom or both ends of the x-grid lines

Text y	input	text at left	text off, text at left, text at right, text at left and right
---------------	-------	--------------	--

the y (North) grid lines can be labelled with their y value. If the grid lines are labelled, the labels can be drawn on the left, the right or both ends of the y-grid lines

Text style	input	1	
-------------------	-------	---	--

the text style of any grid labels.

Pre*postfix x	input		
----------------------	-------	--	--

*prefix/postfix (pre*post) to be applied to the value of x (East). If pretext only, just give the text. If post text is required, precede it by a *. For example E*m will place E before the x value and m after the number.*

Pre*postfix y	input		
----------------------	-------	--	--

*prefix/postfix (pre*post) to be applied to the value of y (North). If pretext only, just give the text. If post text is required, precede it by a *. For example N*m will place N before the y value and m after the number.*

Text height (pix)	input	10.0	
--------------------------	-------	------	--

height in screen pixels of any grid labels.

Text plot height (mm)	input	10.0	
------------------------------	-------	------	--

height in millimetres of any grid labels in a plot.

Text colour	input	yellow	available colours
--------------------	-------	--------	-------------------

colour that any grid labels are drawn in.

Cross size (pixels)	input	5.0	
----------------------------	-------	-----	--

size in screen pixels of grid crosses.

Cross plot size (mm)	input	1.0	
-----------------------------	-------	-----	--

size in millimetres of grid crosses in a plot.

Set	button		
------------	--------	--	--

the grid parameters are set to the values given in the panel. The grid is then redrawn in the view.

Note - If the view name is selected from the pop-up, or a <enter> is done after the view name is entered into the view field, the data for the grid on the named view is placed in the panel fields.

Colour

view_background_colour

Position of option on menu: Plan View Menu View => Settings => Colour

The Colour option is used to set the background colour for the view.

WARNING - in 12d Model V5, the background colour is not saved for the view. It defaults to the default background colour (black or set by the environment variable BACKGROUND_COLOUR_4D) each time the project is opened.

After selecting the Colour option, the **View Background Colour** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set the background colour for.</i>	input/output	current view	available views
Colour <i>if tick, draw any rasters in any models on the view.</i>	colour box	black	available colours
Set <i>set the background colour.</i>	button		

Drawing Filter

view_drawing_filter

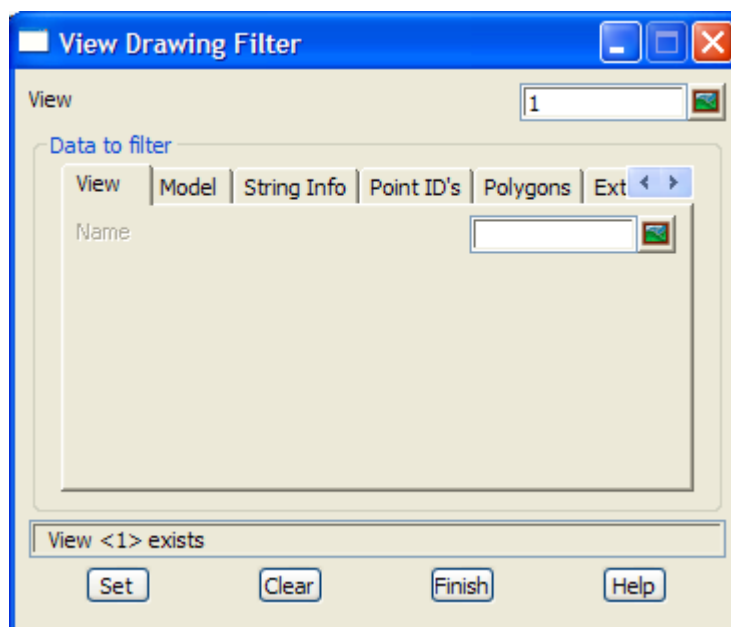

Position of option on menu: Plan View Menu View => Settings => Drawing filter

Position of option on menu: Perspective View Menu View => Settings => Drawing filter

The Drawing filter option is used to set a filter on the view so that only the data satisfying the filter is drawn.

NOTE: the filter is not saved with the project.

After selecting the Drawing filter option, the **View Drawing Filter** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to apply the drawing filter to.</i>	view box	current view	available views
Data filter <i>only the data satisfying the drawing filter is drawn on the view.</i>	view box	current view	available views
Set <i>apply the drawing filter to the view.</i>	button		
Clear <i>clear the drawing filter being applied to the view.</i>	button		

Zoom

Position of menu: Plan View Menu View => Settings => Zoom

The zoom option operators in the same way for Plan and Section views.

The zoom option can be selected in three ways. By clicking LB on zoom on a view button area, selecting the **zoom option** itself by clicking LB when the zoom option is highlighted on the zoom menu, or by activating the zoom option's walk-right menu, **zoom ops**.

The zoom uses either a *dynamics zoom* or a *zoom box*

Dynamic Zoom

After selecting the zoom option, *dynamic zoom* is selected by clicking MB or by typing 'd'.

Then press LB at the point that is to stay put during the dynamic zoom and then move the mouse up to zoom in or move the mouse down to zoom out. Another point can be selected to dynamically zoom in or out about.

The dynamic zoom continues until either RB is clicked, or MB is clicked (or 'd' typed) to place the zoom option into *zoom box* mode.

Zoom Box

Position of option on menu: Plan View Menu View => Settings => Zoom =>Zoom

After selecting the zoom option, the user can define the zoom box by

- (a) pressing down LB at one corner of the box and dragging the mouse and releasing LB when at the other corner of the zoom box

or

- (b) picking two points from any plan views (by clicking LB in a plan view for each point) to define the diagonally opposite points of the zoom box. Note that the two points **do not** have to be from the same plan view.

Next the user selects the view (by clicking LB in the view) which is to be redrawn using this rectangle as the new drawing limits.

Often the same view is chosen for both defining the rectangle and redrawing. However, the power of the option is that the area to be "zoomed in" or "blown up" can be selected from one view and the zoomed area displayed in another view. The other view may not only be different to the views used to defined the zoom box, but may also have different models attached to it.

It is a useful technique to have a master view displaying the entire area of interest in one view, and use it to define zoom-rectangles for use in viewing smaller regions of data in other plan views.

To cancel the zoom after the zoom operation has been selected, click RB.

Next step messages - sent to the screen message area

```
<View Zoom> [Select][[]] select 1st corner of box - RB to cancel
<View Zoom> [Select][[]] select 2nd corner of box - RB to cancel
<View Zoom> [Select][[]] select destination view - RB to cancel
```

WARNING - this option can not be applied to a perspective view.

Please continue to the next section "Zoom Ops menu" .

Zoom Ops menu

[Section_View_Zoom_Menu](#)
[plan_view_zoom_menu](#)

Position of menu: Plan View Menu View => Settings => Zoom

The zoom walk-right menu is

a string defines the extent of the view
 a model defines the extent of the view
 a view defines the extent of the view
 two point zoom - see previous section
 two point shrink
 zoom by a user supplied factor
 zoom into the view by factor of 2
 zoom into the view by factor of 3
 zoom into the view by factor of 4
 zoom into the view by factor of 8
 zoom out of the view by a factor of 8
 zoom out of the view by a factor of 4
 zoom out of the view by a factor of 3
 zoom out of the view by a factor of 2

The by String, by Model and by View options use the x and y extents of the String, Model or View to define the display area for the view. These options will be described in more detail.

The option zoom is the same operation as the option just discussed, factor - to enlarge or reduce the view by a given magnification/reduction factor, and a number of preset view magnification and reduction factors.

By String, by Model and by View

[plan_zoom_by_view](#)
[plan_zoom_by_string](#)
[plan_zoom_by_model](#)

Position of option on menu: Plan View Menu

View => Settings => Zoom =>by string

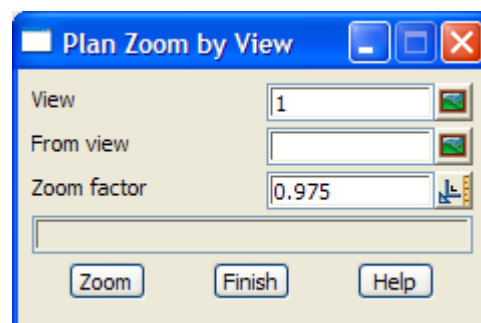

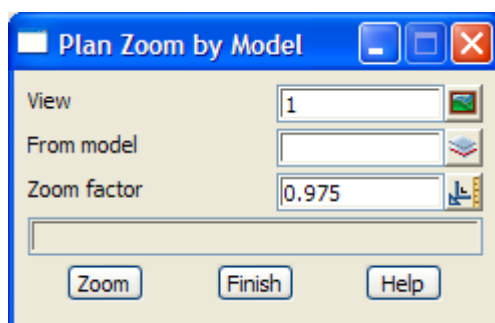

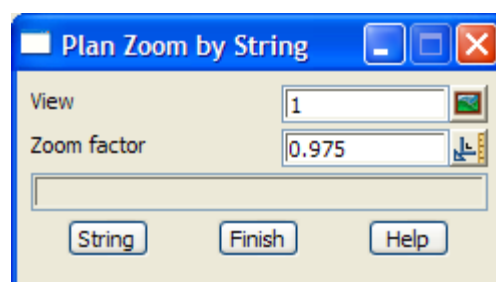

Position of option on menu: Plan View Menu

View => Settings => Zoom =>by model

Position of option on menu: Plan View Menu

View => Settings => Zoom =>by view

The three zoom options by String, by Model and by View work in a similar manner. After selecting the option, the **Plan Zoom by String/ Model/ View** panel is brought up.

For **by String**, the user selects a string using the **String** button and the data on the view is redrawn so the selected string is fitted to the view, adjusted by the Zoom factor given in the panel.

Note that the selected string can be from a different view.

For **by Model**, the user enters a model name into the Model field and then selects the **Zoom** button. The data on the view is redrawn so the specified model is fitted to the view, adjusted by the Zoom factor given in the panel.

Note that the specified model does not have to be on the view.

For **by View**, the user enters a view name into the View field and then selects the **Zoom** button. The data on the view is redrawn so the specified view is fitted to the current view, adjusted by the Zoom factor given in the panel.

Note that the specified view does not have to be on the current view.

Shrink

Position of option on menu: Plan View Menu View => Settings => Zoom => Shrink

Shrink is the opposite of zoom: instead of the information in the view box being expanded to fill the view, the information in the view is shrunk to fit into the zoom box.

After selecting the shrink option, the user picks two points from any plan views (by clicking LB in a plan view for each point) to define the diagonally opposite points of a rectangle. Note that the two points **do not** have to be from the same plan view.

Next the user selects the view (by clicking LB in the view) which is to be redrawn by shrinking the data on the view to fit into this rectangle.

To cancel the zoom after the zoom operation has been selected, click RB.

WARNING - this option can not be applied to a perspective view

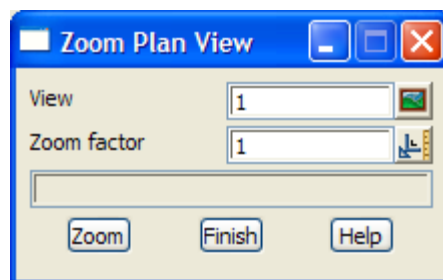

Factor

[zoom_plan_view](#)
[zoom_section_view](#)

Position of option on menu: Plan View Menu View => Settings => Zoom => Factor

Position of option on menu: Section View Menu View => Settings => Zoom => Factor

On selecting the factor option, the **zoom plan view** panel is displayed.

This option is used to magnify or reduce the information in the view by a user given amount.

The field and buttons in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set zoom factor for.</i>	input/output	current view	available views

Zoom factor input 1.0

factor to magnify/reduce the information inside the view by. The value can be greater than 1.0 (zoom in) or less than 1.0 (zoom out).

Zoom button

the information displayed in the view is magnified/reduced by the factor given in the zoom factor field.

WARNING - this option can not be applied to a perspective view.

Pre-set Zoom Factors

Upon selecting a particular zoom factor (e.g. 4 x in), the user is asked to indicate a point in a view which is to become the new view-centre. The user then indicates (by clicking LB in the view) which view is to be redrawn with this point as the new centre and with the selected zoom factor applied to that view.

To cancel the zoom after the zoom operation has been selected, click RB.

Next step messages - sent to the screen message area

<View Magnify> [Select][[]] select new centre of view - RB to cancel
<View Magnify> [Select][[]] select destination view - RB to cancel

Pan

[plan_view_pan_menu](#)
[section_view_pan_menu](#)

Position of menu: Plan View Menu View => Settings => Pan

Position of menu: Section View Menu View => Settings => Pan

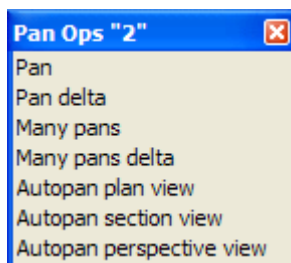

The Pan walk-right menu for Plan and Section views are

Plan View Pan Menu

make selected point the new view centre
pick a point and the place it is to be moved to on the screen
repeated pan
repeated pan delta
autopan for plan locked to plan view
autopan for plan locked to section view

Section View Pan Menu

make selected point the new view centre
pick a point and the place it is to be moved to on the screen
repeated pan
repeated pan delta
autopan for plan locked to section view
autopan for section locked to section view
autopan for perspective locked to section view

Pan operates the same way for *Plan* and *Section* views.

The pan option can be selected in four ways:

- (a) by clicking LB on Pan on a view button area
- (b) by clicking on <Control> LB whilst in the view

- (c) selecting the **Pan option** itself by clicking LB when the Pan option is highlighted on the Pan menu
- (d) by activating the Pan option's walk-right menu, Pan Ops.

The *pan* uses either a *dynamics pan* or two point mode.

Dynamic Pan

After selecting the pan option, *dynamic pan* is selected by clicking MB or by typing 'd'.

Then press LB at the point that is to be dragged across the view during the dynamic pan and then move the mouse to the new position for the point. Another point can then be selected to dynamically pan.

The *dynamic pan* continues until either RB is clicked, or MB is clicked (or 'd' typed) to place the pan option into *two point* mode.

After activating the pan walk-right menu, the user is presented with the option pan (which is the same operation as the option just discussed), pan delta, and many pans and many pans delta.

Pan

Position of option on menu: Plan View Menu View => Settings => Pan => Pan

Position of option on menu: Section View Menu View => Settings => Pan => Pan

After selecting the pan option, the user is asked to indicate a point in a view which is to become the new view-centre. The user then indicates (by clicking LB in the view) which view is to be redrawn with this point as the new centre.

To cancel the pan after the *pan* operation has been selected, click **RB**.

Next step messages - sent to the screen message area

<View Pan> [Select][][] select new centre of view - RB to cancel
<View Pan> [Select][][] select destination view - RB to cancel

Pan Delta

Position of option on menu: Plan View Menu View => Settings => Pan => Pan delta

Position of option on menu: Section View Menu View => Settings => Pan => Pan delta

After selecting the pan delta option, the user is asked to indicate a point in a view and the point on a view where the first point will be moved to. The user then indicates (by clicking LB in the view) which view is to be redrawn with the new position of the point on the view.

To cancel the pan delta after the *pan delta* operation has been selected, click RB.

Next step messages - sent to the screen message area

<View Pan> [Select][][] select 1st position of pan - RB to cancel
<View Pan> [Select][][] select 2nd position of pan - RB to cancel
<View Pan> [Select][][] select destination view - RB to cancel

Many Pans

Position of option on menu: Plan View Menu View => Settings => Pan => Many pans

Position of option on menu: Section View Menu View => Settings => Pan => Many pans

The many pans option is simply one *pan* operation followed by another.

After one *pan* operation has been performed, a new *pan* operation is begun.

The sequence is terminated by clicking RB.

Many Pans Delta

Position of option on menu: Plan View Menu View => Settings => Pan => Many pans delta

Position of option on menu: Section View Menu View => Settings => Pan => Many pans delta

The many pans delta option is simply one *pan delta* operation followed by another.

After one *pan delta* operation has been performed, a new *pan delta* operation is begun.

The sequence is terminated by clicking RB.

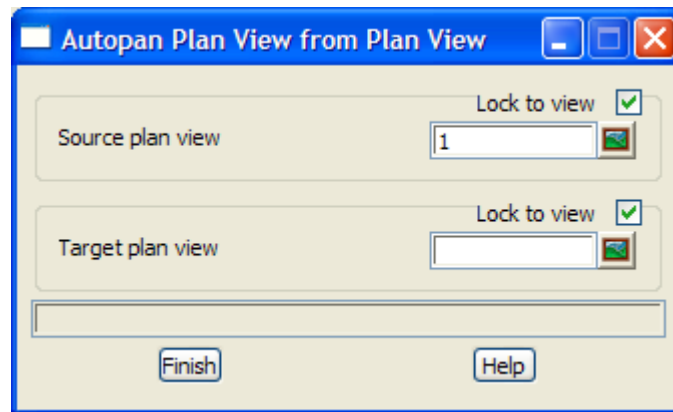

Autopan Plan View Locked to a Plan View

autopan_plan_view_from_plan_view

Position of option on menu: Plan View Menu View => Settings => Pan => Autopan plan view

The Autopan plan view option locks a target plan view to a source plan view. As the cursor is moved in the source plan view, the target plan view is automatically panned to keep the cursor in the middle of it. The target plan view keeps its scale.

Selecting Autopan plan view fires up the **Autopan Plan View from Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source plan view <i>plan view to lock the target plan view to.</i>	view box	current view	available plan views
Lock to view	tick box	tick	
Target plan view <i>plan view to lock the source plan view. As the cursor moves in the source plan view, the target view is automatically panned so that the cursor is in the centre of the target plan view.</i>	view box		available plan views

Autopan Section View Locked to a Plan View

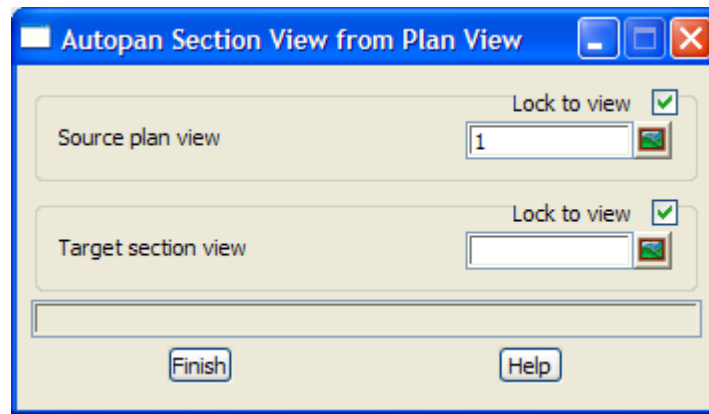

autopan_section_view_from_plan_view

Position of option on menu: Plan View Menu View =>Settings =>Pan =>Autopan section view

The Autopan section view option locks a target section view to a source plan view. As the cursor is moved in the source plan view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.

Selecting Autopan section view fires up the **Autopan Section View from Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source plan view <i>plan view to lock the section view to.</i>	view box	current view	available plan views
Lock to view	tick box	tick	
Target section view <i>section view to lock the source plan view. As the cursor is moved in the source plan view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.</i>	view box		available section views

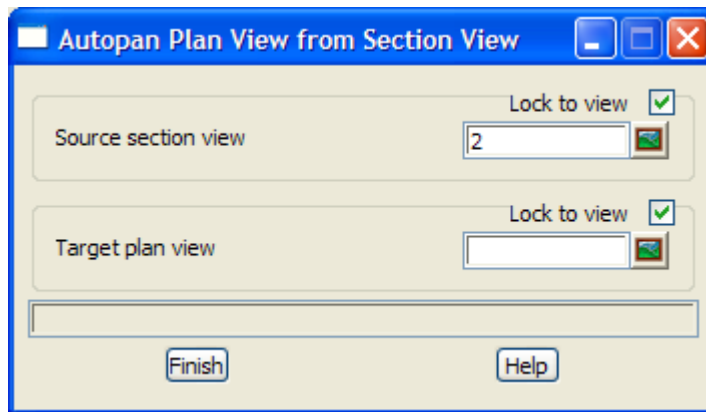

Autopan Plan View Locked to a Section View

[autopan_plan_view_from_section_view](#)

Position of option on menu: Section View Menu View => Settings => Pan => Autopan plan view

The Autopan plan view option locks a target plan view to a source section view. As the cursor is moved in the source section view, the target plan view is automatically panned to keep the cursor in the middle of it. The target plan view keeps its scale.

Selecting Autopan plan view fires up the **Autopan Plan View from Section View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source section view <i>section view to lock the target plan view to.</i>	view box	current view	available plan views
Lock to view	tick box	tick	
Target plan view <i>plan view to lock the source section view. As the cursor moves in the source section view, the target view is automatically panned so that the cursor is in the centre of the target plan view.</i>	view box		available plan views

Autopan Section View Locked to a Section View

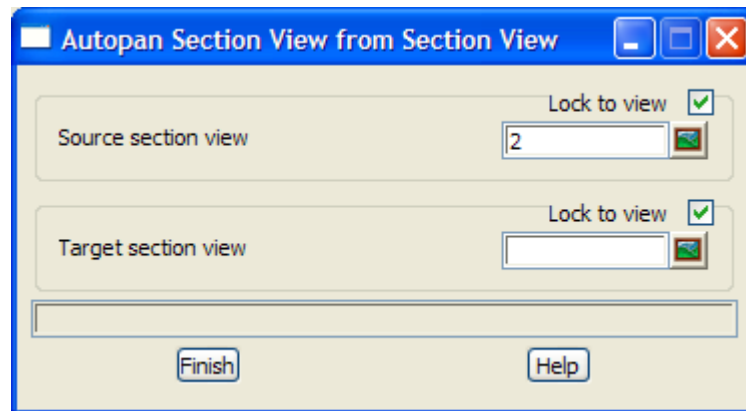

[autopan_section_view_from_section_view](#)

Position of option on menu: Section View Menu View =>Settings =>Pan =>Autopan section view

The Autopan section view option locks a target section view to a source plan view. As the cursor is moved in the source section view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.

Selecting Autopan section view fires up the **Autopan Section View from Section View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source section view	view box	current view	available section views
		<i>section view to lock the target section view to.</i>	
Lock to view	tick box	tick	
Target section view	view box		available section views
		<i>section view to lock the source section view. As the cursor is moved in the source section view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.</i>	

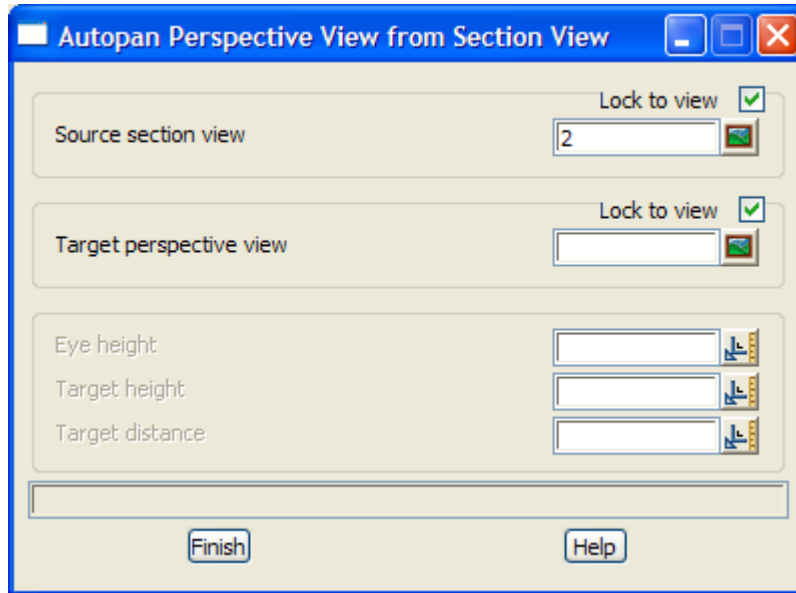

Autopan Perspective View Locked to a Section View

[autopan_perspective_view_from_section_view](#)

Position on menu: Section View Menu View => Settings => Pan => Autopan perspective view

The Autopan perspective view option locks a target perspective view to a source section view. As the cursor is moved in the source section view, the eye and target for the perspective view is automatically changed. Only the eye and target positions are modified for the target perspective view.

Selecting Autopan perspective view fires up the **Autopan Perspective View from Section View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source section view	view box	current view	available section views
<i>section view to lock the target perspective view to.</i>			
Lock to view	tick box	tick	
Target perspective view	view box		available perspective views
<i>perspective view to lock to the source section view. As the cursor moves in the source section view, the eye and target position for the target perspective view is calculated from the (x,y,z) of the profiled string in the section view, and the eye and target information in the panel.</i>			

Plan Utilities

plan_view_utilities_menu

Position of menu: Plan View Menu View => Settings => Utilities

The utilities menu contains miscellaneous options involving the plan view. The **utilities** walk-right menu is

For the option *New view*, go to the section “New View”

<i>Dump</i>	“Dump”
<i>Plot</i>	“Plan Plot”
<i>Plot frames</i>	“Plot Frames”
<i>View to raster</i>	“Create Raster from Plan View”
<i>Info</i>	“View Info”

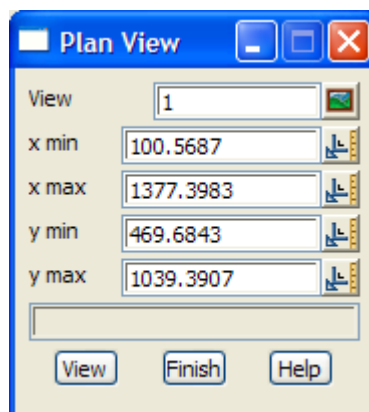

New View

plan_view

Position of option on menu: Plan View Menu View => Settings => Utilities => New view

The new view option displays the current view setting and permits the user to specify new x and y minimum and maximum values as the viewing parameters.

Selecting new view fires up the **plan view** panel.

Because the aspect ratio of the view may be different from the aspect ratio defined by the user supplied x and y minimums and maximums, slightly more data than the specified range may need to be drawn in the view. However, the view will always **include** the user given range.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set min and max for.</i>	input/output	current view	available views
x min/max <i>minimum/maximum x co-ordinate for the view</i>	input/output	current x min/max	
y min/max <i>minimum/maximum y co-ordinate for the view</i>	input/output	current y min/max	
View <i>define the view parameters according to the information in the panel. If the box given by the x and y values in the panel is not the same shape as the view itself (that is, has the same aspect ratio), the x and y values will be modified so that the x and y values match the view shape. The final x and y values are displayed in the panel.</i>	button		

Dump

view_dump

Position of option on menu: Plan View Menu View => Settings => Utilities => Dump

This option is used to write the image of the view out to disk in a user selected format.

After selecting the dump option, a **view dump** panel appears.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to dump out in the specified format.</i>	input	view option picked from	available views
Include title <i>if tick, the view title area is included in the dump.</i>	tick-cross		
Format <i>the format to dump the view out in.</i>	input	gif	gif, xwd, colour postscript
File <i>the file to dump the view images out to</i>	input	*.gif	
Dump <i>dump in the given format the image of the view given in the view field to the file given in the file field.</i>	button		

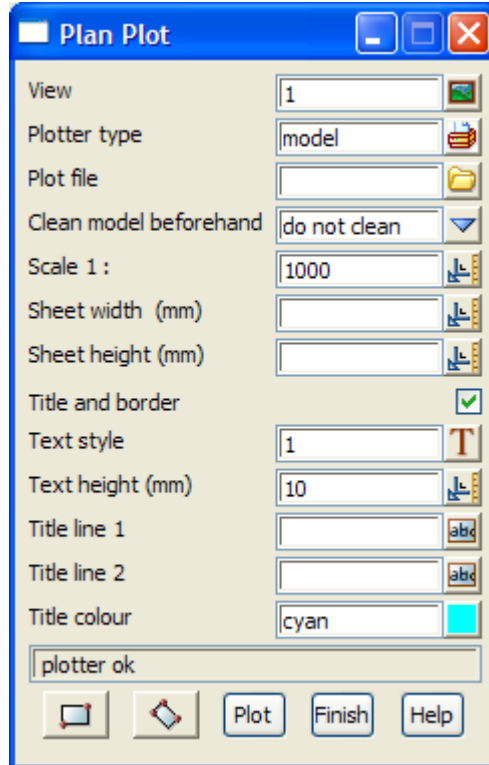

Plan Plot

plan_plot

Position of option on menu: Plan View Menu View => Settings => Utilities => Plot

The plot option writes out all the information displayed in the plan view to either a plot file (in a user selected format) or to a 12d Model model. The user selects a scale for the plot and the sheet width and height are calculated by 12d Model.

After selecting the plot option, the **plan plot** panel is displayed.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to plot.</i>	view box	current view	available views
Plotter type <i>format for the plot information.</i>	input	hp	hp, dxf, postscript etc.
Plot file <i>stem of the name of the file to write the plot of the view to. The name ending is added automatically and depends on the plotter type.</i>	input	depends on plotter type	
Clean model beforehand <i>only applicable if plotting to a model.</i> <i>if always clean, the model is cleaned before the plot is created.</i> <i>If prompt for clean, the user is prompted that the model will be cleaned before the plot is created.</i> <i>If do not clean, the model is not cleaned before the plot is created.</i>	choice box		do not clean prompt for clean always clean
Scale 1: <i>if a value is entered by the user and an <enter> given, the sheet width and height required by the plot are calculated and displayed in the sheet width and sheet height fields.</i>	input		

- Sheet width (mm)** output
*if a value is entered by the user and an <enter> given, the scale and height required by the plot are calculated and displayed in the scale and sheet height fields. The units for sheet width are **millimetres**.*
- Sheet height (mm)** output
*if a value is entered by the user and an <enter> given, the scale and width required by the plot are calculated and displayed in the scale and sheet width fields. The units for sheet height are **millimetres***
- Title and border** tick-cross
*if **tick**, a border and two lines of title are placed on the bottom of the plot.*
- Title line 1/2** input
first/second line of title information.
- Title height (mm)** input 10
*height (in **millimetres**) to draw the two lines of title information.*
- Title colour** input cyan available colours
colour used for the border and the title information.
- Rectangle** button
create a rectangle (parallel to the x,y axis) that the plot is restricted to.
- Rotated Rectangle** button
create a rotated rectangle that the plot is restricted to.
- Plot** button
write out the plot of the information displayed in the view to the file given in the plot file field. The format of the file is given by the plotter type.

Plot Frames

Position of option on menu: Plan View Menu View => Settings => Utilities => Plot frames

To create plan plots of an arbitrary size, rotation and scale, 12d Model uses **plot frames**.

Basically a plot frame consists of a sheet size (in mm), margins within the sheet and a scale for the plot. This will define a plotting area in world co-ordinates (the plot frame).

The plot frame can be arbitrarily positioned and rotated on a plan view.

This option is documented in the section “Plotting Old Plot Frames” of the chapter “Plots”

Create Raster from Plan View

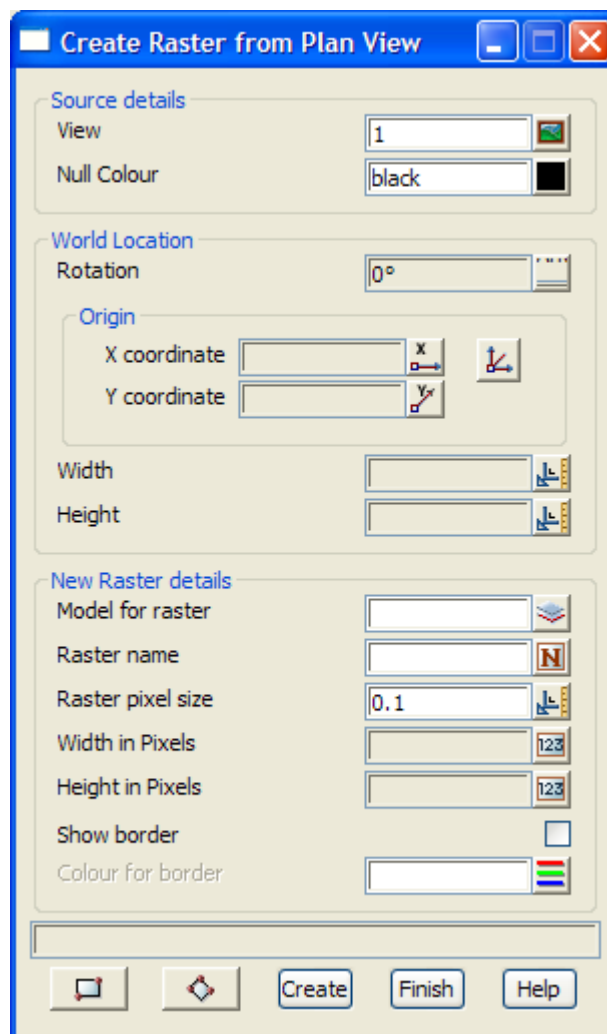

`create_raster_from_plan_view`

Position of option on menu: Plan View Menu View => Settings => Utilities => View to raster

Position of option on menu: Strings => Raster => Plan to raster

This option creates a 12d raster of a user specified pixel size, for the image on a plan view. This is useful for creating a 12d raster from an ECW file to use in draping on a tin in visualisations.

On selecting the View to Raster option, the **Create Raster from Plan View** panel is displayed.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Source Details			
View <i>view to create raster from.</i>	view box	current view	available views
Null colour <i>colour to set to no pixel in the raster</i>	colour box		available colours
World Location			
Anticlockwise rotation <i>the world rotation of the selected rectangle.</i>	angle box		

X/Y co-ordinate real box
the world x/y co-ordinate of the corner of the bottom left corner of the rectangle.

Width/height real box
the width/height in world units of the rectangle.

New Raster Details

Model for raster model box available models
name of the model for the raster element.

Raster name text box
the name for the raster.

Raster pixel size input
the size (in world units) for each pixel in the created raster.

Width/Height in pixels output only
the width/height in pixels of the created raster.

Show border tick-cross tick
if tick then the border of the created raster element is displayed.

Colour for border input default colour available colours
the colour of the border for the created raster.

Rectangle button
create a rectangle (parallel to the x,y axis) that the created raster is restricted to.

Rotated Rectangle button
create a rotated rectangle that the created raster is restricted to.

Create button
create a 12d raster from the image on the plan view.

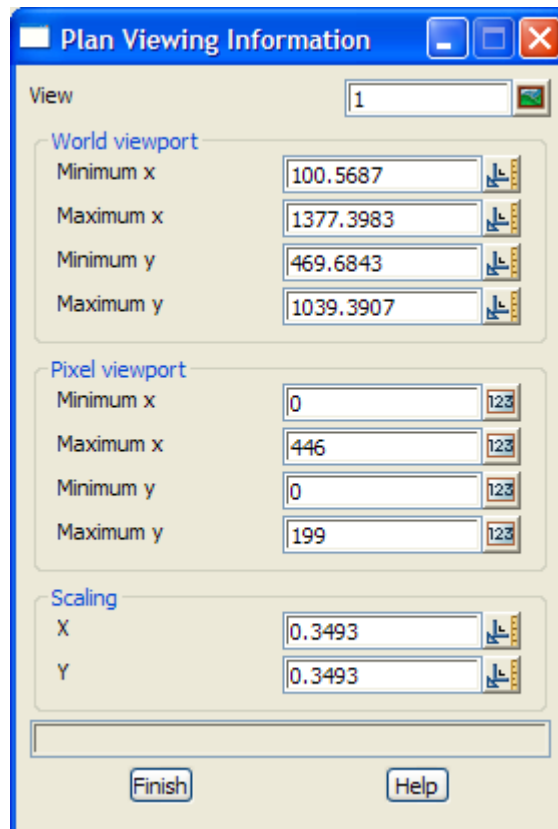

View Info

plan_viewing_information

Position of option on menu: Plan View Menu View => Settings => Utilities => Info

This option displays information about the world and pixel size of a plan view.

On selecting the Info option, the **Plan Viewing Information** panel is displayed.

Perspective Toggle

[perspective_view_toggle_menu](#)

Position of menu: Perspective View Menu View =>Settings =>Toggle

The toggle walk right brings up the **toggle** perspective view menu.

Selecting any options from this menu will toggle the option on/off.

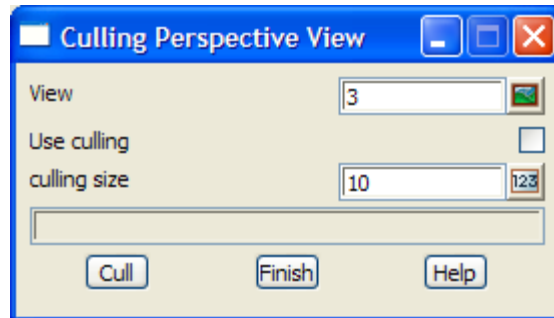

Culling

culling_perspective_view

Position of option on menu: Perspective View Menu View =>Settings =>Culling

The culling option is used to suppress the drawing of strings whose on-screen extent is less than a user defined pixel size.

Selecting culling raises the **culling perspective view** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set culling parameters for.

Use culling	tick-cross
--------------------	------------

*if tick, a string is **not** drawn on the perspective view whenever the string's extent box when drawn on the view would be smaller the culling size given in the culling size field.*

Culling size	input	10
---------------------	-------	----

pixel size used for culling

Cull	button
-------------	--------

record the culling size given in the culling field. If the use culling field and redraw the view.

Faces

face_flags_for_view

Position of option on menu: Perspective View Menu View =>Settings =>Faces

The faces option allows the user to specify how faces are displayed in the perspective view and on any perspective view plots.

Selecting faces fires up the **face flags for view** panel.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to face flags for.</i>	input/output	current view	available views
Draw fill <i>if tick, all faces in the view are drawn in their fill colour.</i>	tick-cross	tick	
Draw edges <i>if tick, all face edges in the view are drawn.</i>	tick-cross		
Draw hatch <i>if tick, all faces in the view are drawn in their hatch pattern.</i>	tick-cross		
Set <i>set the draw fill/edges/hatch fields to the value in the panel fields. The plan view is then redrawn.</i>	button		

Hide

hide_view

Position of option on menu: Perspective View Menu View =>Settings =>Hide

When looking across a landscape, part of the terrain is often hidden by other parts of the terrain. For example hills in the foreground will hide hills behind them.

In 12d Model, a landscape is represented by a triangulated surface (a tin) and a tin can be used by a hidden line algorithm to determining what is visible in a scene.

The hide option in 12d Model uses a tin to define a surface and processes any strings on the perspective against the tin to determine what is visible or hidden.

Only strings that lie on the tin can be sensibly processed. For example, contours, meshes, draped strings and any of the data that was used to create the tin.

When viewing a terrain from an eye point, the **ridge lines** are the edges of transition between visible and invisible areas. The hide option displays the ridge lines to delineate the hidden regions.

Once the hide option is set on, a hide will be done on the view whenever the view parameters are changed. If a model is added to the view when hide is set on, the strings in the model are processed and only the visible sections displayed in the view.

Note - strings can still be selected in a hidden view.

Selecting hide raises the **hide view** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set hide parameters for.</i>	input/output	current view	available views
Tin <i>the name of the triangulated surface (tin) to be used for determining what is visible or not.</i>	input		available tins
Hide view <i>if tick, then the view is processed when the set button is selected.</i>	tick-cross		
Ridges colour <i>the colour for the ridge lines.</i>	input		available colours
Set <i>record the answers for the hide view, tin and ridges colour fields and then process the perspective view using the new parameters. The view type will be changed to hidden.</i>	button		

WARNING - a hide can be very slow for large tins and/or large data sets.

Clipping Planes

clipping_planes_for_view

Position of option on menu: Perspective View Menu View =>Settings =>Planes

The perspective viewing direction is defined by specifying an eye and target point.

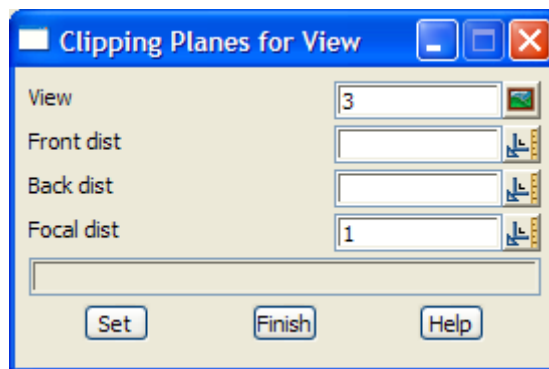

The three dimensional view is then projected onto a plane at right angles to the eye-target line, and at a user defined distance from the eye-point. This plane is called the focal plane and the distance from the eye-point to the focal plane is the focal distance.

The projection of all the data onto the focal plane is what is seen on the screen in a perspective view. Moving the focal plane has the same effect as varying the telephoto lens on a camera - it gives the impression of zooming into and out of the view.

It is not always desirable to include all the data in the perspective view. For example, data behind the viewer is not normally required to be seen. The user can specify the position of two planes (called the front and back clipping planes) parallel to the focal plane. Only data lying between the clipping planes will be seen. Thus the view is "clipped" using the front and back clipping planes.

The distance to the clipping planes is measured from the eye point along the line joining the eye and target points (the eye-target line).

Selecting planes fires up the **clipping planes for view** panel. This panel allows the user to set the focal distance and the front and back clipping plane distances.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set clipping plane for.</i>	input/output	current view	available views
Front dist <i>distance from the eye point to the front clipping plane. If this field is blank, no front clipping plane is used.</i>	input/output		
Back dist <i>distance from the eye point to the back clipping plane. If this field is blank, no back clipping plane is use.</i>	input/output		
Focal dist <i>distance from the eye point to the focal plane. This distance must be non-zero.</i>	input/output		
Set <i>set the distances to the front and back clipping planes and the focal plane. If the front or back clipping distance is blank, that plane is not set. After the set button is chosen, the view is redrawn using the new parameters,</i>	button		

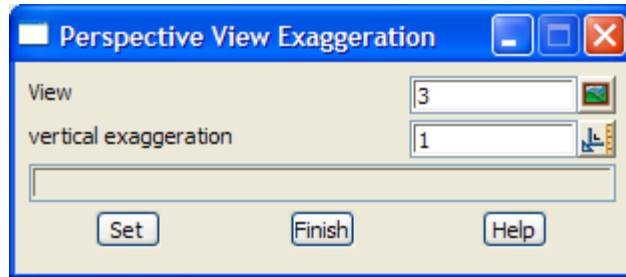

Exaggeration

perspective_view_exaggeration

Position of option on menu: Perspective View Menu View =>Settings =>Exaggeration

The exaggeration option allows the user to specify the vertical exaggeration in the perspective view. The heights (z values) are multiplied by the vertical exaggeration value before drawing on the perspective view.

Selecting exaggeration fires up the **perspective view exaggeration** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set exaggeration for.</i>	input/output	current view	available views
Vertical exaggeration <i>value to multiply the heights (z values) by before drawing in the perspective view.</i>	input	10	1,5,10
Set	button	<i>set the vertical exaggeration to the value in the vertical exaggeration field.</i>	

Tins

perspective_view_tin_settings_menu

Position of menu: Perspective View Menu View =>Settings =>Tins

The options on the tins walk-right menu control the display of tins on the view. The tins walk-right menu is

Contours

Position of option on menu: Perspective View Menu View =>Settings =>Tins =>Contours

The contours option defines contour and bold increments and colours, and also whether these contours are displayed for the triangles from any tins on the view. The panel is the same as for the plan view option. If shade is set on, the triangles will be drawn in back to front order.

Edges

Position of menu: Perspective View Menu View =>Settings =>Tins =>Edges

The edges option allows the user to specify whether the edges of triangles from any tins on the view are displayed. The panel is the same as for the plan view option. If shade is set on, the triangles will be drawn in back to front order.

Flow Arrows

Position of option on menu: Perspective View Menu View =>Settings =>Tins =>Flow arrows

The flow arrows option defines the colour and length of flow arrows, and also whether the flow arrows are displayed for the triangles from any tins on the view. The panel is the same as for the plan view option. If shade is set on, the triangles will be drawn in back to front order.

Mesh

Position of option on menu: Perspective View Menu View =>Settings =>Tins =>Mesh

The mesh option defines a rectangular mesh, and also whether the mesh is displayed for the triangles from any tins on the view. The panel is the same as for the plan view option. If shade is set on, the triangles will be drawn in back to front order.

Shade

shade_view

Position of option on menu: Perspective View Menu View =>Settings =>Tins =>Shade

Position of option on menu: Perspective View Menu View =>Settings =>Shade

In 12d Model, a landscape is represented by a triangulated surface - a tin. Each triangle in the tin is a part of a plane and has its own colour.

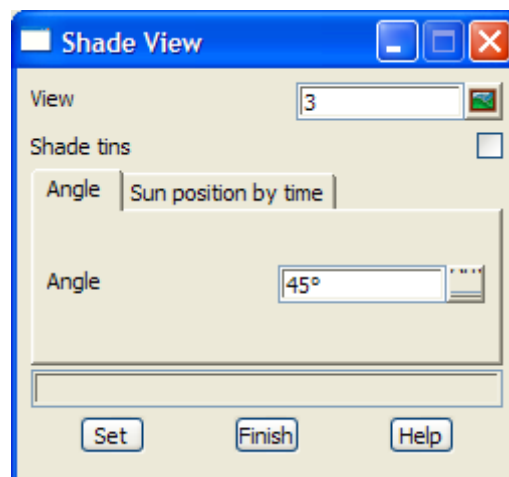

In a perspective view, each triangle can be drawn with a colour that is modified depending on the angle that the triangle makes with the sun (a point light source at infinity). This is called a **flat shade**.

If the triangles are drawn in a back to front order, then when the shaded landscape is drawn, any triangles in the foreground obscure triangles in the background and it looks like a hidden view.

If shade is set for a view, all the triangles in all the tins on the view are drawn as shaded triangles and the triangles are drawn in a back to front order.

Once the shade is set on, a shade will be done on the view whenever the view parameters are changed. A plot of the shaded view can be made using the dump option on the view.

Selecting shade fires up the **shade view** panel:

The fields and buttons used in this panel have the functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set shade parameters for.</i>	input/output	current view	available views
Shade tins <i>if tick, draw all the tins on the perspective view in shade mode.</i>	tick-cross		
Angle <i>angle of the sun (measured from the horizon).</i>	input	45	
Set <i>record and redraw the view using the current parameters.</i>	button		

Shade

Position of option on menu: Perspective View Menu View =>Settings =>Shade

This is exactly the same option as the shade described in the previous section "Shade" .

Eye/Target

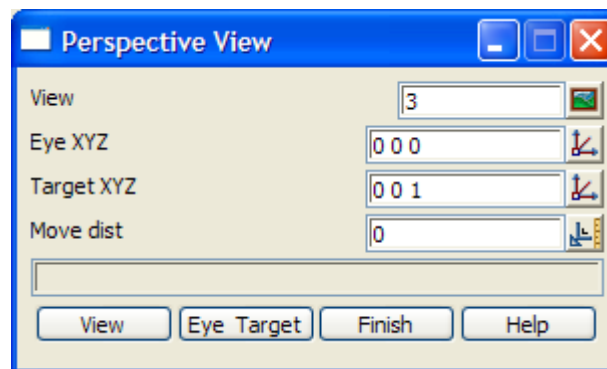

perspective_view

Position of option on menu: Perspective View Menu View =>Eye/Target

The Eye/Target option displays the current eye and target co-ordinates and also allows the user to specify new eye and target points. The points can be chosen from any plan view using the cursor or by typed-input.

The view is projected onto a focal plane using a perspective transformation, and clipped using front and back clipping planes. The focal distance and the front and back clipping plane distances are set and modified in the planes option.

Selecting new view fires up the **perspective view** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set perspective parameters for.</i>	input/output	current view	available views
Eye X Y Z <i>co-ordinates of the eye viewing point. New values can be typed, or a point selected using the xyz ops pop-up menu.</i>	input/output	current eye position	xyz ops menu
Target X Y Z <i>co-ordinates of the target viewing point. New values can be typed, or a point selected using the xyz ops pop-up menu.</i>	input/output	current target position	xyz ops menu
Move dist <i>distance to move the eye point along the eye-target line in the direction of the target point. The target point is also moved the same distance along the eye-target line so that the eye-target distance is kept constant.</i>	input/output		
View	button		
<i>define the perspective parameters according to the information in the panel. If the move distance is non-zero, then the eye and target points are both moved along the eye-target line by the distance given in the Move field. In this case, the new eye and target positions will be written to the eye and target fields.</i>			
Eye & Target	button		
<i>allows the user to define the (x, y) position of the eye and target points using the cursor and views.</i>			
<i>After selection the button, the user is asked to select the eye position from a view by clicking LB in a view. A level input box is then displayed on the screen for the user to enter the level (z value) for the eye point. The level is recorded and the level box removed after a <enter> is entered in the level input box.</i>			
<i>The user is then asked to select the target point from any view by clicking LB at the position of the</i>			

target point. A level input box is then displayed for the user to enter the level (z value) for the target point.

After the target point is defined, the view is redrawn using the new eye and target positions.

How to Use the Panel and Panel Messages

- (a) The eye and target points are set by using typed-input, the xyz ops pop-up menu in either the eye XYZ or target XYZ fields, or the **eye & target** button.

When the **view** button is selected, the perspective viewing parameters are calculated according to the information in the panel. If a non-zero move distance is given, the eye and target points are both moved along the eye-target line through the move distance. The new values for the eye and target points are written into the panel. If no errors are detected in calculating the new viewing parameter, the view is redrawn using the new parameters.

Joy

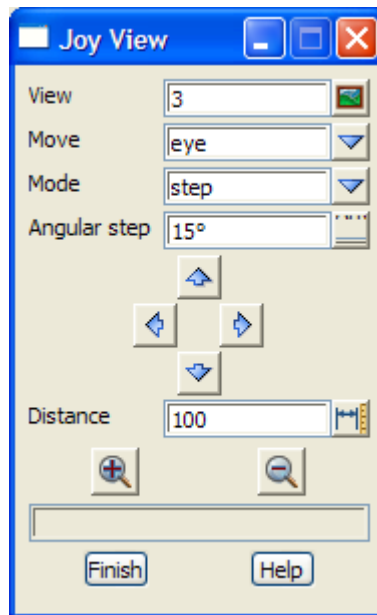

joy_view

Position of option on menu: Perspective View Menu View =>Joy

The hardest thing in a perspective view is finding a good viewing position. The joy option makes it easy to construct a new perspective viewing position relative to the existing position.

The panel can be used to move the eye or target point by rotating them through a given angle to the left, right, up or down, or to move one towards or away from the other. It is also possible to move the eye and target points keeping the distance between them the same.

Selecting joy fires up the joy view panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set joy parameters for.</i>	input/output	current view	available views
Move <i>move the eye point, the target point or both.</i>	input	eye	eye, target, eye & target
Mode <i>in step mode, the view is modified each time an appropriate button is picked. In continuous mode, after the view is redrawn, the picked joy option is continually re-applied until either a new joy button is picked, button LB is clicked anywhere else in the joy panel.</i>	input	step	step, continuous
Angular step <i>angle in degrees that is used with the joy buttons up, down, left and right when moving just the eye or target point.</i>	input	45	
Distance <i>distance used to move the eye or target point.</i>	input	100	

Joy buttons up,down,left,right,in,out

The joy buttons are used to modify the perspective parameters and then redraw the view with the new parameters.

The effect of each joy button depends on whether the move field is set to eye, target or eye & target.

move **field set to eye**

up/down button

rotate the eye-target line about the target point up/down by the angle given in the angle step field. That is, the eye point is moved upwards/downwards, the target point kept fixed.

left/right button

rotate the eye-target line about the target point to the left/right by the angle given in the angle step field. The target point kept fixed.

in/out button

move the eye point towards/away the target point along the eye-target line by the distance given in the distance field. The target point kept fixed.

move **field set to target**

similar to the movements when the move field is set to eye except the eye point is kept fixed and the target point is moved.

move **field set to eye & target**

up/down/left/right button

the eye and target points are both moved up/down/left/right by the distance given in the distance field. That is, the entire eye-target line is moved up/down/left/right and neither the eye or target point is kept fixed.

in/out button

move the eye and target points along the eye-target line by the distance given in the distance field. The direction is towards/away the target point.

How to Use the Panel

- (a) The move, mode, angular step and distance field are given the desired values and then one of the joy buttons (up, down, left, right, in or out) is selected. The perspective view is then redrawn
- (b) If the mode is set to continuous, once drawing is completed, the selected joy option will be re-applied. This sequence is repeated until either a new joy button is picked, button LB is clicked anywhere else in the joy panel or a c key is typed.

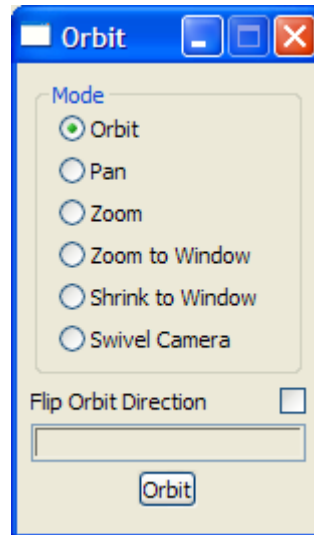

Orbit

joy

Position of option on menu: Perspective View Menu View =>Orbit

The orbit option quickly rotates the data around in the perspective view.

Selecting Orbit fires up the **Orbit** panel.

To use Orbit:

Orbit radio button on: Flip orbit direction radio button off:

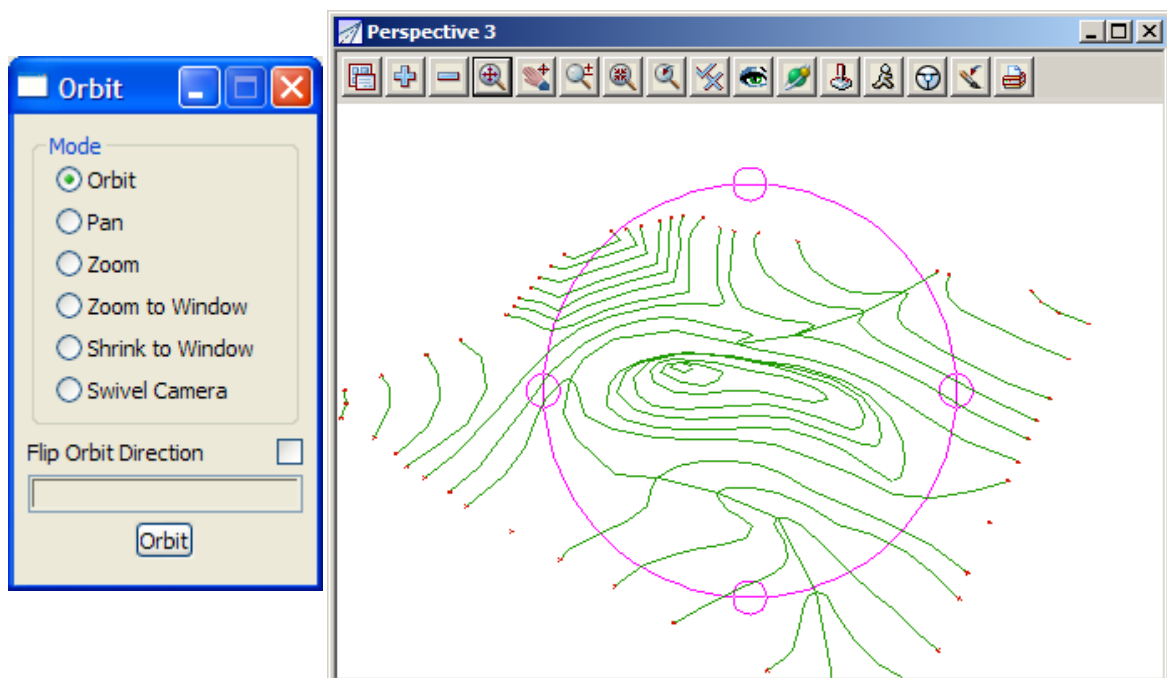

when the left button is clicked in the perspective view, the orbit circle appears and

*holding LB down and **moving up** in the orbit circle tilts the **object up***

*holding LB down and **moving down** in the orbit circle tilts the **object down***

*holding LB down and **moving left** rotates the **object to the left***

*holding LB down and **moving right** rotates the **object to the right***

Orbit radio button on: Flip orbit direction radio button on:the movement is reversed

Pan radio button on:

*holding LB down and **moving up** in the view **raises the object**
holding LB down and **moving down** in the view **lowers the object**
holding LB down and **moving left** in the view **pans the object to the left**
holding LB down and **moving right** in the view **pans the object to the right***

Zoom radio button on:

*holding LB down and **moving up** in the view **zooms into the object**
holding LB down and **moving down** in the view **zooms out from the object***

Zoom to window radio button on:

when a zoom box is drawn on the view, the perspective is modified so that the contents of the zoom box fill the entire view.

Shrink to window radio button on:

when a zoom box is drawn on the view, the perspective is modified so that the contents of the window are shrunk to fit into the zoom box.

Swivel camera radio button on:

holding LB down moves the target point.

Perspective Utilities

perspective_view_utilities_menu

Position of option on menu: Perspective View Menu View => Utilities

The utilities menu contains miscellaneous options involving the perspective view.

The **utilities** walk-right menu is

For the option *String drive*, go to the section

String walk

String movie

Tin shade

Dump

Plot

"String Drive" .

"String Walk" .

"String Movie" .

"Tin Shade" .

"Dump" .

"Perspective Plot" .

String Drive

perspective_view_drive_menu

Position of menu: Perspective View Menu View => Utilities =>String drive

The string drive option makes it easy to construct the perspective view one gets when moving along a string (for example, driving along a road centre line).

The two options on the **string drive** walk-right menu are

and they specify the positioning of eye and target points by:

along string - the eye and target points are automatically moved along the selected string

fixed target - the eye point automatically moves along the selected string but the target point is a selected fixed point.

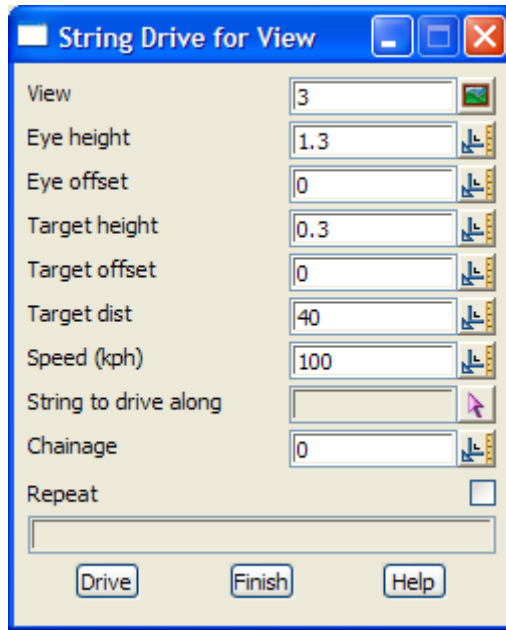

Note - the string drive option can be aborted by pressing the <esc> key or clicking RB.

String Drive - Along String

string_drive_for_view

Position of option on menu: Perspective View Menu View => Utilities =>String drive =>Along string

Selecting along string fires up the **string drive for view** panel.

For **string drive along a string**, a selected string is used to provide the (x, y, z) positions for the eye and target points.

The z-values can be adjusted by typing in a non-zero value for the eye and target heights in the **string drive** panel. These heights are relative to the z-values of the points on the string and are **added** to the z-values.

Like the new view option, the view is projected onto a focal plane and “clipped” using front and back clipping planes.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set drive parameters for.</i>	input/output	current view	available views
Eye height <i>height of the eye viewing point above the picked string</i>	input	1.3	
Eye offset <i>offset of the eye viewing point from the picked string</i>	input	0	
Target height <i>height of the target viewing point above the picked string</i>	input	0.3	
Target offset <i>offset of the target viewing point from the picked string</i>	input	0	
Target distance <i>distance (in string chainage) from the eye point to the target point.</i>	input	40	
Speed (kph) <i>speed in kilometres per hour (that is, one thousand base units per hour) that the eye-target points move along the string.</i>	input	100	
String to drive along <i>a string to drive along is selected from any view. The string must have z-values.</i>	string select		

Chainage input/output 0

*the chainage that the eye point is at on the string. The chainage is updated as the eye and target points are automatically moved along the string. The drive can be set to start at a specific start chainage by simply entering the start chainage into the chainage field and then selecting the **drive** button.*

Repeat tick box

*if **tick**, the drive starts again at the beginning of the string.*

Drive button

*When the **drive** button is selected, the eye and target points are placed above the string as specified in the panel fields, and the view redrawn. The eye and target points are then moved along the string at the given speed until either reaches the end of the string. The chainage of the eye point is continually updated.*

Notes

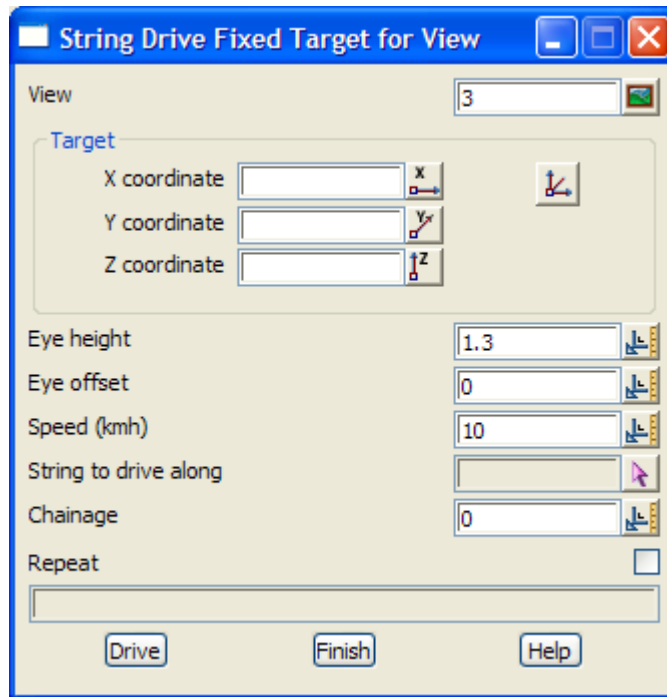

- ▲ the target distance and speed can be positive or negative.
- ▲ the eye and target points are shown on any view displaying the string being driven along. The eye point is drawn as a red cross, the target point, a green cross.
- ▲ if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view.

String Drive - Fixed Target

string_drive_fixed_target_for_view

Position of option on menu: Perspective View Menu View => Utilities =>String drive =>Fixed target

Selecting fixed target fires up the **string drive fixed target for view** panel.

For **string drive fixed target**, a selected string is used to provide the (x, y, z) positions for the eye point, and the target is a selected fixed point. The z-value for the eye is adjusted by adding to it the eye height in the eye height field in the **string drive fixed target** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set drive parameters for.</i>	input/output	current view	available views
Target <i>a fixed target point is selected from any view. The point's co-ordinates are displayed in the X, Y, Z coordinates panel fields.</i>	xyz box		
Eye height <i>height of the eye viewing point above the picked string</i>	input	1.3	
Eye offset <i>offset of the eye viewing point from the picked string</i>	input	0	
Speed (kph) <i>speed in kilometres per hour (that is, in one thousand of the base units per hour that the eye point moves along the string).</i>	input	100	
String to drive along <i>a string to drive along is selected from any view. The string must have z-values.</i>	string select		
Chainage <i>the chainage that the eye point is at on the string. The chainage is updated as the eye point</i>	input/output	0	

automatically moves along the string. The drive can be set to start at a specific start chainage by simply entering the start chainage into the chainage field and then selecting the **drive** button.

Target button

a fixed target point is selected from any view. The point's co-ordinates are displayed in the target panel field.

Repeat tick box

if **tick**, the drive starts again at the beginning of the string.

Drive button

When the **drive** button is selected, the eye point is placed above the string at the chainage given in the chainage field, and the view redrawn. The eye point is then moved along the string at the given speed until it reaches the end of the string. The chainage of the eye point is continually updated.

Notes

- ▲ the speed can be positive or negative.
- ▲ the eye point is shown on any view displaying the string being driven along. The eye point is drawn as a red cross, the target point, a green cross.
- ▲ if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view

String Walk

[perspective_view_walk_menu](#)

Position of menu: Perspective View Menu View => Utilities =>String walk

The *string walk* option makes it easy to construct the perspective view one gets when walking along a string (for example, walking along a road centre line).

The two options on the **string walk** walk-right menu are

and they specify the positioning of eye and target points by:

along string - the eye and target points are automatically moved along the selected string

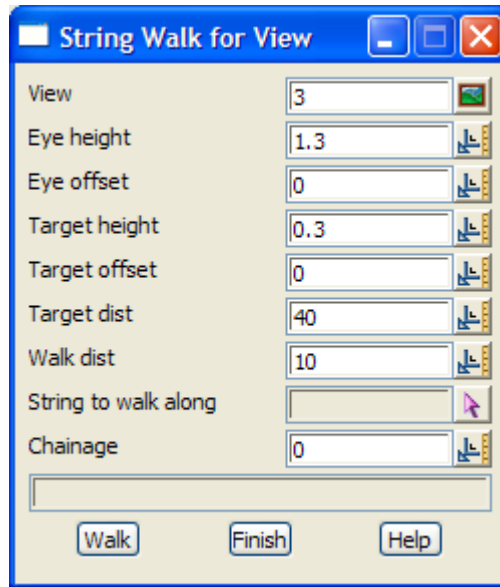

fixed target - the eye point automatically moves along the selected string but the target point is a selected fixed point.

String Walk - Along String

[string_walk_for_view](#)

Position of option on menu: Perspective View Menu View => Utilities =>String walk =>Along string

Selecting **along string** fires up the **string walk for view** panel

For **string walk along a string**, a selected string is used to provide the (x, y, z) positions for the eye and target points.

The z-values can be adjusted by typing in a non-zero value for the eye and target heights in the **string walk** panel. These heights are relative to the z-values of the points on the string and are **added** to the z-values.

Like the new view option, the view is projected onto a focal plane and “clipped” using front and back clipping planes.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set walk parameters for.</i>	input/output	current view	available views
Eye height <i>height of the eye viewing point above the picked string</i>	input	1.3	
Eye offset <i>offset of the eye viewing point from the picked string</i>	input	0	
Target height <i>height of the target viewing point above the picked string</i>	input	0.3	
Target offset <i>offset of the target viewing point from the picked string</i>	input	0	
Target distance <i>distance (in string chainage) from the eye point to the target point.</i>	input	40	
String to walk along <i>a string to walk along is selected from any view. The string must have z-values.</i>	string select		
Walk dist <i>distance to move the eye point along string from the previous eye point chainage. The target point is also moved the same distance along the eye-target line so that the eye-target distance is kept constant.</i>	input	10	

Chainage input/output 0

the chainage that the eye point is at on the string. The chainage is updated whenever the walk button is activated. The eye point can be set to a specific chainage by simply entering the chainage into the chainage field and selecting the walk button.

Walk button

the perspective parameters are defined according to the information in the panel. The first time the walk button is selected, the eye point is placed above the string at the chainage given in the chainage field. For subsequent selections of the walk button, the eye and target points are moved along the eye-target line by the chainage distance given in the walk dist field.

The view is redrawn with the new view parameters and the new eye-chainage displayed in the panel message area and the chainage field.

Notes

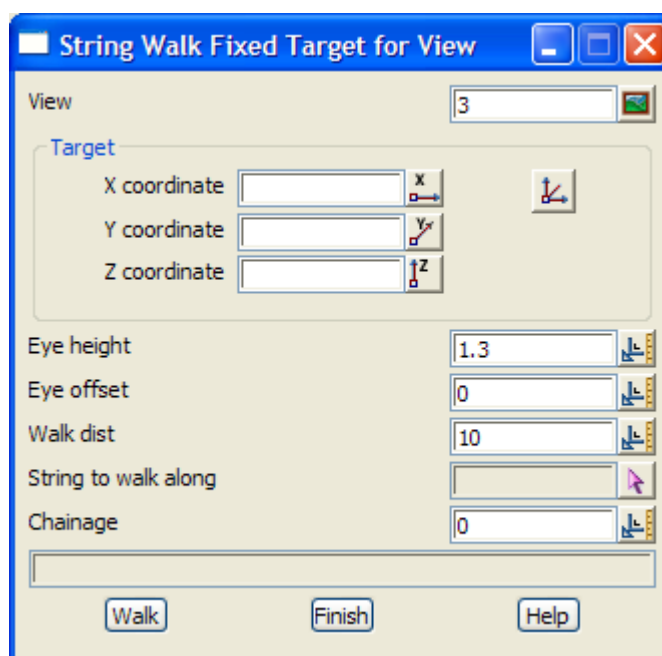

- ▲ the target and move distances can be positive or negative.
- ▲ the eye and target points are shown on any view displaying the string being walked along. The eye point is drawn as a red cross, the target point, a green cross.
- ▲ if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view.

String Walk - Fixed Target

[string_walk_fixed_target_for_view](#)

Position of option on menu: Perspective View Menu View => Utilities =>String walk =>Fixed target

Selecting fixed target fires up the **string walk fixed target for view** panel.

For **string walk fixed target**, a selected string is used to provide the (x, y, z) positions for the eye point, and the target is a selected fixed point. The z-value for the eye is adjusted by adding to it the eye height in the eye height field in the **string walk fixed target** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set walk parameters for.</i>	input/output	current view	available views
Target <i>a fixed target point is selected from any view. The point's co-ordinates are displayed in the X, Y, Z coordinates panel fields.</i>	xyz box		
Eye height <i>height of the eye viewing point above the picked string</i>	input	1.3	
Eye offset <i>offset of the eye viewing point from the picked string</i>	input	0	
Walk dist <i>distance to move the eye point along string from the previous eye point chainage.</i>	input	10	
String to walk along <i>a string to walk along is selected from any view. The string must have z-values.</i>	string select		
Chainage <i>the chainage that the eye point is at on the string. The chainage is updated as the eye point automatically moves along the string. The walk can be set to start at a specific start chainage by simply entering the start chainage into the chainage field and then selecting the walk button.</i>	input/output	0	
Walk <i>the perspective parameters are defined according to the information in the panel. The first time the walk button is selected, the eye point is placed above the string at the chainage given in the chainage field. For subsequent selections of the walk button, the eye point is moved along the string by the chainage distance given in the walk dist field.</i> <i>The view is redrawn with the new view parameters and the new eye-chainage displayed in the panel message area and the chainage field.</i>	button		

Notes

- ▲ the walk distance can be positive or negative.
- ▲ the eye point is shown on any view displaying the string being walked along. The eye point is drawn as a red cross, the target point, a green cross.
- ▲ if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view

String Movie

`perspective_view_movie_menu`

Position of menu: Perspective View Menu View => Utilities =>String movie

The string movie option makes it easy to construct and save to disk the sequence of perspective views one gets when walking along a string (for example, walking along a road centre line).

The screen images are automatically written out to disk in gif format so that they can be replayed at a later time.

This is especially useful when it takes a while to construct each view, for example, when hidden line is turned on.

Under NT/95, the screen images are written to an **avi** file.

Under Unix, the screen images are written to a **gif** file and there can be up to 99,999 of them in the one movie.

The two options on the **string movie** walk-right menu are

and they specify the positioning of eye and target points by:

along string - the eye and target points are automatically moved along the selected string

fixed target - the eye point automatically moves along the selected string but the target point is a fixed selected point.

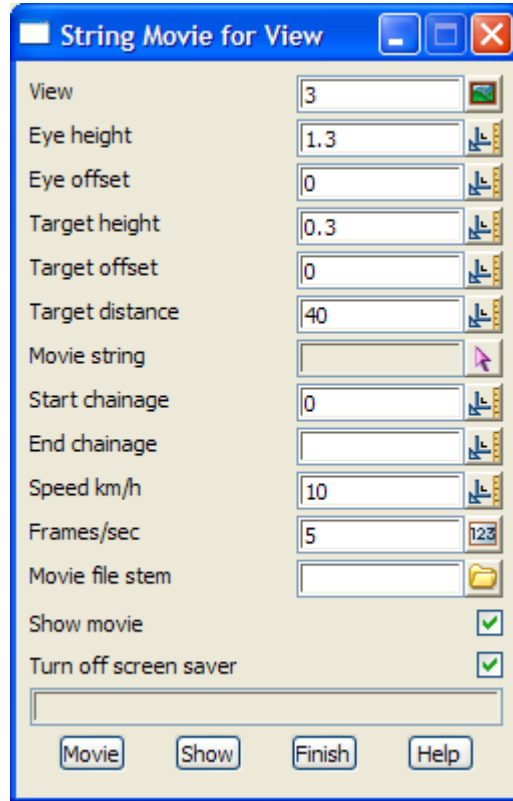

Note - the string movie option can be aborted by pressing the <esc> key or clicking RB.

String Movie - Along String

`string_movie_for_view`

Position of option on menu: Perspective View Menu View => Utilities =>String movie =>Along string

Selecting **along string** fires up the **string movie for view** panel

For **string movie along a string**, a selected string is used to provide the (x, y, z) positions for the eye and target points.

The z-values can be adjusted by typing in a non-zero value for the eye and target heights in the **string movie** panel. These heights are relative to the z-values of the points on the string and are **added** to the z-values.

Like the new view option, the view is projected onto a focal plane and “clipped” using front and back clipping planes

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set movie parameters for.</i>	input/output	current view	available views
Eye height <i>height of the eye viewing point above the picked string</i>	input	1.3	
Eye offset <i>offset of the eye viewing point from the picked string</i>	input	0	
Target height <i>height of the target viewing point above the picked string</i>	input	0.3	
Target offset <i>offset of the target viewing point from the picked string</i>	input	0	
Target distance <i>distance (in string chainage) from the eye point to the target point.</i>	input	40	
Movie string <i>a string to drive along is selected from any view. The string must have z-values.</i>	string select		

Start chainage	input/output	0
<i>the chainage that the eye point starts on the string for the movie.</i>		
End chainage	input/output	0
<i>the chainage to stop the movie at.</i>		
Speed (kph)	input	10
<i>speed in kilometres per hour (that is, one thousand base units per hour) that the eye-target points move along the string.</i>		
Frames/sec)	input	5
<i>number of frames per second to produce for the movie.</i>		
Movie file stem	input	4d-
<i>each frame of the drive in the view is written to disk in avi format using the movie file stem plus the ending .avi as the file name.</i>		
Show movie	tick box	tick
<i>if tick, after all the views along the string are written to disk, a new window, the same size as the perspective view, will be created and movie then run.</i>		
Turn off screen saver	tick box	tick
<i>if tick, the screen saver is disabled so it doesn't come on whilst creating the movie.</i>		
Movie	button	
<i>the perspective parameters are defined according to the information in the panel. When the movie button is selected, the eye point is placed above the string at the chainage given in the chainage field. The view is drawn with these view parameters. After that view is processed and written to disk, the eye and target points are moved along the eye-target line and frames written out to simulate the given speed.</i>		
Show	button	
<i>This button is used to display a previously created movie. If selected, the movie created with the stem given in the movie file stem field is displayed. If Unix, there is a pause between each frame by the number of seconds given in the delay field.</i>		

Displaying the Movie

If a movie has just been created and the show movie field is set to tick, or an existing movie name is given in the movie file stem field and the **show** button is selected, then a new window will be created and the movie will be displayed frame by frame. Outside of 12d Model, the movie can be displayed by simply double clicking on the **avi** file.

Notes

- ▲ the target and move distances can be positive or negative.
- ▲ the eye and target points are shown on any view displaying the string being walked along. The eye point is drawn as a red cross, the target point, a green cross.
- ▲ if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view.
- ▲ the movie can also be displayed from outside 12d Model by simply double clicking on the avi file

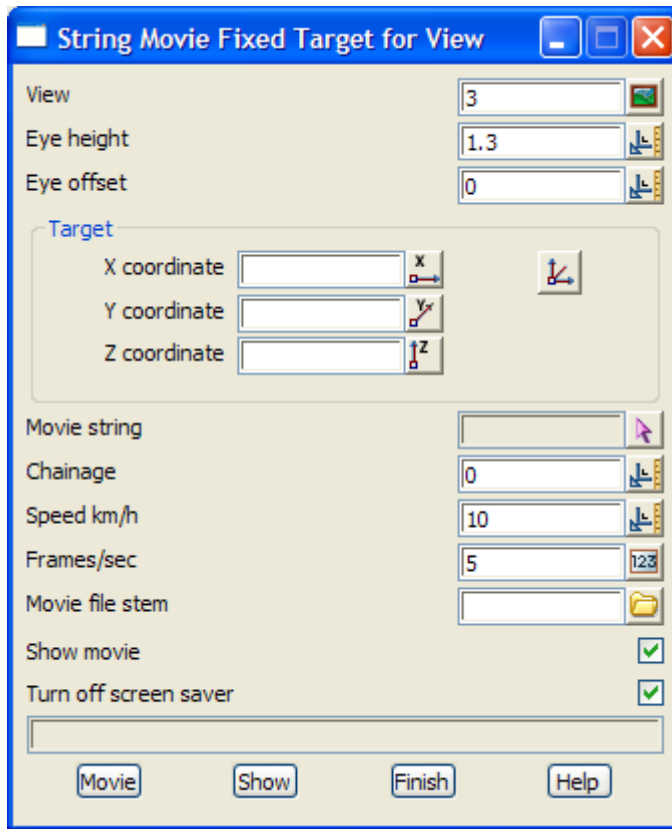

movie-file-stem.avi

String Movie - Fixed Target

`string_movie_fixed_target_for_view`

Position of option on menu: Perspective View Menu View => Utilities =>String movie =>Fixed target

Selecting fixed target fires up the **string movie fixed target for view** panel.

For **string movie fixed target**, a selected string is used to provide the (x, y, z) positions for the eye point, and the target is a selected fixed point. The z-value for the eye is adjusted by adding to it the eye height in the eye height field in the **string movie fixed target** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set movie parameters for.

Eye height	input	1.3	
-------------------	-------	-----	--

height of the eye viewing point above the picked string

Eye offset	input	0	
-------------------	-------	---	--

offset of the eye viewing point from the picked string

Target	xyz box		
---------------	---------	--	--

a fixed target point is selected from any view. The point's co-ordinates are displayed in the X, Y, Z coordinates panel fields.

Movie string	string select		
---------------------	---------------	--	--

a string to drive along is selected from any view. The string must have z-values.

Chainage	input/output	0	
-----------------	--------------	---	--

the chainage that the eye point starts on the string for the movie.

Speed (kph)	input	10
<i>speed in kilometres per hour (that is, one thousand base units per hour) that the eye-target points move along the string.</i>		
Frames/sec)	input	5
<i>number of frames per second to produce for the movie.</i>		
Movie file stem	input	4d-
<i>each frame of the drive in the view is written to disk in avi format using the movie file stem plus the ending .avi as the file name.</i>		
Show movie	tick box	tick
<i>if tick, after all the views along the string are written to disk, the movie is then run.</i>		
Turn off screen saver	tick box	tick
<i>if tick, the screen saver is disabled so it doesn't come on whilst creating the movie.</i>		
Movie	button	
<i>the perspective parameters are defined according to the information in the panel. When the movie button is selected, the eye point is placed above the string at the chainage given in the chainage field. The view is drawn with these view parameters. After that view is processed and written to disk, the eye and target points are moved along the eye-target line by the chainage distance given in the step distance field and the new view drawn and processed.</i>		
<i>This sequence is repeated until the end of the string is reached or the c key is pressed.</i>		
Show	button	
<i>This button is used to display a previously created movie. If selected, the movie created with the stem given in the movie file stem field is displayed. If Unix, there is a pause between each frame by the number of seconds given in the delay field.</i>		

Tin Shade

tin_shade_view

Position of option on menu: Perspective View Menu View => Utilities => Tin shade

In **12d** Model, a landscape is represented by a triangulated surface - a tin. Each triangle in the tin is a part of a plane and has its own colour.

In a perspective view, each triangle can be drawn with a colour that is modified depending on the angle that the triangle makes with the sun (a point light source at infinity). This is called a **flat shade**.

If the triangles are drawn in a back to front order, then when the shaded landscape is drawn, any triangles in the foreground obscure triangles in the background and it looks like a hidden view.

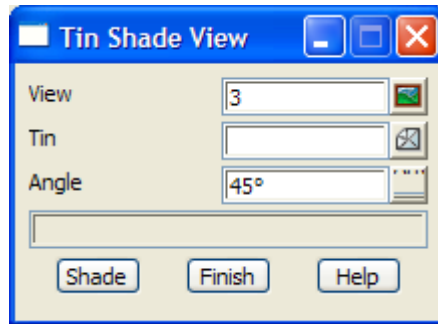

If shade is set for a view, all the triangles in all the tins on the view are drawn as shaded triangles and the triangles are drawn in a back to front order.

Once the shade is set on, a shade will be done on the view whenever the view parameters are changed. A plot of the shaded view can be made using the dump option on the view.

The tin shade option draws the selected tin over the perspective view as a shade. The selected tin does not have to be on the view for the shade to function.

When the view is refreshed, the shade is lost (the shade option under settings is used for setting a shade permanently on). A plot of the shaded view can be made using the dump option on the view.

Selecting tin shade option fires up the **tin shade view** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set shade parameters for.</i>	input/output	current view	available views
Tin <i>name of the tin to be used for the shade.</i>	input		available tins
Angle <i>angle of the sun.</i>	input	45	
Shade <i>draw the given tin on the view as a shaded tin.</i>	button		

Dump

Position of option on menu: Perspective View Menu View => Utilities =>Dump

This option is used to write the view image out to disk in a user selected format. It is the same as the dump option for a plan view.

Perspective Plot

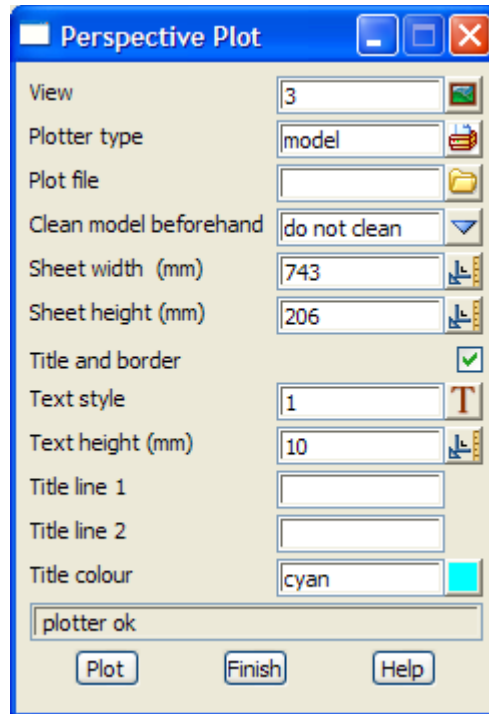

perspective_plot

Position of option on menu: Perspective View Menu View => Utilities =>Perspective plot

The plot option is used to make a plot file of all the information displayed in the perspective view.

The user simply gives a sheet width and height and 12d Model calculates the scaling factor required to best fit the plot of the view to the sheet.

After selecting the plot option, the **perspective plot** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set perspective plot parameters for.</i>	input/output	current view	available views
Plotter type <i>file format for the plot information.</i>	input	hp	hp, dxf, postscript etc.
Plot file <i>stem of the name of the file to write the plot of the view to. The name ending is added automatically and depends on the plotter type.</i>	input	depends on plotter type	
Clean model beforehand <i>only applicable if plotting to a model. if always clean, the model is cleaned before the plot is created. If prompt for clean, the user is prompted that the model will be cleaned before the plot is created. If do not clean, the model is not cleaned before the plot is created.</i>	choice box		do not clean prompt for clean always clean
Sheet width/height (mm) <i>if a value is entered by the user and an <enter> given, the height/width required by the plot is calculated and displayed in the sheet height/width field. The units for sheet width and height are millimetres. If both Sheet width and height are given with no <enter>, then a scaling factor is calculated by 12d Model to best fit the plot of the view to a rectangle of size given by the sheet width and height.</i>	input		
Title and border <i>if tick, a border and two lines of title are placed on the bottom of the plot</i>	tick-cross		
Title line 1/2 <i>first/second line of title information</i>	input		

Title height (mm)	input	10	
	<i>height (in millimetres) to draw the two lines of title information</i>		
Title colour	input	cyan	available colours
	<i>colour used for the border and the title information</i>		
Plot	button		
	<i>write out the plot of the information displayed in the view to the file given in the plot file field. The format of the file is given by the plotter type</i>		

Section View Menu

section_view_menu

Position of menu: Section View Menu View

The section view is used to display string profiles and sections through tins and service items. The horizontal units are taken to be the **chainage** along a particular string called the **primary string** for the view. The z-values (heights) are the vertical units for the section. Hence, the section view is a (chainage, z-value) diagram with respect to the primary string on the view. The primary string's model and name is displayed in the view title area of the section view.

Since a tin represents a two dimension continuous surface, sectioning through a tin along a string appears as a continuous line string in a section view. For example, the natural surface on a road long-section is the section of the road centre-line through the natural surface tin.

When a corridor is set, any strings in models added to the section view (service items) will be drawn on the section view wherever they are inside the corridor.

A section view has a **vertical exaggeration** and whenever a string is profiled on the view, the vertical exaggeration is displayed inside square brackets after the view name in the view title area. For example [10x] is a vertical exaggeration of 10.

The section views menu is

For the option <i>Models</i> , go to the section	"Model Ops"
<i>Settings</i>	"Section View Settings"
<i>Redraw</i>	"Redraw"
<i>Fit</i>	"Fit"
<i>Previous</i>	"Previous"
<i>Pan</i>	"Pan"
<i>Profile</i>	"Profile"
<i>Regenerate</i>	"Regenerate" .
<i>Plotting</i>	"Section Plotting"
<i>Utilities</i>	"Section Utilities"
<i>Delete</i>	"Delete"

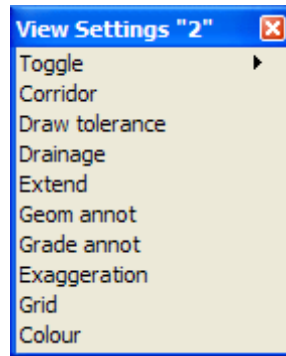

Section View Settings

section_view_settings_menu

Position of menu: Section View Menu View => Settings

If the settings option is picked rather than moving onto the walking right, then the toggle menu from the toggle walk-right menu is displayed on the screen. The toggle menu will be described in the next section.

The settings walk-right menu for the section view is

For the option <i>Toggle</i> go to the section	“Section Toggle”
<i>Corridor</i>	“Corridor”
<i>Draw tolerance</i>	“Draw Tolerance”
<i>Drainage</i>	“Drainage HGL”
<i>Extend</i>	“Extend”
<i>Grade annot</i>	“Grade Annotation”
<i>Exaggeration</i>	“Exaggeration”
<i>Grid</i>	“Grid”
<i>Colour</i>	“Colour”

Section Toggle

section_view_toggle_menu

Position of menu: Section View Menu View => Settings =>Toggle

The toggle walk right brings up the **toggle** section view menu.

Selecting any options from this menu will toggle the option on/off.

Corridor

section_corridor

Position of option on menu: Section View Menu View => Settings =>Corridor

The standard section view is designed to profile any selected string and create and display sections along the profiled string through any tins in any models added to the section view.

Hence the section view is like a vertical ribbon tracing out the path of the primary string.

The corridor option extends the ribbon to the left and right and projects any strings in any models added to the section view back onto the section view.

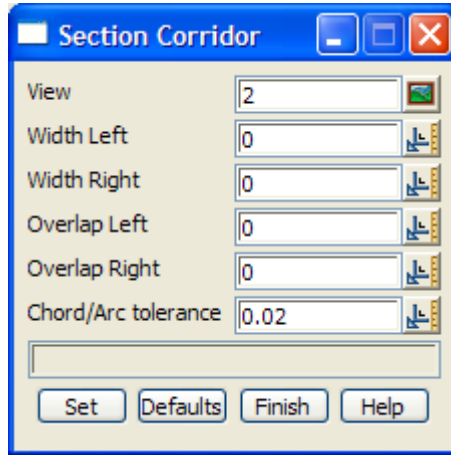

Consequently, the section view will display any strings or parts of strings that cross the corridor, run parallel to the primary string but stay within the corridor as well as displaying the standard sections through any tins in any models added to the section view.

The corridor is particularly useful for examining any **clashes** of strings with the primary string.

For example, services such as telephone cables, water and gas pipes and electricity cables could be modelled as 3d or pipe strings and added to the section view.

The section view with non-zero corridor widths would then display any of the services that lie within the corridor about the chosen primary string.

Selecting corridor fires up the **section corridor** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	
View <i>view to set corridor parameters for.</i>	input/output	current view	available views
Width left/right <i>width of the corridor to the left/right of the primary string.</i>	input	0.01	
Overlap left/right <i>for each straight/arc in the primary string, extend the straight/arc to the left/right by the value of the overlap left/right field before drawing the straight/arc. Section through the extended string.</i>	input	0.01	
Chord/Arc tolerance <i>value of the chord to arc ratio to be used when approximating circles in alignments, arcs and pipeline strings.</i>	input	0.02	
Set <i>define the corridor parameters according to the information in the panel. The section view for the new corridor will then be calculated and displayed.</i>	button		
Defaults <i>reset the corridor settings to the default values.</i>	button		

Draw Tolerance

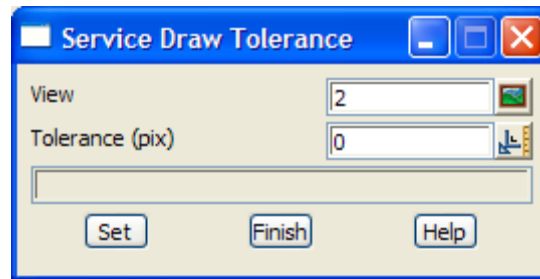

service_draw_tolerance

Position of option on menu: Section View Menu View => Settings => Draw tolerance

It is possible for the bits of services displayed on a section view to be very small and possibly too small to be easily seen. This is often the case for strings that are perpendicular to the corridor.

To overcome this visualization difficulty, a tolerance can be defined for the section view and when the size of any piece of a service is below the tolerance, it will be drawn as a cross.

Selecting draw tolerance fires up the **service draw tolerance** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	
View <i>view to set service parameters for.</i>	input/output	current view	available views
Tolerance (pix) <i>if the size of any piece of a service is below this tolerance, it will be drawn as a cross.</i>	input	4	
Set <i>set the service draw tolerance.</i>	button		

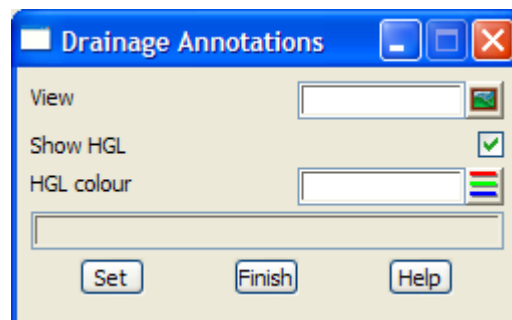

Drainage HGL

drainage_annotatons

Position of option on menu: Section View Menu View => Settings => Drainage annotations

If the data exists in the drainage string, the HGL line can be drawn when profiling a drainage string.

Selecting Drainage annotations fires up the **Drainage Annotations** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	
View <i>view to set HGL parameters for.</i>	input/output	current view	available views
Show HGL <i>if tick then the HGL line is drawn for any drainage strings that are profiled (and have GHL data)</i>	tick box	tick	
HGL colour <i>colour to draw the HGL line</i>	colour box		available colours
Set <i>set the HGL drawing parameters</i>	button		

Extend

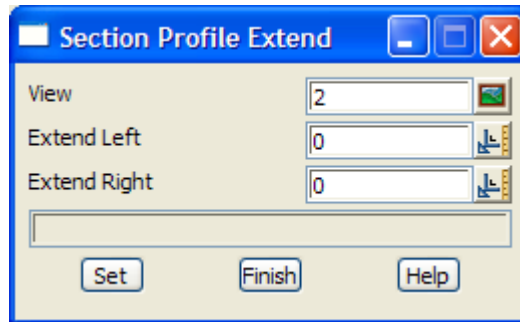

section_profile_extend

Position of option on menu: Section View Menu View => Settings =>Extend

When displaying the profile of a string on a section view, the user often wishes to see sections through the information before the string begins and after the string ends. This is particularly useful if it is intended to extend the string in either direction.

The extend option allows the user to extend the profile length.

Selecting extend fires up the **section profile extend** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	
View <i>view to set extension parameters for.</i>	input/output	current view	available views
Extend left <i>pre-extend the profile by this distance before sectioning through any tins or models on the view.</i>	input	0	
Extend right <i>post-extend the profile by this distance before sectioning through any tins or models on the view.</i>	input	0	
Set <i>define the profile length according to the length of the primary string plus the two extend lengths. The section view for the new length will then be calculated and displayed.</i>	button		

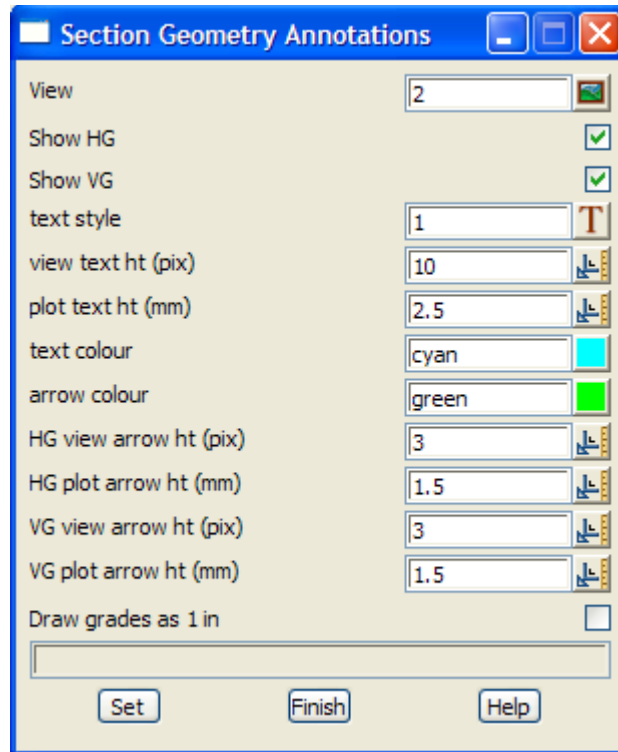

Geometry Annotation

section_geometry_annotations

Position of option on menu: Section View Menu View => Settings =>Geom annot

The geom annot option allows the user to specify whether horizontal geometry and/or vertical geometry is displayed for any alignment and pipeline strings profiled in the section view and hence on any section view plots.

Selecting geom annot fires up the **section geometry annotations** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set alignment geometry parameters for.

Show HG	tick-cross	tick	
----------------	------------	------	--

if tick, the value of the radii and spiral lengths for any horizontal curves selected as the primary string will be shown plus an arrow indicating the chainage extent of the radii.

If no tick, the horizontal geometry will not be displayed in the section view or on any plots of the section view.

Show VG	tick-cross	tick	
----------------	------------	------	--

if tick, the value of the curve length for any vertical curves selected as the primary string will be shown, plus an arrow indicating the chainage extent of the curve length. The percentage grades for any vertical straights will also be displayed with an arrow indicating the chainage extent of the vertical straight.

If no tick, the vertical curve lengths and percentage grades will not be displayed in the section view or on any plots of the section view.

Text style	input	1	
-------------------	-------	---	--

text style to be used for all text in the geometry annotation.

View text ht (pix)	input	10	
---------------------------	-------	----	--

height (in pixels) to draw the geometry annotation values in the section view (the screen width is approximately 1000 pixels).

Plot text ht (mm)	input	10	
--------------------------	-------	----	--

height (in mm) to draw the geometry annotation values on any plots of the section view.

Text colour	input	cyan	available colours
--------------------	-------	------	-------------------

colour of the geometry annotation values drawn on the screen and any plots.

Arrow colour	input	green	available colours
<i>colour of the HG arrows drawn on the screen and any plots.</i>			
HG view arrow ht (pix)	input	3	
<i>height (in pixels) of the arrow head above the arrow line when drawing the HG arrows in the view.</i>			
HG plot arrow ht (mm)	input	1.5	
<i>height (in mm) of the arrow head above the arrow line when drawing the HG arrows on any plots of the section view.</i>			
VG view arrow ht (pix)	input	3	
<i>height (in pixels) of the arrow head above the arrow line when drawing the VG arrows in the view.</i>			
VG plot arrow ht (mm)	input	1.5	
<i>height (in mm) of the arrow head above the arrow line when drawing the VG arrows on any plots of the section view.</i>			
Draw grades as 1 in	tick box		
<i>if tick, grades are drawn as 1:in values. if not tick, grades as drawn as percent (%)</i>			
Set	button		
<i>set the section settings values to the values in the above panel fields. The section view is then redrawn using these values.</i>			

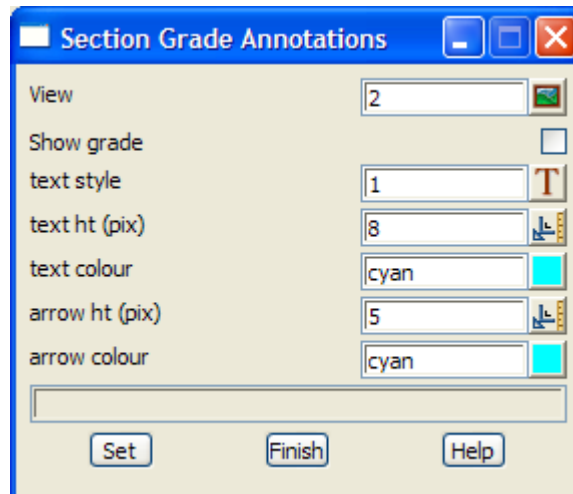

Grade Annotation

section_grade_annotations

Position of option on menu: Section View Menu View => Settings =>Grade annot

The grade annot option allows the user to specify whether the grades and plan widths of string links are displaced for strings profiled in the section view.

Selecting grade annot fires up the **section grade annotations** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set grade annotation parameters for.</i>	input/output	current view	available views
Show grade <i>if tick, the value of the grades (in percent grade) and plan widths of string links for any strings selected as the primary string will be shown plus an arrow indicating the chainage extent of the grade. If no tick, the grades and widths will not be displayed in the section view or on any plots of the section view.</i>	tick-cross	tick	
Text style <i>text style to be used for all text in the grade annotation.</i>	input	1	
Text ht (pix) <i>height (in pixels) to draw the grade annotation values in the section view (the screen width is approximately 1000 pixels).</i>	input	8	
Text colour <i>colour of the grade annotation values drawn on the screen and any plots.</i>	input	cyan	available colours
Arrow ht (pix) <i>height (in pixels) of the arrow head above the arrow line when drawing the arrows in the section view.</i>	input	3	
Arrow colour <i>colour of the arrows drawn on the screen.</i>	input	cyan	available colours
Set <i>set the section settings values to the values in the above panel fields. The section view is then redrawn using these values.</i>	button		

Exaggeration

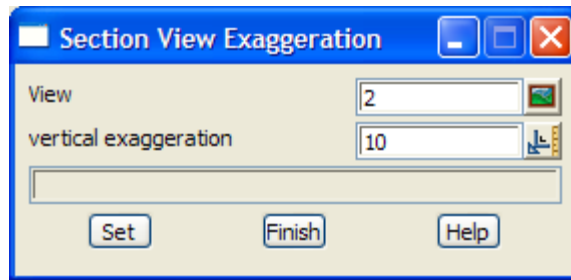

section_view_exaggeration

Position of option on menu: Section View Menu View =>Settings =>Exaggeration

The exaggeration option allows the user to specify the vertical exaggeration for the section view. The heights (z values) are multiplied by the vertical exaggeration value before drawing on the section view.

Whenever a string is profiled on the section view, the **vertical exaggeration** is displayed inside square brackets after the view name in the view title area. For example [10x] is a vertical exaggeration of 10.

Selecting exaggeration fires up the **section view exaggeration** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set exaggeration parameters for.</i>	input/output	current view	available views
Vertical exaggeration <i>value to multiply the heights (z values) by before drawing in the section view.</i>	input	10	1,5,10
Set	button		
<i>set the vertical exaggeration to the value in the vertical exaggeration field.</i>			

Profile

section_view_profile_menu

Position of menu: Section View Menu View => Profile

The profile option is used to display a long-section view of a selected string. That is, the coordinate system for the section view is defined in terms of the chosen string by

- (a) the chainage along the selected string defines the horizontal axis for the section view
- (b) the vertical axis is the z-axis (heights).

Hence a (chainage,height) diagram of the selected string is drawn in the section view. The scale is automatically chosen so that all of the selected string fits into the section view.

The string selected to be profiled is called the **primary string** for the section view.

The model and name of the primary string is displayed in the section view's title area (after the vertical exaggeration).

The primary string is drawn on the section view in the primary string's colour.

If the primary string is an alignment or pipeline string, the radii and chainage extent of any horizontal curves can be displayed in the section view plus any vertical curve lengths and percent-grades of vertical straights. For other strings, the grade and widths of each string link can be displayed.

For any tins in the models added to the section view, the section along the primary string through the tin will be calculated and drawn on the section view in the same colour as the tin colour. Any strings (service items) in models added to the section view, the parts of the strings in any corridor defined for the primary string will be calculated and drawn on the section view in the same colour as the strings.

Each time a new primary string is chosen with the profile option, the sections along the new primary string are calculated and displayed for all the tins and strings in the models added to the section view.

The profile walk-right menu is

The One string option allows one string to be profiled and then the option terminates.

The Many strings option profiles one string and then allows the user to select another string to be profiled without leaving the profile option. The many strings option is very useful when a number of strings need to be examined one after another in a section view.

The Model strings option profiles the strings from a given model, one at a time. For example, it is used to sequentially examine each cross-section down a road when all the cross-sections are stored in one model.

The 2 points option dynamically profiles between two selected points. The profile between the first selected point and the cursor position is dynamically recalculated as the cursor is moved around the view.

The Perpendicular to CL option dynamically profiles along a cross-section which is perpendicular to a selected string. The cross section profile is dynamically recalculated as the cursor is moved along the selected string.

The one substring and many substrings options are used to section along house connections and property controls for sewer and drainage strings.

For the option <i>One String</i> , go to the section	"One String"
<i>Many strings</i>	"Many Strings"
<i>Model strings</i>	"Model Strings"
<i>2 points</i>	"2 Points"
<i>Perpendicular to CL</i>	"Perpendicular to CL"
<i>One substring</i>	"One Substring"
<i>Many substrings</i>	"Many substrings"

One String

Position of option on menu: Section View Menu View =>Profile =>One string

After choosing the one string option, the user selects the string to be profiled. The option then terminates.

To cancel the option without selecting any string, click LB to bring up the pick ops menu and select **cancel**.

Many Strings

Position of option on menu: Section View Menu View =>Profile =>Many strings

The many strings option is designed for profiled a number of strings one after another.

After choosing the many strings option, a string is selected for profiling. After the string has been profiled, another string is selected for profiling.

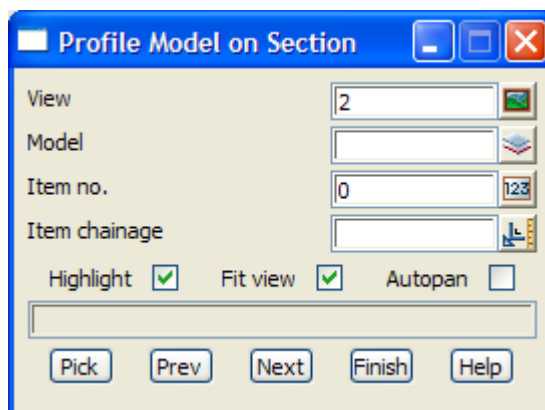

The option will keep profiling selected strings until the option is terminated by clicking LB to get the pick ops menu and selecting cancel.

Model Strings

[profile_model_on_section](#)

Position of option on menu: Section View Menu View =>Profile =>Model strings

After selecting the model strings option, the **Profile Model on Section** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

View	input/output	current view	available views
	<i>view to set profile parameters for.</i>		
Model	input		available models
	<i>name of the model containing the strings to be profiled one at a time</i>		
Item no.	input/output		
	<i>number of the string in the model being profiled.</i>		
Item chainage	input/output		
	<i>chainage of the section string in the model being profiled. Also if a chainage is typed in followed by an <Enter> then the model will be searched for a X-section of that chainage and if it exists, it will be profiled.</i>		
Highlight	tick box	tick	
	<i>if tick, the string being profiled in the section view is locked and highlighted on any views where it is visible.</i>		
Fit view	tick box	tick	
	<i>if tick, the string being profiled is fitted to the section view. if no tick, the same scale is used for the next section being profiled.</i>		
Autopan	tick box		
	<i>if tick, then if the profiled string is not visible on any plan views that the model containing the string is on, then the plan view is modified so that the profiled string is in the centre of the plan view.</i>		
Pick	button		
	<i>after selecting the pick button, a string is selected. The string is automatically profiled and its model becomes the model being profiled and item no. is set to the string's number in the model.</i>		
Prev	button		
	<i>the previous string given by the item no. field is profiled and the item no. field decremented by one.</i>		
Next	button		
	<i>the next string given by the item no. field is profiled and the item no. field incremented by one.</i>		

How to Use the Panel

- Either a string is picked after selecting the **pick** button, or the name of the model containing the strings to be profiled is entered into the model field.
- The item no. field is initially set to the picked strings item no. or 0, but can be set to the number of any string in the model.
- When the **prev** or **next** button is selected, the string given by the number in the item no. field is decremented or incremented and the string given by the new item no. is profiled in the section view.

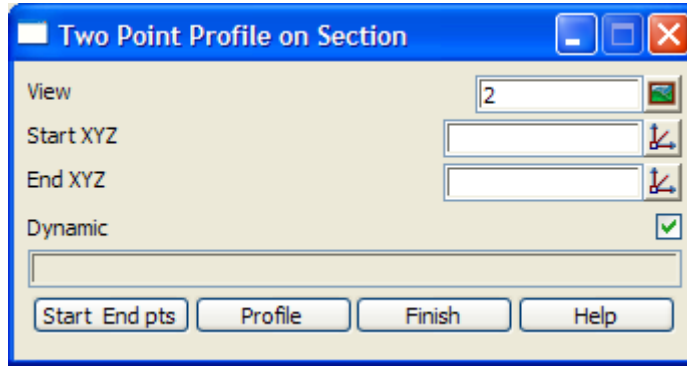

Hence with the model strings option, a number of strings in the one model can be profiled (one after another) by simply repeatedly selecting the **prev** or **next** buttons.

2 Points

two_point_profile_on_section

Position of option on menu: Section View Menu View =>Profile =>2 points

After selecting the 2 points option, the **two points profile on section** panel is displayed.

The fields and buttons used in this panel have the following functions.

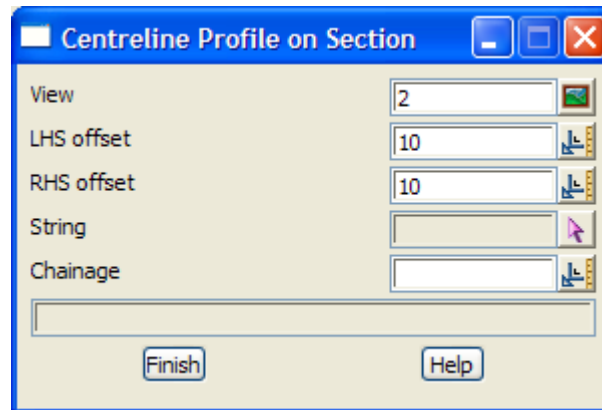

Field Description	Type	Defaults	Pop-Up
View <i>view to set profile parameters for.</i>	input/output	current view	available views
Start X Y Z <i>co-ordinates of the start section point. New values can be typed, or a point selected using the xyz ops pop-up menu.</i>	input/output		xyz ops menu
End X Y Z <i>co-ordinates of the end section point. New values can be typed, or a point selected using the xyz ops pop-up menu.</i>	input/output		xyz ops menu
Dynamic <i>if tick, the profile will be dynamically calculated between the first selected point and the cursor position.</i>	tick-cross	tick	
Start and End pts <i>after selecting the start and end pts button, the first point of the section to be profiled is selected and its value written to the start xyz field. If dynamic is set on, then a profile from the first point to the cursor position is automatically calculated as the cursor is moved around the view. Selecting the second points finalises the section and the co-ordinates of the final point is written to end xyz field.</i>	button		
Profile <i>after selecting the profile button, a section is calculated between the start xyz and end xyz points.</i>	button		

Perpendicular to CL

centreline_profile_on_section

Position of option on menu: Section View Menu View =>Profile =>Perpendicular to CL

After selecting the perpendicular to cl option, the **centreline profile on section** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set profile parameters for.

LHS offset	input	10
-------------------	-------	----

distance (in world units) to take the section to the left of the selected string.

RHS offset	input	10
-------------------	-------	----

distance (in world units) to take the section to the right of the selected string.

String	string-select
---------------	---------------

the selected string is used to specify the position where a cross-section is defined. Once the string is selected, then as the cursor is moved around in a view, its position will be dynamically be dropped perpendicularly onto the selected string, and a cross-section defined at right angle to the selected string. A profile along the cross-section will then be drawn in the section view. The cross-section profile will be dynamically modified as the cursor position is modified.

One Substring

Position of option on menu: Section View Menu View =>Profile =>One substring

As well as profiling strings, the one substring option can profile a house connection or property control (**substrings**) in a drainage or sewer string.

After the one substring option is chosen from the menu, the user selects a substring for profiling. After the string or substring has been profiled, the option terminates.

Many substrings

Position of option on menu: Section View Menu View =>Profile =>Many substrings

The many substrings option is designed for profiled a number of substrings, one after another.

After the many substring option is chosen, the user selects a substring for profiling. After the substring has been profiled, another string or substring can be chosen for profiling.

The option is terminated by clicking LB to get the pick ops menu and selecting cancel.

Regenerate

Position of option on menu: Section View Menu View =>Regenerate

The regenerate option is used to re-calculate and re-display the profile of the primary string of the section view.

This is necessary because modifications to the primary string or any strings or tins one the view may make the initial profile invalid. A regenerate is a quick method of bringing the profile up to date.

Section Plotting

section_view_plot_menu

Position of menu: Section View Menu View =>Plotting

The plotting walk-right menu contains the options plot, long plot and X plot.

The plot option is used to make a plot file of all the information displayed in the section view.

The long plot option is used to make a traditional long section plot with string chainages and elevations displayed for each of the strings in the section view. The form of the long plot can be finely controlled by a file of plot parameters.

The X plot creates the traditional stacked x-section plots for each x-section string in a given model. The form of the x-plot can be finely controlled by a file of plot parameters.

For the option <i>Plot</i> , go to the section	"Section Plot"
<i>Long plot</i>	"Long Plot" in the chapter "Plots"
<i>X plot</i>	"X Plot" in the chapter "Plots"
<i>Drainage/Sewer</i>	"Drainage Longsections" in the chapter "Drainage and Sewer"
<i>Melbourne water</i>	"Melbourne Water" in the chapter "Drainage and Sewer"
<i>Pipeline</i>	"Plots" in the chapter "Pipeline"

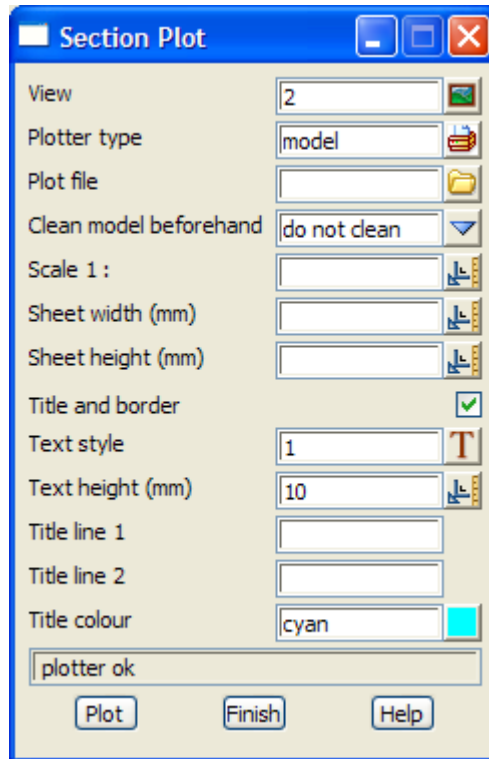

Section Plot

section_plot

Position of option on menu: Section View Menu View =>Plotting =>Plot

The plot option writes out all the information displayed in the section view to either a plot file (in a user selected format) or to a 12d Model model. The user selects a scale for the plot and the sheet width and height are calculated by 12d Model.

After selecting the plot option, the **section plot panel** is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set plot parameters for.</i>	input/output	current view	available views
Plotter type <i>file format for the plot information.</i>	input	hp	hp, dxf, postscript etc.
Plot file <i>stem of the name of the file to write the plot of the view to. The name ending is added automatically and depends on the plotter type.</i>	input	depends on plotter type	
Clean model beforehand <i>only applicable if plotting to a model. if always clean, the model is cleaned before the plot is created. If prompt for clean, the user is prompted that the model will be cleaned before the plot is created. If do not clean, the model is not cleaned before the plot is created.</i>	choice box		do not clean prompt for clean always clean
Scale 1: <i>if a value is entered by the user and an <enter> given, the sheet width and height required by the plot are calculated and displayed in the sheet width and sheet height fields.</i>	input		
Sheet width (mm) <i>if a value is entered by the user and an <enter> given, the scale and height required by the plot are calculated and displayed in the scale and sheet height fields. The units for sheet width are millimetres.</i>	output		
Sheet height (mm) <i>if a value is entered by the user and an <enter> given, the scale and width required by the plot are</i>	output		

calculated and displayed in the scale and sheet width fields. The units for sheet height are **millimetres**

Title and border	tick-cross	tick	
	<i>if tick then a border and two lines of title are placed on the bottom of the plot</i>		
Text style	input	1	
	<i>text style for the title information</i>		
Text Height (mm)	input	10	
	<i>height (in millimetres) to draw the two lines of title information</i>		
Title line 1/2	input		
	<i>first/second line of title information</i>		
Title colour	input	cyan	available colours
	<i>colour used for the border and the title information</i>		
Plot	button		
	<i>write out the plot of the information displayed in the view to the file given in the plot file field. The format of the file is given by the plotter type</i>		

Long Plot

Position of option on menu: Section View Menu View =>Plotting =>Long plot

The option is for creating long section plots.

The Long plot option is documented in the section "Long Plot" in the chapter "Plots"

X Plot

Position of option on menu: Section View Menu View =>Plotting =>X plot

The x plot option is for creating x-section plots.

The option is documented in the section "X Plot" in the chapter "Plots"

Drainage/Sewer Plot

Position of option on menu: Section View Menu View =>Plotting =>Drainage/Sewer

The *Drainage/Sewer plot* option is used to make the long section plots for a drainage or sewer network.

This option is documented in the section "Drainage Longsections" of the chapter "Drainage and Sewer"

Melbourne Water Plot

Position of option on menu: Section View Menu View =>Plotting =>Melbourne Water

The *Melbourne Water plot* option is used to make the long section plots for a sewer network to Melbourne Water standards.

This option is documented in the section "Melbourne Water" of the chapter "Drainage and Sewer"

Pipeline Plot

Position of option on menu: Section View Menu View =>Plotting =>Pipeline

The *Pipeline plot* option is used to make the long section plots for a sewer network to Melbourne Water standards.

This option is documented in the section “Longsections” of the chapter “Pipeline”

Section Utilities

section_view_utilities_menu

Position on menu: Section View Menu View =>Utilities

The utilities menu contains miscellaneous options involving the section view. The **utilities** walk-right menu is

For the option <i>New view</i> , go to the section	“New View”
<i>Report</i>	“Report”
<i>VG edit</i>	“VG Edit”
<i>Dump</i>	“Dump”

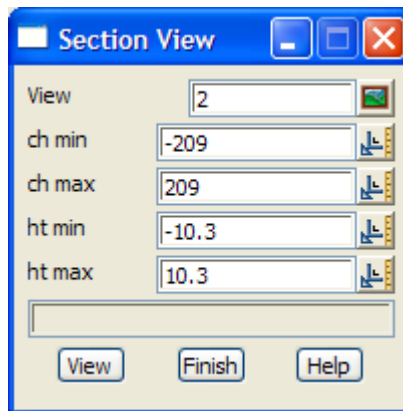

New View

section_view

Position of option on menu: Section View Menu View =>Utilities =>New view

The new view option displays the current minimum and maximum chainage and height values for the view, and permits the user to specify new values as the section’s viewing parameters.

Selecting New view fires up the **section view** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults
View <i>view to set section parameters for.</i>	input/output	current view available views
chain min/max <i>minimum/maximum string chainage for the view. Chainage is used as the x-axis co-ordinates in a section view.</i>	input/output	current chainage min/max
Ht min/max <i>minimum/maximum height (z value) for the view. Height is used as the y-axis co-ordinates in a section</i>	input/output	current height min/max

view.

View button

define the section view parameters according to the information in the panel. If the box given by the chainage and height values in the panel is not the same shape as the view itself, the chainage and height values will be modified so that the chainage and height values match the view shape. The final chainage and height values are displayed in the panel.

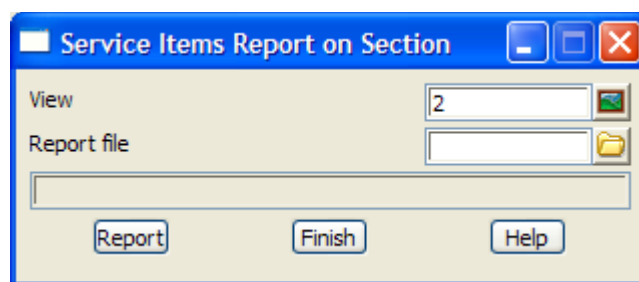

Report

service_items_report_on_section

Position of option on menu: Section View Menu View =>Utilities =>Report

This report option is for producing information on all the items displayed in the section view.

After selecting the report option, the **service items report on section view** panel is displayed

For the profiled string, this option generates a report which includes the

- ▲ section through any tins on the section view
- ▲ name and model of any services in the corridor defined by the section view
- ▲ co-ordinates and chainages of the parts of the service in the corridor, and the chainage and offset for each of the point of the parts projected onto the profiled string.
- ▲ clearance at the point where any service goes under or over the profiled string.

VG Edit

vg_edit_string

Position of option on menu: Section View Menu View =>Utilities =>VG Edit

The VG edit option is used to interactively create and modify the vertical geometry of a **12d** Model alignment string, or the vertical information of any string that can be edited in a section view (e.g. drainage string). Vertical geometry can only be created for an existing string.

After selecting the VG edit option, the **VG edit string** panel is placed on the screen.

The option is already in **pick** mode and the user simply picks and accepts the string whose vertical geometry is to be created and/or edited. The **pick & edit** button only needs to be used if the pick was cancelled from the pick ops menu.

Once the string has been selected, it is automatically made the primary string for the section view and a string profile created along the string.

As discussed in the section view profile options, for each tin in a model added to the section view, the section through the tin along the primary string (the selected string) is calculated and displayed in the section view.

The VG edit option then fires up the standard string editor which is described in detail in the string edit options.

Dump

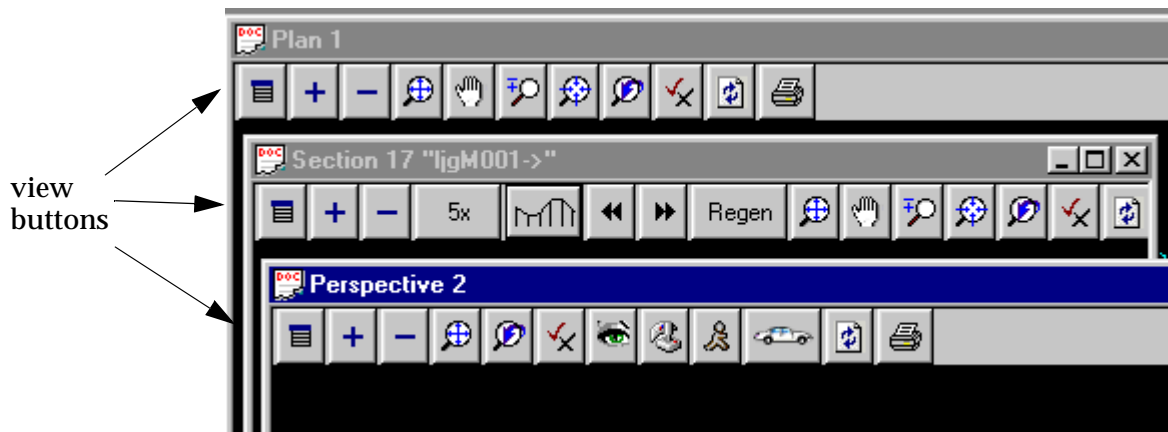

Position of option on menu: Section View Menu View =>Utilities =>Dump

This option is used to write the view out in a user selected format. It is the same as the dump option for the plan view and is fully documented in the plan **View => Utilities** section.

View Buttons

For each view type, there are a number of selected view menu options available as buttons (view buttons) in the *view title area*.

The options on each view type are

To select one of the view buttons, click LB whilst the cursor is over the button.

Note that the view buttons do not highlight when the cursor passes over them.

If RB is clicked over any view button other than **Profile** on the section view, the view menu for the view type will be displayed.

For documentation on the *Plan view buttons*, go to the section “Plan View Buttons” .

Perspective view buttons, go to the section “Perspective View Buttons” .

Section view buttons, go to the section “Section View Buttons” .

Plan View Buttons

Menu

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the View menu appears.

Because of the differences between plan, perspective and section views, the options on the View menu vary for each view type.

The plan View menu is

The View menu is removed by selecting the [X] button or if the View menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the **View** menu has been moved, clicking **RB** will warp the cursor to the moved View menu.

+ or Add

The + view button works in four modes.

- ▲ clicking LB whilst the cursor is over the + brings up the Models to Add list. This list contains all of the models not yet added to the view.
- ▲ typing a keyboard character whilst the cursor is over the + brings up a Models to Add list containing only those models not on the view **with names beginning** with the typed character.
- ▲ typing a * character whilst the cursor is over the + brings up a Add Models to View panel which can then be used with wild cards and characters.
- ▲ clicking MB whilst the cursor is over the + brings up the Add Models to View by Pick panel and starts up a **same as** for a view. Models to add to the view are then selected by simply picking a string from the model. See chapter **Tools and Concepts** for further documentation on **same as**.
- ▲ clicking RB whilst the cursor is over the + brings up the **View** panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, please continue to the section "Same As for Views" .

- or Remove

The - view button works in four modes.

- ▲ clicking LB whilst the cursor is over the - brings up the Models to Remove list. This menu lists all of the models on the view.
- ▲ typing a keyboard character whilst the cursor is over the - brings up a Models to Remove list containing only those models on the view with names beginning with the typed character.
- ▲ typing a * character whilst the cursor is over the - brings up a Remove Models from View panel which can then be used with wild cards and characters.
- ▲ clicking MB whilst the cursor is over the - brings up the Remove Models from View by Pick panel and starts up a **same as** for a view. Models to remove from the view are then selected by simply picking a string from the model. See the next chapter for further documentation on **same as**.
- ▲ clicking RB whilst the cursor is over the - brings up the **View** panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, please continue to the section "Same As for Views" .

Fit

This is the same as fit from the view menu.
 If LB is clicked on the **fit**, then the fit option is activated.
 If RB is clicked on the **fit**, then the view option is activated.

Pan

This is the same as pan from the View=>Pan menu.
 If LB is clicked on the **Pan**, then the pan option is activated.

Zoom

This is the same as the two point zoom option from the plan View=>Zoom menu.
 If LB is clicked on the **Zoom**, then the zoom option is activated.

Shrink

This is the same as the two point shrink option from the plan View=>Zoom menu.
 If LB is clicked on the **shrink**, then the shrink option is activated.

Previous

This is the same as previous from the view menu.
 If LB is clicked on the **prev**, then the previous option is activated.
 If RB is clicked on the **prev**, then the view option is activated.

Toggle

This is the same as toggle from the View=>Settings menu.
 If LB is clicked on the **toggle**, then the toggle menu is activated.
 If RB is clicked on the **toggle**, then the view option is activated.

The Toggle menu for the plan view types is:

Refresh

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

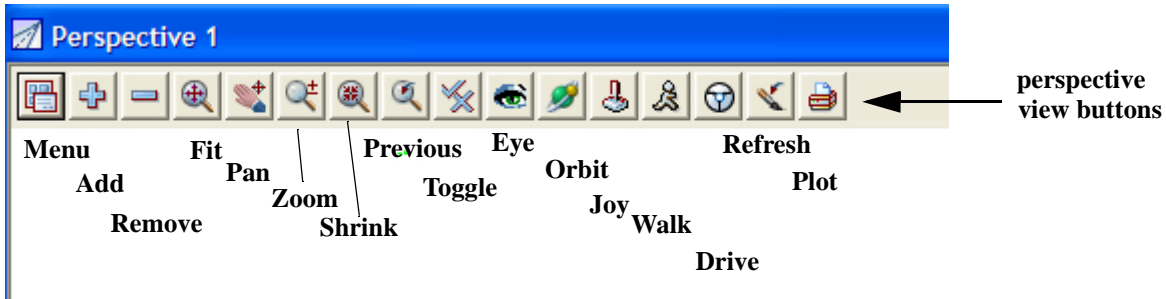

Plot

[plan_view_plot_menu](#)

If LB is clicked on **Plot**, then the View Plotting menu for the plan view is activated.

Perspective View Buttons

Menu

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the View menu appears.

Because of the differences between plan, perspective and section views, the options on the View menu vary for each view type.

The **Perspective View** menu is

The View menu is removed by selecting the **[X]** button or if the View menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the View menu has been moved, clicking **RB** will warp the cursor to the moved View menu.

+ or Add

The + view button works in four modes.

- ▲ clicking LB whilst the cursor is over the + brings up the Models to Add list. This list contains all of the models not yet added to the view.
- ▲ typing a keyboard character whilst the cursor is over the + brings up a Models to Add list containing only those models not on the view **with names beginning** with the typed character.
- ▲ typing a * character whilst the cursor is over the + brings up a Add Models to View panel which can then be used with wild cards and characters.
- ▲ clicking MB whilst the cursor is over the + brings up the Add Models to View by Pick panel and starts up a **same as** for a view. Models to add to the view are then selected by simply picking a string from the model. See chapter **Tools and Concepts** for further documentation on **same as**.
- ▲ clicking RB whilst the cursor is over the + brings up the View panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, please continue to the section "Same As for Views" .

- or Remove

The - view button works in four modes.

- ▲ clicking LB whilst the cursor is over the - brings up the Models to Remove list. This menu lists all of the models on the view.
- ▲ typing a keyboard character whilst the cursor is over the - brings up a Models to Remove list containing only those models on the view with names beginning with the typed character.
- ▲ typing a * character whilst the cursor is over the - brings up a Remove Models from View panel which can then be used with wild cards and characters.
- ▲ clicking MB whilst the cursor is over the - brings up the Remove Models from View by Pick panel and starts up a **same as** for a view. Models to remove from the view are then selected by simply picking a string from the model. See the next chapter for further documentation on **same as**.
- ▲ clicking RB whilst the cursor is over the - brings up the **View** panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, please continue to the section "Same As for Views" .

Fit

This is the same as fit from the view menu.

If LB is clicked on the **fit**, then the fit option is activated.

If RB is clicked on the **fit**, then the view option is activated.

Previous

This is the same as previous from the view menu.

If LB is clicked on the **prev**, then the previous option is activated.

If RB is clicked on the **prev**, then the view option is activated.

Toggle

This is the same as toggle from the View=>Settings menu.

If LB is clicked on the **toggle**, then the toggle menu is activated.

If RB is clicked on the **toggle**, then the view option is activated.

The Toggle menu for the perspective view is:

**Eye**

This is the same as eye/target from the View menu.

If LB is clicked on the **Eye**, then the **Eye-target** option is activated.

Joy

This is the same as joy from the View menu.

If LB is clicked on the **joy**, then the joy option is activated.

Walk

This is the same as string walk =>along string from the View =>Utilities menu.
If LB is clicked on the **walk**, then the walk along string option is activated.

Drive

This is the same as string drive => along string from the View =>Utilities menu.
If LB is clicked on the **drive**, then the drive along string option is activated.

Redraw

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

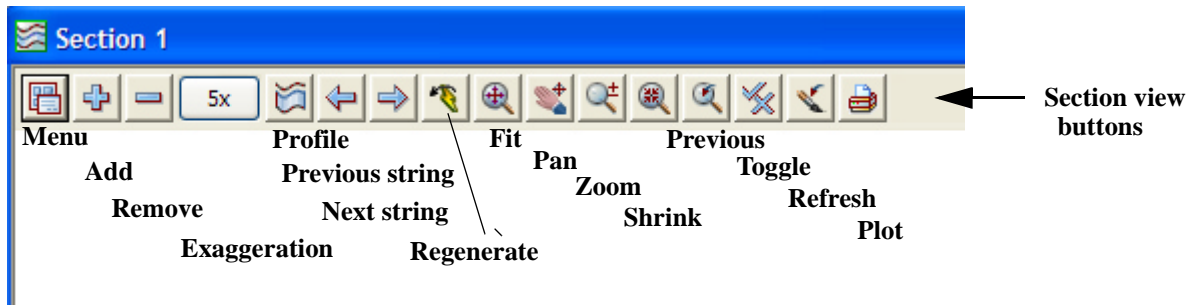

Plot

[perspective_view_plot_menu](#)

If LB is clicked on **plot**, then the view plotting menu for the perspective view is activated.

Section View Buttons

Menu

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the View menu appears.

Because of the differences between plan, perspective and section views, the options on the View menu vary for each view type.

The **Section View** menus is

The View menu is removed by selecting the **[X]** button or if the View menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the **View** menu has been moved, clicking **RB** will warp the cursor to the moved View menu.

+ or Add

The + view button works in four modes.

- ▲ clicking LB whilst the cursor is over the + brings up the Models to Add list. This list contains all of the models not yet added to the view.
- ▲ typing a keyboard character whilst the cursor is over the + brings up a Models to Add list containing only those models not on the view **with names beginning** with the typed character.
- ▲ typing a * character whilst the cursor is over the + brings up a Add Models to View panel which can then be used with wild cards and characters.
- ▲ clicking MB whilst the cursor is over the + brings up the Add Models to View by Pick panel and starts up a **same as** for a view. Models to add to the view are then selected by simply picking a string from the model. See chapter **Tools and Concepts** for further documentation on **same as**.
- ▲ clicking RB whilst the cursor is over the + brings up the **View** panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, please continue to the section “Same As for Views” .

- or Remove

The - view button works in four modes.

- ▲ clicking LB whilst the cursor is over the - brings up the Models to Remove list. This menu lists all of the models on the view.
- ▲ typing a keyboard character whilst the cursor is over the - brings up a Models to Remove list containing only those models on the view with names beginning with the typed character.
- ▲ typing a * character whilst the cursor is over the - brings up a Remove Models from View panel which can then be used with wild cards and characters.
- ▲ clicking MB whilst the cursor is over the - brings up the Remove Models from View by Pick panel and starts up a **same as** for a view. Models to remove from the view are then selected by simply picking a string from the model. See the next chapter for further documentation on **same as**.
- ▲ clicking RB whilst the cursor is over the - brings up the **View** panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, please continue to the section “Same As for Views” .

[exagg]

This is the vertical exaggeration for the view.

If LB is clicked on the exaggeration, then the toggle option for the section view is activated.

This has options to quickly change the vertical exaggeration.

Profile

section_view_profile_menu

If LB is clicked on **profile**, then the profile option is activated. This option is the same as View=>Profiling=>One string. If a string is being profiled, then the string name is displayed after the Section view name.

If **RB** is clicked on **Profile**, then the profiling menu is activated.

<<

Profile previous string.

>>

Profile next string.

Regen

This is the same as the option regenerate option from the section view menu.

If LB is clicked on the **regen**, then the regen option is activated.

Fit

This is the same as fit from the view menu.

If LB is clicked on the **fit**, then the fit option is activated.

If RB is clicked on the **fit**, then the view option is activated.

Pan

This is the same as pan from the View=>Pan menu.

If LB is clicked on the **Pan**, then the pan option is activated.

Zoom

This is the same as the two point zoom option from the plan View=>Zoom menu.

If LB is clicked on the **Zoom**, then the zoom option is activated.

Shrink

This is the same as the two point shrink option from the plan View=>Zoom menu.

If LB is clicked on the **shrink**, then the shrink option is activated.

Previous

This is the same as previous from the view menu.

If LB is clicked on the **prev**, then the previous option is activated.

If RB is clicked on the **prev**, then the view option is activated.

Toggle

This is the same as toggle from the View=>Settings menu.

If LB is clicked on the **toggle**, then the toggle menu is activated.

If RB is clicked on the **toggle**, then the view option is activated.

The Toggle menu for the section view is:

**Refresh**

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

Plot**section_view_plot_menu**

If LB is clicked on **plot**, then the view plotting menu for the section view is activated.

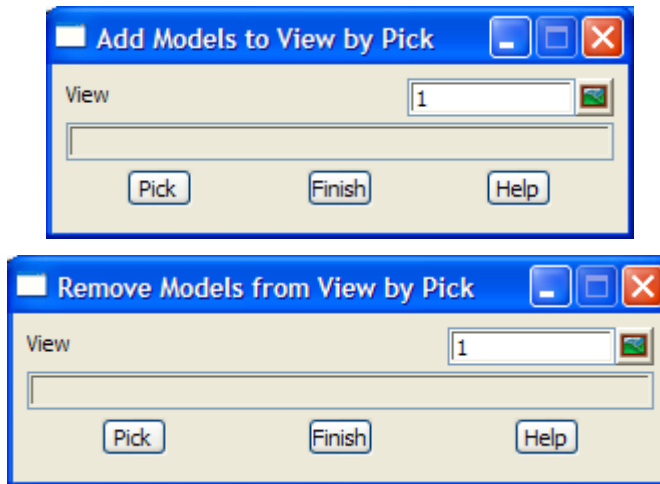

Same As for Views

`add_models_to_view_by_pick` `remove_models_from_view_by_pick`

Clicking the middle mouse button (MB) over the + or - view buttons will activate a **same as pick** which allows the user to select the model to add to (+) or remove from (-) the view by simply picking any string from the model to be added or removed.

After clicking MB over the + or - view button, the **add models to view by pick** or **remove models from view by pick** panel is brought up.

The option is already running and when a string is picked, the model containing the string is added to/removed from the view. Further strings can then be selected to add or remove another model.

The option is terminated by selecting **[X]** or **finish** from the panels, or cancel from the pick ops menu.

6 Projects

projects

The projects walk-right menu is:

on Main menu

create floating Projects menu (see right)
 change working directory and/or project
 make a copy of a project
 number of points for base point count
 project description and details
 edit project setup/management files
 exit and restart in same project
 save the working project to disk
 project data and set up files in tree form
 project utilities
 delete a project from disk

information on 12d Model
 User Projects menu

create floating 12d Model menu
 exit 12d Model

on 12d Model menu
 and floating menu

For the option *Change*, go to the section "Change"

<i>Copy</i>	"Copy"
<i>Check points</i>	"Check Base Points"
<i>Details</i>	"Details"
<i>Management</i>	"Management"
<i>Restart</i>	"Restart"
<i>Save</i>	"Save"
<i>Tree</i>	"Tree"
<i>Utilities</i>	"Utilities"
<i>Delete</i>	"Delete"
<i>12d Model</i>	"12d Model"
<i>Exit</i>	"Exit"

Each option will now be discussed in the order that they appear on the **Projects** menu.

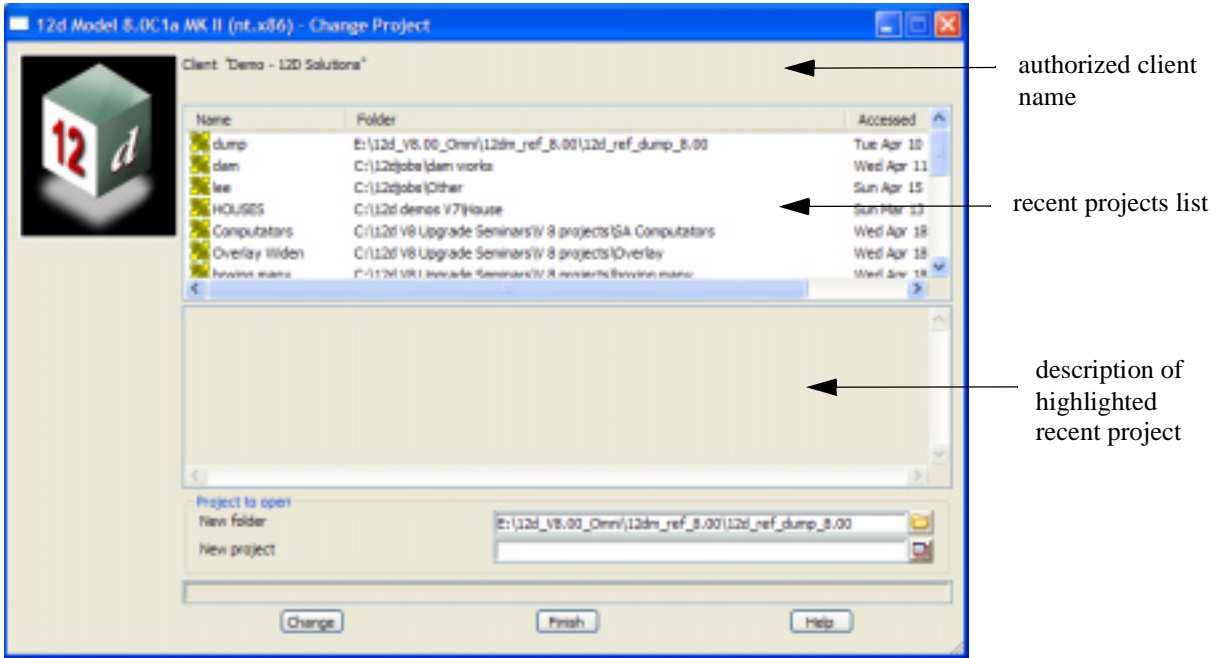

Change

change_project

Position of option on menu: Project =>Change

The **change** option is used to change the working directory and the working project. The panel can be resized.

On selecting the **change** option, the **change project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Client name	display only		
--------------------	--------------	--	--

authorized 12d Model client.

Recent projects list	output	recent projects	
-----------------------------	--------	-----------------	--

names and directories of project recently select. Single clicking on an entry in the list displays the projects description in the Project description area. Double clicking on an entry in the list changes the project

Project description	output		
----------------------------	--------	--	--

description of the project highlighted in the Recent projects list.

New directory	input	current directory	local directories
----------------------	-------	-------------------	-------------------

name of the directory to become the working directory.

New project	input	projects in new directory	
--------------------	-------	---------------------------	--

name of the project to become the working project in the new directory.

Change	button		
---------------	--------	--	--

after selecting this button, the working directory is changed to the directory specified in the new directory field. The working project is set to the project given in the new project field. If the new directory or new project does not exist, it will be created.

Note: This is a resizable panel.

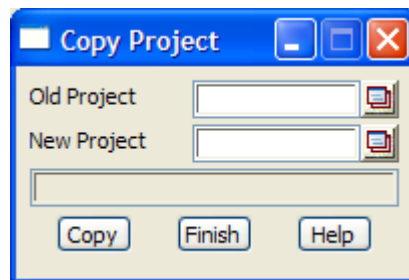

Copy

`copy_project`

Position of option on menu: Project =>Copy

The `copy` option is used to make a copy of any project (other than the current project) in the working directory.

On selecting the `copy` option, the **copy project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old project <i>name of the project to be copied.</i>	input	none	projects in directory
New project <i>name of the copy of the project. The new project name cannot be the same as an existing project in the working directory.</i>	input		
Copy <i>after selecting this button, a complete copy of the project given in the old project field is made and saved under the name given in the new project field.</i>	button		

Check Base Points

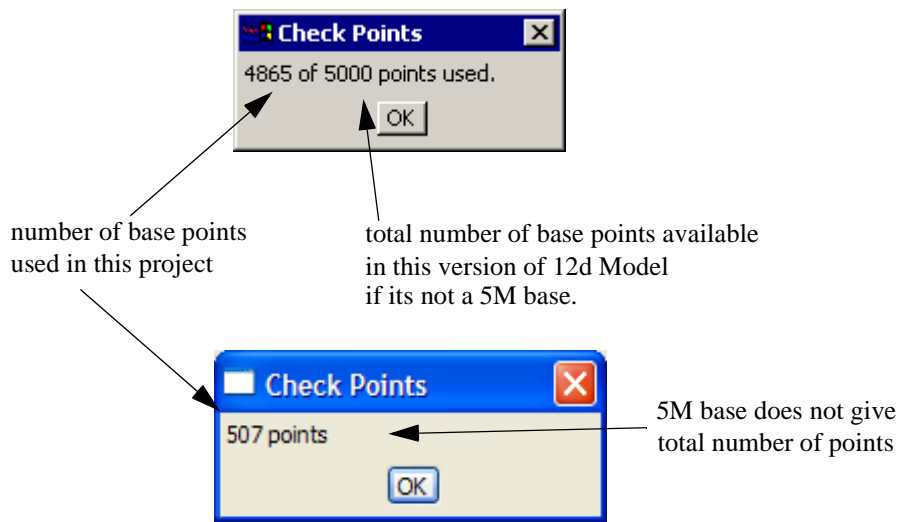

check_points

Position of option on menu: Project =>Check base points

The **Check points** option gives the number of *base* points used in the project and the total number of base points available in the customers version of 12d Model.

Note that not all vertices in all strings are "base" points and count towards the number of base points. For example, vertices in contours generated by the **Contour** option do not count as base points. The vertices of strings created when plotting to a model are also not counted as base points.

On selecting **Check points** from the **Projects** menu, the **Check Base Points** panel is displayed.

Details

project_details

Position of menu: Project =>Details

A project description and project details can be defined.

The **Project details** walk-right menu contains various projection items.

display/modify the project description
display/modify the project details

For the option *Description*, go to the section “Description”

Details

“Details”

The options in the menu will now be described.

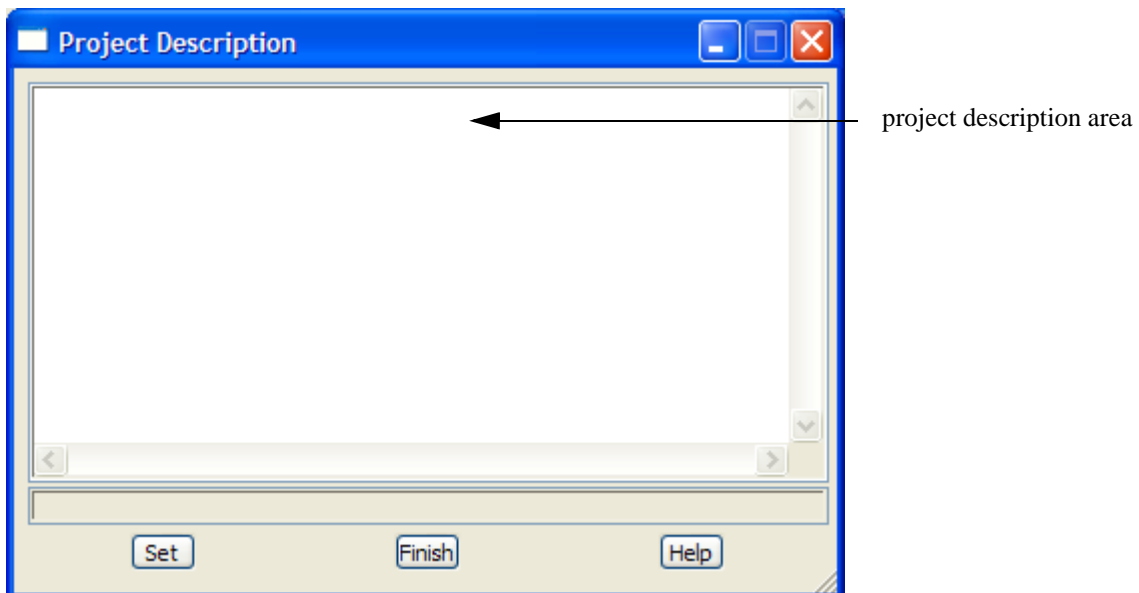

Description

project_description

Position of option on menu: Project =>Details =>Description

The **description** option is used to create and edit the project description.

On selecting the **Description** option, the **Project Description** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Project description area	input		
---------------------------------	-------	--	--

the description for the project to be rebuilt. The description can be more than one line long.

Set	button		
------------	--------	--	--

set the project description.to be the text in the project description area.

Note: This panel a resizable panel.

Details

[enter_project_details](#)

Position of option on menu: Project =>Details =>Details

The **Details** option is used to enter project details.

On selecting the **Details** option, the **Enter Project Details** panel is displayed.

What information is to be entered into the **Enter Project Details** panel is defined in the option

Project =>Management =>Details editor - go to "Details Editor"

The fields and buttons used in the **Enter Project Details** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

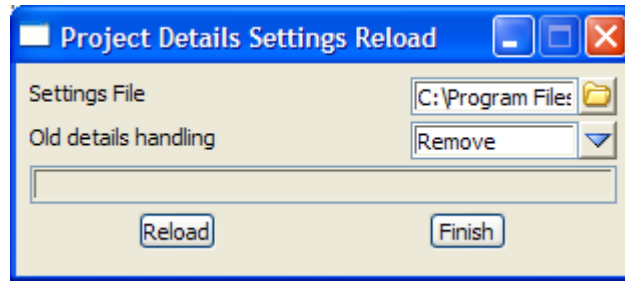

Set	button		
------------	--------	--	--

set the project details to the values show in the panel. The values are stored as project attributes.

Load	button		
-------------	--------	--	--

*brings up the **Projects Details Setting Reload** panel that is used to load a new definition of project detail attributes.*

[project_details_settings_reload](#)

*A file defining a new set of project attributes of project details can be loaded. How existing project details are handled depends on the value of **Old details handling***

Old details handling

Remove - all existing project detail attributes are removed and totally replaced by the new set

Keep (no update) - any existing project detail are kept but their values **are not** updated by the default setting if the same attribute exists in the Settings file.

Keep (with update) - any existing project detail are kept and their values **are updated** by the default setting if the same attribute exists in the Settings file.

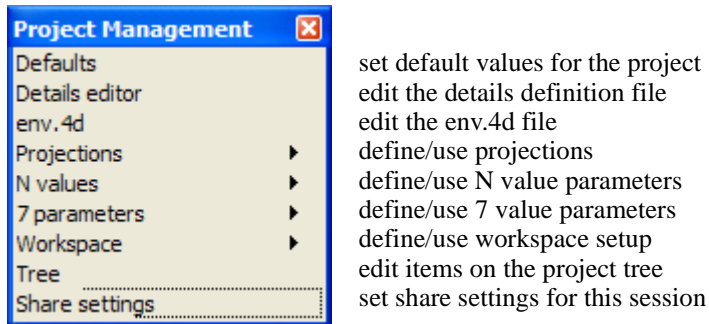

Management

project_management

Position of menu: Project =>Management

Options to set up the project

The **Project management** walk-right menu contains various projection items.

For the option *Defaults*, go to the section “Defaults”

<i>Details editor</i>	“Details Editor”
<i>env.4d</i>	“env.4d”
<i>Projections</i>	“Projections”
<i>N Values</i>	“N values”
<i>7 Parameters</i>	“7 Parameters”
<i>Workspace</i>	“Workspace”
<i>Tree</i>	“Tree”
<i>Share settings</i>	“Share Settings”

The options in the menu will now be described.

Defaults

defaults

Position of option on menu: Project =>Management =>Defaults

The **Defaults** option allows the user to view and modify many of the default values used in the current 12d Model project.

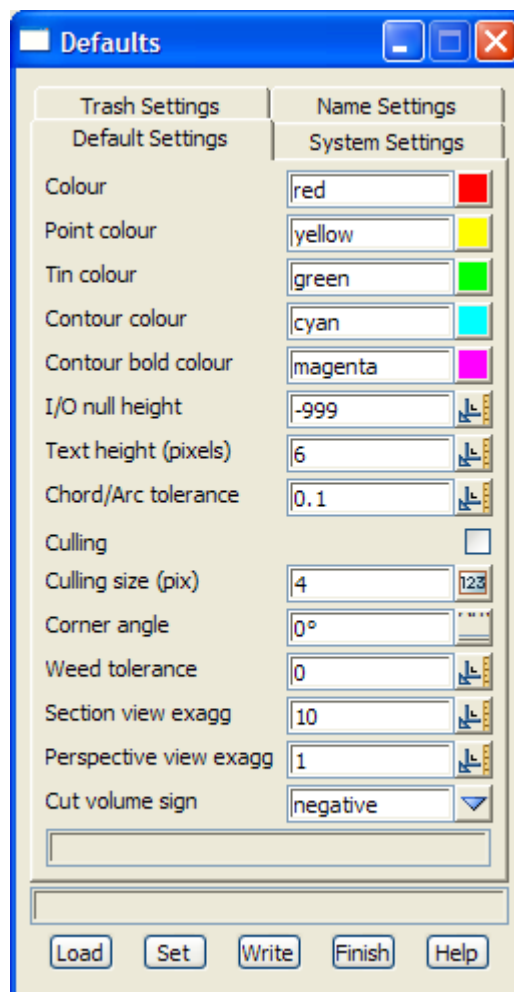

NOTE - The values in the default option panels are initially set for a new project by the values in the **defaults.4d** file. For more information on the defaults.4d file, go to the section “Defaults” in the Appendix “Set Ups”

Any changes made in the **Defaults** panel are used in the current session for the project when the **Set** button is pressed. The values are only **saved** for the project if a *Project =>Save* is done after the **Set**.

The **Defaults** panel consists of tabs for the groups of settings *Defaults*, *System*, *Trash* and *Name*.

Default Settings Tab

On selecting the **Default Settings** tab, the **Default Settings** are displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Colour <i>the name of the current default colour used for line strings.</i>	colour box	default colour	available colours
Point colour <i>the current default colour used for point strings.</i>	colour box	def point colour	available colours
Tin colour <i>the default tin colour used in the triangulate model and view panels.</i>	colour box	def tin colour	available colours
Contour colour <i>the default contour colour used in the contour panel.</i>	colour box	def cont colour	available colours
Cont bold colour <i>the default contour bold colour is used in the contour panel.</i>	colour box	def cont index col	available colours
I/O null height <i>this field contains the value of the value recognised as a null height when reading in and writing out data.</i>	input	-999.0	
Text height (pixels) <i>the default text height used in the sewer option and other panels.</i>	input	8	
Chord/Arc tolerance <i>the maximum value of a chord to arc distance. If this distance is exceeded when approximating curves by chords, extra points are inserted into the curve so that the chords all have chord/arc distances less than this value. A value of zero disables the chord/arc test.</i>	input	0.1	
Culling <i>the culling setting for any new perspective or plan views.</i>	tick box		
Culling size (pix) <i>the culling size for any new perspective or plan views.</i>	input	5	
Corner angle <i>when applying templates or calculating interfaces along a string, extra sections may be required at string vertices with no horizontal curve on them. If the corner angle is non-zero, extra sections are added in at multiples of the corner angle value for the plan angle at the vertex.</i>	input	15	
Weed tolerance <i>if two points on a string (with the same bearing) are closer than this distance then the second point is left out. This applies to the extra points added in at chainage points in interfacing and corner angles.</i>	input	0	
Section view exagg <i>the vertical exaggeration used for any new section views.</i>	input	10	
Perspective view exagg <i>the vertical exaggeration of any new perspective.</i>	input	1	
Cut volume sign <i>the sign (positive or negative) used for cut volumes and areas. The sign for fill is the opposite.</i>	choice box	negative	negative, positive
Load <i>read the default values from the current default.4d file for the project. The values are not used for the project until the Set button is pressed. The values are not saved for the project until a 'Project =>Save' is done after the Set.</i>	button		
Set <i>when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a 'Project =>Save' is done after the Set.</i>	button		

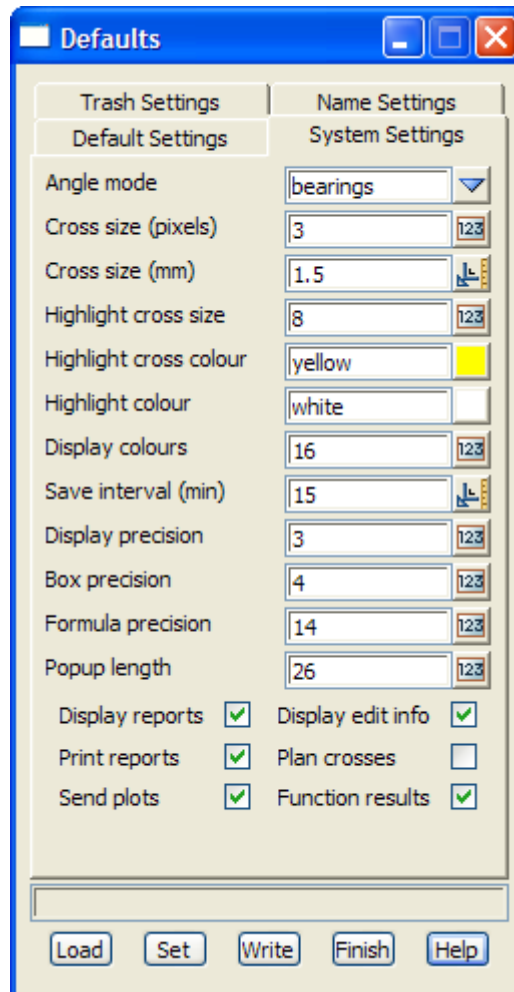

Write button

write the values in the panel to the defaults.4d file.

The values are not used for the project until the **Set** button is pressed. The values are not saved for the project until a 'Project =>Save' is done after the **Set**. For more information on the **Write** button, go to the section "Writing Set Up Files" in the Appendix "Set Ups".

Systems Settings Tab

On selecting the **System Settings** tab, the **System Settings** are displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Angle mode	choice box	bearings	cartesian, bearings
<i>specifies whether bearings or cartesian angles are used in reporting the instantaneous direction of the selected string in the information menu.</i>			
Cross size (pixels)	input/output	2	
<i>the size in pixels that crosses (for points etc.) are drawn on the screen.</i>			
Cross size (mm)	input/output	2.5	
<i>the size in millimetres that crosses (for points etc.) are drawn on any plots.</i>			
Highlight cross size	input/output	8	
<i>the size in pixels of the cross used for highlighting objects in views.</i>			

Highlight cross colour	colour box	yellow	available colours
	<i>the colour of the cross used for highlighting objects in views.</i>		
Highlight colour	colour box	white	available colours
	<i>the colour used to display objects in views when they are highlighted.</i>		
Display colours	input/output	0	
	<i>the number of colours from the top of the colour map file, colour_map.def, that are displayed in a colour pop-up. If 0, all colours are displayed.</i>		
Save interval (min)	input/output	5	
	<i>the number of minutes that elapse after a save before the save project reminder panel comes up. If 0, the panel never comes up.</i>		
Display precision	input/output	3	
	<i>the number of decimal places used for values displayed in the information menus.</i>		
Box precision	input/output	4	
	<i>the number of decimal places used for values displayed in boxes and panels.</i>		
Popup length	input/output	28	
	<i>the maximum number of items in a pop-up before breaking the pop-up into walk-rights.</i>		
Display reports	tick box	tick	
	<i>if tick, as soon as a report is produced, it will be displayed in the editor defined by the environment variable, EDITOR_4D.</i>		
Display edit info	tick box	tick	
	<i>if tick, the edit info panel is automatically displayed whenever a string is created or edited.</i>		
Print reports	tick box	tick	
	<i>if tick, as soon as a report is produced, it will be passed to the script/program defined by the environment variable, PRINTER_4D.</i>		
Send plots	tick box	tick	
	<i>if tick, as soon as a plot is produced, it will be passed to the script/program defined by the environment variable, PLOTTER_4D.</i>		
Plan crosses	tick box		
	<i>This option is experimental - at the moment things will look messy when editing in a section view with plan crosses turned on.</i>		
	<i>if tick, when the cursor is in a plan or perspective view, it is projected onto any section views as well.</i>		
Function results	tick box	tick	
	<i>if tick, function results such as volumes will be displayed on the screen every time a recalc is done.</i>		
	<i>if not tick, no function results as displayed on a function recalc.</i>		
Load	button		
	<i>read the default values from the current default.4d file for the project. The values are not used for the project until the Set button is pressed. The values are not saved for the project until a 'Project =>Save' is done after the Set.</i>		
Set	button		
	<i>when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a 'Project =>Save' is done after the Set.</i>		
Write	button		
	<i>write the values in the panel to the defaults.4d file.</i>		
	<i>The values are not used for the project until the Set button is pressed. The values are not saved for the project until a 'Project =>Save' is done after the Set. For more information on the Write button, go to</i>		

the section “Writing Set Up Files” in the Appendix “Set Ups”

Trash Settings Tab

On selecting the **Trash Settings** tab, the **Trash Settings** are displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Trash mode	choice box	trash string	keep string, trash string, delete string

In many string options, new strings are created from existing strings. What happens to the original strings may be determined by the trash mode.

*If set to **keep string**, the original strings will not be touched*

***trash string**, the original strings will be moved to the trash model*

***delete string**, the original strings will be deleted.*

Trash model	model box	Trash Model	available models
--------------------	-----------	-------------	------------------

the model that trashed strings are put into. This model needs to be cleaned or deleted to permanently remove the strings.

Load	button
-------------	--------

*read the default values from the current default.4d file for the project. The values are not used for the project until the **Set** button is pressed. The values are not saved for the project until a 'Project =>Save' is done after the **Set**.*

Set	button
------------	--------

*when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a 'Project =>Save' is done after the **Set**.*

Write button

write the values in the panel to the defaults.4d file.

*The values are not used for the project until the **Set** button is pressed. The values are not saved for the project until a 'Project =>Save' is done after the **Set**. For more information on the **Write** button, go to the section "Writing Set Up Files" in the Appendix "Set Ups"*

Names Settings Tab

On selecting the **Name Settings** tab, the **Name Settings** are displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Names	input		*.mf files
<i>name of the mapping file used as the default name mapping file.</i>			

Load button

*read the default values from the current default.4d file for the project. The values are not used for the project until the **Set** button is pressed. The values are not saved for the project until a 'Project =>Save' is done after the **Set**.*

Set button

*when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a 'Project =>Save' is done after the **Set**.*

Write button

write the values in the panel to the defaults.4d file.

*The values are not used for the project until the **Set** button is pressed. The values are not saved for the project until a 'Project =>Save' is done after the **Set**. For more information on the **Write** button, go to the section "Writing Set Up Files" in the Appendix "Set Ups".*

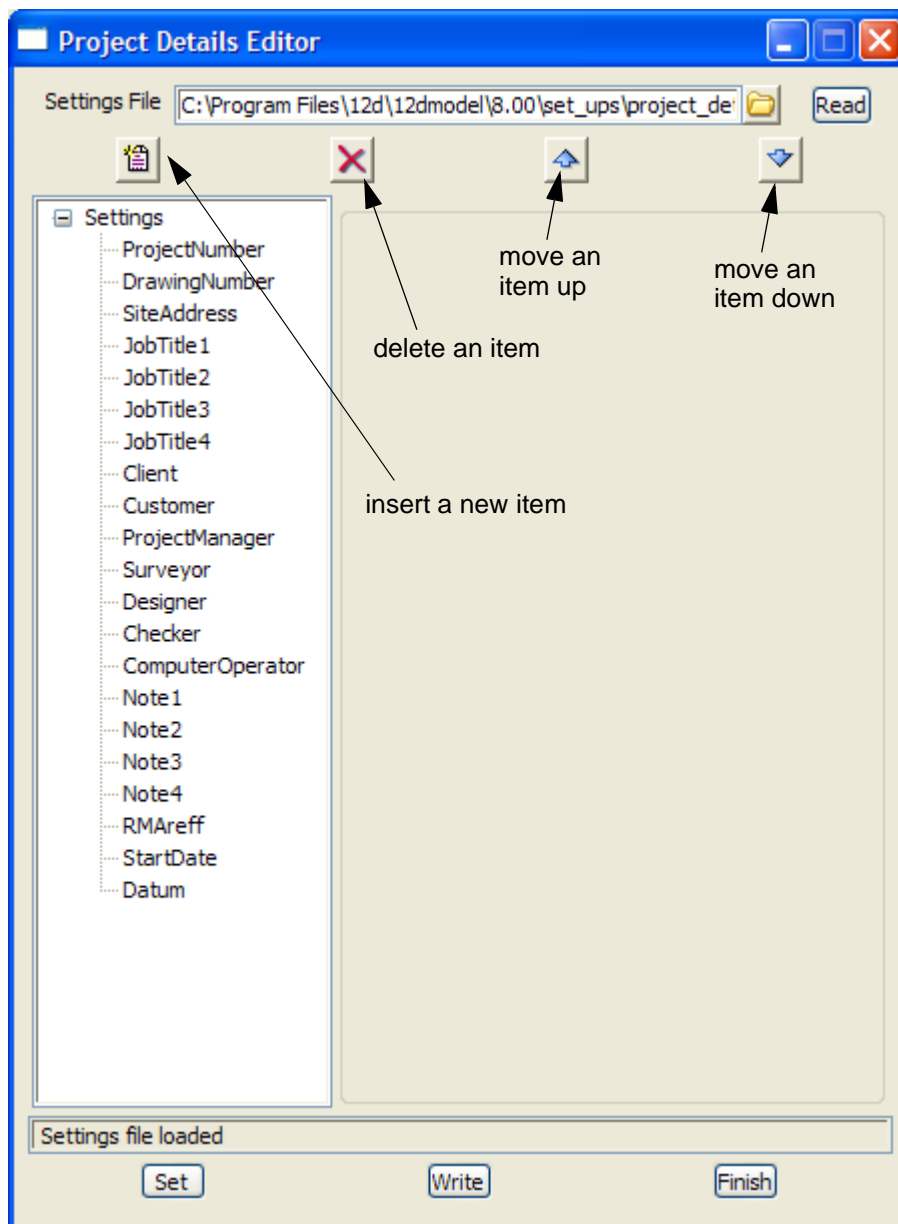

Details Editor

`project_details_editor`

Position of option on menu: **Project =>Details =>Management =>Details editor**

The **Details Editor** option creates the files used to define the project attributes displayed in the **Project Details** panel.

On selecting the **Details Editor** option, the **Project Details Editor** panel is displayed.

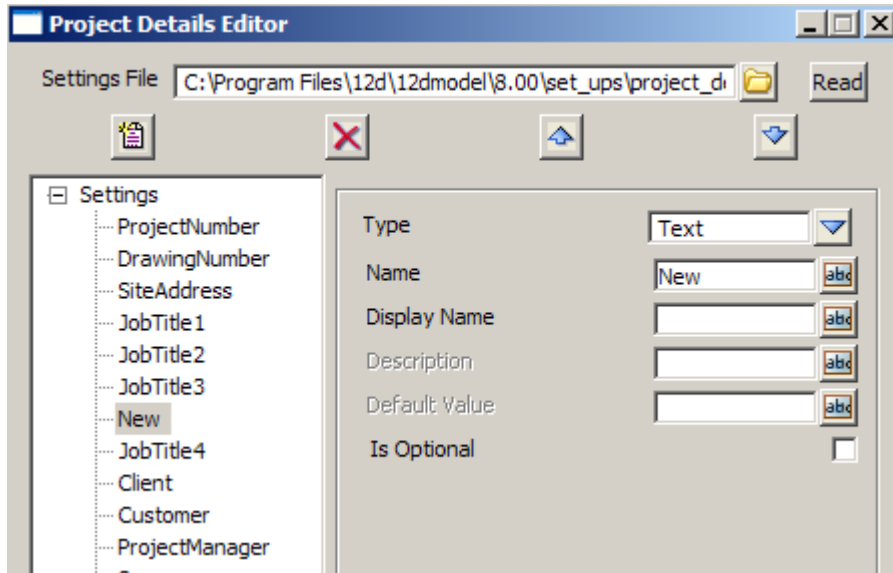

The items defined in the **Project Details Editor** panel can be of type Text (e.g. fred), Integer (e.g. 11) or Real (e.g. 23.15).

The fields and buttons used in the **Enter Project Details** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Set <i>the values in the panel are set as the project details setup</i>	button		
Write <i>writes out a project details file.</i>	button		

When inserting a new "detail", the following is displayed

|

Field Description	Type	Defaults	Pop-Up
Type <i>the detail can be text, an integer or a real value</i>	choice box	Text	Text, Integer, Real
Name <i>name of the project attribute used to store the detail</i>	input		
Display name <i>name to appear in the Enter Project Details panel</i>	input		
Description <i>description that appears when the Display name is clicked in the Enter Project Details panel</i>	input		
Default value <i>default value for the detail</i>	input		
Precision <i>only for Type Real - number of decimal places</i>	integer box		
Is optional <i>if tick, then the detail does not have to be filled in. If not tick, it is compulsory to fill in the detail in the Enter Project Details panel before leaving the panel.</i>	tick box	tick	

env.4d

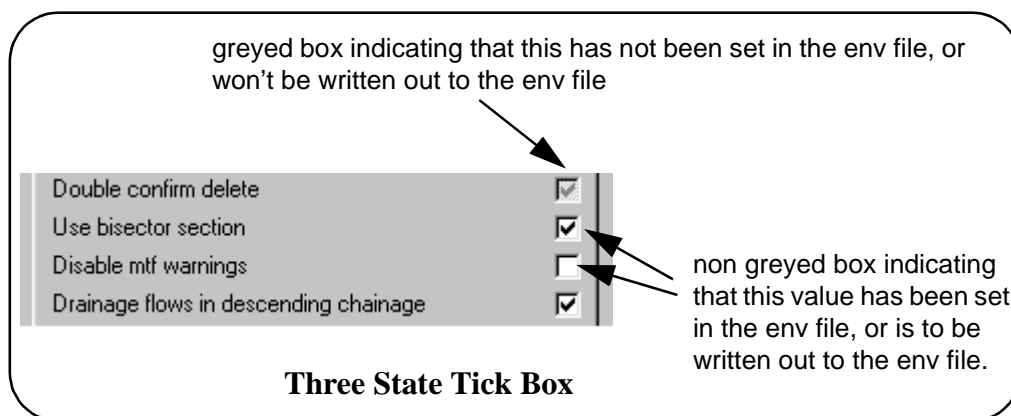

edit_environment_variables

Position of option on menu: Project =>Management =>env.4d

The **env.4d** option is used to create/update the *env.4d* file of environmental variables.

When the option is selected, it reads in the *current* env.4d file and displays in the panel, the values for any environment variables **in the file**. Hence the panel shows the values for the environment variables *in the file*, not those that are not in the file and have default values set by 12d Model.

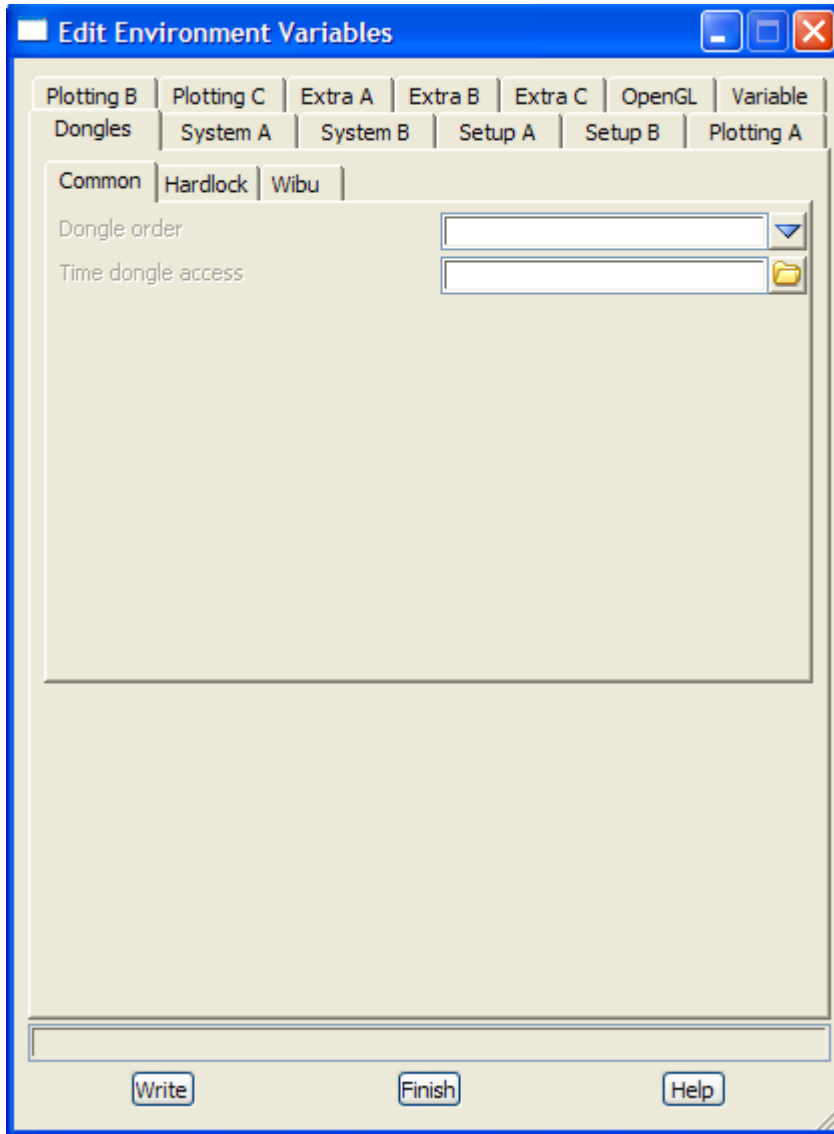

Hence the tick boxes in the *Edit Environment Variables* panel have three states rather than the standard two states. There is the standard tick or nothing to denote the value of the variable is set from the env file (or is going to be written out to the env file) or a greyed out tick or greyed out blank box to indicate that the value has *not* been set by the environment variable. Clicking on the tick box will toggle between the three states - on, off and no value.

After any modifications are made, the parameters are written out to an env.4d file.

Note that the *env.4d* file is only used when a project is loaded so the parameters written to an *env.4d* file can only take affect for the current project if a project **restart** is done.

On selecting the **env.4d** option, the **edit environmental variables** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Write	button		

*write the values in the panel to a file. For more information on the **Write** button, go to the section "Writing Set Up Files" in the Appendix "Set Ups"*

Note - the *env.4d* file is only used when a project is loaded so the parameters written to the *env.4d* file will only take affect for the current project if a project **restart** is done.

For more information on the variables on the tab *Dongles*, go to the "Dongles tab"

<i>System A</i>	"System B tab"
<i>System A</i>	"System B tab"
<i>Setup A</i>	"Setup A tab"
<i>Setup B</i>	"Setup B tab"
<i>Plotting A</i>	"Plotting A tab"
<i>Plotting B</i>	"Plotting B tab"
<i>Plotting C</i>	"Plotting C tab"
<i>Extra A</i>	"Extra A tab"

<i>Extra B</i>	“Extra B tab”
<i>Extra C</i>	“Extra C tab”
<i>OpenGL</i>	“OpenGL tab”
<i>Variable</i>	“Variable tab”

The environment variables are described in more detail in the section “Environment Variables” of the Appendix “Set Ups” .

Dongles tab

Common tab

Dongle order	DONGLE_ORDER_4D	Hardlock/Wibu, Wibu/Hardlock
		<i>order to search for network dongles</i>
Time dongle access	DEBUG_DONGLE_ACCESS_4D	
		<i>time between searches for a dongle</i>

Hardlock tab

User hardlock dongle	HARDLOCK_4D	tick box
		<i>if tick, search for 12d Hardlock dongles</i>
		<i>If no tick, don't search for Hardlock dongles</i>

Local	local, no local
	<i>if local, then a single user Hardlock dongle is looked for on the computer</i>
	<i>If no local, then no single user Hardlock dongle is looked for on the computer</i>

Network	no network, network first, network last
	<i>if no network, then no Hardlock network dongle is looked for.</i>
	<i>If network first, then a Hardlock network dongle is looked for before a single user local dongle.</i>
	<i>If network last, then a Hardlock network dongle is looked for after looking for a single user local dongle.</i>

Login retries

number of retries to find a Hardlock dongle

Login wait

time in seconds to wait between Hardlock dongle retries

Disable dongle	tick box
	<i>if tick, don't search for a Hardlock dongle</i>
	<i>if no tick, search for a Hardlock dongle</i>

Debug dongle	tick box
	<i>if tick, write out Hardlock dongle debug information</i>

Hardlock IP/Name addresses

*if **non blank**, a list of IP addresses and/or computer names to search for a 12d Hardlock network dongle.*

*If **blank**, search the entire network for a 12d Hardlock network dongle*

Wibu tab

User hardlock dongle	WIBU_4D	tick box
		<i>if tick, search for 12d Wibu dongles</i>
		<i>If no tick, don't search for 12d Wibu dongles</i>

Local	local, no local
<i>if local, then a single user Wibu dongle is looked for on the computer</i>	
<i>if no local, then no single user Wibu dongle is looked for on the computer</i>	
Network	no network, network first, network last
<i>if no network, then no Wibu network dongle is looked for.</i>	
<i>if network first, then a Wibu network dongle is looked for before a single user local dongle.</i>	
<i>if network last, then a Wibu network dongle is looked for after looking for a single user local dongle.</i>	
Login retries	
<i>number of retries to find a Wibu dongle</i>	
Login wait	
<i>time in seconds to wait between Wibu dongle retries</i>	
Disable dongle	tick box
<i>if tick, don't search for a Wibu dongle</i>	
<i>if no tick, search for a Wibu dongle</i>	
Debug dongle	tick box
<i>if tick, write out Wibu dongle debug information</i>	
Hardlock IP/Name addresses	
<i>if non blank, a list of IP addresses and/or computer names to search for a 12d Wibu network dongle.</i>	
<i>if blank, search the entire network for a 12d Wibu network dongle</i>	
System A tab	
Text editor	EDITOR_4D
<i>the script or program that is fired up when a report is created. It usually points to an editor.</i>	
Genio wildcard	GENIO_WILDCARD_4D
<i>Sets the ending of the files selected for the pop-up list for the File field in the Read Genio Data panel.</i>	
Degrees character	DEGREES_CHARACTER_4D
<i>The integer (base 10) value of the character to use as the degrees symbol.</i>	
Pre*postfix for model for tin	MODEL_FOR_TIN_PREFIX_4D
<i>Customize the default model for the tin in the panels for creating triangulations.</i>	
Amount of report header	REPORT_HEADER_4D
<i>Controls the amount of header information in reports.</i>	
Typed units mode	TYPED_UNITS_MODE_4D
<i>Controls the typed input units for feet - international and/or US.</i>	
Default table width	DEFAULT_TABLE_WIDTH_4D
<i>Gives the number of characters displayed in tables such as decisionals and mtf editor.</i>	
Default view colour	DEFAULT_VIEW_COLOUR_4D
<i>The default background colour for views.</i>	
Double confirm delete	DOUBLE_CONFIRM_DELETE_4D
<i>Controls whether the user is asked once or twice to confirm for deletes and cleans.</i>	
Use bisector section	BISECTORS_4D
<i>At a HIP with no curve on it, either two sections can be applied at the HIP point or just a single bisector section applied to the bisector of the change of angle through the HIP.</i>	

- Disable mtf warnings** `DISABLE_MTF_WARNINGS_4D`
Controls whether the mtf warnings go to a file or to the output window.
- Drainage flows in descending chainage** `DRAINAGE_FLOW_DIR_4D`
Defines the default flow direction used in the creating a drainage string.
- Plan table settings** `PLAN_TABLE_SETTINGS_4D`
Defines the default flow direction used in the creating a drainage string.
- Zoom origin dynamic** `ZOOM_ORIGIN_DYNAMIC_4D`
Controls the origin of the dynamic zoom.
- Zoom pan dynamic** `ZOOM_PAN_DYNAMIC_4D`
If set then dynamic pan is the default for the pan options.
- Data tool tips** `DATA_TIPS_4D`
If set then turn on data tool tips.
- Icons on views** `VIEW_BITMAP_BUTTONS_4D`
If set then icons are used for the menu items on views.
- Use new strings create** `NEW_STRING_CREATES_4D`
*If set then the string creates are for super strings.
 If not set, the string creates are the non-super string creates.*

System B tab

- Delete walkrights distance** `AUTO_DELETE_WALKRIGHTS_4D`
The distance in pixels that is used to collapse the cascade of walk-right menus when the cursor moves that distance past the end of the last walk-right menu.
- Drag reset distance** `AUTO_RESET_SELECT_DRAG_TOLERANCE_4D`
The distance in pixels to move the cursor to reset the picking rejection list for a directional pick. If blank then the value 50 is used.
- Reset distance** `AUTO_RESET_SELECT_TOLERANCE_4D`
The distance in pixels to move the cursor to reset the picking rejection list for a non-directional pick. If blank then the value 5 is used.
- Weed Tolerance** `WEED_TOLERANCE_4D`
Used in Alignment and Super strings so that when arcs have been chord-to-arc'd, the resulting points are weeded so that no point is closer than the weed tolerance. Is also used in Apply and Apply Many so that no cross sections are closer than the weed tolerance.
- Polyline draw** `POLYPOLYLINES_4D`
Different methods that speed up drawing of polylines.
- Web search** `WEB_SEARCH_4D`
Web address that's used in 12d option "Help =>12d on the Web =>Search the web"
- Recent projects** `RECENT_PROJECTS_4D`
Maximum number of accessed projects displayed in the Project list when 12d Model first starts up.
- Plan plot scale** `DEFAULT_PLAN_PLOT_SCALE_4D`
Default plot scale used on any plan views.
- Toolbars file** `TOOLBARS_4D`
The file of toolbar definitions and names.

Textstyle favourites file TEXTSTYLE_MAPPINGS_4D

The file of textstyle favourites.

Nodes file AUTHORIZATION_4D

The authorisation file (nodes.4d file).

Show full path name SHOW_PATHS_4D

When 12d Model fires up the actual file names defined by any environment variables are written to the output window. This is useful for debugging.

Show Vista full path name SHOW_VISTA_VIRTUAL_STORE_PATHS_4D

For Microsoft Vista, when 12d Model fires up the actual file names defined by any environment variables are written to the output window. This is useful for debugging.

Only use super string USE_SUPER_STRINGS_4D

If set, super strings are created by all options.

Enable undo UNDO_4D

Allow Undos.

Tin viewport clip TIN_VIEWPORT_CLIP_4D

Ignore extra tabs in field files FLD_IGNORE_EXTERA_WORDS_4D

If set, trailing tabs are not considered words in a field file. Mainly for Leach when it can't suppress trailing tabs when writing a 12d Field file.

Alignment VG Corridor fixup ALIGNMENT_CORRIDOR_FIXUP_4D

Autopan on selects AUTO_PAN_SELECT_4D

Setup A tab

Autocad template folder ACAD_SEEDFILES_4D

Folder of Autocad template files.

Microstation seed folder MS_SEEDFILES_4D

Folder of Microstation seed files.

CivilCAD folder CIVILCAD_PATH_4D

Folder of CivilCAD files.

TP Stakeout folder TP_STAKEOUT_PATH_4D

Folder of TP Stakeout files.

Xtra menu file EXTRA_OPTIONS_4D

The 12D Solutions supplied file of definitions for some menus.

Data collectors file DATA_COLLECTORS_4D

File defining the available data collectors.

Data collector DATA_COLLECTOR_4D

The data collector that is used in the Survey Data Setup panel or to use if no data collector has been set for a project.

Station prefix STATION_PREFIX_4D

The default prefix to use in the Survey Data Setup panel or to use if prefix has been set for the project.

Fonts file FONT_4D

The file of text fonts to use.

Function keys file	FUNCTION_KEYS_4D
	<i>The file of function key definitions.</i>

- New project workspace file** WORKSPACE_FILE_4D
Full path name of the workspace file for new projects.
- New project details file** PROJECT_DETAILS_4D
Full path name of the project details file for new projects.
- Report files in non Unicode format** ANSI_REPORTS_4D
If set, report files are written out in ANSI from Unicode versions of 1'2d.

Plotting A tab

- Use V7 Title blocks** V7_TITLE_BLOCKS_4D
Use 12d ascii for title block definitions instead of old .tf files.
- Show title variables** SHOW_TITLE_VARIABLES_4D
For debugging the title block file.
- Binary drainage plan parameter file** NEW_DRAINAGE_PLAN_PPF_4D
Default binary drainage plan ppf file.
- Binary Melbourne Water parameter file** NEW_DRAINAGE_MELB_PPF_4D
Default binary drainage plan ppf file.
- Binary drainage parameter file** NEW_DRAINAGE_PPF_4D
Default binary drainage long section ppf file.
- Binary pipeline parameter file** NEW_PIPELINE_PPF_4D
Default binary pipeline long section plot ppf file.
- Binary plot frame parameter file** NEW_PLOT_FRAME_PPF_4D
Default binary plot frame ppf file.
- Binary long section parameter file** NEW_LONG_SECTION_PPF_4D
Default binary long section ppf file.
- Binary x- section parameter file** NEW_X_SECTION_PPF_4D
Default binary x-section ppf file.
- Symbol file for long and x-sections** PLOT_SYMBOLS_4D
Default plot symbols file.
- Plotter script** PLOTTER_4D
Points to a script or program which is fired up whenever a plot is generated.
- User plotters** PLOTTERS_4D
File containing the definitions of plotters.
- Plotter mapping file** PLOTTER_MAPPING_4D
The default plotter mapping file.
- Sheet sizes file** SHEET_SIZES_4D
File defining the plot sheet sizes.
- DGN plot seed file** DGN_PLOT_SEED_FILE_4D
Seed file to use for Microstation plots.
- DWT plot template file** DWG_PLOT_SEED_FILE_4D
Template file to use for AutoCAD plots.

Acad plot unit DWG_PLOT_UNIT_FILE_4D Metric, English

Plotting B tab

Use hardware arcs HARDWARE_ARCS_4D

Use computer hardware to draw arcs (rather than software).

Write all plot parameters WRITE_ALL_PLOT_PARAMETERS_4D

Controls whether all plot parameters are written out or just those that have been used in the ppf file.

Show old plotting options ALLOW_OLD_PLOTTING_4D

If set then a menu with all the old Ascii plot files is displayed.

Offset chainages to output window SPECIAL_OFFSET_CHAINAGES_4D

X-section parameter file X_SECTION_PPF_4D

Default x-section ascii ppf file.

Long-section parameter file LONG_SECTION_PPF_4D

Default long section ascii ppf file.

Drainage-parameter file DRAINAGE_PPF_4D

Default drainage long section ascii ppf file.

Melbourne Water parameter file SEWER_PPF_4D

Default Melbourne Water long section ascii ppf file.

*This is mainly used for setting environment variables that are not already in the **Edit Environment Variables** panel.*

Projections

project_projections

Position of menu: Project =>Management =>Projections

User defined Projections can be defined using the Create/edit option. A user defined projection can then be set for the project (the project projection). Values from the project projection (e.g. scale factor) are used in various options.

The **Project projections** walk-right menu contains various projection items.

set the default projection for the project
create/edit project definitions
delete a project definition
reset the projection set for the project

For the option *Set*, go to the section "Set Projection" .

<i>Create/edit</i>	"Create/Edit Projection" .
<i>Delete</i>	"Delete Projection" .
<i>Reset</i>	"Reset Projection" .

The options in the menu will now be described.

Set Projection

set_projection

Position of option on menu: Project =>Management =>Projections =>Set

The Set option sets the Project projection.

On selecting the Set option, the **Set Projection** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum name	input	all defined projections	

name of the projection to be set as the Project projection.

Depending on the projection type, the relevant projection parameters are displayed.

Set	button
------------	--------

after selecting this button, the current projection is set using the displayed values. These values are used for subsequent calculations in the project

Create/Edit Projection

[create_edit_projection](#)

Position of option on menu: Project =>Management =>Projections =>Create/Edit

On selecting the Create/edit option, the **Create/edit Projection** panel is displayed.

For more information about terminology used in this sections, see the Appendix “Geodetics Summary” .

Field Description	Type	Defaults	Pop-Up
Datum name	input	all defined projections	

name of the projection to be set as the Project projection.

Projection Type	input	Transverse Mercator, UTM
------------------------	-------	--------------------------

RSO, General

the type of projection to be set as the Project projection.

For more information on defining a "general" projection, please go to “Defining a General Cartographic Projection”

Depending on the projection type, the relevant projection parameters can be entered.

Use known ellipsoid tick box tick

if **tick**, the ellipsoid for the projection has been defined previously and the parameters for the particular ellipsoid can be used. The values of defined ellipsoids are displayed when a selection is made from the ellipsoid pop-up box (e.g. GRS80).

if **no tick** then the ellipsoid parameters can be defined by entering the ellipsoid parameters.

Add/Modify button

after selecting this button, the user defined projection is added to the current list or the existing projection definition is modified. using the entered values. A number of new projections can be added by simply entering the relevant data and selecting the add/modify button.

Write button

after selecting this button, the user defined projections defined by the add/modify process can be written in various locations. This means that the defined projections will be allowed to be set in current and future projects. For more information on the **Write** button, go to the section "Writing Set Up Files" in the Appendix "Set Ups"

Defining a General Cartographic Projection

A general *cartographic projection* is defined by giving a series of parameters starting with the mandatory **+proj** parameter giving the projection type. For example,

+proj=projection_type e.g. **+proj=tmerc** or **+proj=utm**

To specify the Earth's elliptical figure used in the projection, two parameters are required.

The first required value is the **major semi-axis** of the ellipse or equatorial radius,

major semi-axis of the ellipse **+a= value**

and the second parameter can be any one of the following standard forms:

minor semi-axis of the ellipse **+b= value**
 flattening **+f= value**
 reciprocal flattening (i.e. 1/f) **+rf= value**
 eccentricity **+e= value**
 eccentricity squared) **+es= value**

For example, the Australian National Spheroid (ANS) is defined by:

+a=6378160
+rf= 298.25

GRS80 is defined by:

+a=6378137
+rf= 298.257222101

WGS84 is defined by:

+a=6378137
+rf= 298.257223663

A further three parameters are common to most projections:

the **central meridian** **+lon_0=value**, and the cartesian offsets for the respective x and y axis, **+x_0=value**, **+y_0=value** (often referred to as false easting and northing).

central meridian **+lon_0= value** units in **decimal**
degrees

x offset- false easting **+x_0=value**
 y offset - false northing **+y_0=value**

A fourth parameter, **+lat_0=value**, is used to designate a central parallel and associated y axis origin for a projection.

Unless a value is specified for the parameters lon_0, lat_0, x_0 and y_0, they are assumed to be zero.

Other parameters will depend on the particular projection used.

Transverse Mercator Projection **+proj=tmerc**

project **+proj=tmerc**
scale factor **+k=value**

e.g. Metro-Perth is:

```
+proj=tmerc +a=6378160 +rf=298.25 +lon_0=115.833333333 +lat_0=0.0 +x_0=54466.561
+y_0=3690893.265 +k=1.0
```

Perth Coastal Grid 1984 (PCG84) is:

```
+proj=tmerc +a=6378160 +rf=298.25 +lon_0=115.833333333 +x_0=40000 +y_0=3800000
+k=1.000006
```

Universal Transverse Mercator Projection **+proj=utm**

This is a special form of the Transverse Mercator Projection. The central meridian is constrained to 6 degree intervals starting at 3 degrees. An extra parameter exists called **+zone** where **+zone=1** specifies the region from 180 degree W to 174 degrees W (equivalent to **+lon_0=177** degrees W) and proceeds easterly until **+zone=60** for the region from 174 degree E to 180 degrees E (i.e. **+lon_0=177** degrees E). Hence

+zone=N N = 1, 2,... 60

which automatically defines the central meridian **+lon_0= 6 x N - 183** where N = zone number.

The **+south** option adds a false northing of 10,000,000 m (used for AMG and MGA co-ordinates) for projection in the Southern Hemisphere.

+south defines **+y_0=10000000**

In all cases, for a Universal Transverse Mercator projection, a false easting of 500,000 m is used.

+x_0=500000

Australian Map Grid (AMG84)

The Australian Map Grid is a Universal Transverse Mercator Projection with

- coordinates are in metres
- zones are 6 degrees wide plus overlapping belts of 80 kilometres at each grid junction
- AMG zones are numbered from zone 49 with central meridian 111 degrees E to zone 57 with central meridian 159 degrees E.
- the origin of each zone is the intersection of the central meridian with the equator
- a central scale factor, k, is defined as 0.9996
- a false easting of 500,000 and a false northing of 10,000,000 are used
- uses the Australian National Spheroid **+a=6378160 +rf=298.25**

For example, the definition of AMG zone 50 is:

+proj=utm +south +zone=50 +k=0.9996 + a=6378160 +rf=298.25

Map Grid of Australia (MGA94)

The Map Grid of Australia is a Universal Transverse Mercator Projection with

- coordinates are in metres
- zones are 6 degrees wide plus overlapping belts of 80 kilometres at each grid junction

- (c) MGA zones are numbered from zone 49 with central meridian 111 degrees E to zone 57 with central meridian 159 degrees E.
- (d) the origin of each zone is the intersection of the central meridian with the equator
- (e) a central scale factor, k, is defined as 0.9996
- (f) a false easting of 500,000 and a false northing of 10,000,000 are used.
- (g) uses GRS80 +a=6378137 +rf=298.257222101

For example, the definition of MGA zone 50 is:

+proj=utm +south +zone=50 +k=0.9996 + a=6378137 +rf=298.257222101

Lambert Conformal Conic Projection +proj=lcc

This is a special form of the Conic Projection.

There are two standard parallels **+lat_1** and **+lat_2** and the projection is centred on **+lat_0** and **+lon_0**

For example, a Lambert Conformal Conic Conformal with standard parallels of 15 degrees South and 39 degrees South, centred at 27 degrees South 134 degrees East, with a false origin at that point is 5,000,000m/5,000,000m and using the Australian National Spheroid (i.e. AGD84) is

**+proj=lcc +lat_1=-15 +lat_2=-39 +lon_0=134 +lat_0=-27
+x_0=5000000 +y_0=5000000 +a=6378160 +rf=298.25**

Delete Projection

[delete_projection](#)

Position of option on menu: Project =>Management =>Projections =>Delete

The **Delete** option deleted a projection from the list of available projections.

On selecting the **Delete Projection** option, the **Delete Projection** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum name	input		all defined projections

name of the projection to be deleted from the Project projection list.

Depending on the projection type, the relevant projection parameters are displayed.

Delete button

after selecting this button, the selected projection is deleted from the project projection list.

This can be done for a number of projections by simply selecting the projection to be deleted and selecting the delete button.

Write button

*after selecting this button, the list of projections altered by the delete process can be written in various locations. This means that the updated projections list will be used to set current and future projects. For more information on the **Write** button, go to the section “Writing Set Up Files” in the Appendix “Set Ups”*

Reset Projection

[project_projection_reset](#)

Position of option on menu: Project =>Management =>Projections =>Reset

The **Reset** option is used to remove the projection set for the project.

On selecting the **reset Projection** option, the **Project Projection Reset** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	pop-Up
Current projection	output only		

name of the projection currently set for the project.

Reset button

after selecting this button, the projection for the project is set to none. That is, no project has been set for the Project

N values

project_n_value_settings

Position of menu: Project =>Management =>N values

N values are the separation distances between the geoid and the ellipsoid. In GPS surveys, heights are often given in ellipsoid heights whilst most other level datums are based on the geoid. Since most geodetic calculations are based on the ellipsoid, any observations should be reduced onto the ellipsoid. This reduction process takes into the consideration the heights above the ellipsoid. Therefore, it is necessary to convert non ellipsoid heights to ellipsoid values by adding the geoid-ellipsoid separations (n values). There are various methods for determining the N values.

An N value method can be defined using the Create/edit option. A user defined N value method can then be set for the project (the project N value setting). Values from the project N value settings are used to determine which method is used to calculate N values. These values are used in various options where the level values are not ellipsoid values and require the N value to be added to get to an ellipsoid height.

For more information about terminology used in this section, see the Appendix "Geodetics Summary" .

The **Project n value** walk-right menu contains various projection items.

set the default N-values for the project
create/edit N-values definitions
delete a N-values definition
reset the N-values set for the project

For the option *Set*, go to the section "Set N-Values" .

<i>Create/edit</i>	"Create/Edit N-Values" .
<i>Delete</i>	"Delete N-Values" .
<i>Reset</i>	"Reset N-Values" .

The options in the menu will now be described.

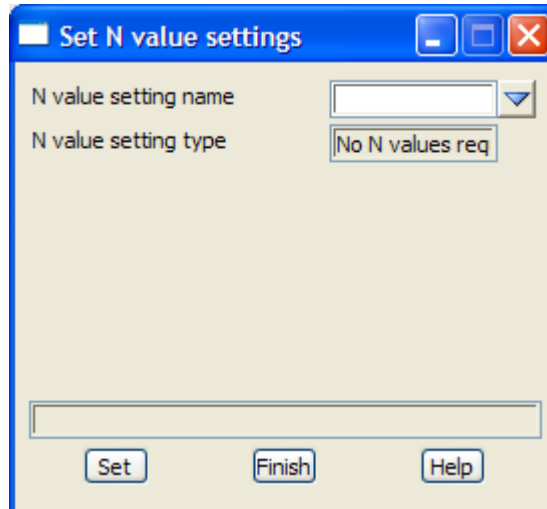

Set N-Values

set_n_value_settings

Position of option on menu: Project =>Management =>N values =>Set

The **Set** option sets the Project projection.

On selecting the **Set** option, the **Set N value settings** panel is displayed.

The fields and buttons used in this panel have the following functions.

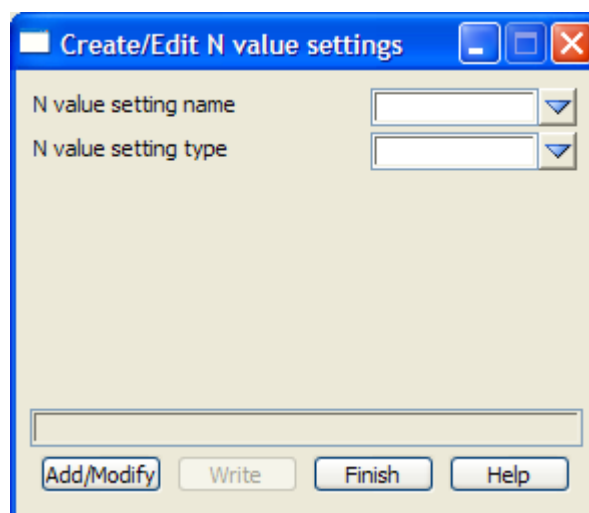

Field Description	Type	Defaults	Pop-Up
N value setting name	choice box		all defined N value settings
<i>name of the n value setting to be set as the Project N value setting.</i>			
N value setting type	input	defined N value types	
<i>Depending on the N value interpolation method, the relevant method is displayed.</i>			
Set	button		
<i>after selecting this button, the current N value setting is set using the displayed values. These values are used for subsequent calculations in the project</i>			

Create/Edit N-Values

[create_edit_n_value_settings](#)

Position of option on menu: Project =>Management =>N values=>Create/Edit

On selecting the Create/edit option, the Create/edit N value settings panel is displayed.

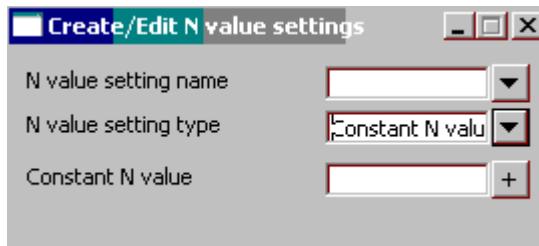

Field Description	Type	Defaults	Pop-Up
N value setting name	choice box		all defined N value settings
<i>name of the n value setting to be set as the Project N value setting.</i>			
N value setting type	choice box	defined N value types	
<i>There are various methods for the determination of the N values. These are given in the choice box:</i>			

Depending on the setting type chosen, the panel will display the appropriate fields.

No N values required: This applies to data that already has ellipsoid heights and requires no interpolation for N values.

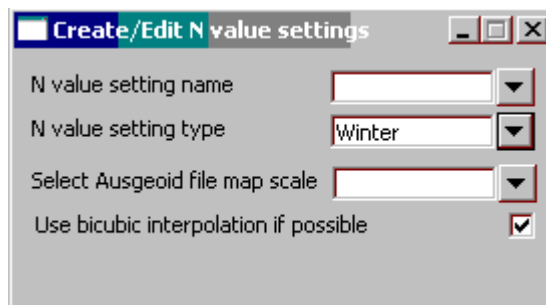

For N value setting type = Constant N value

Field Description	Type	Defaults	Pop-Up
Constant N value	input box		
<i>this N value will be used for the entire n value interpolation process. (i.e. it will not change).</i>			

For N value setting type = Winter

This method uses the same method as the Winter interpolation software supplied by Auslig. The data files used should be winter compatible and reside in a directory that is pointed to by the WINTER_DATA_4D parameter in the env.4d file. The data files can be downloaded from the Auslig website.

Field Description	Type	Defaults	Pop-Up
Select Ausgeoid file map scale	choice box	1:100,000 1:250,000 1:1,000,000	

*this value will be dependant on the type of files to be used by winter. **The files themselves should be in a directory that is pointed to by the WINTER_DATA_4D parameter in the setup area of the env.4d file.***

Use bicubic interpolation if possible tick box

if ticked, the bicubic interpolation method will be used if possible.

For N value setting type = NGS

This method is currently under development.

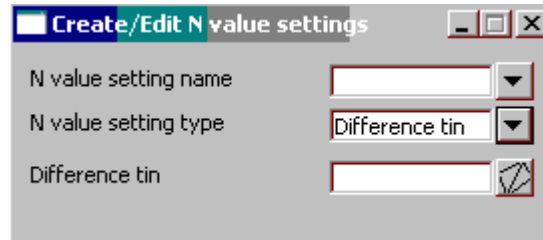

For N value setting type = Plane

This method allows a plane to be defined allowing N values to be derived from that plane.

Field Description	Type	Defaults	Pop-Up
Origin easting	input box		
<i>the origin easting value.</i>			
Origin northing	input box		
<i>the origin easting value.</i>			
Corr constant	input box		
<i>the constant z value of the plane.</i>			
Corr per unit easting	input box		
<i>the z value correction per unit easting.</i>			
Corr per unit northing	input box		
<i>the z value correction per unit nothing.</i>			

For N value setting type = Difference tick box

This method allows value to be interpolated from a difference tin. A difference tin is simply a tin of difference values (N values). This tin can be re-triangulated as new points become available, thus introducing more points than a regular grid.

Field Description	Type	Defaults	Pop-Up
Difference tin	tin box		Available tins
Add/Modify	button		

the difference tin from which the N values will be interpolated.

after selecting this button, the user defined N value settings are added to the current list or the existing N value settings is modified. using the entered values. A number of new settings can be added by simply entering the relevant data and selecting the add/modify button.

Write button

*after selecting this button, the user defined N value settings defined by the add/modify process can be written in various locations. This means that the defined N value settings will be allowed to be set in current and future projects. For more information on the **Write** button, go to the section “Writing Set Up Files” in the Appendix “Set Ups”*

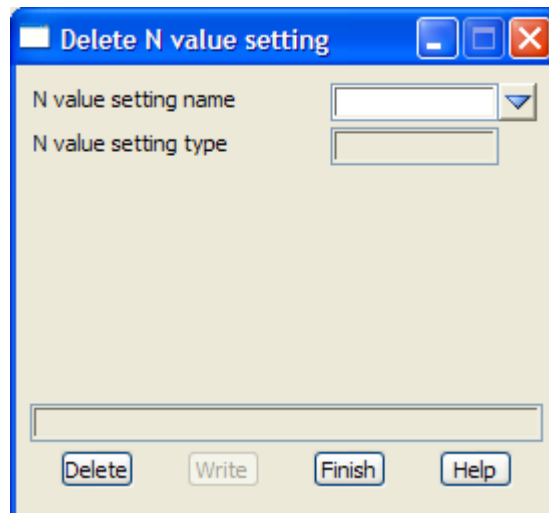

Delete N-Values

Delete_N_value_setting

Position of option on menu: Project =>Management =>N value =>Delete

The **Delete** option deleted a projection from the list of available projections.

On selecting the **Delete** option, the **Delete N value setting** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
N value setting name	input		all defined N value settings
<i>name of the setting to be deleted from the N value setting list. Depending on the setting type, the relevant setting parameters are displayed.</i>			
Delete	button		
<i>after selecting this button, the selected N value setting is deleted from the setting list. This can be done for a number of n value settings by simply selecting the projection to be deleted and selecting the delete button.</i>			
Write	button		
<i>after selecting this button, the list of n value settings altered by the delete process can be written in various locations. This means that the updated n value settings list will be used to set current and future projects. For more information on the Write button, go to the section "Writing Set Up Files" in the Appendix "Set Ups"</i>			

Reset N-Values

Project_N_value_setting_Reset

Position of option on menu: Project =>Management =>N values =>Reset

The **Reset** option is used to remove the projection set for the project.

On selecting the **reset** option, the **Project N value setting reset** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Current N value setting	output only		
<i>name of the n value setting, set for the project.</i>			
Reset	button		
<i>after selecting this button, the N value setting for the project is set to none. That is, no N value setting has been set for the Project</i>			

7 Parameters

[project_7_parameter_settings](#)

Position of menu: Project =>Management =>7 parameters

Seven (7) parameter transformations are used to transform data between two ellipsoids. They are also known as 7 parameter similarity transforms, Bursa-Wolf, 7 parameter Helmert transformations.

Warning: the definition and hence sign of some terms varies between countries.

In 12d Model, the seven parameter similarity transformations are used in the **General Transformation** option *Survey =>Conversions =>General transformations* (see “General Transformations” in the chapter “Survey”) and the transformation is applied in the Global XYZ system.

The **7 parameters** walk-right menu contains options to create and delete seven parameter transformation setting.

create/edit 7 parameter definitions
delete 7 parameter definitions

For the option *Create/edit*, go to the section “Create/Edit 7 Parameters”
Delete “Delete 7 Parameters”

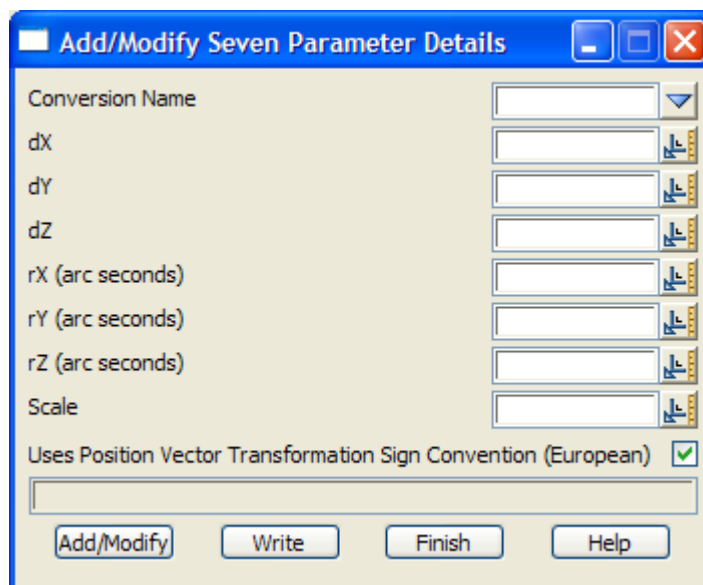

The options in the menu will now be described.

Create/Edit 7 Parameters

[add_modify_seven_parameter_details](#)

Position of option on menu: Project =>Management =>7 parameters=>Create/Edit

On selecting the *Create/edit* option, the **Add/Modify Seven Parameter Details** panel is displayed.

Field Description	Type	Defaults	Pop-Up
Conversion name <i>name of the 7 parameter setting to be created/edited.</i>	choice box		all defined 7 param settings
DX, DY, DZ <i>the translations for the 7 parameter transformation.</i>	input box		
rX (arc seconds), rY (arc seconds), rZ (arc seconds) <i>the rotations, in arc seconds, for the 7 parameter transformation.</i>	input box		
Scale <i>the scale for the 7 parameter transformation.</i>	input box		
Use Position Vector Transformation sign convention (European) <i>if tick, the European Position Vector Transformation convention is used. If not tick, PVT sign is not used (mainly not used for USA). Depending on the sign convention, some of the parameters will have the opposite sign.</i>	tick box		
Add/Modify <i>after selecting this button, either the new 7 parameter set is created or an exiting one modified. To save the setting list, use the Write button.</i>	button		
Write <i>after selecting this button, the user defined 7 parameter settings are written out to the file "7params.4d" in the user selected folder. This means that the 7 parameter settings will be available in the current and future projects. For more information on the Write button, go to the section "Writing Set Up Files" in the Appendix "Set Ups"</i>	button		

Delete 7 Parameters

[Delete_seven_parameter_details](#)

Position of option on menu: **Project =>Management =>7 parameters =>Delete**

The **Delete** option deleted a seven parameter set from the list of available seven parameter settings.

On selecting the **Delete** option, the **Delete 7 Parameter Details** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Conversion name	input		all defined 7 param settings
<i>name of the 7 parameters setting to be deleted from the 7 parameter settings list. The relevant setting parameters are displayed.</i>			
Delete	button		
<i>after selecting this button, the selected 7 parameter setting is deleted from the setting list. This can be done for a number of 7 parameter sets by simply selecting the name to be deleted and selecting the delete button. To save the modified setting list, use the Write button</i>			
Write	button		
<i>after selecting this button, the user defined 7 parameter settings are written out to the file "7params.4d" in the user selected folder. This means that the 7 parameter settings will be available in the current and future projects. For more information on the Write button, go to the section "Writing Set Up Files" in the Appendix "Set Ups"</i>			

Workspace

[project_workspace](#)

Position of menu: Project =>Management =>Workspace

Options to set up the project

The **Project Workspace** walk-right menu contains various projection items.

For the option *Setup*, go to the section "Workspace Setup"
 For the option *Load*, go to the section "Workspace Load"

Workspace Setup

[workspace_setup](#)

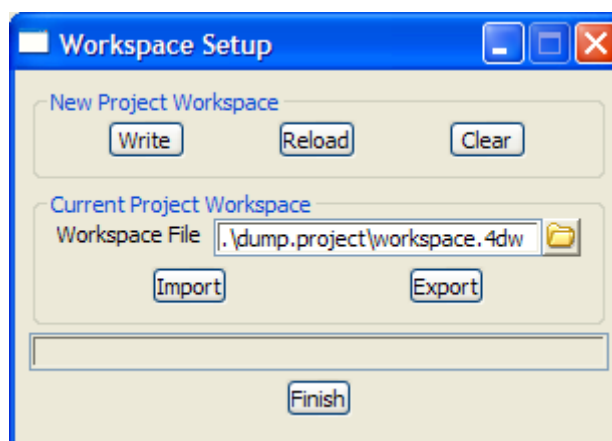

Position of option on menu: Project =>Management =>Workspace =>Setup

The workspace file is used to define the position of toolbars and output window for a new projects.

Once inside an existing project, the workspace file is no longer used and the final positions of the toolbars and output window are recorded inside the project so they come up in the same final position as when the project is reopened.

The Workspace Setup option allows the user to define new workspace setup files that can be loaded at any time in an existing project or used as the default workspace file used for all new projects.

On selecting the **Setup** option, the **Workspace Setup** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Write	button		
--------------	--------	--	--

write out the current toolbar configuration to a .4dw file.

Load	button		
-------------	--------	--	--

read in the workspace.4dw file in the current project folder.

Clear button

remove all the current toolbars and read in the default workspace.4dw file

Workspace file file box current workspace file *.4dw files

name of the workspace file to re imported/exported

Import button

read in and use the workspace file given in the Workspace file field.

Export button

write the current toolbar settings out to the workspace file given in the Workspace file field.

Workspace Load

[project_workspace_load](#)

Position of menu: Project =>Management =>Workspace >Load

This option displays and selects a project workspace file to set up the icons etc. on the screen.

The **Project Workspace Load** walk-right menu contains further walk-rights to display the workspace files in the local project, the set ups folder and the user folder.

To load a workspace file, simply click on the name in the walk-right lists.

list and load workspace files in the project
list and load workspace files in the set ups folder
list and load workspace files in the user folder

Tree

Position of option on menu: Project =>Tree

Position of option on menu: Project =>Management =>Tree

For documented on this option, go to the section "Tree"

Share Settings

[project_share_settings](#)

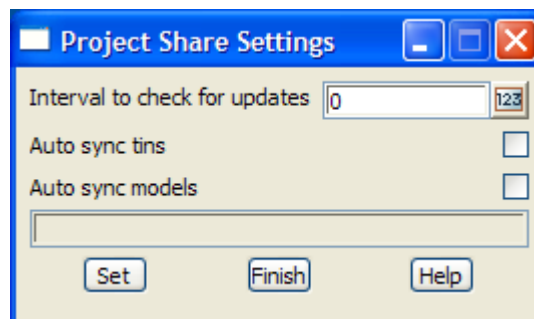

Position of option on menu: Project =>Management =>Share settings

There are three environment variables that control the auto-synchronizing of any shared models or tins added to this project.

SHARE_CHECK_INTERVAL_4D	number_of_seconds
AUTO_MODEL_SYNC_4D	1 or 0
AUTO_TIN_SYNC_4D	1 or 0

This option will temporarily modified the values for this session. When the project is restarted, the values will revert to those given by the environment variables.

Selecting Share settings, brings up the **Project Share Settings** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Interval to check for updates input

time in seconds to check if any of the shared models or tins added to the project have been updated in the server projects.

The environment variable controlling this when the project starts up is

SHARE_CHECK_INTERVAL_4D	number_of_seconds
-------------------------	-------------------

The value is only modified for this session. To permanently change the value, please modify the environment variable.

Autosync tins tick box

if tick, the server projects for any shared tins added to this project are checked to see if they have been modified (checked every SHARE_CHECK_INTERVAL seconds). If any tins have been modified, they are re-copied to this project.

The environment variable controlling this when the project starts up is

AUTO_TIN_SYNC_4D	1 or 0
------------------	--------

The value is only modified for this session. To permanently change the value, please modify the environment variable.

Autosync models tick box

if tick, the server projects for any shared models added to this project are checked to see if they have been modified (checked every SHARE_CHECK_INTERVAL seconds). If any models have been modified, they are re-copied to this project.

The environment variable controlling this when the project starts up is

AUTO_MODEL_SYNC_4D 1 or 0

The value is only modified for this session. To permanently change the value, please modify the environment variable.

Set

set the values in the panel for this session. The values will revert back to the ones given by the environment variables when the project is restarted.

The values are only modified for this session and will evert back to the ones given by the environment variables when the project is restarted. To permanently change the value, please modify the environment variable.

Restart

Position of option on menu: Project =>Restart

The **Restart** option exits the current **12d Model** project and then restart using the same project. Useful for testing changes to set up files etc.

It will prompt if project **Save** is required.

Save

save_project

Position of option on menu: Project =>Save

The **Save** option saves the working project to disk.

On the **Save** from the Main menu, simply select the option and the project is saved.

On selecting **Save** from the floating **Projects** menu, the **save project** panel is displayed.

The position of the **save project** panel is also saved and the panel automatically placed on the screen when the project is started up again.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Save	button		

after selecting this button, the working project is saved to disk.

Tree

project_tree

Position of option on menu: Project =>Tree

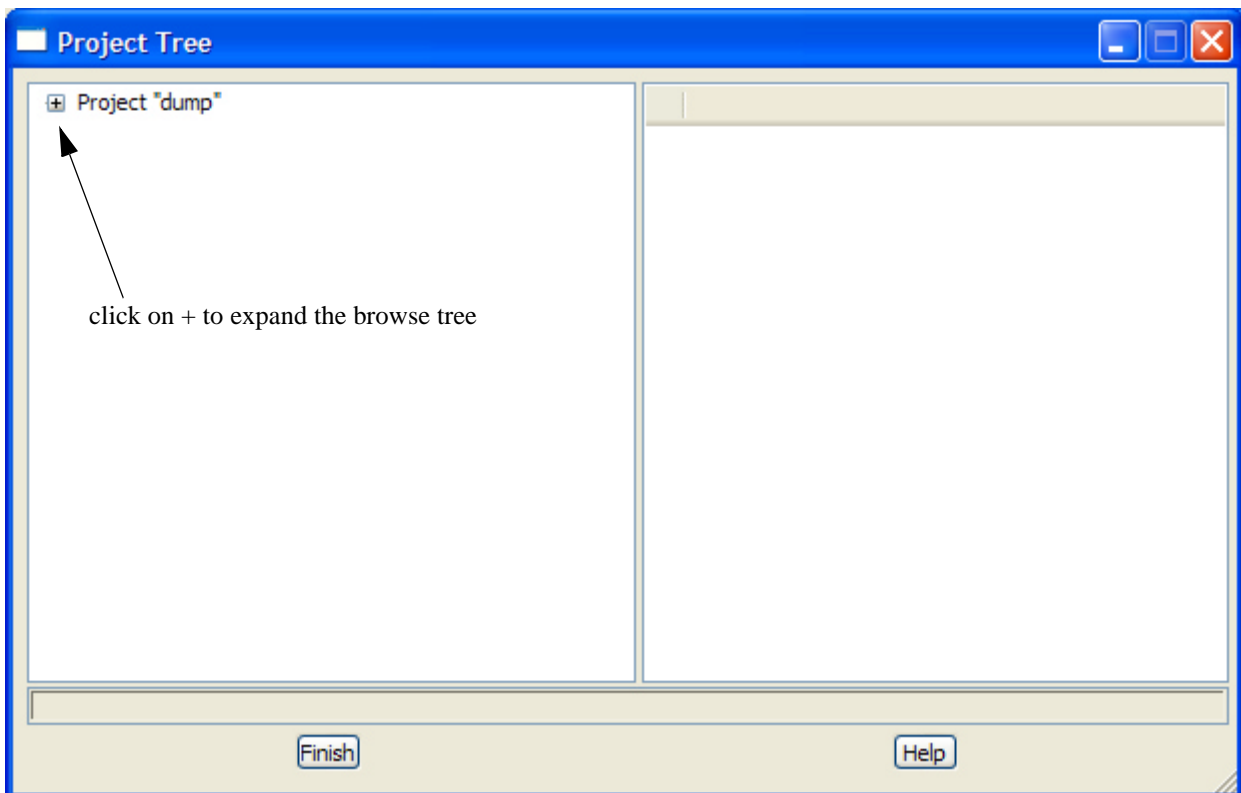

Position of option on menu: Project =>Management =>Tree

The **Tree** option is under continual development and being extended with each version of 12d Model.

Tree is used to drill down through information about the data in the project (for example models, tins and views) and also to interactive create/edit/edit most of the set-up information that is contained in text files. These include:

- (a) Name mapping (file names.4d) documented in the section “Name Mappings”
- (b) Plotters set-ups (file plotters.4d) which in not yet documented. See the section “Plotters” .
- (c) Survey data collectors (file survey.4d) documented in the section “Survey Data Collectors”
- (d) Linestyles (file linestyl.4d) documented in the section “Linestyles”
- (e) Symbols (file symbols.4d) documented in the section “Symbols”
- (f) Patterns (file patterns.4d) which in still under development and not yet documented. See the section “Patterns”
- (g) Textstyles (file textstyl.4d) documented in the section “Textstyles”
- (h) Textstyle data favourites (file textstyle_names.4d) documented in “Textstyle Data Favourites”
- (i) Sheet sized (file sheets.4d) documented in the section “Sheet Sizes”

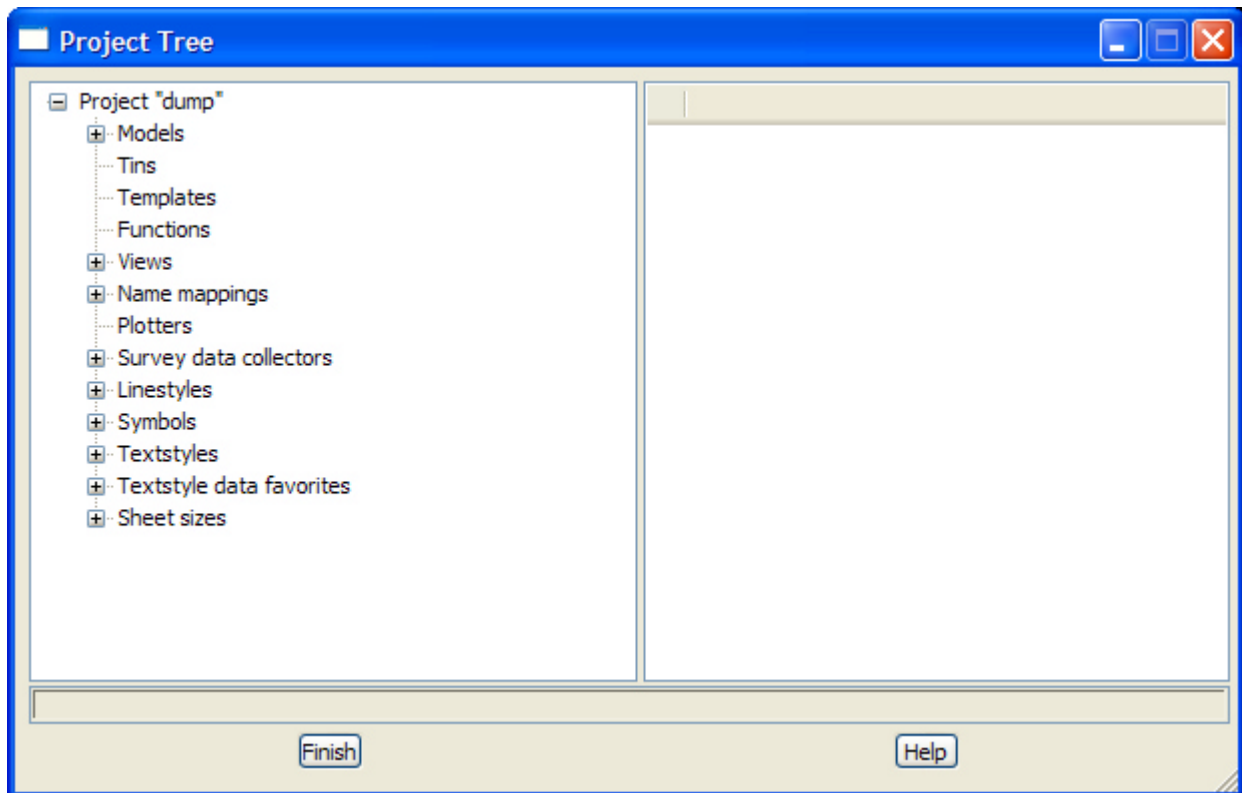

On selecting the **Tree** option, the **Project Tree** panel is displayed.

Note: This is a resizable panel.

Clicking on the '+' expands the browse tree to show what items are available to get more

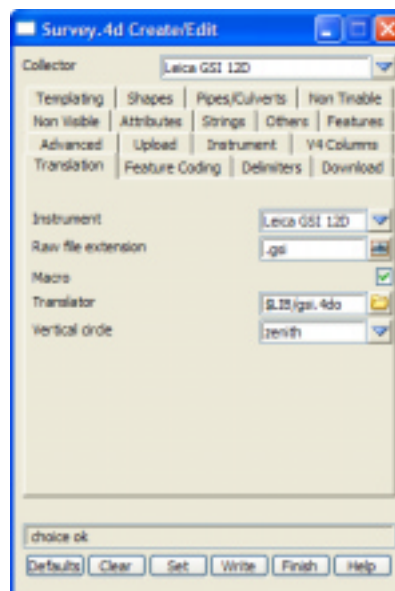

information on.

Again clicking on the + for any of the items in the expanded list then further expands the browse tree to show more items available to get information on.

For the items *Name mappings*, *Plotters*, *Survey data collectors*, *Textstyles* and *Textstyle data favourites*, once they are expanded then the items displayed need no further expansion (there is no + displayed in front of the items) and double clicking on the expanded items brings up the create/edit panels for the item.

For example, clicking on + for *Survey data collectors* and then double clicking on a data collector brings up the *Survey.4d Create/Edit* panel.

For the option *Name mappings*, go to the section “Name Mappings”

<i>Plotters</i>	“Plotters”
<i>Survey data collectors</i>	“Survey Data Collectors”
<i>Linestyles</i>	“Linestyles”
<i>Symbols</i>	“Symbols”
<i>Patterns</i>	“Patterns”
<i>Textstyles</i>	“Textstyles”
<i>Textstyle data favourites</i>	“Textstyle Data Favourites”
<i>Sheet sizes</i>	“Sheet Sizes”

Name Mappings

`names_4d_create_edit`

Position of option on menu: **Project =>Tree**

The name mapping file is used in all panel fields requiring the *name* of a string and the name field in the CAD Controlbar.

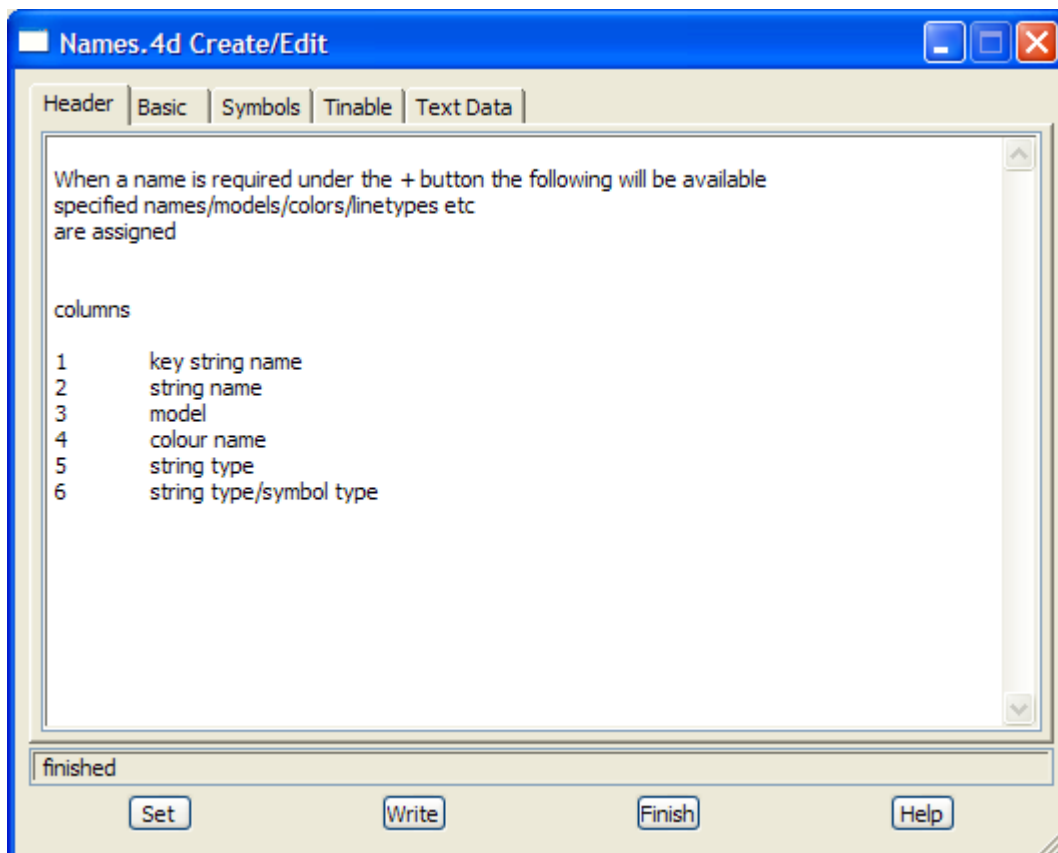

After the string name is typed, if the <Enter> is pressed then each section of the name mapping file being used for the project is searched for matches with the key.

If there is a match of the string name with a key, then the name, model, colour point/line type etc. for that key will be used in the appropriate panel fields, or toolbar fields, that go with the string name.

Click on *Name mapping* to expand the items and then double click LB on *Create name mapping* to create/edit the name mapping file *names.4d*.

Double clicking LB on any of the items below *Create name mapping* will also create/edit the *names.4d* file.

In either case, the **Names.4d Create/Edit** panel will then appear.

Buttons

Set button

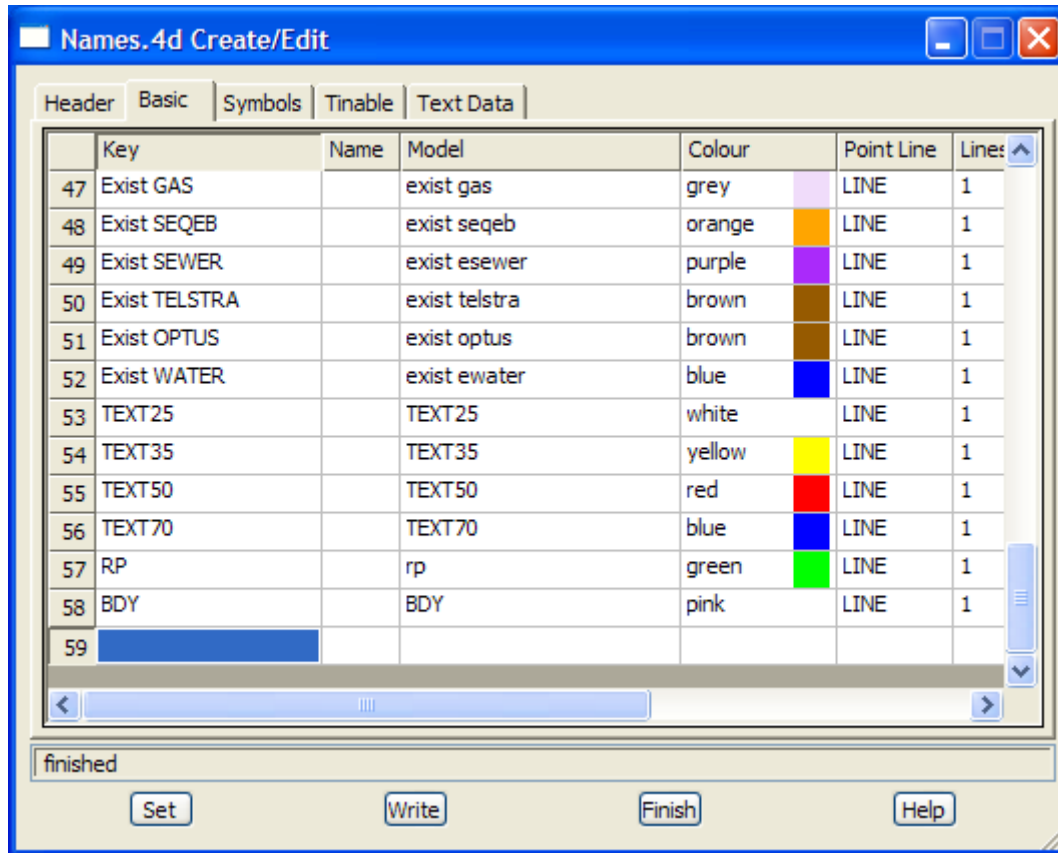

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

*write the information to the file names.4d. The file can then be used when projects are started. The information won't be used for the current session unless the **Set** button is selected as well. For more information on the **Write** button, go to the section "Writing Set Up Files" in the*

Appendix “Set Ups”

Basic Tab

Key input

*the string name is searched against the list of keys for the **Basic** tab until a first match is found. If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The key can include wild cards (*) or wild characters (?)*

Name input

if not blank, name used to replace the string name by. This is usually blank.

Model model grid available models

if not blank, model to use

Colour colour grid available colours

if not blank, colour to use

Point Line point/line grid point/line

if not blank, point-line type to use

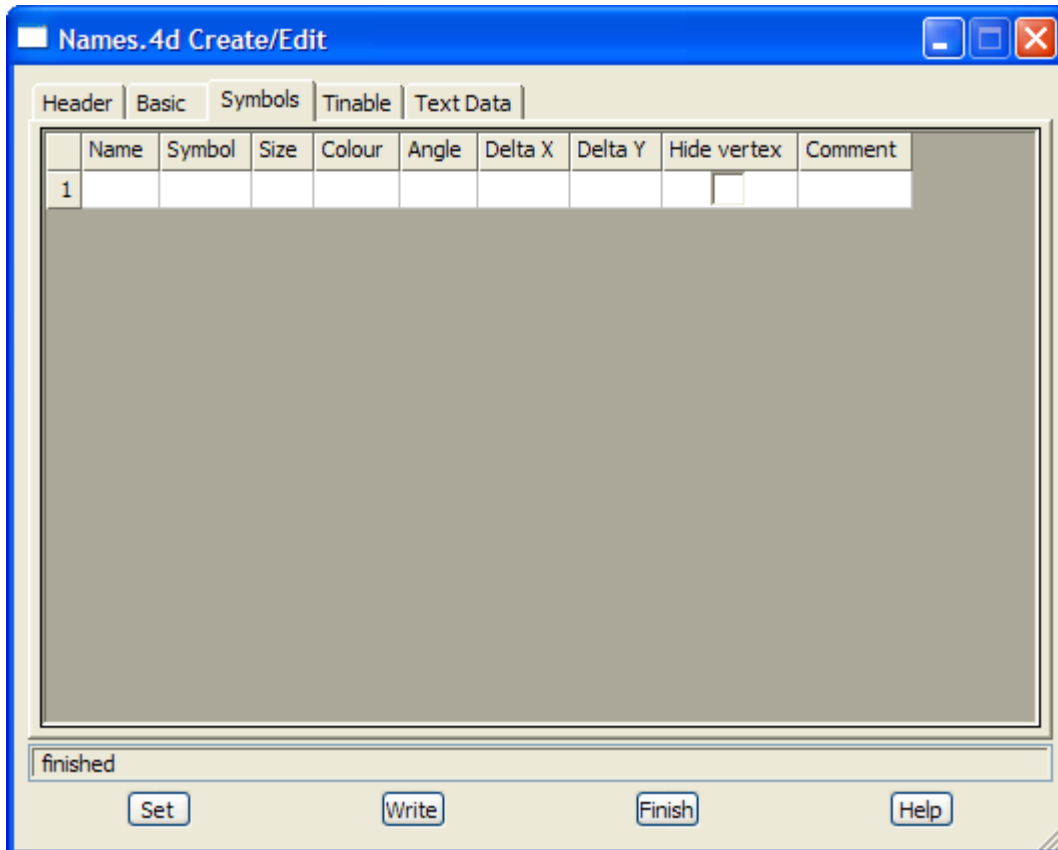

Weight input

if not blank, weight to use for strings with linestyle 1

Comment input

user comment

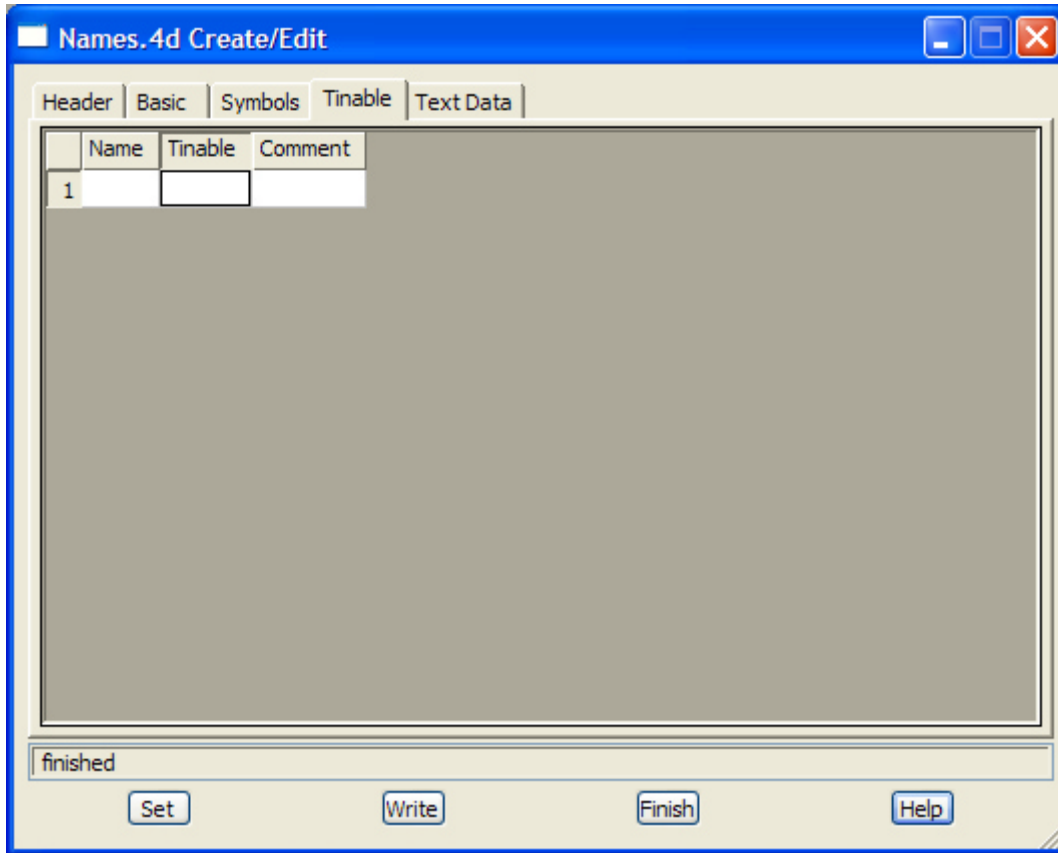

Symbols Tab

Key input

*the string name is searched against the list of keys for the **Symbols** tab until a first match is found. If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The key can include wild cards (*) or wild characters*

Tunable Tab

Key input

*the string name is searched against the list of keys for the **Tinable** tab until a first match is found. If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The key can include wild cards (*) or wild characters*

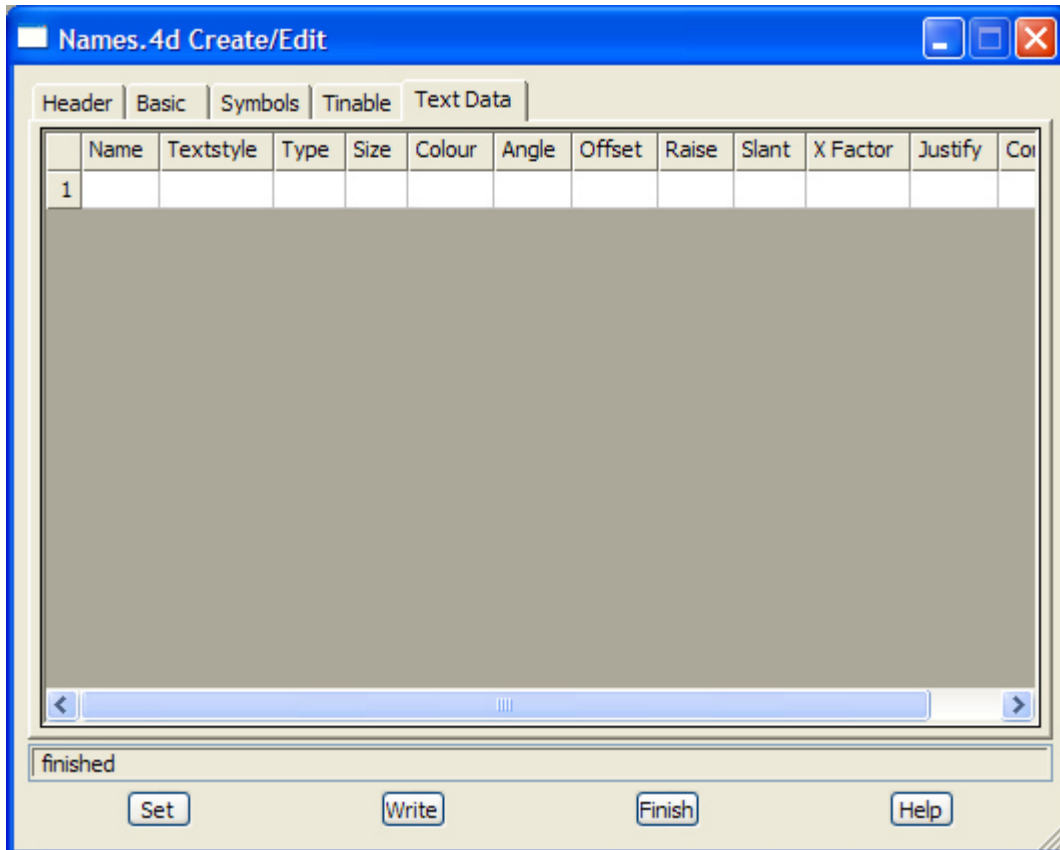

Tinable tinability grid

*if **no**, the entire string is non tinable. That is, the vertices are not included in any triangulation.*

*If **yes**, the entire string is tinable. That is, the vertices are used in any triangulation and the segments between the vertices are used as breaklines.*

*If **points**, the vertices of a string are tinable but the segments are not. That is, the vertices are used in any triangulation but the segments between the vertices are used as breaklines.*

Text Data Tab

Key input

*the string name is searched against the list of keys for the **Text Data** tab until a first match is found. If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The key can include wild cards (*) or wild characters*

Plotters

User defined plotters can be set up in 12d Model and the information is stored in the file **plotters.4d** which is fully documented in the section “User Defined Plotters” of the Appendix “Plotters and Plotting” .

The interactive editor **Plotters** on the Browse option is not yet fully implemented or documented.

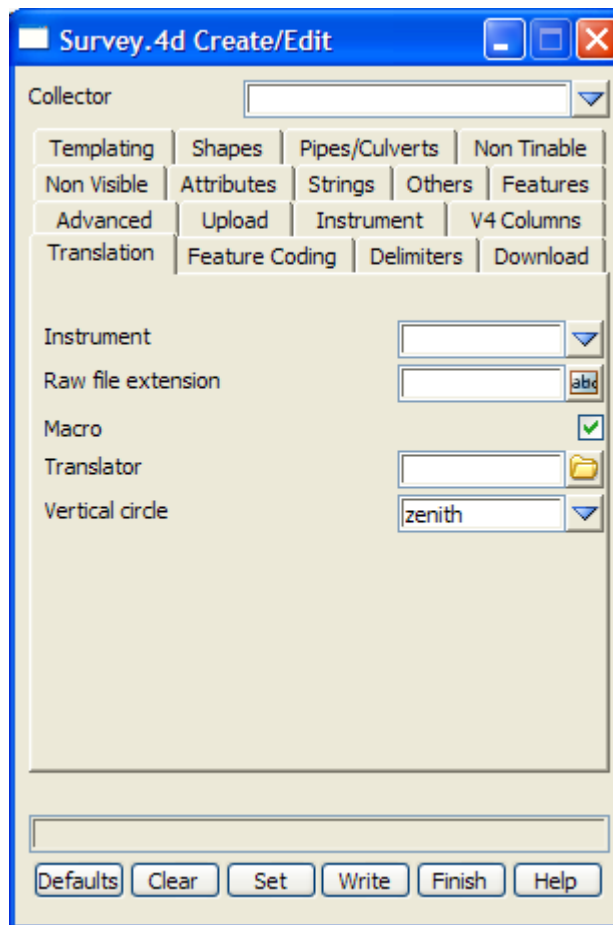

Survey Data Collectors

[survey_4d_create_edit](#)

Position of option on menu: Project =>Tree

Click on *Survey data collectors* to expand the item and then double click LB on *Create data collector* to create a new data collector, or double click LB on an existing data collector in the list to edit an existing data collector definition.

The **Survey.4d Create/Edit** panel will then appear.

This option is fully documented in the "Data Collector Definitions" section of the Appendix "12D Survey Guide".

Linestyles

linestyle_create_edit_delete

Position of option on menu: Project =>Tree

Click on *Linestyles* to expand the item and then double click LB on *Create linestyle* to create, edit or delete linestyles, or double click LB on an existing textstyle in the list to edit an existing linestyle definition. The **Linestyle Create/Edit/Delete** panel will then appear.

The linestyle can be created interactively in 12d Model by drawing the new linestyle using strings containing lines, arcs, circles and text. This information can then be used to create the linestyle.

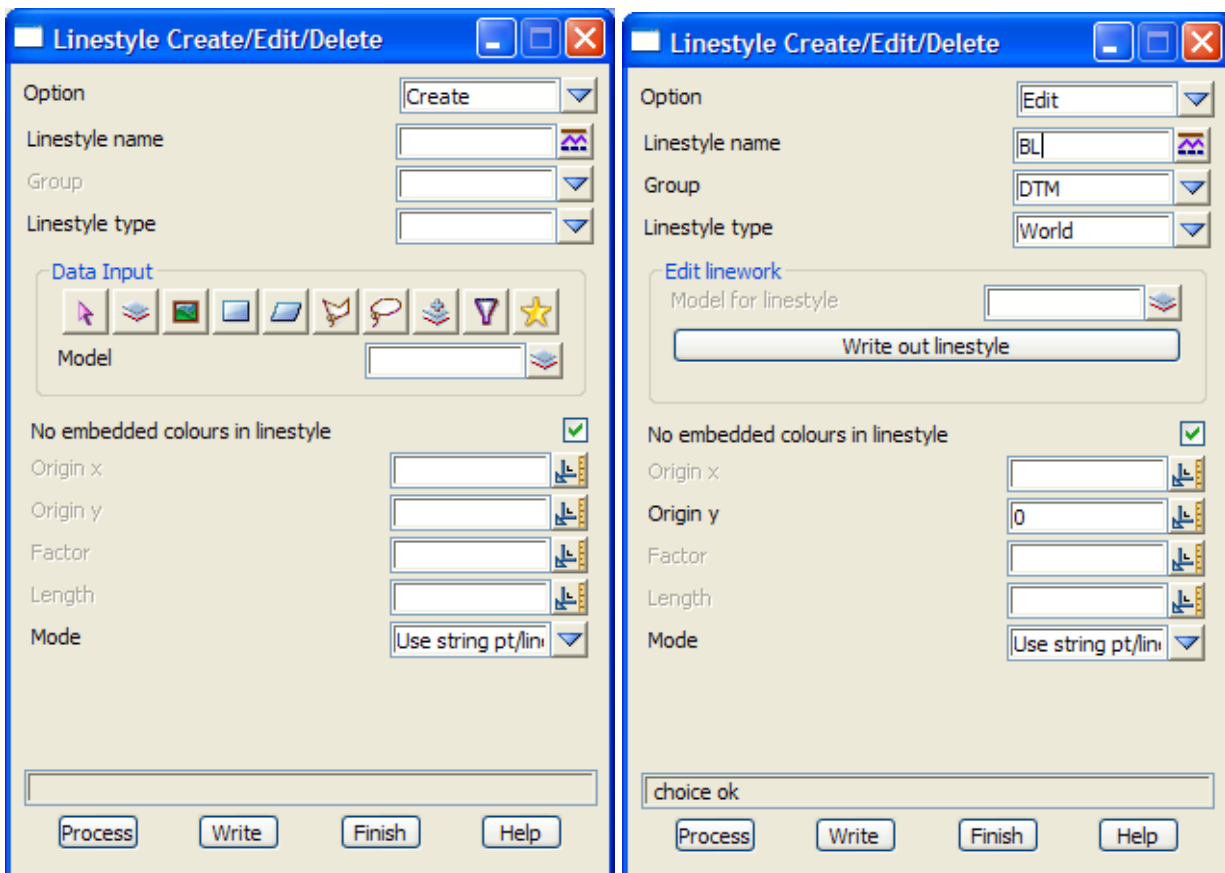

To edit a linestyle, the current definition is written to a model which can then be edited to create the modified linestyle.

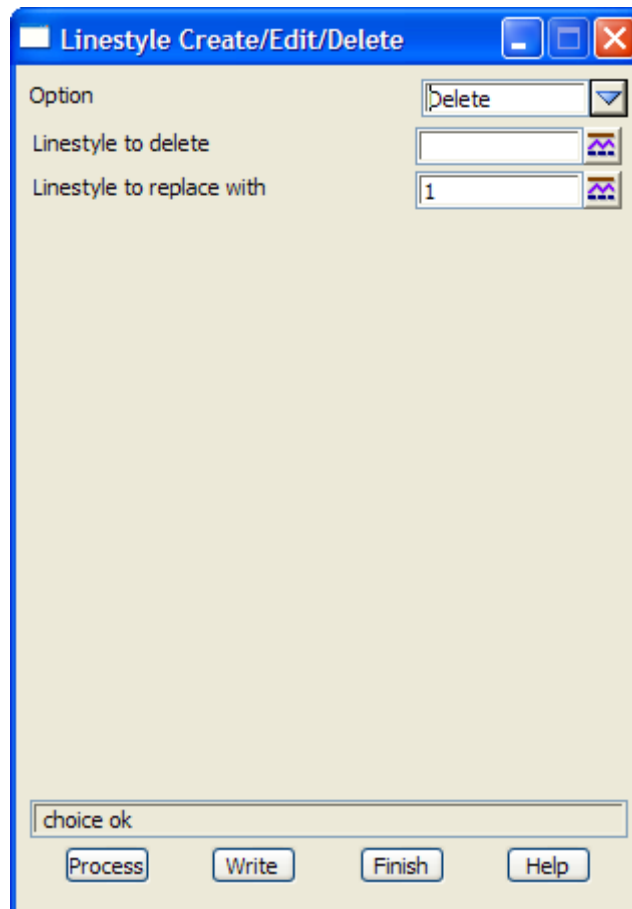

The definition of a linestyle includes:

- a unique name
- the Group to show the linestyle under in the linestyle pop-up
- the linestyle type

All the information for linestyles is stored in the text file *linestyl.4d* but the **Linestyle Create/Edit/Delete** panel is normally used to create and modify the file rather than using a text editor. (the file *linestyl.4d* is fully documented in the “Line Styles” section of the Appendix “Line styles, Symbols and Textstyles”).

The **Linestyle Create/Edit/Delete** panel is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Option <i>type of edit</i>	choice box	Create	Create, Edit, Delete
Linestyle name <i>name of the linestyle to be created, edited or deleted.</i>	input		available linestyles
Group <i>name of the group for the linestyle - can be a new group name.</i>	input		available groups
Linestyle type <i>type of the linestyle.</i>	choice box	world	user, pixel, world, paper, 2 point, group
For Option choice "Create" - Data input			
Data input <i>data to be used to create the linestyle.</i>	source box	model	
For Option choice "Edit" - Edit line work			
Model for linestyle <i>model to write the linestyle out to so that it ca be edited.</i>	model box		available models
Write out linestyle <i>when selected, the linestyle is written out to the Model for linestyle.</i>	button		
For Option choice "Delete"			

Linestyle to delete linestyle box available linestyles
name of the linestyle to delete.

Linestyle to replace it with linestyle box 1 available linestyles
when the linestyle is deleted, any string with that linestyle has to have a new linestyle. This is the linestyle that is set for strings with the deleted linestyle

For the Linestyle type - User, Pixel, World, Paper

No imbedded colours in linestyle tick box tick
*if **tick** then no colours from the data are used in the linestyle.
 If **not tick** then any colours used in the data are used in the linestyle*

Origin x/y double box
*if non blank, the x/y value for the origin of the linestyle.
 If blank, a value is calculated by 12d.*

Factor double box
*if non blank, the linestyle is factored up by this value.
 If blank, the factor is taken to be 1.*

Length double box
*if non blank, the linestyle is repeated after this length.
 If blank, the linestyle length is calculated by 12d.*

Mode choice box use string pt/line type
 only at vertices, repeat style
*if "use string pt/line type", then if the string pt/line type is "line" then the linestyle is repeated after the Length value. If the string pt/line type is "point", then the linestyle is only drawn at each vertex of the string.
 If "only at vertices", then the linestyle is only drawn at each string vertex regardless of the strings pt/line type.
 If "repeat style", then the linestyle is repeated after the Length value regardless of the strings pt/line type.*

For the Linestyle type - 2 point

No imbedded colours in linestyle tick box tick
*if **tick** then no colours from the data are used in the linestyle.
 If **not tick** then any colours used in the data are used in the linestyle*

Origin x/y double box
*if non blank, the x/y value for the first origin of the linestyle.
 If blank, a value is calculated by 12d.*

Origin 2 x/y double box
*if non blank, the x/y value for the second origin of the linestyle.
 If blank, a value is calculated by 12d.*

Stretch in choice box one direction one direction, both directions
*if "one direction", the linestyle is only stretched along the axis joining the two original points.
 The linestyle is not stretched perpendicular to that axis.
 If "both directions", the linestyle is stretched in all directions.*

Drawn on choice box every line/arc
 every second line/arc
*if "one direction", the linestyle is only stretched along the axis joining the two original points.
 The linestyle is not stretched perpendicular to that axis.
 If "both directions", the linestyle is stretched in all directions.*

For Linestyle type - Group**Linestyle** grid*list of linestyles that make up the this one linestyle.***Buttons****Process** button*process the data in the panel fields. The internal definitions of the linestyles is modified. The definitions are not written to the linestyle file.***Write** button*write the modifications to the file `linestyl.4d` file. This files can then be used when projects are opened up. The information won't be used for the current session unless the **Process** button is selected as well. For more information on the **Write** button, go to the section "Writing Set Up Files" in the Appendix "Set Ups"*

This option updates the files `linestyles.4d` which is fully documented in the "Line Styles" section of the Appendix "Line styles, Symbols and Textstyles" .

Symbols

[symbol_create_edit_delete](#)

Position of option on menu: Project =>Tree

Click on *Symbols* to expand the item and then double click LB on *Create symbol* to create, edit or delete symbols, or double click LB on an existing symbol in the list to edit an existing symbol definition. The **Symbol Create/Edit/Delete** panel will then appear.

The symbol can be created interactively in 12d Model by drawing the new symbol using strings containing lines, arcs, circles and text. This information can then be used to create the symbol.

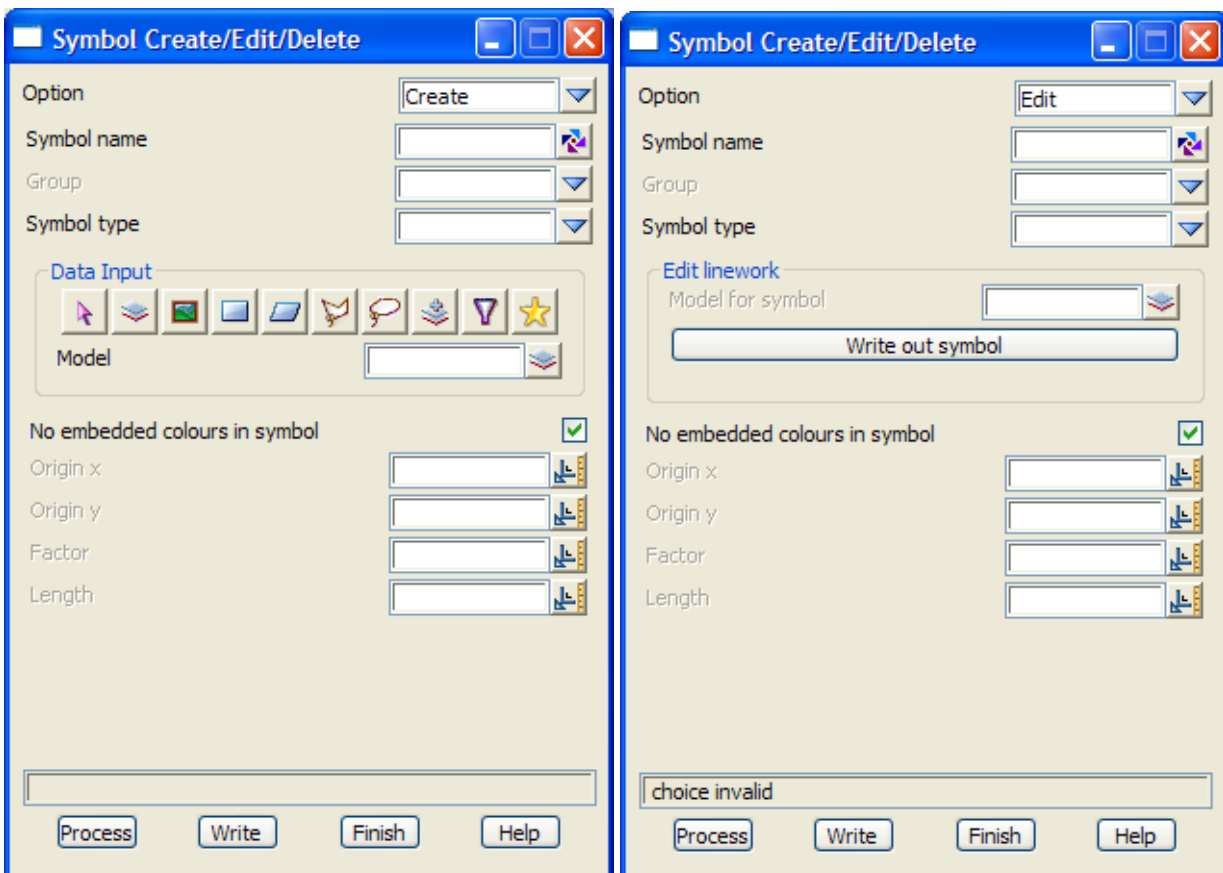

To edit a symbol, the current definition is written to a model which can then be edited to create the modified symbol.

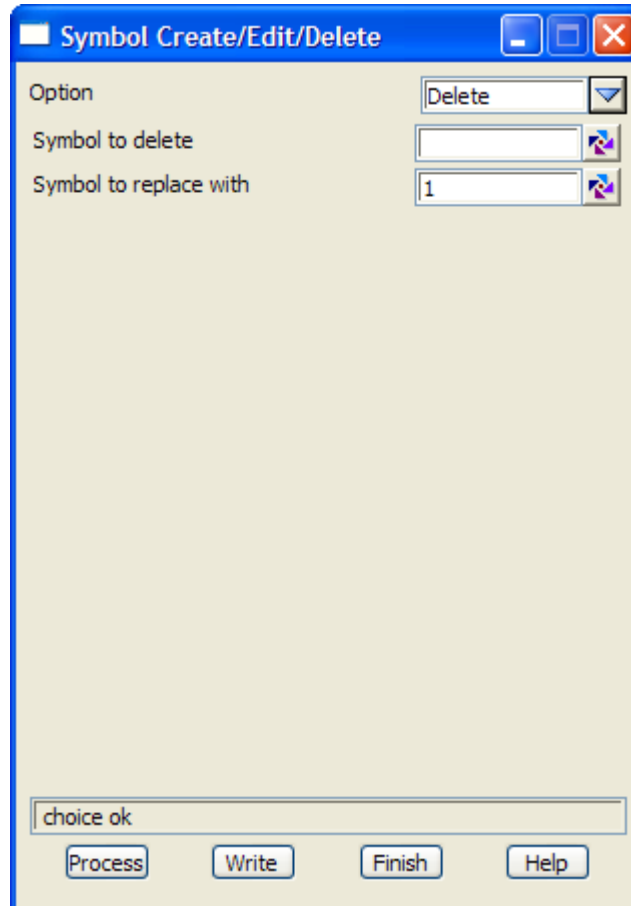

The definition of a symbol includes:

- a unique name
- the Group to show the symbol under in the symbol pop-up
- the symbol type

All the information for linestyles is stored in the text file *symbols.4d* but the **Symbol Create/Edit/Delete** panel is normally used to create and modify the file rather than using a text editor. (the file *symbols.4d* is fully documented in the “Line Styles” section of the Appendix “Line styles, Symbols and Textstyles”).

The **Symbol Create/Edit/Delete** panel is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Option <i>type of edit</i>	choice box	Create	Create, Edit, Delete
Symbol name <i>name of the linestyle to be created, edited or deleted.</i>	input		available symbols
Group <i>name of the group for the symbol - can be a new group name.</i>	input		available groups
Symbol type <i>type of the symbol.</i>	choice box	world	pixel, world, paper
For Option choice "Create" - Data input			
Data input <i>data to be used to create the symbol.</i>	source box	model	
For Option choice "Edit" - Edit line work			
Model for symbol <i>model to write the symbol out to so that it ca be edited.</i>	model box		available models
Write out symbol <i>when selected, the symbol is written out to the Model for symbol.</i>	button		
For Option choice "Delete"			

- Symbol to delete** symbol box available symbols
name of the linestyle to delete.
- Symbol to replace it with** symbol box 1 available symbols
*when the symbol is deleted, any vertex of a string with that symbol has to have a new symbol.
This is the symbol that is set for strings with the deleted symbol*
- No imbedded colours in symbol** tick box tick
*if **tick** then no colours from the data are used in the symbol.
If **not tick** then any colours used in the data are used in the symbol*
- Origin x/y** double box
*if non blank, the x/y value for the origin of the symbol.
If blank, a value is calculated by 12d.*
- Factor** double box
*if non blank, the symbol is factored up by this value.
If blank, the factor is taken to be 1.*
- Length** double box
*if non blank, the symbol is repeated after this length.
If blank, the symbol length is calculated by 12d.*
- Process** button
*process the data in the panel fields. The internal definitions of the symbols is modified. The
definitions are not written to the symbol file.*
- Write** button
*write the modifications to the file symbols.4d file. This files can then be used when projects
are opened up. The information won't be used for the current session unless the **Process**
button is selected as well. For more information on the **Write** button, go to the section "Writing Set
Up Files" in the Appendix "Set Ups"*
- This option updates the files *symbols.4d* which is fully documented in the "Symbols" section of
the Appendix "Line styles, Symbols and Textstyles" .

Patterns

`pattern_create_edit_delete`

Still under development

Position of option on menu: Project =>Tree

Textstyles

create_edit_textstyle

Position of option on menu: Project =>Tree

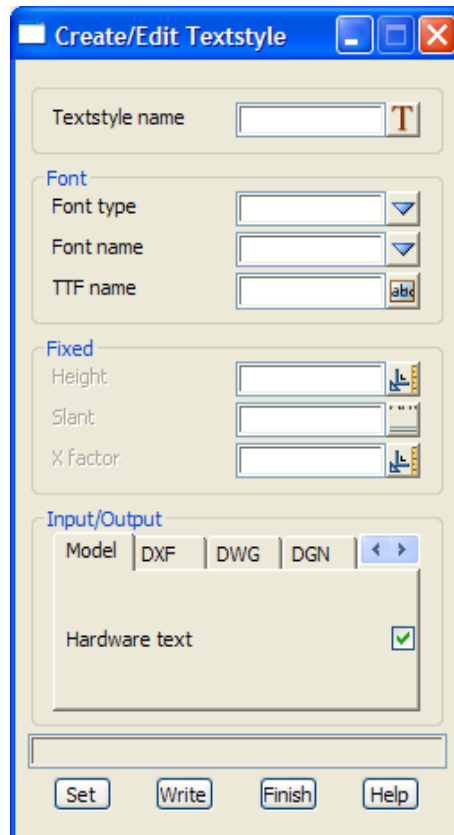

Click on *Textstyles* to expand the item and then double click LB on *Create textstyle* to create a new textstyle, or double click LB on an existing textstyle in the list to edit an existing textstyle definition. The **Create/Edit Textstyle** panel will then appear.

The textstyle definition includes

- (a) a unique name
- (a) the font used for textstyle - this may be a true type font
- (b) mappings of textstyle names when reading in data from AutoCAD and Microstation
- (c) mappings of textstyle names when writing data out to AutoCAD, Microstation and 12d Model Models.

All the information for textstyles and fonts is stored in text files (*textstyl.4d* and *fonts.4d*) but the **Create/Edit Textstyle** panel is normally used to create and modify the files rather than using a text editor. (the files *textstyles.4d* and *fonts.4d* which are fully documented in the "Textstyles and Fonts" section of the Appendix "Line styles, Symbols and Textstyles").

The **Create/Edit Textstyle** panel is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Textstyle name	input		available textstyles
<i>name of the textstyle to be defined or edited.</i>			

Font section

Font name output recent projects

name of the font to be used for the textstyle.

True type font tick box tick

*if **tick** then the font is a true type font. The next box asks for the True Type Font name.*

*If **not tick** then the font needs an SHP file to define the characters. The next box asks for the SHP name.*

TTF name input available true type fonts

name of the true type font.

SHP name input available SHP files

name of the SHP file to define the characters.

Fixed section

Input/Output section

Model tab

Hardware text tick box tick

*if **tick** then any 12d Model text is written out to a model as text strings.*

*If **not tick** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).*

DXF tab

Hardware text tick box tick

*if **tick** then any 12d Model text is written out to the DXF file as text.*

*If **not tick** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).*

Input name input

when a DXF file is read in, any text in the DXF file with style of this 'Input name', is converted to 12d Model text strings with the textstyle 'Textstyle name'.

Output name input

if the 'Hardware text' flag is set to tick - when data is written out to a DXF file, any 12d Model text with the textstyle of the name in the field 'Textstyle name', is converted to DXF text with style of this 'Output name'.

If the 'Hardware text' flag is not set to tick, then this field is ignored.

DWG tab

Hardware text tick box tick

*if **tick** then any 12d Model text is written out to the DWG file as text.*

*If **not tick** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).*

Input name input

when a DGN file is read in, any text in the DGN file with style of this 'Input name', is converted to 12d Model text strings with the textstyle 'Textstyle name'.

Output name input

if the 'Hardware text' flag is set to tick - when data is written out to a DWG file, any 12d Model text with the textstyle of the name in the field 'Textstyle name', is converted to DWG text with style of this 'Output name'.

If the 'Hardware text' flag is not set to tick, then this field is ignored.

DGN tab

Hardware text tick box tick

*if **tick** then any 12d Model text is written out to the DGN file as text.*

If **not tick** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).

Input name input

when a DGN file is read in, any text in the DGN file with style of this 'Input name', is converted to 12d Model text strings with the textstyle 'Textstyle name'. For DGN, the text style must be a number between 1 and 64.

Output name input

if the 'Hardware text' flag is set to tick - when data is written out to a DGN file, any 12d Model text with the textstyle of the name in the field 'Textstyle name', is converted to DGN text with style of this 'Output name'. For DGN, the text style name must be a number between 1 and 64.

If the 'Hardware text' flag is not set to tick, then this field is ignored.

Other tab

Hardware text tick box tick

if **tick** then any 12d Model text is written out to the file as text.
If **not tick** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).

Input name input

when a file is read in, any text in the file with style of this 'Input name', is converted to 12d Model text strings with the textstyle 'Textstyle name'.

Output name input

if the 'Hardware text' flag is set to tick - when data is written out to a file, any 12d Model text with the textstyle of the name in the field 'Textstyle name', is converted to text with style of this 'Output name'.

If the 'Hardware text' flag is not set to tick, then this field is ignored.

Buttons

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

write the information to the files textstyle.4d and fonts.4d files. These files can then be used when projects are started. The information won't be used for the current session unless the **Set** button is selected as well. For more information on the **Write** button, go to the section "Writing Set Up Files" in the Appendix "Set Ups"

This option updates the files textstyles.4d and fonts.4d which are fully documented in the "Textstyles and Fonts" section of the Appendix "Line styles, Symbols and Textstyles".

Textstyle Data Favourites

`textstyle_names_4d_create_edit`

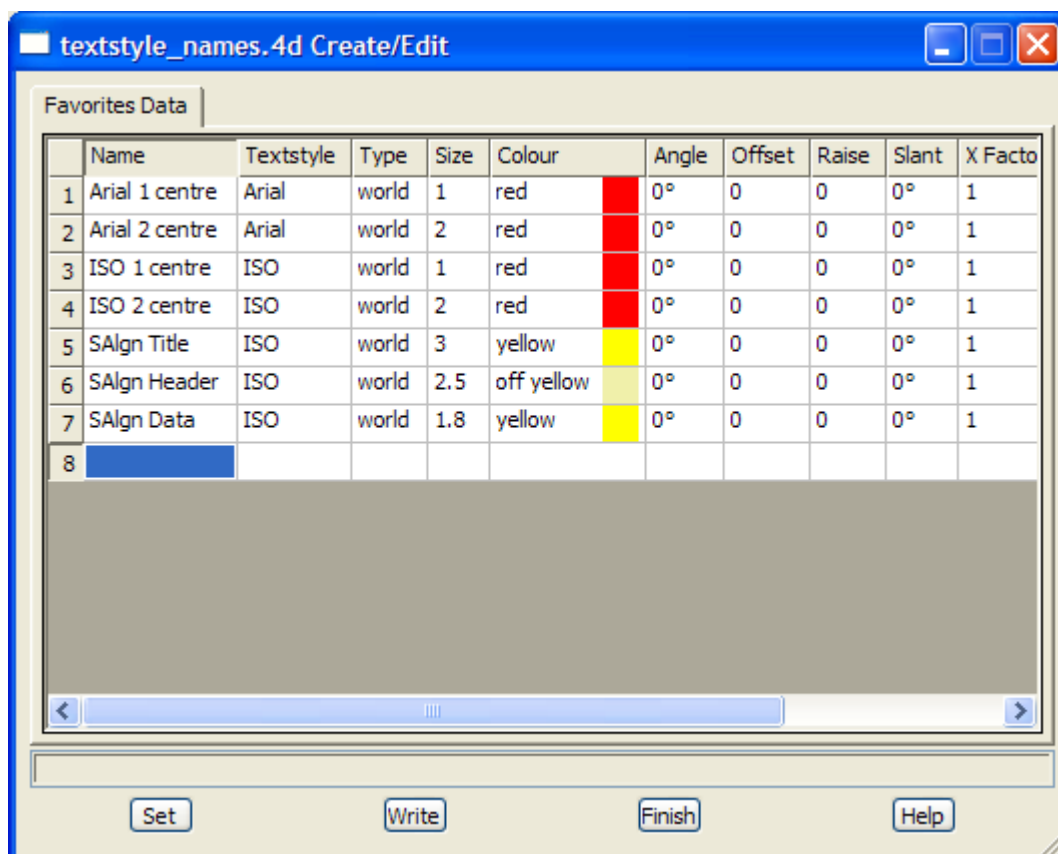

Position of option on menu: Project =>Tree

The *textstyle data favourites* option defines a set of text style parameters recorded with a user given name. When ever a text style needs to be defined, the name of a *textstyle data favourite* can be selected and the values of the favourite used for the text.

To define or modify a textstyle favourite, click on *Textstyle data favourites* in the *Browse* list to expand the item and then double click LB on *Create textstyle data favourite* to create/edit the *textstyle_names.4d* file.

Double clicking LB on any of the items below *Create textstyle data favourite* will also create/edit the *textstyle_names.4d* file.

In either case, the **Textstyle_names.4d Create/Edit** panel will then appear.

Buttons

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

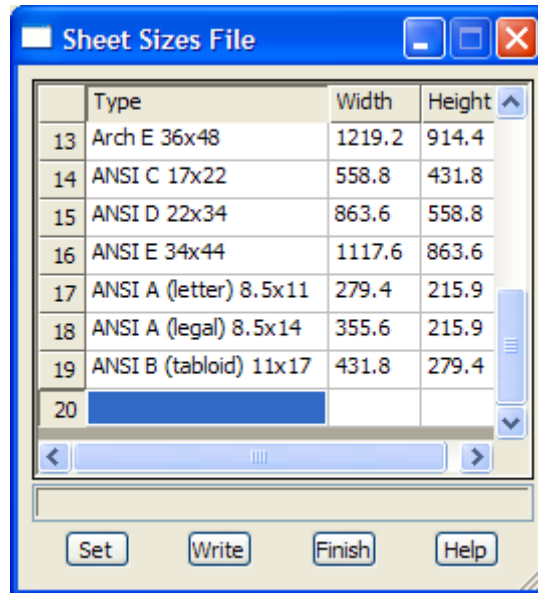

write the information to the textstyle_names.4d file. The file can then be used when projects are started. The information won't be used for the current session unless the Set button is selected as well. For more information on the Write button, go to the section "Writing Set Up Files" in the Appendix "Set Ups"

Sheet Sizes

sheet_sizes_file

Position of option on menu: Project =>Tree

Click on *Sheet sizes* to expand the item and then double click LB on *Create sheet size* to bring up the **Sheet Sizes File** panel to create, edit or delete sheet size definitions , or double click LB on an existing sheet size in the list to also bring up the **Sheet Sizes File** panel.

Buttons

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

write the information to the file *sheets.4d*. The file can then be used when projects are started. The information won't be used for the current session unless the **Set** button is selected as well. For more information on the **Write** button, go to the section "Writing Set Up Files" in the Appendix "Set Ups"

This option updates the file *sheets.4d* which is fully documented in the "Sheet Sizes" section of the Appendix "Set Ups" .

Utilities

project_utilities

Position of menu: Project =>Utilities

The **utilities** walk-right menu contains various project items.

For the option *Attributes*, go to the section “Attributes”

<i>Projects</i>	“Projects”
<i>Create</i>	“Create”
<i>Rebuild</i>	“Rebuild”
<i>Zip</i>	“Zip”

The options in the menu will now be described.

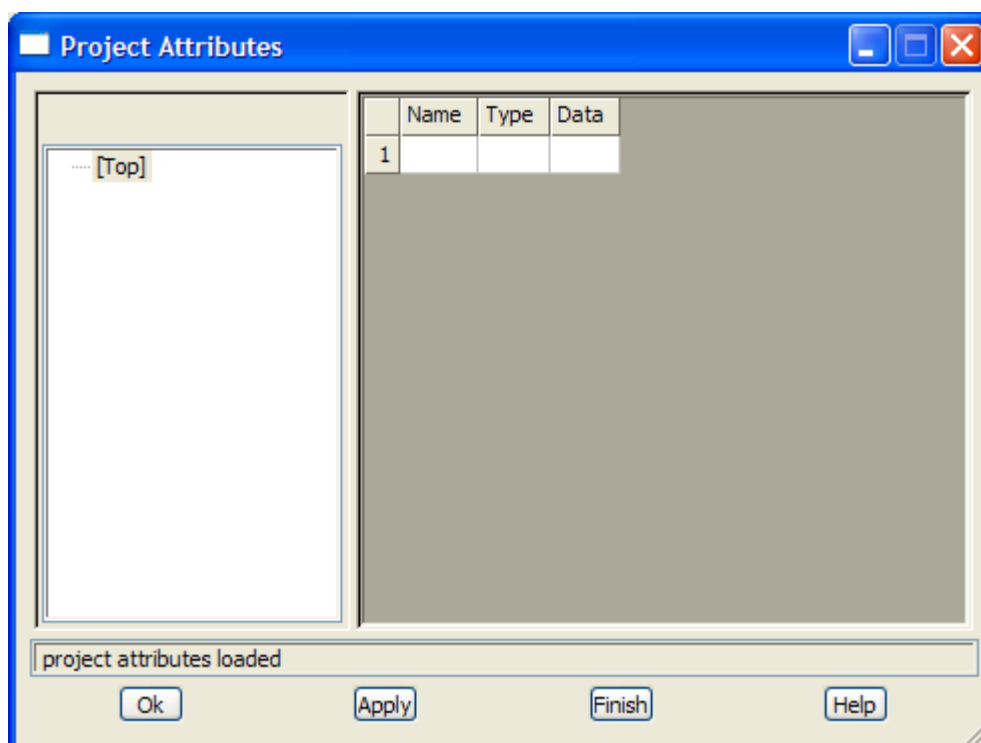

Attributes

project_attributes

Position of option on menu: Project =>Utilities =>Attributes

The **Attributes** options displays, creates and edits the attributes for the current project

On selecting **Attributes**, the **Project Attributes** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name			
<i>name of the attribute</i>			
Type	integer, real, text		
<i>type of attribute - integer, real or text</i>			
Data			
<i>value for the attribute</i>			
OK	button		
<i>set the attributes to the values in the panel and then exit the panel.</i>			
Apply	button		
<i>set the attributes to the values in the panel but don't exit the panel.</i>			

Projects

Position of option on menu: Project =>Utilities =>Projects

The projects walk-right menu provides a list of all the projects available in the working directory. Each project is contained in a sub-directory of the working directory.

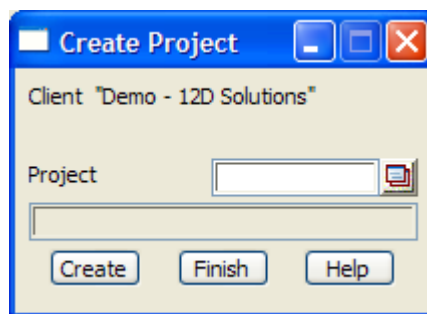

Selecting a project from the walk-right list will bring up the **Change Project** panel with the selected project name already in the new project panel field.

Create

create_project

Position of option on menu: Project =>Utilities =>Create

On selecting the Create option, the **Create Project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project	input		
<i>name of the new project to be created.</i>			
Create	button		
<i>after selecting this button, a new project directory is created. The working project does not change to the new project.</i>			

Rebuild

rebuild_project

Position of option on menu: Project =>Utilities =>Rebuild

The **rebuild** option is used to try and rebuild a project if some of the information has been corrupted.

On selecting the option, the project header file will be deleted and re-created and all the models, tins, templates and functions inside the project's directory added back into the project. The view information for the original project will be lost.

On selecting the **rebuild** option, the **rebuild project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Project	input		
<i>the name of the project to be rebuilt.</i>			

Rebuild	button		
<i>after selecting this button, the project given in the project field is rebuilt.</i>			

Note - the current (working) project cannot be rebuilt.

Zip

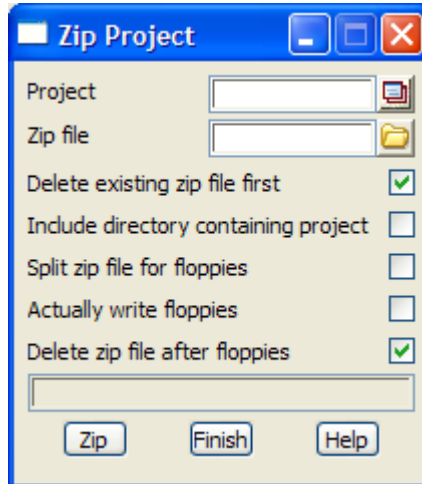

zip_project

Position of option on menu: Project =>Utilities =>Zip

The **zip** option is used to make a zipped up a copy of any project (including the saved current project) in the working folder.

NOTE - this only contains the information in the ".project" folder. It does not include any files in the working folder.

On selecting the **zip** option, the **zip project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project <i>name of the project to be zipped up.</i>	input	none	projects in directory
Zip file <i>name of the zip file for the project.</i>	input	*.zip	
Delete existing zip file first <i>if tick and a zip file already exists, the existing file is deleted before the zip is done. If no tick, any existing files of the same name in the existing zip file will be replaced and any new files will be added to the zip file.</i>	tick box	tick	
Include directory containing project <i>if tick, the whole directory containing the project (not just the project) will be zipped.</i>	tick box		
Split zip file for floppies <i>if tick, the zip file will be split into 1.4 Mb files.</i>	tick box		
Actually write floppies <i>if tick, a batch file will be created and begun which asks for floppies to be inserted and then writes the split zip files onto them.</i>	tick box		
Delete zip file after floppies <i>if tick, delete the zip file and any split files after the floppies are created.</i>	tick box	tick	
Zip <i>after selecting this button, a zip file of the project (or directory containing the project) given in the project field is made.</i>	button		

Delete

`delete_project`

Position of option on menu: Project =>Delete

On selecting the **delete project** option, the **delete project** panel is displayed.

The fields and buttons used in the delete project panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project	input		available projects

name of project to delete

Delete	button
---------------	--------

after selecting this button, a yes-no pop-up menu appears to confirm that deleting the project is required. If deletion is confirmed, the selected project is deleted from the computer disk.

12d Model

12d_model_info 12D_Solutions originators

Position of option on menu: Project =>12d Model

The 12d model walk-right menu and the walk-right by menu are

12D Solutions phone, fax etc.

12d Model version
date version compiled
date authorized to

12D Solutions phone, fax etc.

12d Model Menu

12d_model

Position of option on menu: Project =>12d Model menu

Selecting the **12d Model Menu** option brings up the floating **12d Model** menu as described at the beginning of this chapter.

For the option *Projects*, go to the chapter “Projects”

<i>File I/O</i>	“File I/O”
<i>Edit</i>	“Edit”
<i>Views</i>	“Views”
<i>Models</i>	“Models”
<i>Strings</i>	“Strings”
<i>Triangles</i>	“Triangles”
<i>Survey</i>	“Survey”
<i>Design</i>	“Design”
<i>Drafting</i>	“Drafting”
<i>Plots</i>	“Plots”
<i>Reports</i>	“Reports”
<i>Utilities</i>	“Utilities”
<i>User</i>	“User”
<i>Help</i>	“Help”
<i>Save/ Exit</i>	“Save and Exit”

Exit

Selecting **Exit** exists **12d Model exit**

Also see the chapter “Save and Exit”

7 File I/O

file_i_o

Position of menu: File I/O

The facilities for reading and writing data files, layout files, textstyle definitions, template files into and out of 12d Model, plus screen dumps are collected under the file i/o menu.

The file i/o walk-right menu containing these options is:

on 12d Model menu
and floating menu

create floating File I/O menu
read in data files
write out data files
digitizing option
read in layout files
write out layout files
read in textstyle definitions file
read in templates file
write out templates file
screen dump of window
create/edit a map file
create a label map file
ACAD output map file
use a label map file
edit a file

The options under data input and data output and digitizer will be given in the following three chapters. The rest of the options will be described now.

For the option *Data input*, go to the chapter

Data output

Digitizer

Layout input, go to the section

“Edit”

Layout Input

read_screen_layout

Position of option on menu: File I/O =>Layout input

The layout input option reads in a screen layout file (*.slf) which can create most menus and panels and place them on the screen.

The screen layout file can be created by the layout input option or by any editor.

On selecting the layout input option, the **read screen layout** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layout file <i>the name of the file to read the screen layout information from.</i>	input		*.slf
Read <i>after selecting this button, the screen layout file will be read in.</i>	button		

Layout Output

write_screen_layout

Position of option on menu: File I/O =>Layout Output

The layout output option writes out information on almost all the objects on the screen, and for views, their sizes.

The layout file can be read back in with the layout input option to recreate most menus and panels on the screen (not views). Since the layout file is editable, users can create their own special layout files.

The view size information is helpful in building up a set_up_file to define the initial screen layout.

On selecting the layout output option, the **write screen layout** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layout file <i>the name of the file to print the screen layout information to.</i>	input		*.slf
Save <i>after selecting this button, the screen layout information will be printed out.</i>	button		

Textstyle Input

read_textstyles_definitions

Position of option on menu: File I/O =>Textstyle Input

When **12d** Model starts up, a textstyles definition file can be automatically read in. The textstyles definitions file defines the textstyles and fonts used in the project.

It is possible to redefine the textstyles by reading in another textstyles definitions file using the **textstyle input** option.

On selecting the textstyle input option, the **read textstyles definitions** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Textstyle file <i>the name of the file to read the textstyle information from.</i>	input		*.tsf
Read <i>after selecting this button, the textstyles definitions file will be rad in.</i>	button		

Templates Input

read_templates

Position of option on menu: File I/O =>Templates Input

This option is used to read in templates from files in the special **12d** Model template format.

On selecting the templates input option, the **read templates** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File <i>name of the 12d template file to be read in</i>	input		*.tpl files
Read <i>read the data in.</i>	button		

Note if a template already exists, then the template in the file is ignored.

Templates Output

template_output

Position of menu: File I/O =>Templates Output

The templates output option writes out one or all templates in the 12d Model template format.

The output walk-right menu is

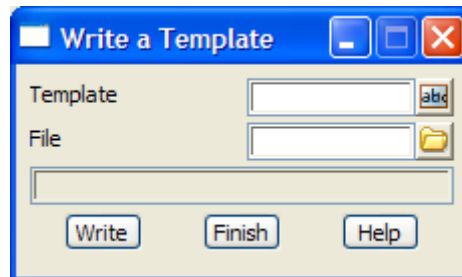

One Template

write_a_template

Position of option on menu: File I/O =>Templates Output =>One Template

This option is for writing a single template out in the special 12d template format.

On selecting the one template option, the **write a template** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template <i>name of the template to be written out.</i>	input		available templates
File <i>name of the file to write the template to.</i>	input		
Write <i>after selecting this button, the template given in the template field will be written out to the file with the name given in the file field.</i>	button		

All Templates

write_all_templates

Position of option on menu: File I/O =>Templates output =>All templates

This option is for writing all template out in the special 12d Model template format.

On selecting the all templates option, the **write all templates** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	input		
<i>name of the file to write all the templates to.</i>			
Write	button		
<i>all the templates will be written out to the file with the name given in the file field.</i>			

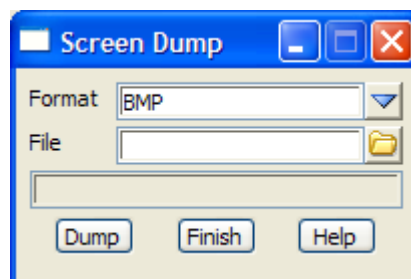

Screen Dump

screen_dump

Position of option on menu: File I/O =>Screen dump

The 12d Model screen can be dumped to disk in either gif or colour postscript format.

On selecting the screen dump option, the **screen dump** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	input	gif	gif, colour postscript
<i>format to write the screen dump out in.</i>			
File	input		*.gif files
<i>file to write the screen. dump to.</i>			
Dump	button		
<i>after selecting this button, the screen/window is dumped out in the selected format.</i>			

Map File

map_file_create_edit

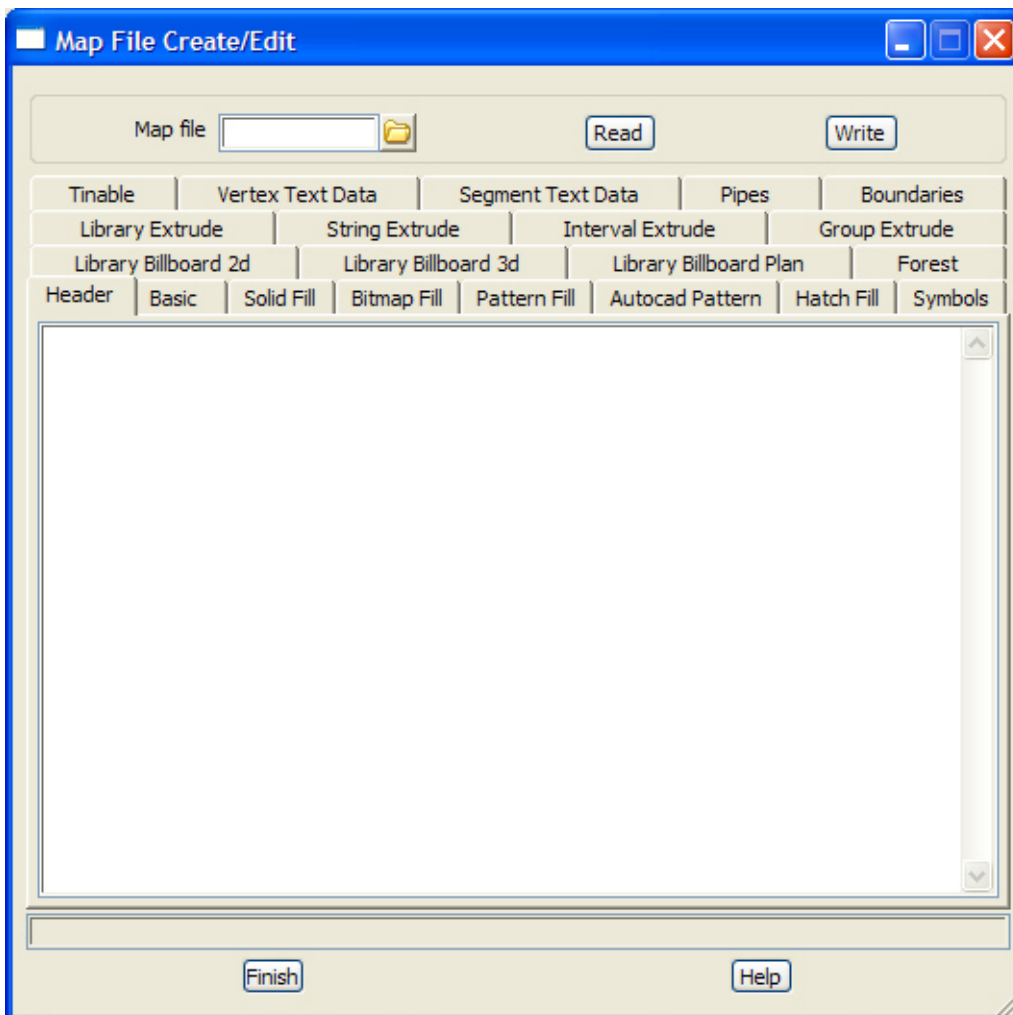

Position of option on menu: File I/O =>Map File

The map file option is used to **create** or **edit** the 12d Map Files which are used in many 12d Model options.

A **12d Map file** consists of tables of **keys** or **entity-masks** which are used to set many strings properties such as string name, colours, linestyles, symbols, models, extrusions and tinability to data that matches one of the keys.

When using a 12d map file, the part of the data that is matched against the *keys* is called the entity-name, and what the entity-name is depends on the option using the map file. For most options, the **entity-name** is a **string** name but it can vary. For example, the xyzs reader uses the **string name** in the xyzs file as the entity-name but in the DGN reader, no string name exists and the **DGN level** can be entity-name.

On selecting the map file option, the **map file create/edit** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	input		*.mf

name of the map file to be created or edited.

Bottom buttons

Read button

read in the map file given in the map file field and load the data into the fields of the table. If the file doesn't exist, an error message is given.

Write button

write out the data in the table to the file name given in the map file field. If the file already exists, a yes-no-cancel panel checks to see if the existing file is to be over written - if no or cancel is selected, nothing is written out.

Header tab

the Header tab just has lines of comment text.

Basic tab

the Basic tab sets colours, linestyles, point-line type, weight and colours for strings.

Key select name menu

key to match the string name against in the Basic tab. The key can include wild cards () and wild characters (?).*

If a match occurs, then the rest of the grid fields for this line of the Basic tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of the Basic tab of the map file.

Name select name menu

if non-blank, the string name to be used for all strings matching the key for this line of the map file. If blank, the original string name (which matched the key) is used.

*A blank name field is written out as a * to the ascii version of the map file and a * in the ascii map file for name is displayed as a blank line in the map file editor.*

Model select model menu

if non-blank, the model to be used for all strings matching the key for this line of the map file. If blank, the string's model is not modified.

*A blank model field is written out as a * to the ascii version of the map file and a * in the ascii map file for model is displayed as a blank line in the map file editor.*

Colour select colour menu

if non-blank, the colour to be used for all strings matching the key for this line of the map file. If blank, the string's colour is not modified.

*A blank colour field is written out as a * to the ascii version of the map file and a * in the ascii map file for colour is displayed as a blank line in the map file editor.*

Point Line point, line

if non-blank, the breakline type to be used for all the data fitting the key for this line of the map file.

If blank, the string's point-line type is not modified. If data is coming from a field file, then the data may be coded as a line or point string.

*A blank point-line field is written out as a * to the ascii version of the map file and a * in the ascii map file for point-line is displayed as a blank line in the map file editor.*

Linestyle

select linestyle menu

*if non-blank, the linestyle to be used for all strings matching the key for this line of the map file.
If blank, the string's linestyle is not modified.*

*A blank linestyle field is written out as a * to the ascii version of the map file and a * in the ascii map file for linestyle is displayed as a blank line in the map file editor.*

NOTE: If the point-line type is point then the linestyle is used as a symbol at each vertex of the string. The size of the symbol at each point is given in the linesytle definition. If a symbol at each point is required whose size, colour and rotation may need to be modified at each point, then the symbol tab must be used to place a symbol at each vertex and a world style must be used in the symbol name field for the symbol tab.

Weight

*if non-blank, the weight to be used for all strings matching the key for this line of the map file.
If blank, the string's weight is not modified.*

*A blank weight field is written out as a * to the ascii version of the map file and a * in the ascii map file for weight is displayed as a blank line in the map file editor.*

Comment

comment to be to be used in this line of the map file. A double slash // is written out to the ascii map file before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

Solid Fill tab

the Solid Fill tab sets whether super strings (closed and non-closed) are filled with a solid colour.

Key

select name menu

key to match the string name against in the Solid Fill tab. The key can include wild cards () and wild characters (?).*

If a match occurs, then the rest of the grid fields for this line of the Solid Fill tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of the Solid Fill tab of the map file.

Colour

select colour menu

colour to use to fill the super string with. If the super string is not closed, the fill will apply as if the super string was closed.

This field can not be blank.

Blend

if non blank, the blend value to use for the solid fill.

Drape name**Drape mode**

choice box

Colour, Colour by texture

Comment

comment to be to be used in this line of the map file. A double slash // is written out to the ascii map file before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

Bitmap Fill tab

the Bitmap Fill tab sets whether super strings (closed and non-closed) are filled with a bitmap pattern.

Pattern Fill tab

this option is under development.

Autocad Pattern

the AutoCad Pattern tab uses a pattern from the AutoCAD pattern file to fill the selected strings

Hatch Fill tab

the Hatch Fill tab sets whether super strings (closed and non-closed) are filled with a hatch pattern.

Symbols tab

the Symbols tab sets what symbols to be used on vertices of strings.

Key

select name menu

key to match the string name against in the Symbol tab. The key can include wild cards () and wild characters (?).*

If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.

Symbol

select symbol menu

*the name of the **symbol** to be used for each vertex of all strings matching the key.*

This field can not be blank. If the symbol does not exist when the map file is being used, then an error message will be written to the output window.

Size

measures menu

the size of the symbol to be used for each vertex of all strings matching the key.

This field can not be blank.

Colour

select colour menu

the colour of the symbol to be used for each vertex of all strings matching the key.

This field can not be blank.

Angle

measures menu

the angle of the symbol to be used for each vertex of all strings matching the key.

This field can not be blank.

Delta X

measures menu

the x-distance to offset the symbol from each vertex of the strings matching the key.

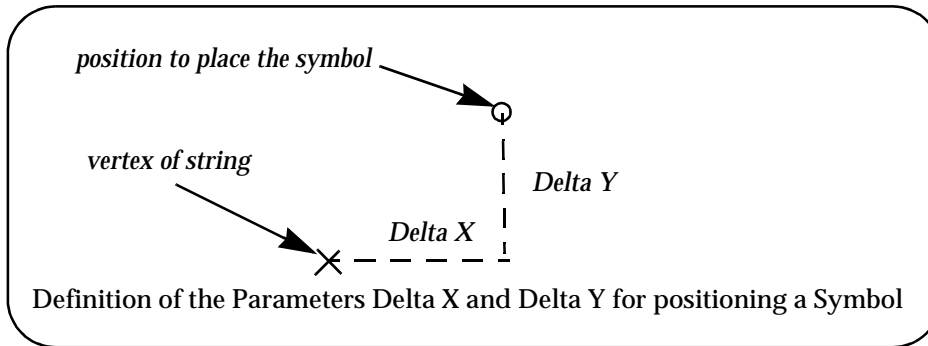

This field can not be blank.

Delta Y

measures menu

the y-distance to offset the symbol from each vertex of the strings matching the key.

This field can not be blank.

Hide vertex tick box

if tick, no default cross is placed at the vertex of the string.

Comment

comment to be to be used in this line of the map file. A double slash // is written out to the ascii map file before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

Tinable tab

the Tinable tab sets whether the vertices and segments are tinable (used in triangulations), not tinable (not used in triangulations) or only the vertices (points) are tinable.

Key select name menu

key to match the string name against in the Tinable tab. The key can include wild cards () and wild characters (?).*

If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.

Tinable yes, no, points

if yes, the vertices and segments for all the strings matching the key are tinable.

If no, the vertices and segments for all the strings matching the key are not tinable.

If points, the segments are not tinable and the vertices are tinable for all the strings matching the key.

This field can not be blank.

Comment

comment to be to be used in this line of the map file. A double slash // is written out to the ascii map file before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

Vertex Text Data tab

the Vertex Text Data tab sets parameters for drawing text on the vertices of super strings.

Key select name menu

key to match the string name against in the Vertex Text Data tab. The key can include wild cards () and wild characters (?).*

If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.

Textstyle select text style menu

*the textstyle used for any vertex text for all strings matching the key.
This field can not be blank.*

Type screen, paper, world

*the textstyle type used for any vertex text for all strings matching the key.
This field can not be blank.*

Size measures menu

*the size of the vertex text to be used for each vertex of all strings matching the key.
This field can not be blank.*

Colour select colour menu

*the colour of the vertex text to be used for each vertex of all strings matching the key.
This field can not be blank.*

Angle measures menu

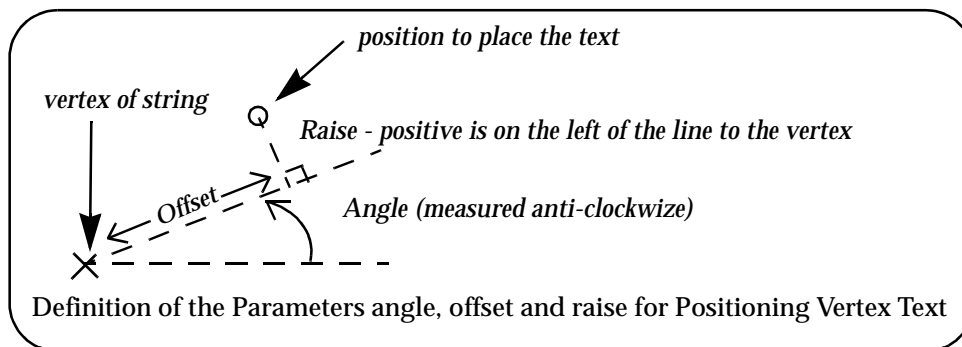

*the angle of the vertex text to be used for each vertex of all strings matching the key.
This field can not be blank.*

Offset measures menu

*the distance to offset the text from each vertex of the strings matching the key.
This field can not be blank.*

Raise measures menu

*the distance to perpendicularly raise the text for each vertex of all strings matching the key.
This field can not be blank.*

Slant Measures menu

*the slant for the vertex text of all strings matching the key.
This field can not be blank.*

X factor Measures menu

*the x-factor for the vertex text of all strings matching the key.
This field can not be blank.*

Justify Select Justification Choice menu

*the justification for the vertex text of all strings matching the key.
This field can not be blank.*

Comment

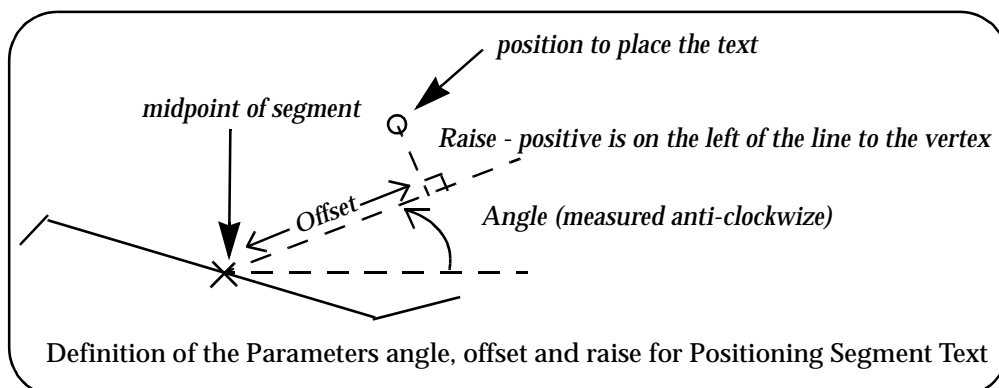

comment to be used in this line of the map file. A double slash // is written out to the ascii map file

before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

Segment Text Data tab

the Segment Text Data tab sets parameters for drawing text on the segments of super strings. The text is positioned about the mid point of the segment.

Key	select name menu
key to match the string name against in the Segment Text Data tab. The key can include wild cards (*) and wild characters (?).	
If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.	
If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.	
Textstyle	select text style menu
the textstyle used for any segment text for all strings matching the key. This field can not be blank.	
Type	screen, paper, world
the textstyle type used for any segment text for all strings matching the key. This field can not be blank.	
Size	measures menu
the size of the segment text to be used for each segment of all strings matching the key. This field can not be blank.	
Colour	select colour menu
the colour of the segment text to be used for each segment of all strings matching the key. This field can not be blank.	
Angle	measures menu
the angle of the segment text to be used for each segment of all strings matching the key. This field can not be blank.	
Offset	measures menu
the distance to offset the text from each segment of the strings matching the key. This field can not be blank.	
Raise	measures menu
the distance to perpendicularly raise the text for each segment of all strings matching the key. This field can not be blank.	

Slant Measures menu

*the slant for the segment text of all strings matching the key.
This field can not be blank.*

X factor Measures menu

*the x-factor for the segment text of all strings matching the key.
This field can not be blank.*

Justify Select Justification Choice menu

*the justification for the segment text of all strings matching the key.
This field can not be blank.*

Comment

comment to be used in this line of the map file. A double slash // is written out to the ascii map file before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

Pipes tab

the Pipes tab sets parameters for sizing pipes and culverts for super strings.

Key select name menu

key to match the string name against in the Pipes tab. The key can include wild cards () and wild characters (?).*

If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.

Justify invert, centre, obvert

*the pipe/culvert justification used for all strings matching the key.
This field can not be blank.*

Shape diameter, culvert

*the shape of the super string segment for all strings matching the key.
This field can not be blank.*

Size 1 measures menu

for a pipe shape, the diameter of the super string segment to be used for each segment of all strings matching the key.

For a culvert shape, the width of the super string segment to be used for each segment of all strings matching the key.

This field can not be blank.

Size 2 measures menu

for a culvert shape, the height of the super string segment to be used for each segment of all strings matching the key. Ignored for a pipe shape.

This field can only be blank for a pipe shape.

Comment

comment to be used in this line of the map file. A double slash // is written out to the ascii map file before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

Boundaries tab

the Boundaries tab sets a parameters for a string so that when it is part of a triangulation it is also used to null or reset any triangles.

Key select name menu

key to match the string name against in the Boundaries tab. The key can include wild cards () and wild characters (?).*

If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.

Boundaries exclude, include

If the mode is exclude, then any triangles inside the polygon are set to null.

If the mode is include, then any triangles inside the polygon are reset so that they aren't null.

Comment

comment to be to be used in this line of the map file. A double slash // is written out to the ascii map file before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

Library Extrude tab

the Library Extrude tab applies an extrude from the 12d library to selected super strings. Note that extrudes can only be applied to super strings.

Key select name menu

key to match the string name against in the Library Extrude tab. The key can include wild cards () and wild characters (?).*

If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.

Extrude select extrudes menu

the library extrude to apply to the super string

Comment

comment to be to be used in this line of the map file. A double slash // is written out to the ascii map file before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

String Extrude tab

the String Extrude tab applies an extrude to selected super strings. Note that extrudes can only be applied to super strings.

Key select name menu

key to match the string name against in the String Extrude tab. The key can include wild cards () and wild characters (?).*

If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.

Comment

comment to be to be used in this line of the map file. A double slash // is written out to the ascii map file

before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

Interval Extrude tab

the String Extrude tab applies an extrude to selected super strings. Note that extrudes can only be applied to super strings.

Key

select name menu

key to match the string name against in the Interval Extrude tab. The key can include wild cards (*) and wild characters (?).

If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.

Comment

comment to be used in this line of the map file. A double slash // is written out to the ascii map file before the comment, and a comment in an ascii map file is read in and displayed without the double slash.

Please see the next section "Ascii Form of the 12d Map File" for a discussion of the text form of the 12d map file.

Ascii Form of the 12d Map File

Basic Tab

The *Basic* tab enables the string name, model, colour, point-line type, linestyle and weight to be defined and for many applications, this is all that is required in the 12d Map file.

The Basic tab consisted of one or more lines of information. Each line begins with a key (entity-mask) followed by a string name, model name, colour, breakline type (point or line), line style, weight and comment. The key can contain wild cards (*) and wild characters (?).

When a string is read in and satisfies a key, the key's corresponding string name, model, colour, breakline type and style is used for that string.

For example, any entity name beginning with **31** can be created as a **12d** Model string with the name **picket**, colour **cyan**, breakline type **line**, line style **1** and model **fences** by the map file line

```
31      picket      fences      cyan      line      1
```

If a map file is used, as each entity is read in, the map file is searched **sequentially** until a match with a key is made and the key's name, colour etc. used. If no match is found, the default colours and model (given in the read panel) are used.

Notes

1. If the entity-name is to be used as the new string name, use an asterisk (*) in place of the string name. For example,

```
fred      *      fences      cyan      line      1
```

2. If the default model for the reader is to be used as the model name, use an asterisk in place of the model name. For example,

```
31      31      *      cyan      line      1
```

3. A * for colour, breakline type and linestyle means that if the entity has a colour, breakline style or linestyle, then it is used rather than be mapped to another one.
4. All model names used in the map file can be given an extra (common) prefix by typing the prefix into the prefix for models field in the read panel.
5. If any information includes a space, then it must be enclosed in quotes ". For example, the model name may be "trial 1" or a style "large tanks".
6. Comments can be included in the map file by preceding them with a double forward slash//. Anything on the line after the // is ignored.

An example of a 12d Model map file is

```
// 12d Model map file
// key      name      model      colour      pt-line      linestyle

102        break      breaks     red          line          solid
305        fence      cadast     green        point         dash
998        bdry       bound      cyan         line          solid
spots      *          spot       yellow       point         1
PS*        *          *          yellow       point         1
```

Other tabs

For all tabs other than the *Basic* tab, the map file is broken up into sections (one section for each tab of the map file editor) and each section begins with a header record which is the section name enclosed in braces { }. For example, the symbols section has the header

```
{symbol_data}
```

Inside each section, the data is similar to the *Basic* tab with lines consisting of a key (entity-mask) followed by the data required for that section. The key can contain wild cards (*) and wild characters (?).

The exact format for the map file is not required since they are created and edited from within 12d Model by the option

File i/o => Map file

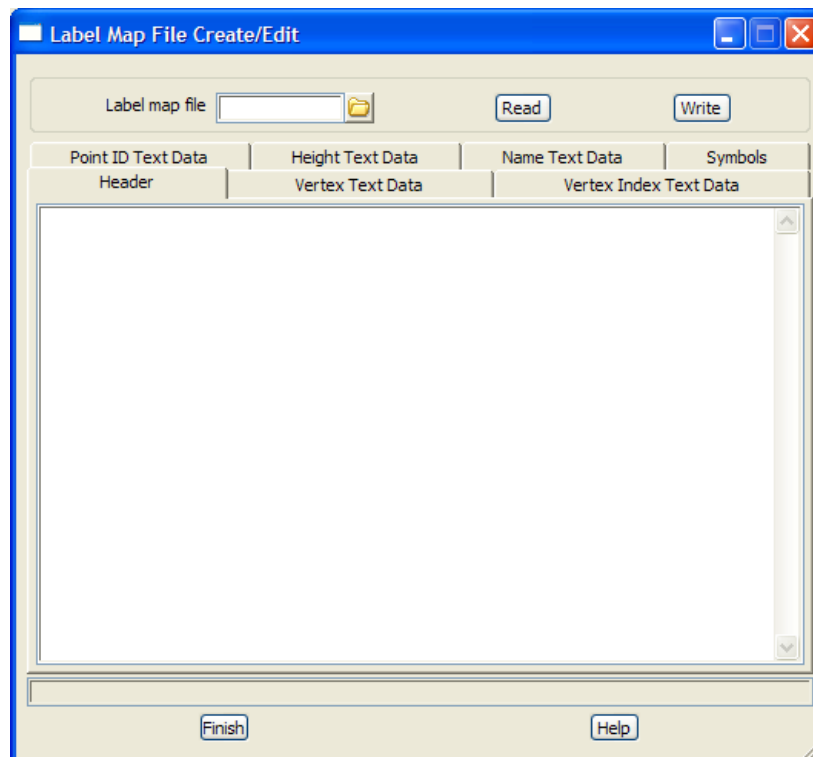

Label Map File

label_map_file_create_edit

Position of option on menu: File I/O =>Label Map File

The label map file option can be used to **create** or **edit** the map files used to create labelling for vertices.

On selecting the label map file option, the **label map file create/edit** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Label map file <i>name of the label map file to be created or edited.</i>	input		*.lmf

Bottom buttons

Read button

read in the label map file given in the label map file field and load the data into the fields of the table. If the file doesn't exist, an error message is given.

Write button

write out the data in the table to the file name given in the label map file field. If the file already exists, a yes-no-cancel panel checks to see if the existing file is to be over written - if no or cancel is selected, nothing is written out.

Header tab

lines of text that are written out at the top of the label map file.

Vertex text data tab - labelling of the text at each vertex

Key select name menu for fields
key to be used in this line of the label map file.

Textstyle select textstyle menu for fields
textstyle for labels.

Type/Size/Colour
units for size of text labels/size of the text/ colour of the text.

Angle/Offset/Raise/Slant/X Factor/Justify
angle/offset/raise/slant/x factor/justification for the text.

Comment
comment to be to be used in this line of the map file. A double slash // is written out to the file before the comment, and comment in a map file is read in and displayed without the double slash.

Vertex index text data tab - labelling of the vertex index

Key select name menu for fields
key to be used in this line of the label map file.

Textstyle select textstyle menu for fields
textstyle for labels.

Type pixel, world
units for size of text labels.

Size
size of the text in the given units.

Colour select colour menu for fields
colour of the text.

Angle/Offset/Raise/Slant/X Factor/Justify
angle/offset/raise/slant/x factor/justification for the text.

Comment
comment to be to be used in this line of the map file. A double slash // is written out to the file before the comment, and comment in a map file is read in and displayed without the double slash.

Point id text data tab - labelling the point id at each vertex

Key select name menu for fields
key to be used in this line of the label map file.

Textstyle select textstyle menu for fields
textstyle for numbers.

Type/Size/Colour
units for size of number labels/size of the text/ colour of the number.

Angle/Offset/Raise/Slant/X Factor/Justify
angle/offset/raise/slant/x factor/justification for the number text.

Comment

comment to be to be used in this line of the map file. A double slash // is written out to the file before the comment, and comment in a map file is read in and displayed without the double slash.

Height text data tab - labelling of the height of the vertex

Key select name menu for fields
key to be used in this line of the label map file.

Textstyle select textstyle menu for fields
textstyle for labels.

Type/Size/Colour
units for size of text labels/size of the text/ colour of the text.

Angle/Offset/Raise/Slant/X Factor/Justify
angle/offset/raise/slant/x factor/justification for the text.

Comment
comment to be to be used in this line of the map file. A double slash // is written out to the file before the comment, and comment in a map file is read in and displayed without the double slash.

Name text data tab - labelling of the string name(codes) at each vertex

Key select name menu for fields
key to be used in this line of the label map file.

Textstyle select textstyle menu for fields
textstyle for labels.

Type/Size/Colour
units for size of text labels/size of the text/ colour of the text.

Angle/Offset/Raise/Slant/X Factor/Justify
angle/offset/raise/slant/x factor/justification for the text.

Comment
comment to be to be used in this line of the map file. A double slash // is written out to the file before the comment, and comment in a map file is read in and displayed without the double slash.

Symbols - placing symbols at each vertex

Key select name menu for fields
key to be used in this line of the label map file.

Style select textstyle menu for fields
linestyle to apply to the vertex.

Size/Colour
size/colour of symbol.

Angle/Offset/Raise
angle/offset/raise for the symbol.

Comment
comment to be to be used in this line of the map file. A double slash // is written out to the file before the

comment, and comment in a map file is read in and displayed without the double slash.

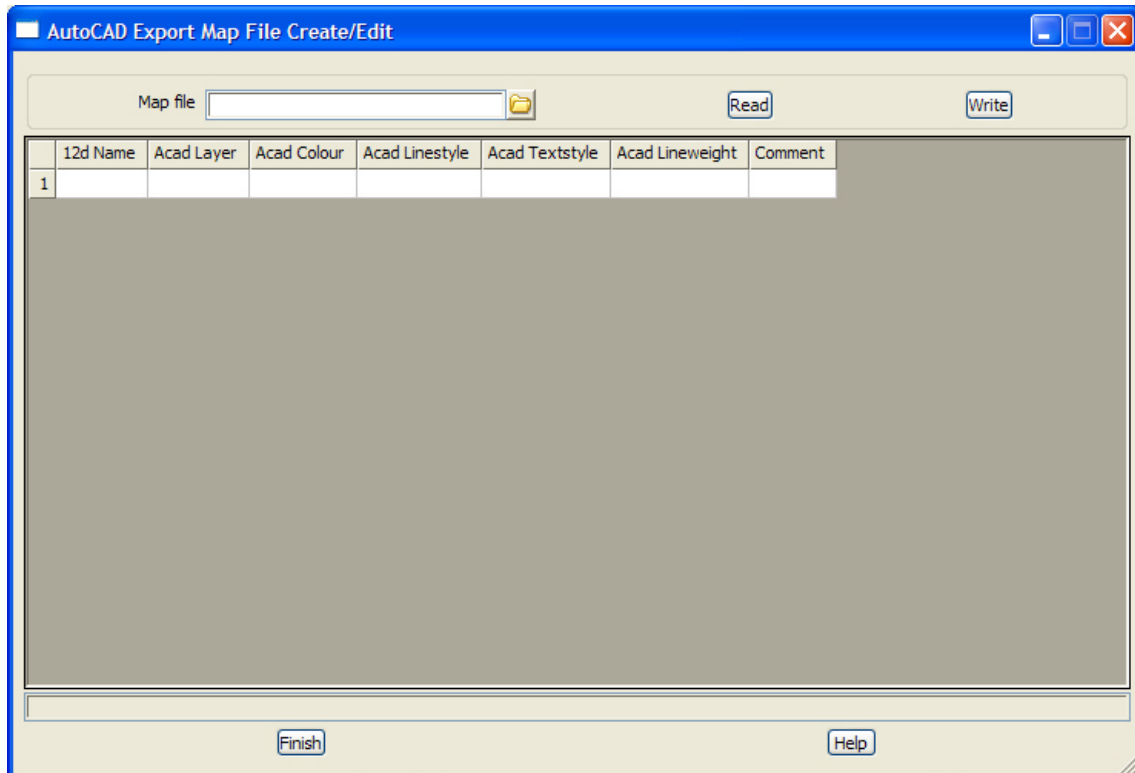

AutoCAD Output Map File Create/Edit

autocad_export_map_file_create_edit

Position of option on menu: File I/O =>AutoCAD output map file

The AutoCAD output map file option **creates** or **edits** the map files used when writing data out to AutoCAD using the DWG Output option (not used for plotting to AutoCAD).

On selecting the IAcad output map file option, the **Autocad Export Map File Create/Edit** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	input		*.acadmf

name of the Autocad output map file to be created or edited.

Read	button
-------------	--------

read in the Autocad output map file given in the map file field and load the data into the fields of the table. If the file doesn't exist, an error message is given.

Write	button
--------------	--------

write out the data in the table to the file name given in the map file field. If the file already exists, a yes-no-cancel panel checks to see if the existing file is to be over written - if no or cancel is selected, nothing is written out.

Grid Cells

12d Name

12d Model string names for the mapping to apply to - wild cards () and characters (!) can be used.*

Acad layer

*AutoCAD layer to send the selected strings to. Use * to write the 12d Model model of the string out*

Acad colour

*AutoCAD colour to use for the selected strings - a number between 0 and 256. Use * for 12d Model colour number. Use BYLAYER for ACD BYLAYER*

Acad linestyle

*AutoCAD linestyle to use for the selected strings. User * for 12d Model linestyle or BYLAYER for ACD BYLAYER*

Acad Textstyle

*AutoCAD Textstyle to use for the selected strings. Use * for 12d Model text style*

Acad lineweight

AutoCAD lineweight to use for the selected strings.

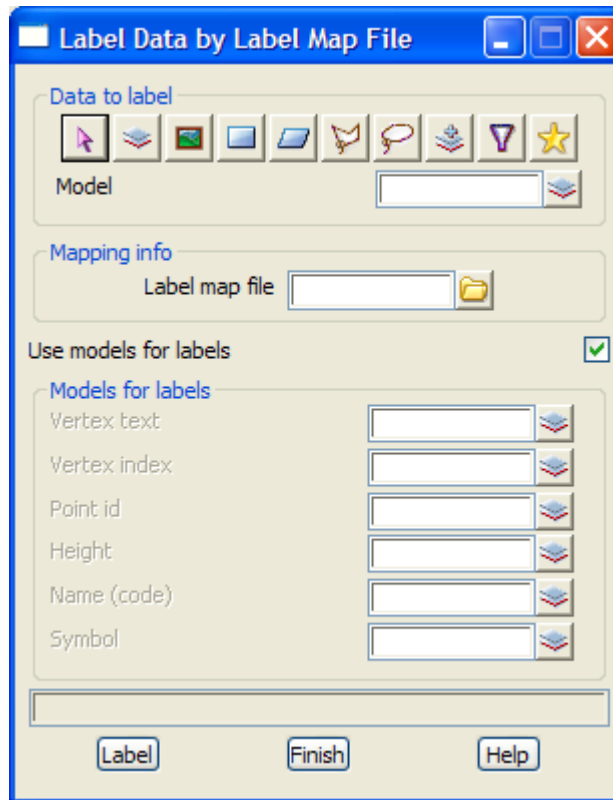

Use Label Map File

label_data_by_label_map_file

Position of option on menu: File I/O =>Use Label Map File

Use a label map file to create text labels for all strings is the selected data source.

On selecting the use label map file option, the **label data by label map file** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data selection type</i>		Model	
Data source <i>source of data is to be written out to a file.</i>	input		
Label map file <i>name of the label map file to be created or edited.</i>	input		*.lmf
Use models for labels <i>if tick, all the labels for all vertices of the strings go into the appropriate models for vertex, vertex numbers, point ids, height, string name (code) and symbols given in the panel fields.</i> <i>if not tick, the labels for a string from a model go into the model of the same name but with a prefix/postfix given by the vertex, vertex ni, height and code panel fields.</i>	tick box	tick	
Vertex text, Vertex index, Point id, Height, Name, Symbol <i>model box</i>			available models

if User models for labels is ticked, these models are used for the create data.

Label button
process the selected strings and label them.

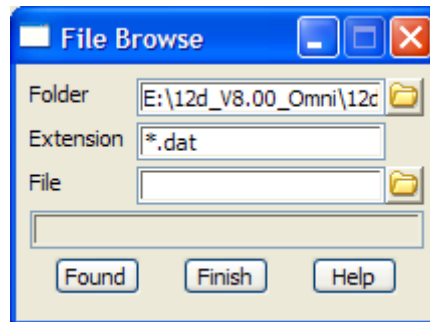

Edit

file_browse

Position of option on menu: File I/O =>Edit

Files can be searched for and then displayed in the editor using the browse option.

On selecting the Edit option, the **File Browse** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>folder to search for files with the extension given in the extension field.</i>	input	current folder	Microsoft browser
Extension <i>wild cards and extension to limit the search of files. An <enter> needs to be typed after changing the extension.</i>	input	*.*	
File <i>select the file to be displayed in the editor.</i>	input		files satisfying the folder and extension fields.
Found <i>display in the editor the file of the name given in the file field.</i>	button		

Note

The **editor** is pointed to by the environment variable EDITOR_4D (see Appendix A).

8 Data Input

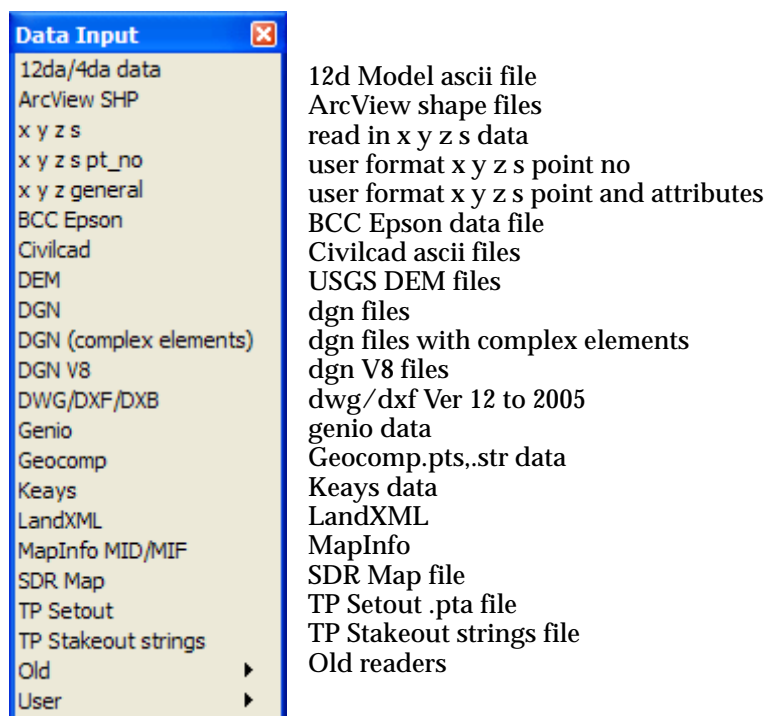

data_input

Position of menu: File I/O =>Data input

The facilities for reading data files into 12d Model are collected under the File i/o=>Data input menu.

Some of the formats are provided in the base product (xyz data, BCC Epson, 12d Model HP plots and 12d Model ascii files) and the rest are optional (dxf, genio, geocomp, etc.).

The default *Input null value* is described in the section “Input Null Value”

The default *Input null value* is described in the section “Input Null Value”

For the option *12da data*, go to the section

<i>ArcView SHP</i>	“12d Ascii Input” .
<i>x y z s</i>	“ArcView SHP Input” .
<i>x y z s pt_no</i>	“X Y Z S File Format” .
<i>x y z general</i>	“User Format X Y Z Input” .
<i>BCC Epson</i>	“User X Y Z and Attributes Input” .
<i>Civilcad</i>	“BCC Epson Input” .
<i>DEM</i>	“CivilCad Input” .
<i>DGN</i>	“DEM Input” .
<i>DGN (complex elements)</i>	“DGN Binary Input” .
<i>DGN V8</i>	“DGN With Complex Elements” .
<i>DWG/DXF/DXB</i>	“DGN V8” .
<i>Genio</i>	“DWG/DXF Input” .
<i>Geocomp</i>	“Genio File Format” .
	“Geocomp File Format” .

<i>Keays</i>	"Keays Input" .
<i>LandXML</i>	"LandXML Input" .
<i>MapInfo</i>	"Mapinfo Input" .
<i>SDR Map</i>	"SDR Map Input" .
<i>TP Setout</i>	"TP Setout Input" .
<i>TP Stakeout strings</i>	"TP Stakeout Strings Input" .
<i>Old</i>	"Old Inputs" .

Input Null Value

In three dimensional data, it is possible that a point can have a valid plan position but an undefined height. In **12d** Model, there is a special **null** value which is used internally when height is undefined (-9.9e29).

In other systems, the null value will be different.

To allow for the different null values, **12d** Model has an **i/o null height** parameter.

As data is read in, the height is checked and if it is equal to the **i/o null height**, then it is replaced by the **12d** Model null height.

The **i/o null height** is set in **Default Settings** tab of the **Defaults** panel in the option Utilities=>Defaults.

Note - some input panels have their own special null value field which is used instead of the i/o null height.

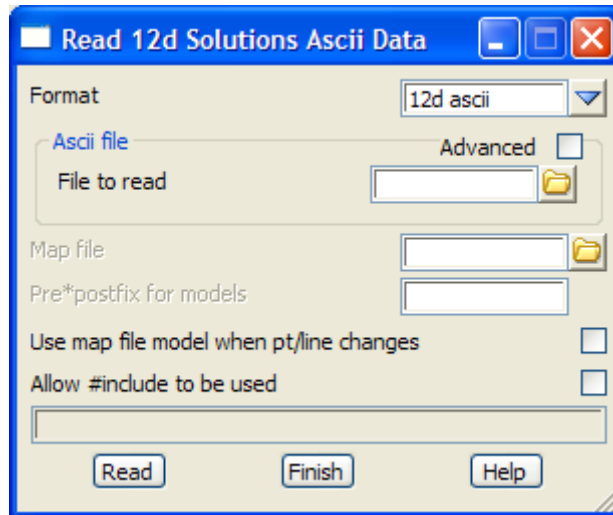

12d Ascii Input

read_12D_Solutions_ascii_data

Position of option on menu: File I/O =>Data input =>12d/4da data

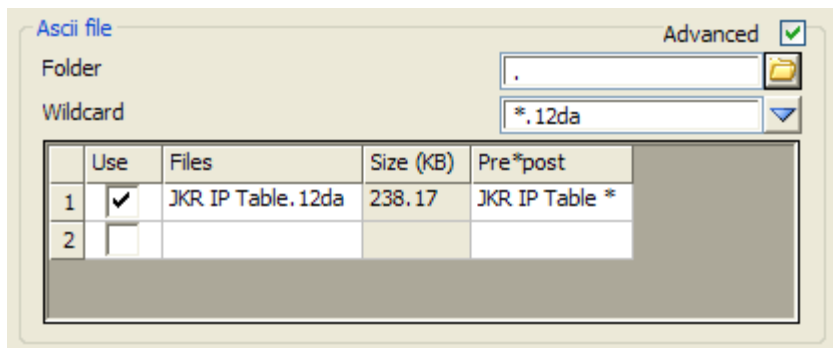

The 12d Ascii format is a special format defined by 12D Solutions to allow data to be easily transferred from other programs into 12D Solutions software such as 12d Model. The 12d Ascii format is given in the Appendix.

Selecting the 12d data brings up the **Read 12d Solutions Ascii Data** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format <i>use 12d ascii or 4d ascii format (the only difference is the file name ending)</i>	choice box	12d ascii	12d ascii, 4d ascii
File to read <i>name of the 12d Model Ascii file to be read in.</i>	file box		*.12da or *.4da files
Advanced <i>if tick, a grid to allow multiple 12d ascii files to be read in, is opened. A wild card is used to select all the files to be read in.</i>	tick box		

Folder folder box
folder to search for files using the Wild card

Wildcard input

wild card to use in search for files in the given folder

Use tick box

*if **tick**, read in the file*

Files output

name of the file in the folder

Size output

file size

Pre*post text input

*if **non blank**, pre*post text to use for the models in this 12d ascii file (see “Pre*Postfix Panel Fields” for information on using pre*postfix.*

*If **blank**, use the pre*post text from the Pre*postfix for models panel field.*

Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.

Map file file box *.mf files

*if non-blank, the name of the 12d map file to be used for all strings read in, including any files given with the **Advanced** mode ticked on.*

If blank, no map file is used

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section “Map File” in chapter “File I/O” for information about an 12d map file.

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.

*Go to the section “Pre*Postfix Panel Fields” for information on using pre*postfix.*

Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.

Use map file model when pt/line changes tick box

*if **not tick** and the pt/line type of the string does not match that in the map file, then the string is placed in the .*

If tick, the .

Allow #include to be used tick box

if tick, XXXX.

Read button

read the data in.

ArcView SHP Input

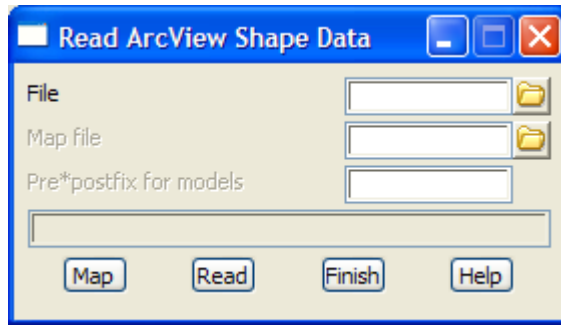

[read_ArcView_shape_data](#)

[ArcView_input_mapping](#)

Position of option on menu: File I/O =>Data input =>ArcView SHP

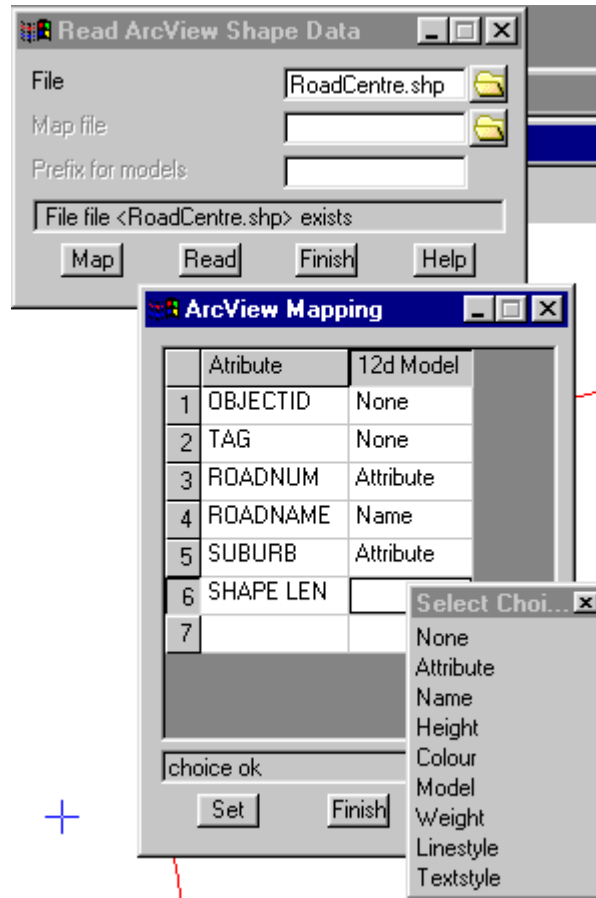

This Option is currently under development.

On selecting the **ArcView SHP** option, the **Read ArcView Shape Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	file box		*.shp files
<i>name of the ArcView shape file. 12d Model then reads this and the two (2) other files that go with the shape file. The two other file extensions are *.shx and *.dbf.</i>			
<i>If no attribute is mapped to model, then the file name (minus the .shp) is used as the model for the data.</i>			
Map file	file box		*.mf files
Pre*postfix for models	pre*postfix box		
<i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.</i>			
<i>Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.</i>			
Map	button		
<i>After specifying the Shape file name, click on Map to scan the file and find the names of all the attributes in the shape file. An ArcView Input Mapping panel is then displayed with a list of all the ArcView attributes in the shape file. How the attribute are to be mapped and used in 12d Model is then be specified for each attribute in the panel. For example, the value of an attribute could be used for a 12d string name, or colour etc.</i>			

If None is selected for an attribute, then the attribute is ignored.

*Once the table is completely filled in (no field in the column titled 12d Model can be left blank) then the **Set** button must be selected and then the **Finish** button selected to remove the ArcView Input Mapping panel.*

NOTE - if no ArcView attribute is mapped to Model, then the file name (minus the .shp) is used as the model or the data.

Read button

read the data in.

X Y Z S File Format

`read_x_y_z_s_data`

The x-y-z-s format is designed so that point and line strings can be quickly and easily coded and entered into 12d Model. It is **not** intended for more complex strings such as alignments and text where the 12d Model ascii format is more suitable.

For the x-y-z format, **point** data is set out with one point of x y z data per line. The three values are separated by one or more spaces (free format). For example

```
990          3          10
112          1001       23.5
```

A point-string is represented in 12d Model with a cross at each point. The colour of the cross can be defined by including a POINT_COLOUR command on the line before the point-string begins.

For example, a two point point-string with red crosses would be coded as

```
POINT_COLOUR      red
100.3  990.3   10
112  1001     23.5
```

Line string data is also set out with one point per line (in the order that the points occur in the string) but with a string label included at the end of each line. The string label is repeated for each point in the string. The line string terminates when the string label changes to another name for a new line string or is blank for a point string.

A line-string is drawn with a line connecting a point to its neighbouring points in the string (the string links). The colour of the links of the string can be set using the LINE_COLOUR command.

For example, a green, three point line-string called S1 becomes

```
LINE_COLOUR green
100.3  990.3  10  S1
112  1001  23.5  S1
119.3 1203.1 29.4  S1
```

Notes

- The name of the line string can include spaces but in that case the name must be enclosed in quotes ". For example, the string name may be "toe 1".
- If a string of a certain name is created and the string name reoccurs in the file, then a new string with the same name is created. It is not joined to the earlier string.

xyz Map File

See the section "Map File" in chapter "File I/O" for information about an 12d map file.

The **name** of the xyzs string is used as the entity-name to be used for matching with a map file. The map file can be used to override the breakline type of line-strings in the x-y-z file.

X Y Z Input

Position of option on menu: File I/O =>Data input =>x y z s

On selecting the xyzs option, the **read xyzs data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File <i>name of the data file to be read in</i>	file box		*.dat files
Map file <i>if non-blank, the name of the 12d map file to be used for all strings read in. If blank, no map file is used</i>	map file box		*.mf files
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix</i>	pre*postfix box		
Default line colour <i>colour used for line-strings (if no colour is defined in the file)</i>	colour box	default colour	available colours
Default point colour <i>colour used for the crosses in point-strings (if no colour is defined in the file)</i>	colour box	default pt colour	available colours
Default model for data <i>name of the model that the data is to be placed in. The model will be created if it does not already exist. This field must be filled in.</i>	model box		available models
Use super strings <i>if tick, super strings will be created. If not tick, 3d strings will be created.</i>	tick box		
Add to view <i>if non blank, the default model will be automatically added to the view</i>	view box		available views

Read button

read the data into the model given in the model field.

User Format X Y Z Input

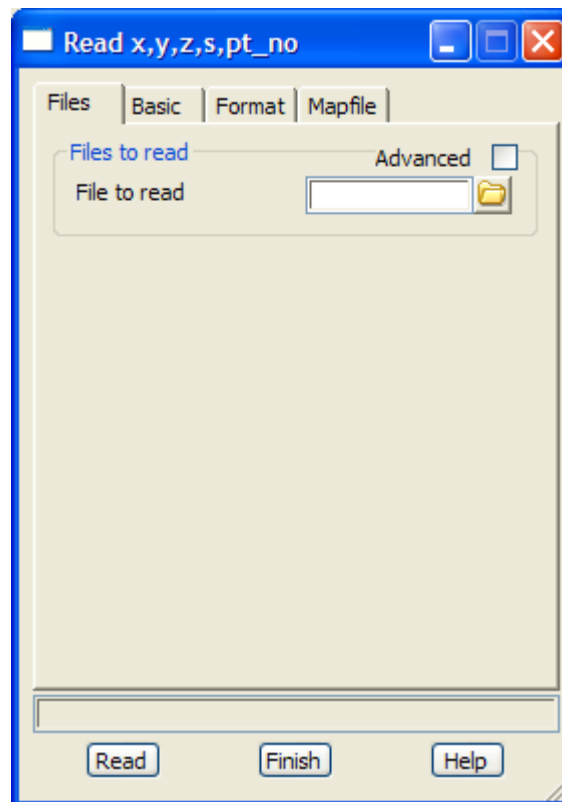

Read_x_y_z_s_pt_no

Position of option on menu: File I/O =>Data input =>x y z s pt_no

On selecting the read x,yzs,pt_no option, the **read xyzs pt no** panel is displayed.

This option reads data in one line at a time with the values separated by a delimiter (tab, space, semi-colon or comma) or the data on each line can be in fixed width columns.

In either case, the user specifies the order that the x, y, z, s and point number are in and if desired, only an x and y value needs to be read in.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

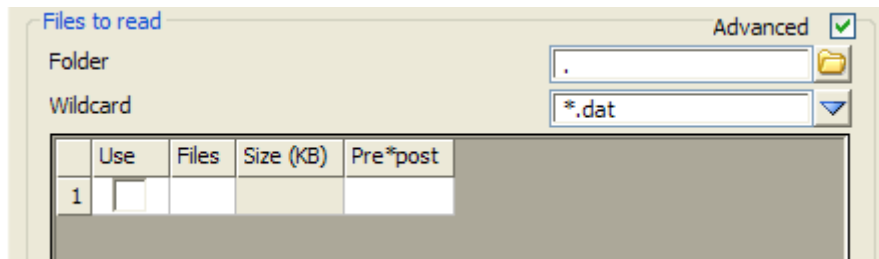

Button on bottom

Read	button		
<i>read the data into the model given in the model field.</i>			

Files tab

File to read	input		*.dat files
<i>name of the data file to be read in</i>			

Advanced	tick box		
<i>if tick, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.</i>			

Folder folder box

folder to search for files using the Wild card

Wildcard input

wild card to use in search for files in the given folder

Use tick box

if tick, read in the file

Files output

name of the file in the folder

Size output

file size

Pre*post text input

*if non blank, pre*post text to use for the models in this file (see "Pre*Postfix Panel Fields" for information on using pre*postfix.*

*If blank, use the pre*post text from the Pre*postfix for models panel field.*

Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.

Basic tab

Default line colour colour box default colour available colours

colour used for line-strings (if no colour is defined in the file)

Default point colour colour box default pt colour available colours

colour used for the crosses in point-strings (if no colour is defined in the file)

Default text style input available textdatas

textdata for the point ids

Skip column headers tick box

if tick, the first line of the file is skipped.

Join all tick box

if tick, all vertices with the same string names are joined together regardless of where they are in the file. The order of the vertices is the order they occur in the file.

If no tick then any time a string name changes in the file, a new string is created. So if the same string name occurs but separated by a different string name, then more than one string of that same name will be created. The order of the vertices is the order they occur in the file.

Default model for data model box available models

name of the model that the data is to be placed in. The model will be created if it does not already exist.

This field must be filled in.

Add to view view box available views
if non blank, the default model will be automatically added to the view

Format tab

Input mode choice box delimiter delimiter, fixed width
*if **delimiter**, the type of delimiter and the columns for the x, y and optionally z, name and point number are given.*

Delimiter choice box tab \f one space, tab \t,
semi colon, comma
many spaces

*if **fixed width**, the start and end positions are given for x, y and optionally z, name and point number.*

Mapfile tab

Map file file box *.mf files

*if **non-blank**, the name of the 12d map file to be used for all strings read in, including any files given with the **Advanced** mode ticked on.
If **blank**, no map file is used*

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section "Map File" in chapter "File I/O" for information about 12d map files.

Pre*postfix for models pre*postfix box

*if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.
Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.*

***Note** - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.*

User X Y Z and Attributes Input

Read_x_y_z_General_File

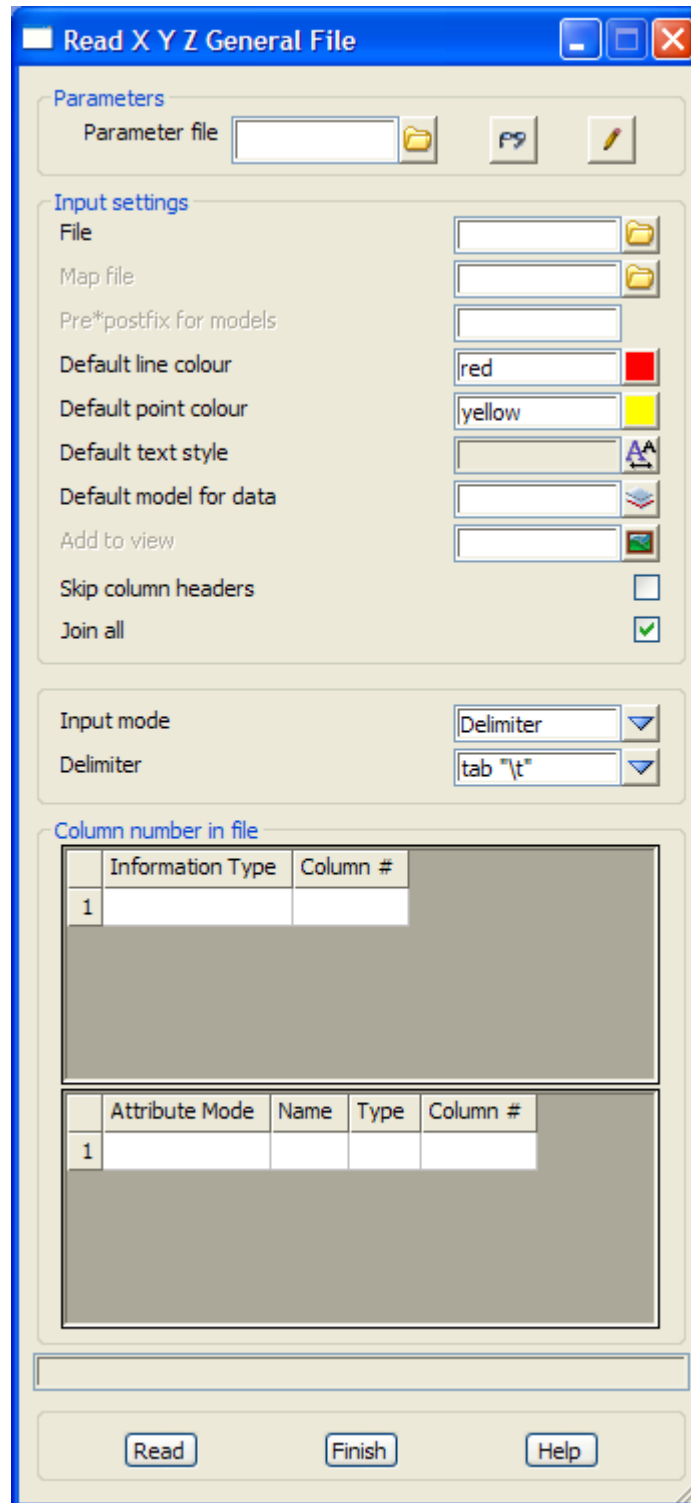

Position of option on menu: File I/O =>Data input =>x y z general

On selecting the read x,y,z general option, the **Read x y z s General File** panel is displayed.

This option reads data in one line at a time with the values separated by a delimiter (tab, space, semi-colon or comma) or the data on each line can be in fixed width columns.

In either case, the user specifies the order that the x, y, z, string name, point number and attributes appear in the file. If desired, only an x and y value needs to be read in.

The set-ups for defining all the positions of all the data in the file can be written out to a file (.xyf) for re-use.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Parameters section

Parameter file	input		*.xyf files
		<i>name of the file containing the settings for how the data is positioned in the input file.</i>	

Read icon	button
------------------	--------

read the parameter file in.

Write icon button

write the setting in the panel out to a parameter file.

Input settings section

File input *.dat files

name of the data file to be read in

Map file file box *.mf files

if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The string name is used as the entity-name for matching with the keys in the map file. See the section "Map File" in chapter "File I/O" for information about an 12d map file.

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.

Default line colour input default colour available colours

colour used for line-strings (if no colour is defined in the file)

Default point colour input default pt colour available colours

colour used for the crosses in point-strings (if no colour is defined in the file)

Default text style input available textdatas

textdata for the point ids and other text

Default model for data input available models

name of the model that the data is to be placed in. The model will be created if it does not already exist. This field must be filled in.

Add to view input available views

if a view name is entered, then the model will be automatically added to the view. This field can be blank.

Skip column headers tick box

if tick, the first line of the file is skipped.

Join all tick box

if **tick**, all vertices with the same string names are joined together regardless of where they are in the file. The order of the vertices is the order they occur in the file. If **no tick** then any time a string name changes in the file, a new string is created. So if the same string name occurs but separated by a different string name, then more than one string of that same name will be created. The order of the vertices is the order they occur in the file.

Input mode choice box delimiter delimiter, fixed width

if **delimiter**, the type of delimiter and the columns for the x, y and optionally z, name and point number are given.

Delimiter choice box tab \f one space, tab \t, semi colon, comma many spaces

if **fixed width**, the start and end column positions are given for x, y and optionally z, name and point number.

Column number/Start end position section

information to read in (x,y,z, attributes etc.) and its position in the input file.

BCC Epson Input

read_bcc_epson_data

Position of option on menu: File I/O =>Data input =>BCC Epson

The BCC Epson input option is designed to read in files in the BCC (Brisbane City Council) Epson format.

The BCC Epson format is point based with unique point numbers for each point. It also has the concept of **non-tinable** points. Since the super string supports vertex tinability, it is the best string type to use for storing data coming in BCC Epson format. Also the BCC Epson point ids are stored as the point ids of the super string vertices.

BCC Epson breaks its data up by a feature code and a 12d Model map file can be used to define models, colours, linestyles etc. where the BCC **feature code** as the entity-name (key) in the map file.

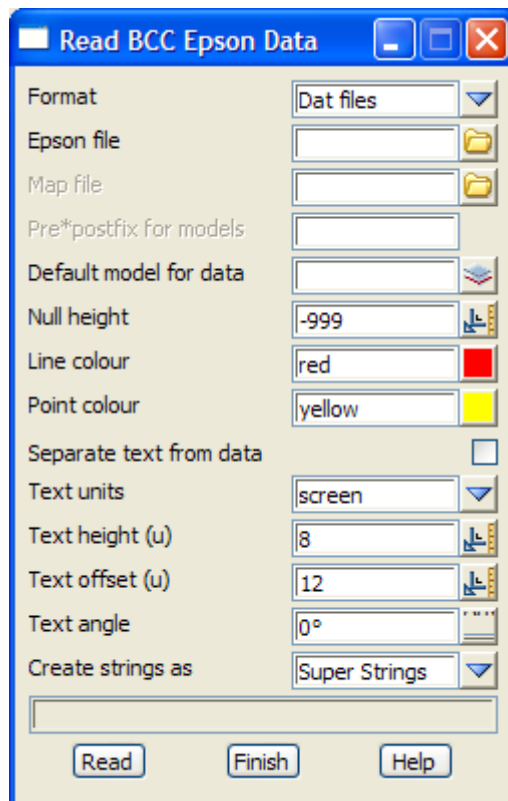

The best way to read in BCC Epson data is to have a map file which maps BCC Epson feature codes into strings with the same name as the feature code, and also places the strings into sensible models.

See the section “Map File” in chapter “File I/O” for information about a 12d map file.

Note:

All text after column 68 in the BCC Epson file is considered to be a note.

On selecting the BCC Epson option, the **Read BCC Epson Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	input	Dat files	Dat files, SUR files

format to use when reading in the BCC Epson file.

Epson file	input		matches the selected format
<i>name of the BCC Epson file to be read in.</i>			
Map file	input		*.mf files
<i>if non-blank, the name of the map file to be used for all strings read in.</i>			
<i>If blank, no map file is used.</i>			
<i>The BCC Epson feature code is used as the entity-name to match against the key in the 12d map file.</i>			
<i>See the section "Map File" in chapter "File I/O" for information about an 12d map file.</i>			
Pre*postfix for models	pre*postfix box		
<i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.</i>			
<i>Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.</i>			
Default model for data	input		available models
<i>name of the model that any unmapped data is placed in. The model will be created if it does not already exist. This field must be filled in.</i>			
Null height	input	-999	
<i>if non-blank, any BCC Epson z values equalling this value are taken as null values.</i>			
Line colour	input	red	available colours
<i>colour for BCC Epson string s.</i>			
Point colour	input	yellow	available colours
<i>colour for BCC Epson points that are not part of strings.</i>			
Separate text from data	tick box		
<i>if not tick, text is used in 4d or super strings</i>			
<i>if tick, separate text strings are created.</i>			
Text units	input	pixels	pixels, world
<i>units for the height of the text label.</i>			
Text height (u)	input		
<i>height of the text (in text units).</i>			
Text offset (u)	input		
<i>distance (in text units) to offset the text from its (x,y) placement position.</i>			
Text angle	input		
<i>angle of the text.</i>			
Create strings as	input	Super Strings	3d, 4d, Polyline, Super
<i>type of strings to create.</i>			
Read	button		
<i>read the data in.</i>			

CivilCad Input

`read_civilcad_data`

CivilCad input is a separate chargeable module.

Position of option on menu: File I/O =>Data input =>Civilcad

The civilcad input option is designed to read in CivilCad Version 4, 5 and some 6 ascii files.

CivilCad breaks its data up by a layer name only. By default, CivilCad layers are mapped into 12d Model models.

CivilCad has no strings but only points, lines, arcs and circles. CivilCAD spirals are ignored. When reading in CivilCad data, 12d Model will try to head to tail consecutive lines from the same layer to create strings.

The CivilCad format is point based with unique point ids for each point. It also has the concept of **non-contourable** or **non-tinable** points.

Since the super string supports point tinability, it is the best string type to use for storing data coming in CivilCad format. CivilCad point ids are stored as the point numbers of the super string vertices.

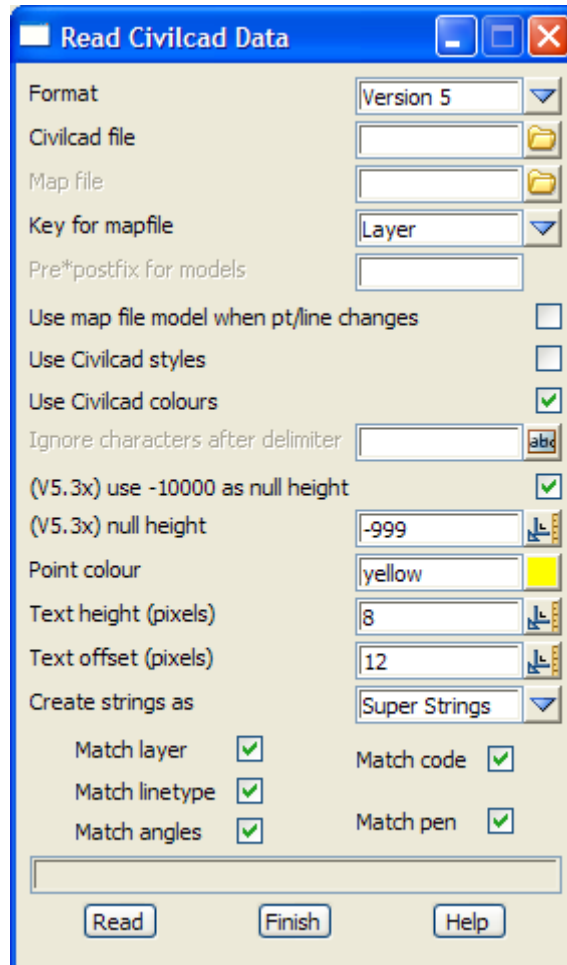

In CivilCad, a layer is defined to contain only breaklines or non-breaklines. In 12d Model, this simply corresponds to strings having a line or point *breakline* type.

If a **map** file is used when reading CivilCad data, either the CivilCad **layer** name, entity code, layer/code or code/layer can be used as the entity-name to match against the **key**.

See the section "*Map File*" in chapter "File I/O" for information about an 12d map file.

Warning - CivilCad has a null value of -10,000 - these values may need to be nulled in 12d Model after the CivilCad data is read in.

On selecting CivilCAD, the **Read Civilcad Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format <i>format of CivilCad ascii file to be read in.</i>	choice box	Version 5	version 4, version 5, version 6
Civilcad file <i>name of the Civilcad ascii file to be read in.</i>	file box		*.asc
Map file <i>if non-blank, the name of the map file to be used for all strings read in If blank, no map file is used. The Key for map file defines what is used to match against the key in the map file. See the section "Map File" in chapter "File I/O" for information about an 12d map file.</i>	map file box		*.mf files
Key for map file <i>if Layer, the Civilcad layer is used as the entity-name to match against the key in the map file. if Code, the Civilcad layer is code as the entity-name to match against the key in the map file.</i>	choice box	Layer	Code, Layer, Code/Layer, Layer/Code
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.</i>	pre*postfix box		
Use CivilCad styles	tick box		

if **tick**, then the CivilCad linestyle number is used as the 12d Model linestyle name.

Use CivilCad colours tick box

if **tick**, then the CivilCad colour number is used as the 12d Model colour number.

Ignore characters after delimiter tick box

if **tick**, r.

(V5.3x) use -10000 as null height tick box tick

if **tick**, any CivilCad z values of -10,000 are taken as null values.

(V5.3x) null height input -999

the value in the CivilCAD file to use as null height if User -10000 is not ticked.

Point colours colour box yellow available colours

colour for CivilCad points that are not part of strings.

Text height (pixels) input 8

the height in pixels of any text created, or for point numbers.

Text offset (pix) input 12

the offset (in pixels) from the (x,y) co-ordinate position for any text or point numbers.

Create strings as input Super Strings Lines and Arcs
3d Strings and Arcs,
Polyline Strings
Super Strings

type of strings to create.

Match flags tick box

CivilCad data consists of individual lines and arcs. When reading CivilCad data, it undergoes head to tail processing and the match flags specify what CivilCad data can be joined.

Match layer/code/linetype/angles/pen tick box

if **tick**, then any CivilCad lines and arcs must have the same layer/code/linetype/angle/pen before they can be joined in the head to tail process.

Read button

read the data in.

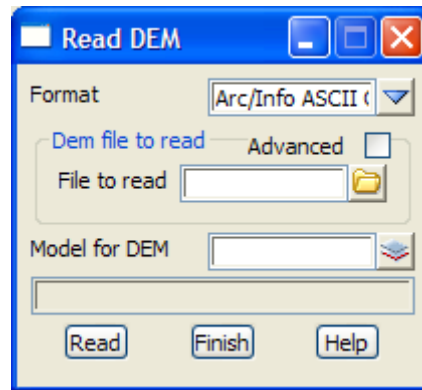

DEM Input

read_DEM

Position of option on menu: File I/O =>Data input =>DEM

The DEM option is designed to read in Digital Elevation Model data in the Arc/Info format.

On selecting Dem, the **Read DEM** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format <i>format of the DEM to read in.</i>	choice box	Arc/Info ASCII	Arc/Info ASCII Grid *.dem
Dem file to read <i>name of the DEM file to be read in.</i>	file box		
Model for DEM <i>model to put the DEM data in.</i>	model box		available models
Read <i>read the data in.</i>	button		

DGN Binary Input

read_dgn_data

DGN binary input is a separate chargeable module.

Position of option on menu: File I/O =>Data input =>DGN

The DGN input option is designed to read in Intergraph and Microstation binary models (.dgn files) up to V7. Microstation V8 has a new undocumented format.

Because of the limited number of levels available in an DGN file, the colour, linestyle and weight of items are often used to differentiate data types. For special files for VicRoads, there is also an DGN attribute which can be used to tag data.

Hence the entity-name used for matching in a map file when reading DGN files into 12d Model can be either the:

- ▲ DGN level
- ▲ VicRoads attribute
- ▲ DGN level, colour, linestyle, weight
- ▲ VicRoads attribute, colour, linestyle, weight

In the DGN map file, the four level key is given as a single key made up of the four items separated by | (with no additional spaces) in the order:

level or VicRoads attribute | colour | line style | weight

For example, the key

30 | 2 | 0 | 0 means level 30, colour 2, style 0 and weight 0

A * can be used for any of the four items to indicate that no match is required for that item.

30 | * | 0 | * means level 30, any colour, style 0, any weight

If a map file is not used, the DGN data is read into a 12d Model string of the same **name** as the DGN level and the DGN colour numbers are mapped to 12d Model colours. All the strings created go to the 'Default model for data' specified in the *Read DGN Data* panel.

See the section "Map File" in chapter "File I/O" for information about an 12d map file.

Text for Points in DGN

A further complication with DGN is that many Microstation users record individual points as a text entity with a character from a possibly user defined DGN font to represent a symbol at the point. The text then often has a justification other than left-bottom.

However, Microstation does not record the (x,y) co-ordinates of the justification point but only the left-bottom position to draw the symbol at. The actual (x,y) point needs to be calculated from the text justification and the actual symbol size.

Unfortunately this requires a knowledge of the DGN font symbol being used to calculate the true (x,y) position for the text justification point.

To help read in text as points so that they may be included in processes such as triangulation, in the DGN reader, it is possible to create 4d strings (which consist of an (x,y,z) point plus a piece of text) instead of a text string.

Warning

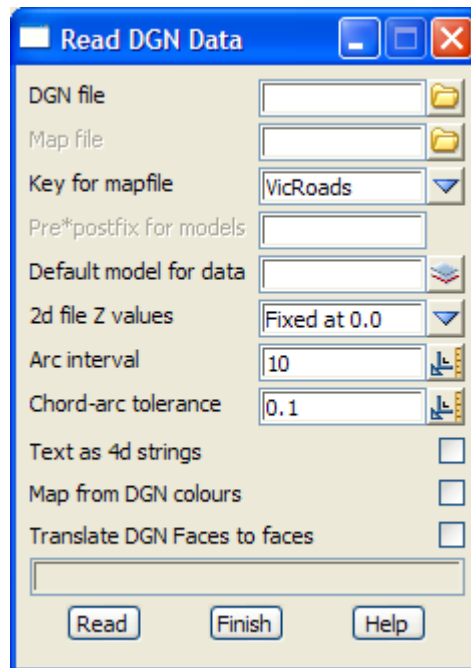

Because of the problem with needing to know the DGN font information to correctly calculate

the (x,y) co-ordinate of the text, creating a 4d string instead of text will not fix the error in the (x,y) co-ordinates if an incorrect font is used in 12d Model.

The only safe solution is to avoid data in DGN format if the points are being represented by text.

NOTE: the format for DGN V8 has been changed and has not been published. There is a beta version of the DGN reader to try and read DGNV8. At this stage it is probably better to use DWG I/O to go in and out of Microstation V8.

On selecting the DGN option, the **read DGN data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
DGN file <i>name of the DGN binary file to be read in</i>	input		*.dgn files
Map file <i>if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The DGN level is used as the string name and all strings go to the 'Default model for data'.</i> <i>See the section "Map File" in chapter "File I/O" for information about an 12d map file.</i>	input		*.mf files
Key for mapfile <i>specifies how the key from the mapfile is interpreted.</i>	input	VicRoads	level, VicRoads, level/colour/linestyle/weight Vicroads/colour/linestyle/weight
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.</i>	pre*postfix box		
Default model for data <i>model to use for strings not mentioned in the map file or if no map file is used.</i>	input		available models

2d file Z values	input	Fixed at 0.0	fixed at 0.0, contour Z low, contour Z element Z low, element Z
high			
high			
<i>z value to use for 2d .dgn file</i>			
Arc interval	input	10	
<i>interval to use to break 3d circles are broken up into segments.</i>			
Chord-arc tolerance	input	0.1	
<i>chord to arc tolerance to use when breaking 3d circles into segments.</i>			
Text as 4d strings	tick box		
<i>if tick, text is read in as a 4d string (an (x,y,z) co-ordinate plus a piece of text)</i>			
Map from DGN Colours	tick box		
<i>if not tick, DGN colour number n is mapped to 12d Model colour n. if tick, some of the DGN colours are attempted to be mapped to 12d Model colours.</i>			
Translate DGN faces to faces	tick box		
<i>if tick, DGN faces are read in as 12d Model face strings.</i>			
Read	button		
<i>read the data in.</i>			

[Read_DGN_Data__Complex_Elements_.bmp](#)

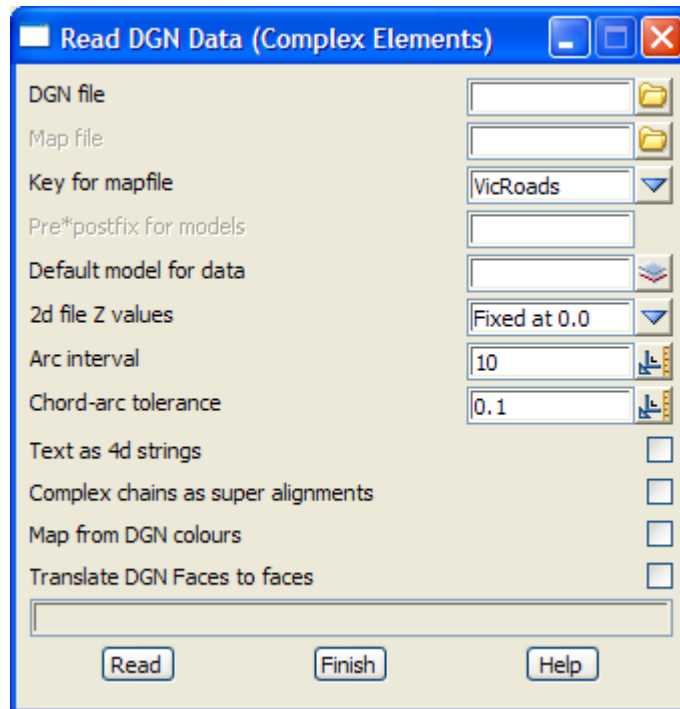

DGN With Complex Elements

This option reads DGN complex elements as super strings.

Note: this option is under development

NOTE: the format for DGNV8 has been changed and has not been published. There is a beta version of the DGN reader to try and read DGN V8. At this stage it is probably better to use DWG I/O to go in and out of Microstation V8.

On selecting the DGN Complex Elements option, the **read DGN Data (Complex Elements)** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
DGN file <i>name of the DGN binary file to be read in</i>	input		*.dgn files
Map file <i>if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The DGN level is used as the string name and all strings go to the 'Default model for data'.</i> <i>See the section "Map File" in chapter "File I/O" for information about an 12d map file.</i>	map file box		*.mf files
Key for mapfile <i>specifies how the key from the mapfile is interpreted.</i>	input	VicRoads	level, VicRoads, level/colour/linestyle/weight Vicroads/colour/linestyle/weight
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.</i>	pre*postfix box		
Default model for data <i>model to use for strings not mentioned in the map file or if no map file is used.</i>	model box		available models
2d file Z values high high <i>z value to use for 2d .dgn file</i>	input	Fixed at 0.0	fixed at 0.0, contour Z low, contour Z element Z low, element Z
Arc interval <i>interval to use to break 3d circles are broken up into segments.</i>	input	10	

- Chord-arc tolerance** input 0.1
chord to arc tolerance to use when breaking 3d circles into segments.
- Text as 4d strings** tick box
if tick, text is read in as a 4d string (an (x,y,z) co-ordinate plus a piece of text)
- Complex chains as super alignments** tick box
if tick, DGN complex chains are read in as super alignments.
- Map from DGN Colours** tick box
*if not tick, DGN colour number n is mapped to 12d Model colour n.
 if tick, some of the DGN colours are attempted to be mapped to 12d Model colours.*
- Translate DGN faces to faces** tick box
if tick, DGN faces are read in as 12d Model face strings.
- Read** button
read the data in.

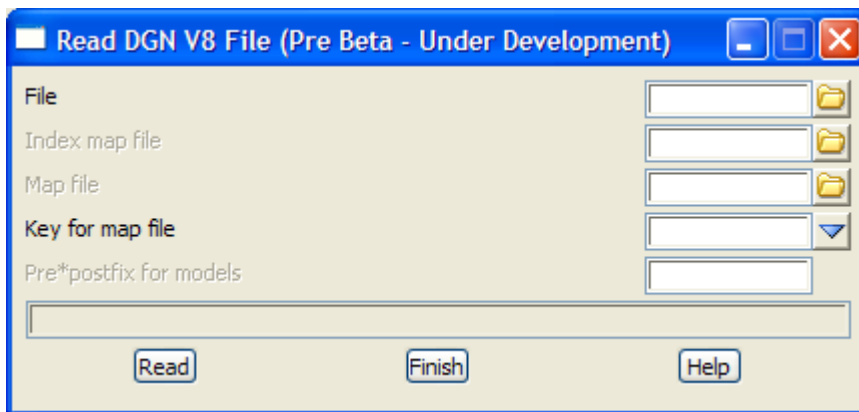

Read_DGN_V8_File__Pre_Beta__Under_Development_

DGN V8

NOTE: the format for DGN V8 has been changed and has not been published. There is a beta version of the DGN reader to try and read DGNV8. At this stage it is probably better to use DWG I/O to go in and out of Microstation V8.

Note: this option is under development

On selecting the DGN V8 option, the **read DGN V8 File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
DGN file <i>name of the DGN V8 binary file to be read in</i>	input		*.dgn files
Index map file	input		*.imf files
Map file	map file box		*.mf files

if non-blank, the name of the map file to be used for all strings read in.

If blank, no map file is used. The DGN level is used as the string name and all strings go to the 'Default model for data'.

See the section "Map File" in chapter "File I/O" for information about an 12d map file.

Key for mapfile choice box Levels
Level/Colour/Linestyle/Weight

specifies how the key from the mapfile is interpreted.

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.

*Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.*

Read button

read the data in.

DWG/DXF Input

read_dwg_dxf_data

DWG/DXF input is a separate chargeable option

Position of option on menu: File I/O =>Data input =>DWG/DXF

The DWG/DXF input option is designed to read most Autocad DWG and DXF files.

Each DWG/DXF item has an associated layer. By default, 12d Model creates models of the same name as the layers (or with an additional user supplied prefix) and the DWG/DXF items placed in them.

However, this can be over written using a standard 12d map file where the key is matched against Autocad **layers** rather than string names.

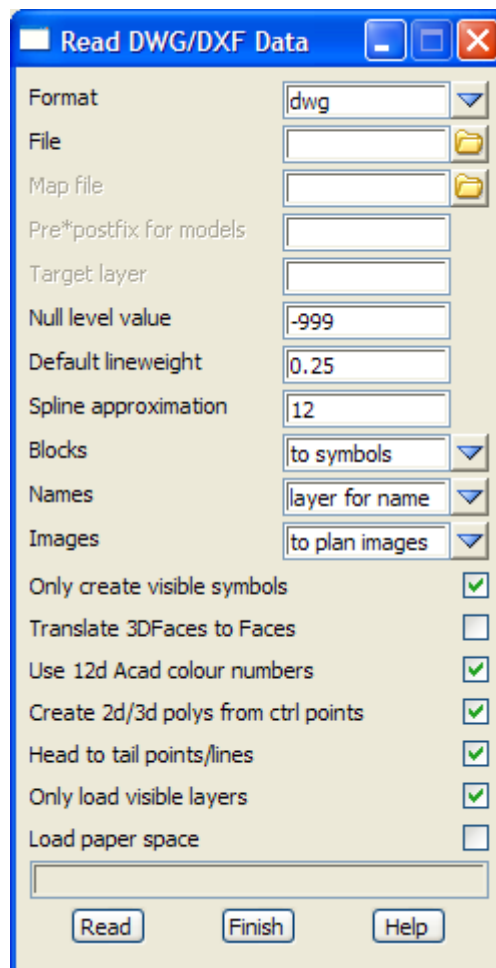

See the section “Map File” in chapter “File I/O” for information about an 12d map file.

Autocad blocks are recognised and either a point with the block name is created or the blocks are expanded into their components, each time they are referenced in the DWG/DXF file.

Bulges in polylines can only be interpreted correctly when the polyline has a constant z-value. For this case, a 12d Model polyline string is created from the DXF polyline.

Finally, DWG/DXF POINT entities of the same layer and colour can be concatenated into one point string as they are read in.

On selecting the DWG/DXF option, the **Read DWG/DXF Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format <i>type of Autocad file to read in</i>	choice box	DWG	DWG, DXF
File <i>name of the DWG or DXF file to read in</i>	file box		*.dwg or *.dxf files
Map file <i>if non-blank, the name of the map file to be used for all DWG/DXF layers read in. The DWG/DXF layer is the entity-name for matching against the key in the map file. If blank, no map file is used. See the section "Map File" in chapter "File I/O" for information about an 12d map file.</i>	map file box		*.mf files
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.</i>	pre*postfix box		
Target layer <i>if non-blank, only autocad items in the layer with the name given in the target layer field will be read in.</i>	input		
Null level value <i>z-value to treat as a null level</i>	input	-999	
Default AutoCAD lineweight <i>lineweight to use when it is undefined in an AutoCAD entity.</i>	input	0.25	
Spline approximation <i>splines are broken into small segments</i>	input	12	
Blocks <i>if to symbols, blocks are read in as 12d Symbols of the same name. If explode, blocks are read in and exploded into vertices and line work. If to points, a 12d vertex is created at each block.</i>	choice box	to symbols	to symbols, explode, to points
Names <i>if no name, strings are not given a name. If layer for name, strings are given the name of the AutoCAD layer they were on.</i>	choice box	layer for name	no name, layer for name
Images	choice box	to plan images	to plan images, to rasters, ignore
Only create visible symbols	tick box	tick	
Translate 3DFaces to facest <i>if tick, DWG/DXF faces are read in as 12d Model face strings.</i>	tick box		
User 12d ACAD colour numberst	tick box		
Create 2d/3d polys from ctrl points	tick box		
Head to tail points/lines <i>if tick, DWG/DXF POINT entities of the same layer and colour are concatenated into one point string as they are read in and DWG/DXF LINE entities of the same layer and colour are</i>	tick	tick	
Only load visible layers <i>if tick, only DWG/DXF visible layers are read in otherwise all layers are read in.</i>	tick	tick	
Load paper space <i>if tick, paper space data will be read in.</i>	tick	no tick	

Read

button

read the data in.

Genio File Format

Genio input is a separate chargeable module.

Position of option on menu: File I/O =>Data input =>Genio

The software package MX (formerly called Moss) includes a data file format called GENIO for use in transferring data between Moss and other programs (see the MX Manual for a partial description of genio). There is currently two default genio input formats - versions 6 and 7. **12d** Model recognizes both formats.

MX provides three options (001,003,017) to allow variations in the format of the genio 080 records. **12d** Model recognizes and uses each option.

MX free format (that is, using commas and the 'field-number=' syntax) is allowed.

For example

```
080,ABCD, ,5=0.0
```

MX 2d, 3d, 4d, 6d, text and most 12d and text strings are loaded directly into **12d** Model strings. For 5d, the strings are processed but only the 3d information is used and loaded into **12d** Model. The MX 10d (volume string) is allowed in the genio file but will not be read into **12d** Model.

In the genio file, the GENIO card defines the name of the MX model for the following strings. **12d** Model loads the strings into a **12d** Model model with the same name as the MX model. However, **12d** Model allows the user to define a **map file** which may over-ride the Genio card.

A genio file may contain more than one MX model, each genio model being separated by a 999 card. **12d** Model will load each separate MX model into a **12d** Model model with the same name as the MX model.

If an error occurs whilst reading a genio record, the genio record will be skipped and, if possible, the next genio record read.

12d Map File

See the section "*Map File*" in chapter "File I/O" for information about an 12d map file.

The **name** of the MX string is used as the entity-name to be used for matching with an 12d map file.

The MX model given in the GENIO record is taken to be the default model for the genio reader.

Hence the genio map file can be used to over-ride the MX GENIO card and the MX default for point strings (this is necessary for genio files generated from non MX systems that don't use the correct point string convention).

For **text** in a Genio file (the string name for text must start with a * in the Genio file), the *key in the map file must start with **geniotext** followed by the characters to match on which will be matched against the characters following the * in the genio string name. For example*

```
geniotextEB* * text yellow point "PHCP" // matches text
```

will match any Genio text with the string name starting with "*EB"

Note that * is not a wild card in the Genio string name but the "EB*" after "geniotext" is for use by the 12d map file and hence is an "EB" followed by a wild card. Hence it matches against any Genio text name starting with "*EB".

Summary

12d Model recognizes the following genio options for MX V6 and V7 formats -

```
GENIO
FINISH
001      format card
003      order card
```

017 angle card
080 for 2d, 3d, 4d, 6d, 12d and text strings
080 the 3d information only for 5d strings
090 triangulation information
999
genio comment lines

12d Model accepts MX null values of -999.0

12d Model **ignores** the genio options:

080 for **10d** strings

A12d map file can be used to select the colour and model for any strings read in from the MX genio file whose names match the keys in the map file.

Genio Input

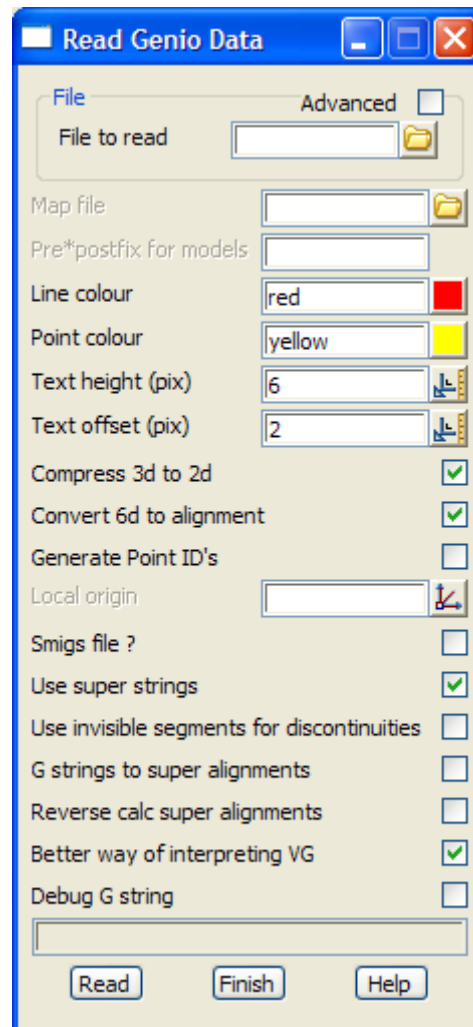

read_genio_data

Position of option on menu: File I/O =>Data input =>Genio

Genio input is a separate chargeable module.

For information on the Genio file format support by 12d Model, please go to the section “Genio File Format”

On selecting the genio option, the **read genio data** panel is displayed.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
File to read	file box		default *.mos files This can be modified by the environment variable GENIO_WILDCARD_4D
<i>name of the genio file to be read in</i>			
Advanced	tick box		
<i>if tick, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.</i>			

Folder folder box

folder to search for files using the Wild card

Wildcard input

wild card to use in search for files in the given folder

Use tick box

if **tick**, read in the file

Files output

name of the file in the folder

Size output

file size

Pre*post text input

if **non blank**, pre*post text to use for the models in this file (see "Pre*Postfix Panel Fields" for information on using pre*postfix).

If **blank**, use the pre*post text from the Pre*postfix for models panel field.

Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.

Map file file box *.mf files

if non-blank, the name of the 12d map file to be used for all strings read in, including any files given with the **Advanced** mode ticked on.

If blank, no map file is used

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section "Map File" in chapter "File I/O" for information about an 12d map file.

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.

Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.

Line colour colour box default colour available colours

colour used for line-strings

Point colour colour box default pt colour available colours

colour used for the crosses in point-strings (genio string labels starting with **P**).

Text height (pix) input 8

the height in pixels of any text in a moss 4d string.

Text offset (pix)	input	2	
	<i>the offset in pixels of the 4d text from the (x,y) position.</i>		
Compress 3d to 2d	tick box	tick	
	<i>if tick, convert any 3d strings with constant z-value to 2d strings.</i>		
Convert 6d to alignment	tick box	tick	
	<i>if tick, convert any 6d strings to 12d Model alignment strings.</i>		
Local origin	x y box		x y selector
	<i>if non-blank, the given co-ordinates are used as a local origin when reading in the data. That is, the local origin values are subtracted from each data point as it is read in.</i>		
Smigs file ?	tick box	no tick	
	<i>if tick, try to interpret the genio file as a Smigs genio file.</i>		
Use super strings	tick box	tick	
	<i>if tick, all strings are read in as super string</i>		
Use invisible segments for discontinuities	tick box		
	<i>if tick, MX strings with discontinuities are read in as super strings with invisible segments. If not tick, MX strings with discontinuities are broken into pieces when read in.</i>		
G strings to super alignments	tick box	no tick	
	<i>if tick, MX G strings are read in as 12d super alignments</i>		
Debug G strings	tick box	no tick	
	<i>because of the lack of documentation of the G string in MX, a G string may not be interpreted correctly. If tick, a super string is created with the information from the MX G string to try and help interpret what the data was.</i>		
Reverse calc super alignments	tick box	no tick	
Better way of interpreting VG	tick box	tick	
	<i>if tick, a different method for interpreting vertical geometry in a MX G strings is used. This may or may not be successful.</i>		
Read	button		
	<i>read in the genio data from the file given in the file field.</i>		

Example of Genio 12d Map File

```
//
// 12d map file (for input data)
//
// This file allows strings to be mapped to specified models/colours/string types/ styles
// as they are read in.
//
// The columns are:
// 1   key   2   string name   3   model name
// 4   colour name (or number) 5   string type (point or line) 6   string style

// 1       2       3       4       5       6           comment
PHCP      *       mapp    yellow    point    "PHCP"      // horizontal control point

Geocomp File Format

Geocomp input is a separate chargeable module.

Geocomp is a software package used for manipulating and reducing survey data on a PC.

Geocomp is a point based system. The fundamental data consists of individual points with unique point numbers and entities such as lines and arcs defined in terms of the points.

Geocomp has an ascii data format consisting of two files - the points file and the strings file. These ascii files can be used to transfer data from Geocomp to 12d Model.

The Geocomp **points file** is a sequential list of points, one point per line. Each point consists of the data

easting, northing, elevation, stand-point-number

that is

x-value, y-value, z-value, stand-point-number

The line number of each point in the file is also the unique **point number** for that point. For example, the point defined on the eleventh line of the points file, is point number eleven.

The stand-point-number is the point number of the instrument station used for collecting the points co-ordinates. The stand-point-number is not used in 12d Model.

The Geocomp **strings file** defines how the Geocomp **entity types** are constructed from points in the point file. The Geocomp entity types are

Entity Number	Description
1	two point lines
2	irregular lines
3	arc defined by start point, point on arc, end point
4	arc defined by start point, arc centre, end point
5	point feature
6	circle defined by centre and a point on the circle

The strings file also gives each defined entity an **entity number**.

The 12d Model Geocomp data reader recognises all the entity types in the strings file **except** for irregular lines (type 2).

All point numbers referred to in the strings file are references to the (implied) point numbers of points in the points file. Hence both files are needed to define the Geocomp data and the order of points in the point file is critical and cannot be modified.

The Geocomp naming convention for the two files is to use the six digit Geocomp job number as a name stem and append **.pts** for the points file and **.str** for the strings file.

That is,

geocomp-job-number.pts	points file
geocomp-job-number.str	strings file

For example

099999.pts	is the point file for Geocomp job number 099999
099999.str	is the strings file for Geocomp job number 099999

12d Model uses a wider data set than is directly represented in the Geocomp points and strings files. However, by observing a number of conventions and processing the strings file data according to these conventions, the Geocomp data can be sensibly passed across to 12d Model.

For example, although the Geocomp strings file only defines two-point lines, 12d Model can

construct strings of many points from consecutive two-point lines by joining the lines together whenever

- (a) the second point of one line is the same as the first point of the next line in the file and
- (b) the lines have the same entity number.

The entity number of the consecutive lines is used as the 12d Model string name.

Similarly, consecutive point features with the same entity number are joined to form a 12d Model 4d **point** string with the entity number as the string name.

In the Geocomp strings file, **descriptive text** can also be included at the end of each line defining an entity. The text is enclosed within double quotes ". The descriptive text is ignored for all entities **except point features**.

For a point-feature, which is represented in 12d Model as a 4d string, the descriptive text is recorded as the text label for that point.

By using a systematic entity and descriptive text labelling system in Geocomp, it is possible to sensibly transfer all of the Geocomp data to 12d Model.

Note - in Geocomp, a z-value of -9999 represents a null z-value, that is, a z-value that has **not** defined. Any Geocomp null values are recorded as 12d Model null values.

Geocomp Map File

See the section "*Map File*" in chapter "File I/O" for information about an 12d map file.

Using the conventions described in the previous section, Geocomp data can be interpreted as 12d Model strings with entity-names corresponding to the Geocomp entity numbers.

Hence the Geocomp **entity numbers** are used as the entity-names for matching with a map file.

If no match is found with the map file, the default colours and model given in the Geocomp read panel are used. The point-line type is taken to be **point** for point feature entities (entity type 5) and **line** point-line type for all other entities. The geocomp entity number is used as the string name and the style set to 1.

WARNING

If the **breakline type** in the map file is set to point or line and this does not match the point or string type coming from the geocomp file, then the string is placed in the **defaults** model. This is a consistency check for entities that can only be a point **or** a line breakline type (but not both). To disable this feature, a * can be used in the map file for the breakline type and then the breakline type is determined by whether the Geocomp entity is a point feature or not.

Summary

12d Model **recognizes** the following Geocomp entity types

Entity Number	Entity type
1	two point lines
3	arc defined by start point, point on arc, end point
4	arc defined by start point, arc centre, end point
5	point feature
6	circle defined by centre and a point on the circle

12d Model **recognizes** the Geocomp null values of -9999

12d Model **ignores** the entity type

2	irregular lines
---	-----------------

A Geocomp map file can be used to specify the string name, breakline type, colour, style and model for strings read from the Geocomp ascii files.

Note - the breakline type of a string of Geocomp point features (entity type 5) will always be set to **point** regardless of the Geocomp map file.

Geocomp Input

geocomp_input

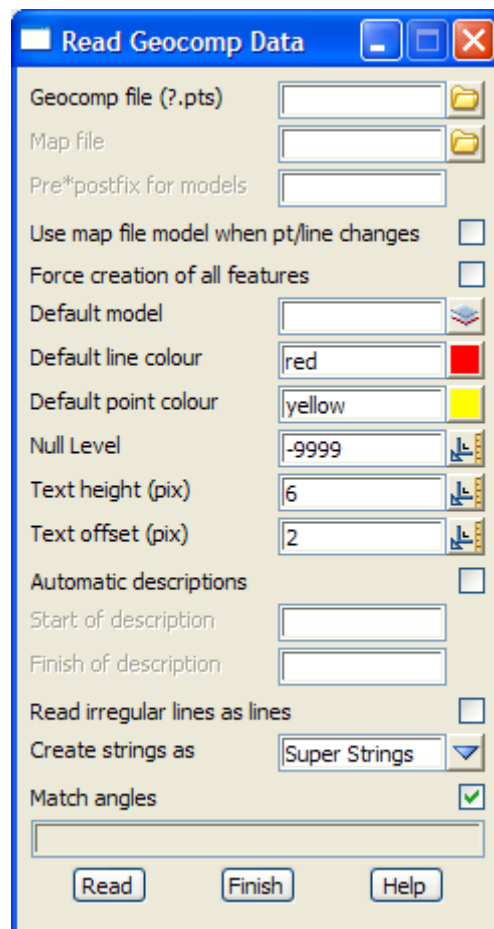

read_geocomp_data

Position of option on menu: File I/O =>Data input =>Geocomp

Geocomp input is a separate chargeable module.

Although there are three Geocomp Input options, V4.0 uses super strings and supersedes V3.1 and V3.2. More information on the Geocomp data structure is given in the previous section "Geocomp File Format" .

On selecting the Geocomp option, the **Read Geocomp Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Geocomp file (? .pts)	file box		*.pts files
<i>name of the Geocomp points file to be read in. The corresponding strings file is also used.</i>			
Map file	map file box		*.mf files
<i>if non-blank, the name of the map file to be used for all strings read in.</i>			
<i>If blank, no map file is used.</i>			
<i>See the section "Map File" in chapter "File I/O" for information about an 12d map file.</i>			
Pre*postfix for models	pre*postfix box		
<i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.</i>			

Go to the section “Pre*Postfix Panel Fields” for information on using pre*postfix.

Use mapfile model when pt/line changes	tick box	no tick	
<i>if tick, then if the geocomp.str file says the entity is a line (point) feature and the map file says it is a point (line), the mapfile is used.</i>			
Default model	model box		available models
<i>model to use for strings not mentioned in the map file</i>			
Default line colour	colour box	default colour	available colours
<i>colour used for line-strings</i>			
Default point colour	colour box	default pt colour	available colours
<i>colour used for the crosses in point-strings.</i>			
Null level	input	-9999	
<i>the Geocomp z-values to be considered null z-values.</i>			
Text height (pix)	input	8	
<i>the height in pixels of any text created for point number or Geocomp descriptions.</i>			
Text offset (pix)	input	2	
<i>the offset (in pixels) from the (x,y) co-ordinate position for the text of a 4d string.</i>			
Automatic descriptions	tick box		
<i>if tick, then the first three characters of the entity code are compared to the first 3 characters of the 20 character description and if they are the same, the text is only characters 6 to 15 of the description.</i>			
Start of description	input		
<i>the user can restrict the amount of the geocomp description that is read in. if non-blank, this is the number of the character position to start reading the description from. If blank, the start position is 1.</i>			
Finish of description	input		
<i>if non-blank, this is the number of the character position to end reading the description from. If blank, it is the end of the geocomp description.</i>			
Read irregular lines as lines	tick		
<i>if tick, Geocomp irregular lines are read in as strings.</i>			
Create strings as	input	Super Strings	Polyline Strings Super Strings
<i>type of strings to create.</i>			
Match angles	tick	tick	
<i>if tick, preference is given to joining geocomp lines of similar angles first. if not tick, geocomp lines are joined in the order they are in the file.</i>			
Read	button		
<i>read in the Geocomp data from the points file and (corresponding strings file) given in the file field.</i>			

Keays Input

read_keays_data

Position of option on menu: File I/O =>Data input =>Keays

The Keays input option is designed to read in Keays (RoadPak) files in trf format.

The Keays data has a code and notes, and the code and notes can be used with a 12d Model map file to define models, colours, linestyles etc.

The Keays note is made up of individual notes separated by spaces. Each individual note (in order) can be used as part of the entity-name for use with the map file.

In the Keays map file, the multi-level key is given as a single key made up of the required items separated by | (with no additional spaces) in the order:

Code | note 1 | note 2 | ... | note n

For example, the key:

BD|building| means code BD, note 1 = "building"

A * can be used for any of the items to indicate that no match is required for that item.

BD|*|top| means code BD, anything for note 1, note 2 = "top"

A * and nothing else after the code means that all notes are accepted.

BD* means code BD and any notes

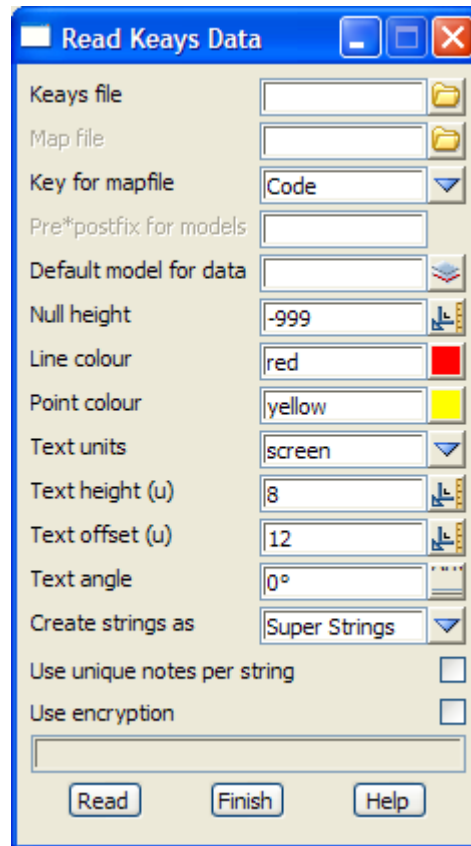

A * at the end of the notes means any note is a match from that point onwards.

BD|*|top|* means code BD, anything for note 1, note2 = "top",
and any note after note 2.

If a map file is not used or no match is found in the map file, the Keays data is placed into the default model with its code as the string name.

See the section "Map File" in chapter "File I/O" for information about an 12d map file.

On selecting the Keays option, the **Read Keays Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Keays file <i>name of the Keays trf file to be read in.</i>	file box		*.trf
Map file <i>if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The Keays code and note can be used as the entity-name to match against the key in the map file. See the section "Map File" in chapter "File I/O" for information about an 12d map file.</i>	map file box		*.mf files
Key for map file <i>if code, the Keays code is used as the key for the map file. If code/note, the Keays code and note is used as the key for the map file.</i>	input	code	code, code/note
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.</i>	pre*postfix box		
Default model for data <i>name of the model that any unmapped data is placed in. The model will be created if it does not already exist. This field must be filled in.</i>	model box		available models
Null height <i>if non-blank, any Keays z values equalling this value are taken as null values.</i>	input	-999	
Line colour <i>colour for Keays string s.</i>	colour box	red	available colours

Point colour	colour box	yellow	available colours
<i>colour for Keays points that are not part of strings.</i>			
Text units	input	pixels	pixels, world
<i>units for the height of the text label.</i>			
Text height (u)	input		
<i>height of the text (in text units).</i>			
Text offset (u)	input		
<i>distance (in text units) to offset the text from its (x,y) placement position.</i>			
Text angle	input	0	
<i>angle of the note text.</i>			
Create strings as	input	Super Strings	3d, 4d, Polyline, Super
<i>type of strings to create.</i>			
Use unique notes per string	tick box		
<i>if tick, a change of code or note is used to break Keays string data into strings. This also applies to the point ids and notes text.</i>			
Use encryption	tick box		
<i>if tick, then the last 4 characters of the code is used to denote tinability and boundary information.</i>			
Read	button		
<i>read the data in.</i>			

LandXML Input

read_landXML_file

Position of option on menu: File I/O =>Data input =>LandXML

LandXML is a format that attempts to cover some civil and surveying entities. It does not include any information such as colours, styles etc. but just some geometry definitions.

Unfortunately to make the format useful, every vendor has their own proprietary extensions which makes the format of only limited value. A different tailored LandXML reader is required for each vendor variation.

Also the methodology behind the LandXML model is based on US ideas of using X-sections and not strings to model data.

12d Model has special LandXML readers for LINZ-XML (for LandOnline NZ) and Leica-XML.

LandXML

One possible use of LandMXL may be to get access to data from vendors packages such as AutoCAD and Microstation who only have non-published proprietary formats.

This option is under continual developed as the LandXML standard keep changing.

On selecting the LandXML option, the **Read LandXML File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File <i>name of the LandXML file to be read in</i>	file box		*.xml files
Map file	map file box		*.mf files

*if non-blank, the name of the map file to be used for all strings read in.
If blank, no map file is used.*

See the section “Map File” in chapter “File I/O” for information about an 12d map file.

Pre*postfix for models pre*postfix box

*if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.
Go to the section “Pre*Postfix Panel Fields” for information on using pre*postfix.*

Load tick box

Name

Model model cell available models

model to read the data into

Colour colour cell available colours

colour to use for the strings

Linestyle linestyle cell available linestyles

linestyle to use for the strings

Weight input

weight to use for the strings

Read button

read the data into the model given in the model field.

Mapinfo Input

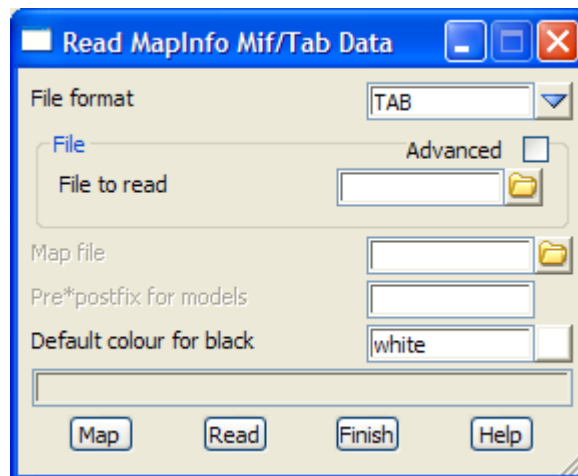

[read_mapinfo_mif_tab_data](#)

[mapinfo_input_mapping](#)

Position of option on menu: File I/O =>Data input =>Mapinfo MID/MIF

This Option is currently under development.

On selecting the 12d data option, the **Read 12d Solutions Ascii Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File format <i>the MapInfo format</i>	choice	TAB	TAB, MIF
File to read <i>name of the MapInfo file.</i>	file box		*.tab or *.mif files
Advanced <i>if tick, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.</i>	tick box		

Folder <i>folder to search for files using the Wild card</i>	folder box
Wildcard <i>wild card to use in search for files in the given folder</i>	input
Use	tick box

if **tick**, read in the file

Files output

name of the file in the folder

Size output

file size

Pre*post text input

if **non blank**, pre*post text to use for the models in this file (see “Pre*Postfix Panel Fields” for information on using pre*postfix).

If **blank**, use the pre*post text from the Pre*postfix for models panel field.

Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.

Map file file box *.mf files

not yet implemented.

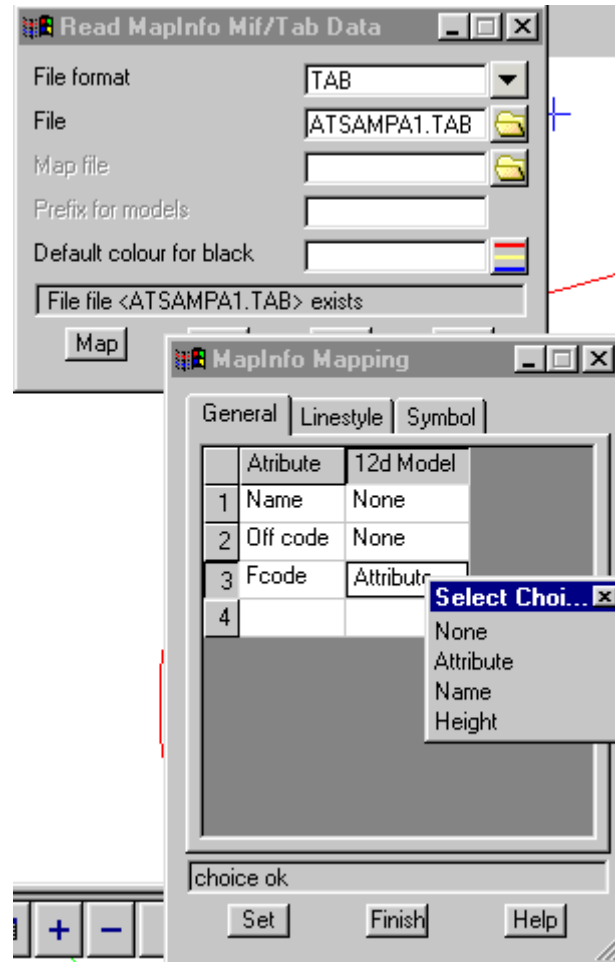

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section “Pre*Postfix Panel Fields” for information on using pre*postfix.

Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.

Map button

After specifying the MapInfo file format and name, click on **Map** to scan the file and find the names of all the attributes in the MapInfo file. A **Mapinfo Input Mapping** panel is then displayed with a list of all the MapInfo attributes in the file. How the attributes are to be mapped and used in 12d Model is then specified for each attribute in the panel. For example, the value of an attribute could be used as the 12d string name.

If None is selected for an attribute, then the attribute is ignored.

*Once the table is completely filled in (no field in the column titled 12d Model can be left blank) then the **Set** button must be selected and then the **Finish** button selected to remove the Mapinfo Input Mapping panel.*

Read button

read the data in.

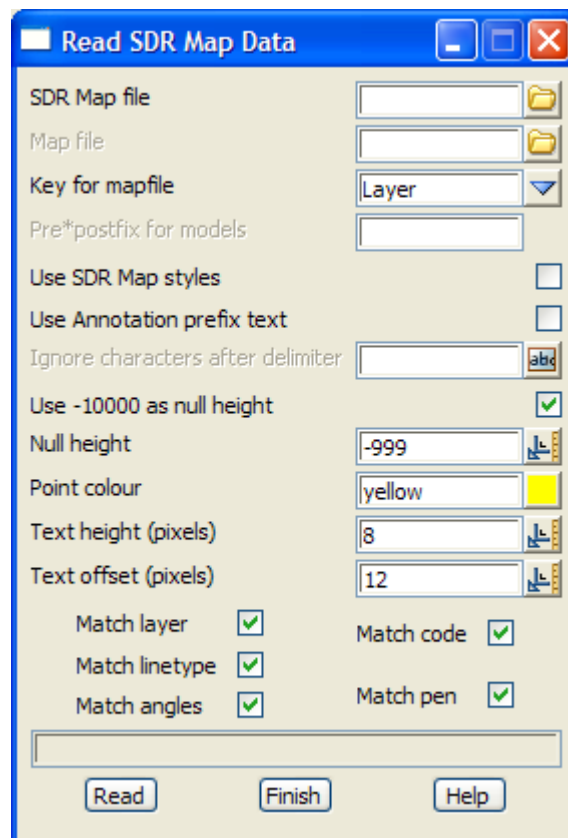

SDR Map Input

read_sdr_map_data

Position of option on menu: File I/O =>Data input =>SDR Map

The SDR Map input option is designed to read in files in the SDR Map ASCII format.

On selecting the SDR Map option, the **Read SDR Map Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
SDR Map file <i>name of the SDR Map ascii file to be read in.</i>	file box		*.txt
Map file <i>if non-blank, the name of the map file to be used for all data read in. See the section "Map File" in chapter "File I/O" for information about an 12d map file.</i>	map file box		*.mf files
Key for map file <i>if code, the SDRmap code is used as the key for the map file. If layer, the SDRmap layer is used as the key for the map file. If code/layer, the SDRmap code/layer is used as the key for the map file. If layer/code, the SDRmap layer/code is used as the key for the map file.</i>	choice box	code	code, layer code/layer, layer/code
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.</i>	pre*postfix box		

Go to the section “Pre*Postfix Panel Fields” for information on using pre*postfix.

Use SDR Map styles tick box

if tick,

Ignore characters after delimiter input

if non-blank, all characters on the line after the given delimiter will be ignored.

Use SDR Map styles tick box

if tick,

Use -10000 as null height tick box tick

if tick, any z value of -10000 is converted to a null height in 12d Model.

Null height input -999

if non-blank, any SDR Map z values equalling this value are converted to null values in 12d Model.

Point colour colour box yellow available colours

colour for SDR Map points that are not part of strings.

Text units input pixels pixels, world

units for the height of the text label.

Text height (u) input

height of the text (in text units).

Text offset (u) input

distance (in text units) to offset the text from its (x,y) placement position.

Match flags tick box

SDRMap data consists of individual lines and arcs. When reading SDRMap data, it undergoes head to tail processing and the match flags specify what SDRMap data can be joined.

Match layer/code/linetype/angles/pen tick box

if tick, then any SDRMap lines and arcs must have the same layer/code/linetype/angle/pen before they can be joined in the head to tail process.

Read button

read the data in.

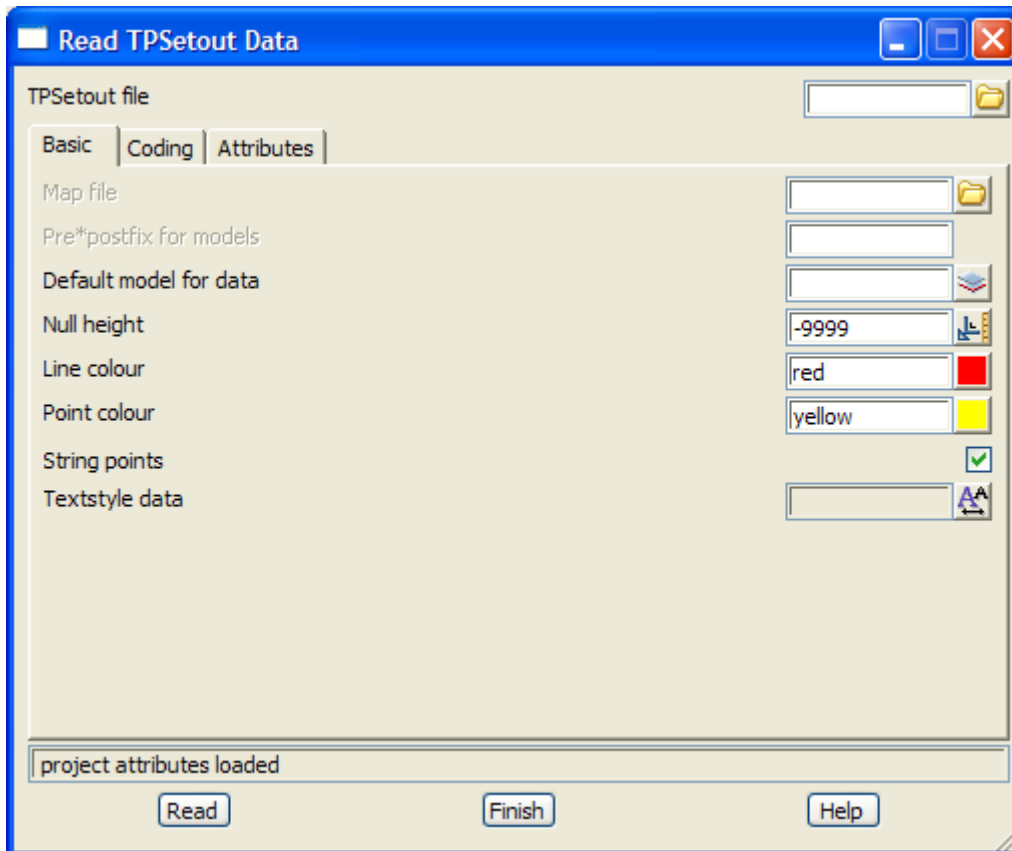

TP Setout Input

read_tpsetout_data

Position of option on menu: File I/O =>Data input =>TP Setout

The TP Setout input option is designed to read in .pta files from *TP Setout*

On selecting the TP Setout option, the **read TP Setout data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
TP Setout file <i>name of the TP Setout .pta file to be read in.</i>	file box		*.pta

Basic tab

Map file <i>if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The TP Setout code is used as the entity-name to match against the key in the map file. See the section "Map File" in chapter "File I/O" for information about an 12d map file.</i>	map file box		*.mf files
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section "Pre*Postfix Panel Fields" for information on using pre*postfix.</i>	pre*postfix box		
Default model for data	model box		available models

name of the model that any unmapped data is placed in. The model will be created if it does not already exist. This field must be filled in.

Null height	input	-9999

TP Stakeout Strings Input

read_tp_stakeout_binary_strings

Position of option on menu: File I/O =>Data input =>TP Stakeout strings

The TP Stakeout strings input option is designed to read in .3db files (binary strings) from TP Stakeout.

On selecting the TP Stakeout strings option, the **Read TP Stakeout Binary Strings** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	radio button		
<i>if on then an individual binary string file is to be read in.</i>			
File name	file box		*.3db files
<i>if non-blank, the name of the binary string file to read in.</i>			
Folder	radio button		
<i>if on then the all the binary string files in the folder are to be read in.</i>			
Folder name	folder box		
<i>if non-blank, all the binary string files in this folder are read in.</i>			
Default model for data	input		available models

Old Inputs

old_data_input

Position of menu: File I/O =>Data input =>Old

The Old menu contains superseded options. The Old walk-right menu is

12D HP Plot File

read_4D_hp_plot_file

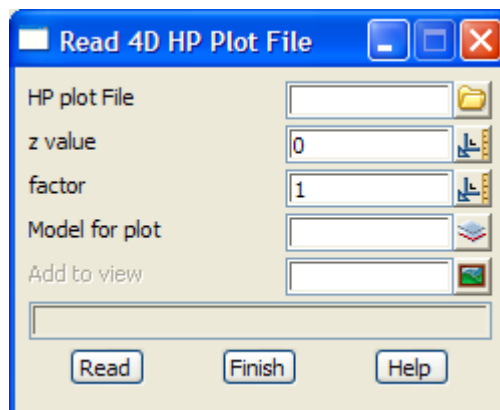

Position of option on menu: File I/O =>Data input =>Old =>4D HP plot

12d Model has options to create plots for HPGL compatible plotters. This option reads back into **12d** Model any plots created by **12d** Model using HPGL plot options.

A plot file is only a two dimensional file defined in millimetres. When read back into **12d** Model, the units are automatically multiplied by 1000.

In the option, the user can supply a further factor to multiply the x and y co-ordinates by and also a z-value which is used as a z co-ordinate for all the lines in the plot file.

On selecting the **12d** HP plot option, the **read 4D HP plot file** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
HP plot file <i>name of the 12d HP plot file to be read in</i>	input		*.hp files
z value <i>z co-ordinate to use for the lines read in from the plot file</i>	input	0.0	
Factor <i>the default units used when reading in a plot file are multiplied by 1000. They are then multiplied by this value.</i>	input	1.0	
Model for plot	input		available models

name of the model that the plot file is to be placed in. The model will be created if it does not already exist. This field must be filled in.

Add to view input available views

if a view name is entered, then the model will be automatically added to the view. This field can be blank.

Read button

read the plot file into the model given in the model field.

DXF Input

read_dxf_data

Position of option on menu: File I/O =>Data input =>Old =>DXF

DXF input is a separate chargeable option

The DXF input option is designed to read most autocad DXF files (up to Version 12), including binary DXF which was introduced in AutoCAD Release 10 as a means of addressing the problems of large file sizes, slow processing and limited accuracy that occur when using the ASCII DXF format. 12d Model will automatically sense whether the input file is binary or ASCII.

The standard Autocad colours can be mapped to the equivalent 12d Model colours or just mapped on a one-to-one basis to 12d Model colour numbers.

Each DXF item has an associated layer. By default, 12d Model creates models of the same name as the layers (or with an additional user supplied prefix) and the DXF items placed in them.

However, this can be over-written using a standard 12d map file where the key is matched against Autocad **layers** rather than string names.

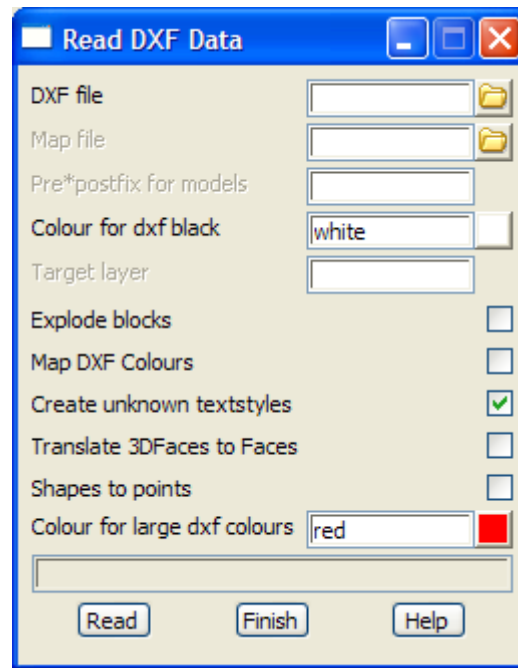

See the section “Map File” in chapter “File I/O” for information about an 12d map file.

Autocad blocks are recognised and either a point with the block name is created or the blocks are expanded into their components, each time they are referenced in the DXF file.

Bulges in polylines can only be interpreted correctly when the polyline has a constant z-value. For this case, a 12d Model polyline string is created from the DXF polyline.

Finally, DXF POINT entities of the same layer and colour are concatenated into one point string as they are read in.

On selecting the DXF option, the **read dxf data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
DXF File <i>name of the DXF file to be read in</i>	input		*.dxf files
Map file <i>if non-blank, the name of the map file to be used for all DXF layers read in. The DXF layer is the entity-name for matching against the key in the map file. If blank, no map file is used. See the section "Map File" in chapter "File I/O" for information about an 12d map file.</i>	input		*.mf files
Prefix for models <i>if non-blank, all 12d Model model names created by the reader will be prefixed by this name.</i>	input		
Colour for dxf black <i>if the DXF colour of an item is black, then the colour in the colour for black field is used for the item in 12d Model.</i>	input	white	available colours
Target layer <i>if non-blank, only autocad items in the layer with the name given in the target layer field will be read in.</i>	input		
Explode blocks <i>if tick, autocad blocks are exploded in 12d Model. If not tick, blocks are not exploded and a point string is placed at the position of the block.</i>	tick	no tick	
Map DXF colours <i>if tick, the first seven DXF colours are mapped to the corresponding default 12d Model colours. If no tick, the nth DXF colour is mapped to the nth 12d Model colour.</i>	tick	no tick	
Create unknown textstyles <i>if tick, then if a textstyle in the DXF file is not already defined in 12d Model, then a new 12d Model textstyle of the same name is created. If no tick, then the 12d Model textstyle "1" is used for any unknown DXF textstyles.</i>	tick	tick	

Translate 3DFaces to facedick no tick

if tick, DXF faces are read in as 12d Model face strings.

Colour for large dxf colours input red available colours

if the DXF colour is greater than the largest colour number defined in the 12d Model colour map, then the colour in the colour for large dxf colours field is used for the DXF colour.

Read button

read the data in.

9 Data Output

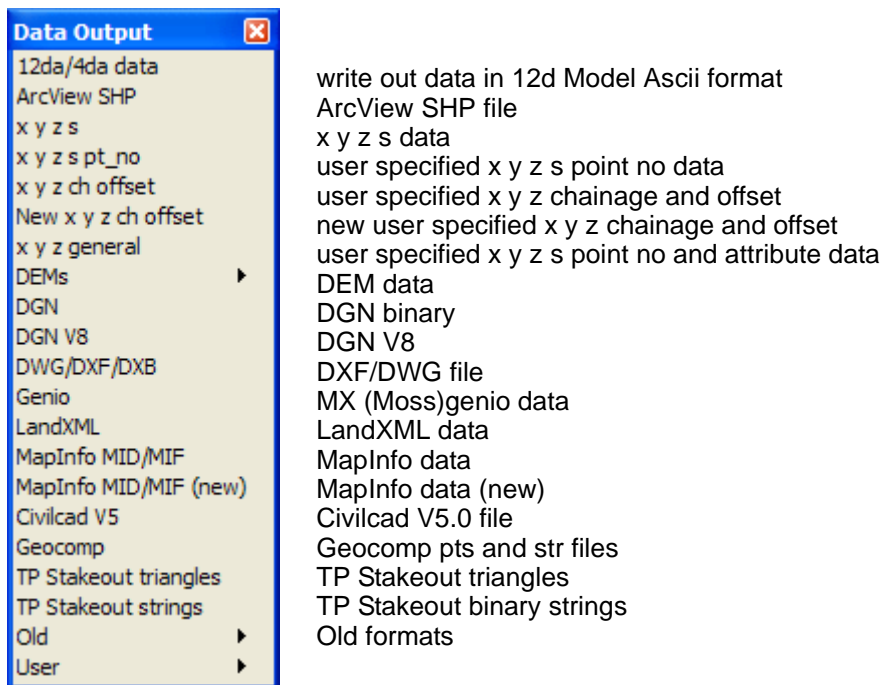

data_output

Position of menu: File I/O =>Data output

12d Model provides output options so that data in a model or on a view can be written out to a disk file. this may be to allow data to be transferred to other programs for further processing or simply to get a readable list of data.

The default *Output null value* is described in the section “Output Null Value”

The data output walk-right menu containing these options is

For the option *12da data*, please continue to the section “12d Ascii Output” .

“Old Outputs” .

Output Null Value

When writing out data for other systems, it is usually not appropriate to write out the internal 12d Model null height (- 9.9e29).

Consequently as data is written out, any 12d Model null heights are replaced by the value given by the **I/O null height** parameter.

The **I/O null height** is set in **Default Settings** tab of the **Defaults** panel in the option Utilities=>Defaults.

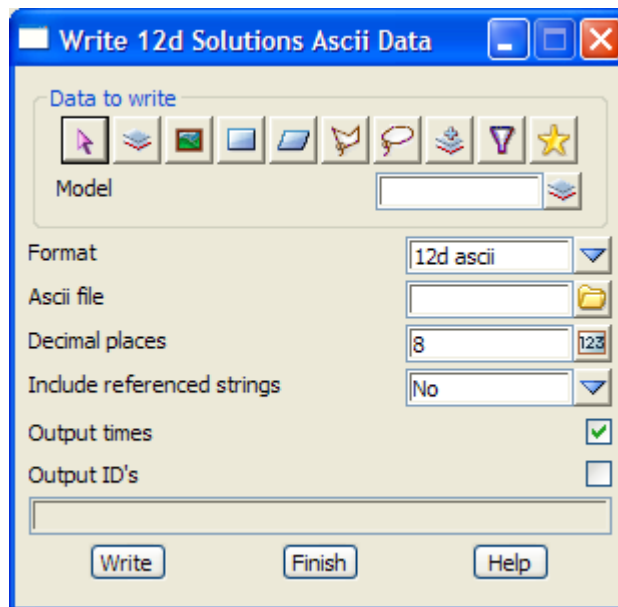

12d Ascii Output

write_12d_Solutions_ascii_data

Position of option on menu: File I/O =>Data output =>12da/4da data

The 12d ascii (4D Ascii) format is a special text format defined by 4D Solutions (see the Appendix) for writing out 12d Model data. This option is used to write out **12d** Model data in the 12d Ascii format.

On selecting the 12d data output option, the **Write 12d Solutions Ascii Data** for panel is displayed as the default choice for Data source.

The Data source field can then be modified for either *String*, *Model* or *View*.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
Format	choice	12d ascii	12d ascii, 4d ascii
<i>use 12d ascii or 4d ascii format (the only difference is the file name ending)</i>			
Ascii file	input		*.12da or *.4da
<i>name of the file for the information to be written out to in 12d Ascii format. If the file already exists, the data will be appended to the file.</i>			
Decimal places	input	8	
<i>number of decimal places used when writing the data out.</i>			
Write	button		
<i>write out, in 12d Ascii format, all the string data specified by the Data source.</i>			

ArcView SHP Output

[write_ArcView_shape_files_for](#)

[Arcview_output_mapping](#)

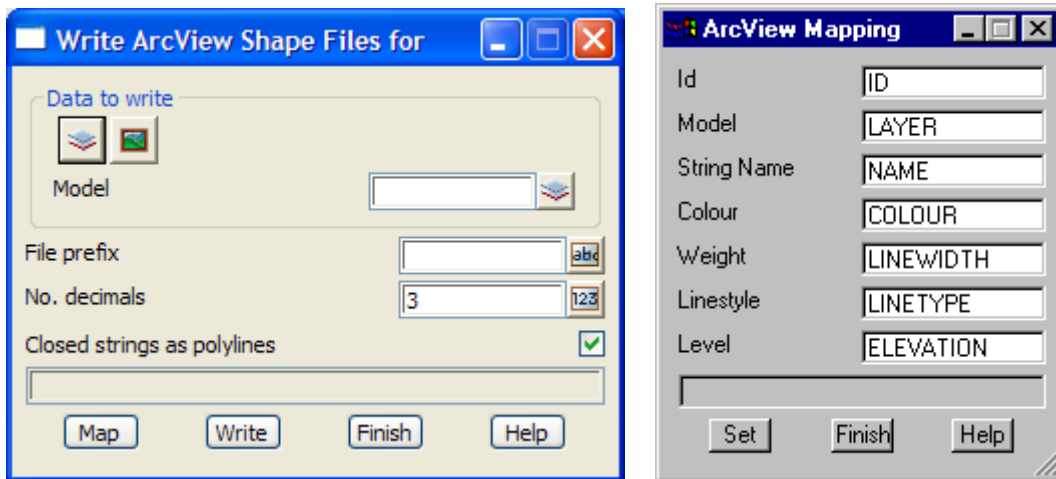

Position of option on menu: File I/O =>Data output =>ArcView SHP

This Option is currently under development.

The *ArcView Shape File* format consists of nine different files containing different data types.

The ArcView shape format has no colour, model or layer information, string names etc. so this information has to be passed through as attributes for the data.

On selecting the ArcView SHP option, the **Write ArcView Shape Files for** panel is displayed.

The fields and buttons used in the **Write ArcView Shape Files for** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
File prefix	input		
<i>prefix to use for the nine different shape files to be produced for the data.</i>			
Map	button		
<i>brings up the ArcView Mapping panel which defines the ArcView attributes to write the standard 12d Model string header information to.</i>			
Write	button		
<i>write out, in ArcView shape file format, all the string data specified by the Data source.</i>			

The fields and buttons used in the **ArcView Mapping** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Id		ID	
<i>if non blank, write out an integer number which increments from 1.</i>			
Model		LAYER	

if non blank, write out the model of the string to this attribute.

String name NAME

if non blank, write out the name of the string to this attribute.

Colour COLOUR

if non blank, write out the colour of the string to this attribute.

Weight LINEWIDTH

if non blank, write out the weight of the string to this attribute.

Linestyle LINETYPE

if non blank, write out the linestyle of the string to this attribute.

Z value ELEVATION

if non blank, write out the first z-value of the string to this attribute.

Set button

record the attribute names given in the panel as the ones to be use when writing out the data.

X Y Z S Output

write_xyz_file_for

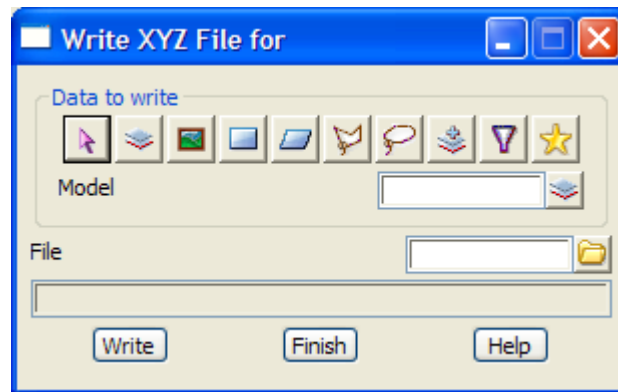

Position of option on menu: File I/O =>Data output =>x y z s

The xyzs output format is identical to the input format - one point per line with the x y and z values separated by spaces.

A string's colour and label are used as colour records and string labels in the output file.

At this stage, 4d, interface and alignment strings are only output as 3d strings. The use of the 12d Model ascii file format is suggested for writing out all strings.

On selecting the xyz option, the **Write XYZ File for** panel is displayed.

The Data source field can then be modified for either *View*, *String* or *Global*.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be written out to a file.

File	input		*.dat files
-------------	-------	--	-------------

name of the file for the information to be written out to.

Write	button		
--------------	--------	--	--

write out, in x y z format, all the string data specified by the Data source.

User X Y Z S Output

write_xyzs_pt_no_file_for

Position of option on menu: File I/O =>Data output =>x y z s pt_no

The xyzs output format is identical to the user specified input format - one point per line with the x y z s and point number values in a user specified order separated by either delimiters or in fixed width columns.

At this stage, 4d, interface and alignment strings are only output as 3d strings. The use of the **12d** Model ascii file format is suggested for writing out all strings.

On selecting the xyzs pt_no option, the **Write XYZS pt_no File for** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source input

source of data is to be written out to a file.

Output mode choice box delimiter delimiter, fixed width

*if **delimiter**, the type of delimiter and the columns for the x, y, z, name and point number are given (and are all optional).*

*If **fixed width**, the start and end column positions are given for x, y, z, name and point number which are all optional.*

Output Settings

Number of decimal places input box 3

number of decimal places to use in the x, y and z values.

Default for null value input box -999

value to write out for z when it is a null value in 12d Model.

Include column names tick box

if tick, the names x, y, z etc. are written out in the appropriate columns as the first line of the file.

File input *.dat files

name of the file for the information to be written out to.

Write button

write out all the string data specified by the Data source.

User X Y Z Chainage and Offset Output

[write_xyzch_file_for](#)

[new_write_xyzch_file_for](#)

Position of option on menu: File I/O =>Data output =>x y z s ch offset

Position of option on menu: File I/O =>Data output =>New x y z s ch offset

The *New xyz ch offset* option was introduced in V7C1g and will replace the standard option.

The difference is that the new option turns off the panel fields that are not required.

The *xyz and ch* output option writes out the x, y, z and chainage values for each string or a centreline string can be selected and the x, y, z and chainage values from the original string are output along with the chainage and offset from the selected reference string.

On selecting the *xyzs ch offset* option, the **Write XYZSCH File for** panel is displayed.

Write XYZCH File for

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be written out to a file.

Write	button		
--------------	--------	--	--

write out all the data specified by the Data source.

General tab

Number of decimal places	input box	3	
---------------------------------	-----------	---	--

number of decimal places to use in the x, y, z and chainage values.

Default for null value	input box	-999	
-------------------------------	-----------	------	--

value to write out for z when it is a null value in 12d Model.

Include column names	tick box		
-----------------------------	----------	--	--

if tick, the names x, y, z etc. are written out in the appropriate columns as the first line of the file.

- Output File** input *.dat files
name of the file for the information to be written out to.
- Report at string points** tick box
if tick, the values are output for the points (vertices) of the strings from the data source. If a centre line has been selected, then the chainage for the centre line is calculated by dropping the string vertex onto the centre line.
- Report at centreline chainages** tick box
if tick, the specified chainages of the selected centre line (given by label mode etc.) are used and then the positions on the strings from the data source are calculated by going out at right angles to the centre line at the chainage.
- Centreline** string select
optional - a selected centreline to use for chainages.
- Label mode** input regular interval,
 regular interval plus end pts
 end points only
 horizontal TPs,
 vertical TPs,
 horizontal discontinuities
 vertical discontinuities
 all discontinuities,
 crests/sags
 all horizontal points
- type of chainages to use from the centreline.*
- Ch interval or n/a** input
the regular interval to use for chainages.
- Ch reference** input 0
the chainages to user are integer multiples of the chainage interval added to the reference chainage. For example, if the reference chainage is 23.2 and the chainage interval 10, the chainages 3.2, 13.2, 23.2, 33.2 etc. will be used.
- Start chainage** input
*if non-blank, the string chainage to start using.
If blank, start at the beginning of the string.*
- End chainage** input
*if non-blank, the string chainage to finish.
If blank, go to the end of the selected string.*
- Special chainage** input
file of special chainages to use.
- Chord/arc tolerance** input default chord/arc tolerance
the chord to arc tolerance to use on the centreline string for determining how many points are used around horizontal curves.
- Maximum offset from centreline**
*if non blank, any vertices further than this distance from the centreline will NOT be written out.
If non blank, all vertices will be written out.*
- Position tab**
- Output mode** choice box delimiter delimiter, fixed width
*if **delimiter**, then the specified data is written out, each value separated by the delimiter given in the Delimiter field.
If **fixed width**, the specified data is written out to a fixed position on the line. An end position is also*

given.

String name

if the column number (delimiter) or start-end position (fixed width) is given, then the name of the string from the data source is written out. Otherwise it is not written out.

String vertex no

if the column number (delimiter) or start-end position (fixed width) is given, then the vertex number of the string is written out.

String point no

if the column number (delimiter) or start-end position (fixed width) is given, then the point number of the vertex of the string is written out.

String chainage

if the column number (delimiter) or start-end position (fixed width) is given, then the string chainage of the vertex of the string is written out (not the centre line chainage).

String x/y/z

if the column number (delimiter) or start-end position (fixed width) is given, then the x/y/z co-ordinate of the position on the string is written out (not the centre line x/y/z).

CL offset

if the column number (delimiter) or start-end position (fixed width) is given, then the offset of the string from the centre line is written out.

CL chainage

if the column number (delimiter) or start-end position (fixed width) is given, then the chainage of the centre line is written out.

CL x/y/z

if the column number (delimiter) or start-end position (fixed width) is given, then the x/y/z co-ordinate of the position on the centre line string is written out.

User X Y Z S and Attributes Output

write_x_y_z_General_File_for

Position of option on menu: File I/O =>Data output =>x y z general

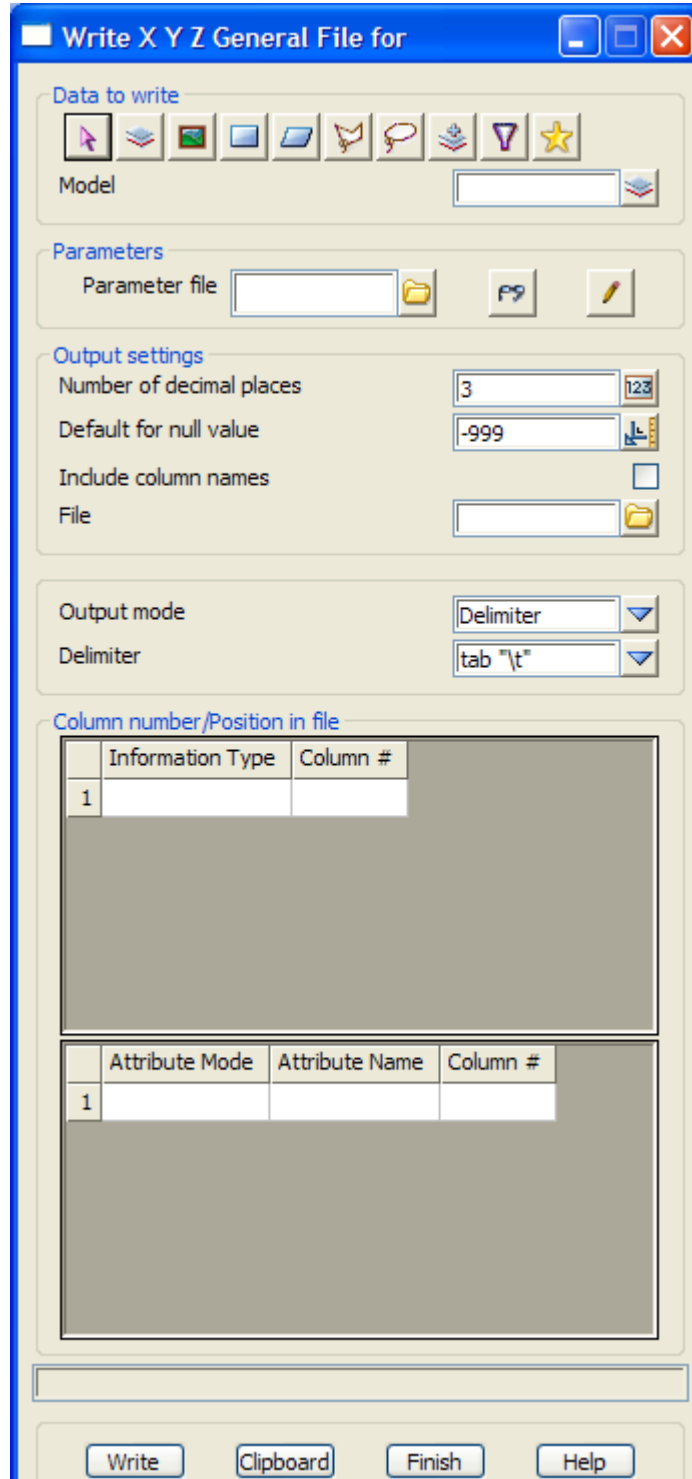

The xyzs output format is identical to the user specified input format - one point per line with the x y z s, point number and attribute values in a user specified order separated by either delimiters or in fixed width columns.

In either case, the user specifies the order that the x, y, z, string name, point number and attributes appear in the file. Only one or more of the items needs to be written out.

The set-ups for defining all the positions of all the data in the file can be written out to a file (.xyf) for re-use.

At this stage, 4d, interface and alignment strings are only output as 3d strings. The use of the **12d** Model ascii file format is suggested for writing out all strings.

On selecting the xyzs general option, the **Write X Y Z General File for** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data to write section

Data source type Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source input

source of data is to be written out to a file.

DGN Output

write_dgn_file_for

Position of option on menu: File I/O =>Data output =>DGN

DGN output is a separate chargeable module.

Using the DGN output option, 12d Model produces DGN binary files (*.dgn files - as defined in the public domain by Intergraph Corp) as used by Intergraph and Microstation. Since DGN supports 3D facets, the triangles created in 12d Model can be transferred to DGN for use in shaded models and walk-throughs.

DGN files are either 2d or 3d. 12d Model can write either type of file. If a 3d file is being written, the 12d Model strings will be written out as three dimensional DGN lines. The alignment strings and arcs will be approximated by short lines.

If a 2d file is being written, arcs in alignment strings are written out as DGN plan arcs.

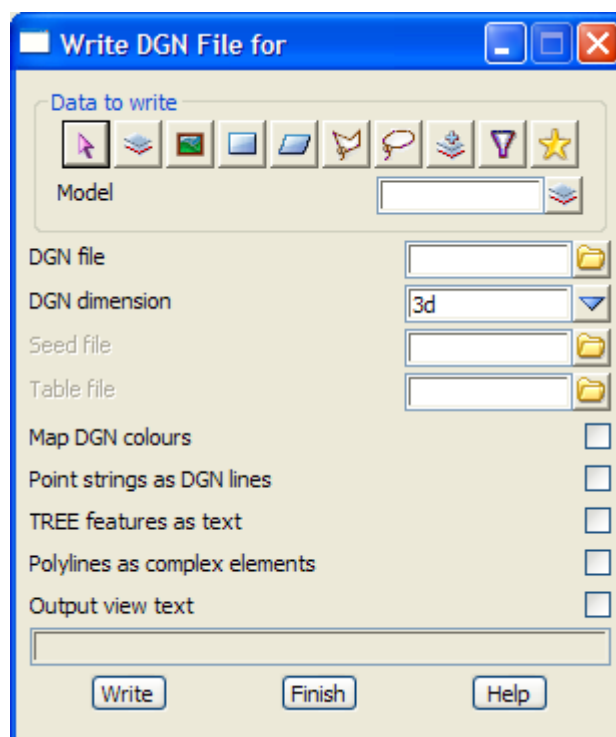

When creating a DGN binary file, it is often convenient to append the information to an existing DGN file known as a **seed file** (the seed file usually contains set up information for the DGN drawing).

In 12d Model, the user can specify a folder containing seed files by pointing to it using the environment variable MS_SEEDFILES_4D. In the DGN output options, the pop-up for the **seed file** panel field displays all the files ending in .dgn in the folder pointed to by MS_SEEDFILES_4D.

If the environment variable MS_SEEDFILES_4D has not been set, the pop-up uses the current working folder to search for seed files.

It is possible to use an output map file (called a table file) with string name as the key to set DGN levels, colours, weight, style and special symbols (see next section). Because of the limitation of 64 levels in DGN, using a table file is normally the best method of getting data across to DGN.

On selecting the DGN option, the **Write DGN File for** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
DGN file	input		*.dgn
<i>name of the DGN file to write the model/view data out to. If the file exists, it is appended to, and the settings for TCB variables are read from the file. If the file does not exist, it is created with default TCB settings. The file is created either 2d or 3d depending on the DGN Dimension field.</i>			
DGN Dimension	input	3d	2d/3d
<i>this field controls the dimension of DGN files created for the case where the file named in the Seed file does not exist.</i>			
Seed file	input		files in the seed folder
<i>if non-blank, this field gives the name of the DGN file to be used as a seed file for the DGN output. The folder containing the seed files, the seed folder, is given by the environment variable MS_SEEDFILES_4D.</i>			
Table file	input		*.tbl file
<i>if non-blank, the file is used as an output map file between 12d Model and the .dgn binary file.</i>			
Map DGN Colours	tick box		
<i>if not tick, 12d Model colour number n is mapped to DGN colour n. if tick, some of the 12d Model colours are attempted to be mapped to DGN colours.</i>			
Point strings as DGN lines	tick box		
<i>if tick, 12d Model points go out as DGN two point strings with the same value for each point. if not tick, 12d Model points go out to DGN points.</i>			
TREE features as text	tick box		
<i>if tick and there is a table file match for TREE, then 12d Model writes out feature strings of name "TREE" as text in DGN. Other feature strings go out as circles. if not tick, all 12d Model feature strings go out as DGN circles.</i>			
Polylines as complex elements	tick box		
<i>if tick and DGN dimension is 2d, 12d Model writes out polylines as complex elements made up of lines and arcs. if not tick, the polyline goes out as individual lines and arcs.</i>			
Output view text	tick box		
<i>if tick, any view text turned on (point numbers, z-values etc.) are output as text in DGN. if not tick, view text is not output.</i>			
Write	button		
<i>write out all the data specified by the Data source to the file given in the DGN file field.</i>			

DGN Output Map File (Table File)

When using the output options to write out a DGN file, an output map file (table file) can be used, with string names as the key, so that the user can specify DGN level, colour, weight, style and some information which is placed in an DGN attribute. The format is based on the VicRoads specification.

The key can have wild cards (*) and wild characters (?) as for the input map files.

The table consists of lines containing either 8 or 16 free format fields. Fields 9-16 can be left off if they are not needed.

The key for the map is the 12d Model string name which is given as the first field of a line. The rest of the fields on the line are used for .dgn information.

- field 1 12d Model string name (any length but if field 2 is a *, only the first four characters are passed)
- field 2 text of which the first four characters are used in a DGN attribute. For example, the VicRoads code
- field 3 AS2482 feature code
- field 4 description (any length but quotes needed if there are embedded spaces)
- field 5 line level (between 1 and 64)
- field 6 line colour (between 1 and 256)
- field 7 line weight (between 1 and 7)
- field 8 line style

fields 9-16 are only used for special symbols placed at points.

- field 9 symbol font (between 0 and 7)
- field 10 symbol character
- field 11 symbol character justification
- field 12 symbol character height
- field 13 symbol character width
- field 14 symbol level
- field 15 symbol weight
- field 16 symbol colour

Field 1, the 12d Model string name, can contain wild cards * or wild characters ?.

Field 2, a text string, and the first four characters of the text is inserted into a DGN attribute. This DGN attribute is used by the 12d Model DGN reader for matching with a 12d Model input map file.

If field 2 is a * then the first four characters of the 12d Model string name is inserted as an Intergraph attribute.

Line strings and Text strings only use fields 1 to 8 and ignore fields 9-16 (if they exist).

Fields 9 through 16 are only used for 12d Model point strings which are then mapped with the specified Intergraph symbol at each point of the string.

If either field 12 or 13 is zero, then it is interpreted to mean that only the first 8 fields are used.

If any of the fields 5 through 16 (except 9 and 11) is a *, then that field is not used in the map.

Double quotes " are entered as text as \", a ' as \' and a \ as \\.

An example of a map table where the first four characters of the 12d Model string names are passed directly through to the DGN attribute.

CONT	*	50020000	"Contour - Standard "	2	4	0	0								
TOP	*	25060001	"Top - Cut/fill/bank "	2	11	1	2								
TOE	*	25060002	"Toe - Cut/fill/bank "	3	11	1	7								
ES*	*	50090001	"Existing surface-spot "	4	9	1	0	110	A	7	1000	1000	4	0	9
CIND	*	50080000	"Contour - Index "	2	4	1	0								

An example of a map table where the 12d Model string names are used for mapping but different names go through to the DGN attribute.

```

101      CONT      50020000  "Contour - Standard "  2   4   0   0
102      TOP       25060001  "Top - Cut/fill/bank "  2  11   1   2
104  ES      50090001  "Existing surface-spot" 4   9   1   0 110 A  7 1000 1000  4   0   9

```

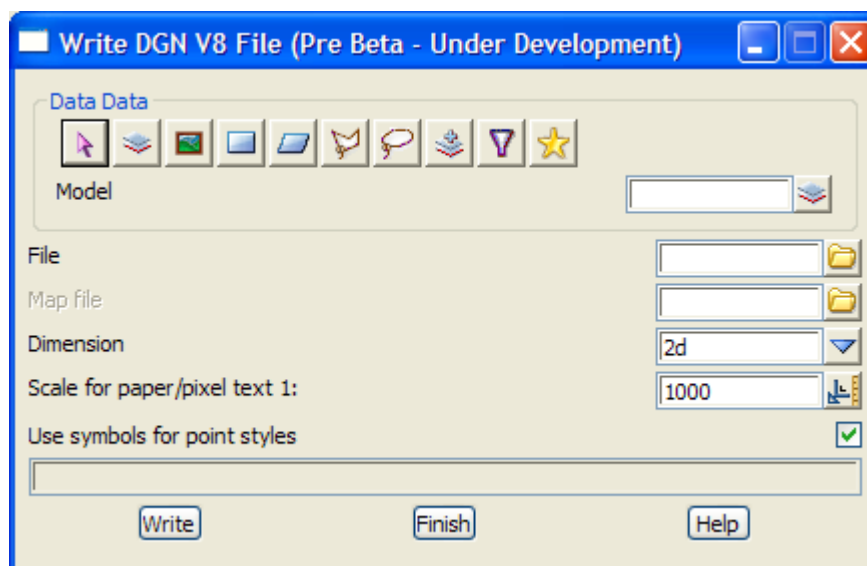

Write_DGN_V8_File__Pre_Beta___Under_Development_

DGN V8

NOTE: the format for DGNV8 has been changed and has not been published. This is a beta version of the DGN Write to try and write DGNV8. At this stage it is probably better to use DWG I/O to go in and out of Microstation V8.

Note: this option is under development

On selecting the DGN V8 option, the **Write DGN V8 File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
DGN file <i>name of the DGN V8 binary model to be write to</i>	input		*.dgn files
Write <i>read the data out.</i>	button		

DWG/DXF Output

`write_dwg_dxf_file_for`

Position of option on menu: File I/O =>Data output =>DWG/DXF

The DWG/DXF output format is for writing data out in a format compatible with AutoCAD versions 2.5 to 2000.

12d Model line strings are output as POLYLINES, point strings as a series of Autocad POINTs and triangles as 3DFACEs.

By default, the string or triangle colour is used in the Autocad colour record. The DXF layer used is the items model name with any spaces in the model name replaced by a minus (-). However, a DXF output map file with matches on string name can be used to give DXF layers, colours and line type (see next section).

At this stage, 4d, interface and alignment strings are only output as Autocad POLYLINES.

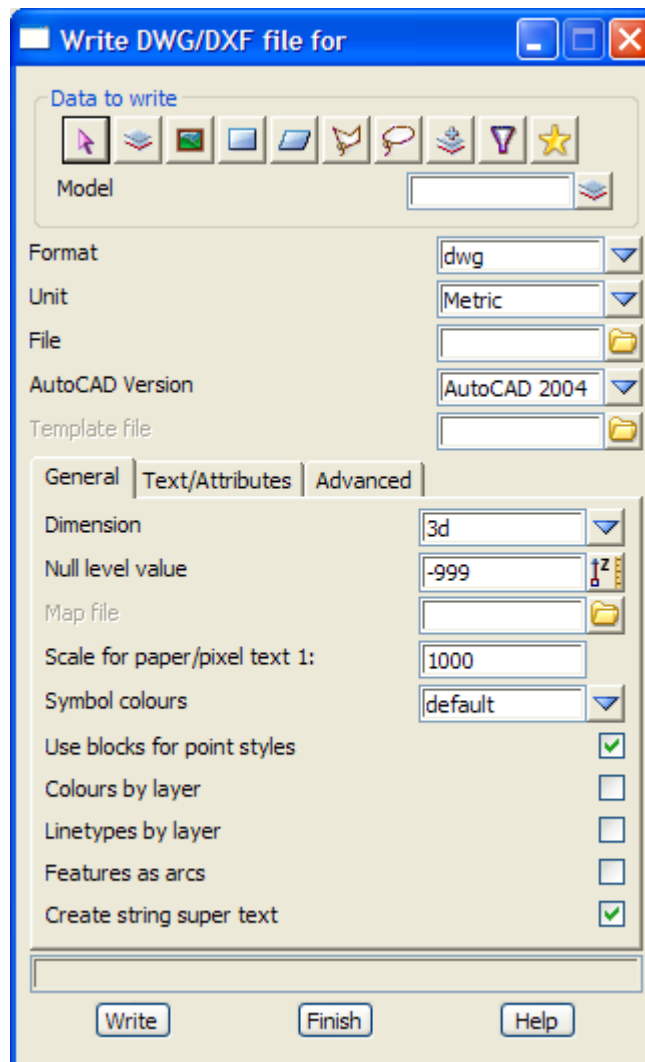

When creating an AutoCAD file, it is often convenient to use an existing AutoCAD file as a template or **seed file** (the seed file usually contains set up information for the AutoCAD drawing).

In **12d** Model, the user can specify a folder containing seed files by pointing to it using the environment variable ACAD_SEEDFILES_4D. In the AutoCAD DWG/DXF output option, the pop-up for the **seed file** panel field displays all the files with the appropriate ending in the folder pointed to by ACAD_SEEDFILES_4D.

If the environment variable ACAD_SEEDFILES_4D has not been set, the pop-up uses the current working folder to search for seed files.

It is also possible to use a label map file to create labels for vertex information such as z-values, symbols and point numbers which are written directly to the AutoCAD file. See the section "Label Map File" and "Use Label Map File" for more information on the label map file.

On selecting the DWG/DXF output option, the **Write DWG/DXF file for** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
Format	choice	dwg	dwg, dxf, bdx
<i>AutoCAD format of the file.</i>			
Unit	choice	Metric	Metric, English
<i>AutoCAD units type.</i>			
File	input		
<i>name of the ACAD file for the data to be written out to.</i>			
AutoCAD version	choice	AutoCAD 2004	AutoCAD 12, 13, 14 AutoCAD 2000, 2002, 2004 2005, 2006, 2007
<i>AutoCAD version of the file produced.</i>			
ACAD Template file	input		

name of the file to use as the AutoCAD template

Write button

write out, in DXF format, all the data specified by the Data source, to the file given in the file field.

General tab

Dimension choice 3d 2d, 2d and contours 3d,3d

if **2d**, the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as dxf polylines with bulges for the arcs.

If **2d and contours 3d**, the z-value of all the non-contour data is set to zero and arcs and curves in alignment strings are written out as dxf polylines with bulges for the arcs. Contours are written out as 3d polylines.

If **3d**, strings will be written out as three dimensional DXF polylines. Alignment strings and arcs will be approximated by short lines.

Null level value input -999

AutoCAD z-value to use for any vertices with the 12d Model null value

ACAD output map file input *.mf files

if non-blank, the name of an AutoCAD output map file to map the data. See "AutoCAD Output Map File Create/Edit".

Scale for paper/pixel text 1: input 1000

scale to use to convert 12d Model paper and pixel text to ACAD world units

Symbol colour choice default default, by block, by layer

if **default**, use the 12d Model colour.

If **By block**, write out as BY BLOCK.

If **By layer**, write out as BY LAYER.

Colour by layer tick box no tick

if **tick**, the colour is set to BY LAYER

Linestyles by layer tick box no tick

if **tick**, the linestyle is set to BY LAYER

Features as arcs tick box no tick

if **tick**, feature strings output as arcs in DXF.

if not **tick**, the centre of the feature string is output as a point.

Create string super text tick box no tick

if **tick**,

Text/Attributes

Label map file input *.mf files

if non-blank, the name of a file to be used as label map file for creating labels.

Layer name for symbols input *.mf files

if non-blank, the name of a file to be used as label map file for creating labels.

Advanced

Space in model names choice space space, underscore, hyphen

if **space**, then spaces in 12d Model names go out as spaces to ACAD layer names.

If **underscore**, then spaces in 12d Model names go out as underscores to ACAD layer names.

If **hyphen**, then spaces in 12d Model names go out as hyphens to ACAD layer names.

Acad point style choice style 0 Acad point styles

Point mode choice relative relative, absolute

	<i>if relative, then</i>		
	<i>If absolute, then .</i>		
Point size (%)	input		5
Output view text	tick box		no tick
	<i>if tick, any view text turned on (point numbers, z-values etc.) are output as text in DXF.</i>		
	<i>if not tick, view text is not output.</i>		
Explode interface strings	tick box		no tick
	<i>if tick, interface strings are broken into separate strings for the cut or fill colour.</i>		
	<i>If not tick, interface strings are written out as one string in magenta.</i>		
Use model name for mapping	tick box		no tick

	<i>if not tick, .</i>		
Associate vertex attributes with symbol	tick box		no tick
	<i>if tick,</i>		
	<i>if not tick, .</i>		
Vertex attributes height	input		-999

DWG/DXF Output Map File

See "AutoCAD Output Map File Create/Edit" .

When using the output options to write out a DWG/DXF file, an output map file can be used, with 12d Model string names as the entity-name to match the key, so that the user can specify Autocad layer, colour and style. BYLAYER can be used with colour and style.

The key can have wild cards (*) and wild characters (?) as for the input map files. The fields in the DWG/DXF output map file are (ACD = Autocad):

field 1	key - string name	can include wild cards * and wild characters ?
field 2	new name	not output to DXF
field 3	ACD layer	* for 12d Model name
field 4	ACD colour	number between 0 and 256, * for 12d Model colour mapped to ACD,
		BYLAYER for ACD BYLAYER
field 5	ACD line type	* for 12d Model linestyle, BYLAYER for ACD BYLAYER
field 6	ACD text style	not yet used, * for 12d Model text style

An example of an DWG/DXF output map file is.

//	1	2	3	4	5	6
//	key	name	layer	colour	linetype	textstyle
	cont*	ignored	CONTOURS	1	1	*
	EB*	ignored	ROAD	2	CONTINUOUS	*
	103	ignored	*	3	*	*
	fe*	ignored	FENCE	*	BYLAYER	*
	SURV*	ignored	SURVEY	BYLAYER	DASH	*

Genio Output

`write_genio_file_for`

Genio i/o is a separate chargeable module.

The Genio output option write out the strings selected by the data source, to a genio file, the format used by MX (formerly Moss). A genio 001 option is used to specify the record format.

Because MX and in 12d Model have different data types, not all 12d Model data can be transferred to MX. The user must be aware of what data can be transferred to MX.

1. MX model names are limited to thirty two characters (in upper case). Hence the first thirty two characters of the 12d Model model name are converted to upper case and used as the MX model name.
2. MX string names can only be four characters and each string in MX must have a unique name. This limits MX to a maximum of 1,679,616 string. Strings can have the same name in the genio file but the strings will be *renamed* when read into MX to give each string a unique name.

Since 12d Model places no restrictions on string name length, the following rules are used to produce genio string names.

For a **line-string**, the first four characters of the string name are used as the genio string name. The four characters are mapped to upper case. Remember that MX line strings can not start with a P.

For a **point-strings** whose names start with **P**, the first four characters of the string name are used as the genio string name. Otherwise the genio string name is **P** plus the first three letters of the point-string name. The three letters are mapped to upper case.

3. 12d Model null heights go out as -999 to MX.
4. The four character limit and uniqueness for MX string names restricts the number of strings that can be read into MX. For example, since points strings must start with P so there can be a maximum of 46,656 point strings. Or if a MX string must start with ABB say, then there can only be 36 distinct ABB strings in the MX project.
5. All MX x and y co-ordinates have to be positive. That is, all co-ordinates must be in the first quadrant.
6. 12d text strings go out as MX text strings but there is a maximum of 44 characters in the MX text string. There is no unit for height in the MX text string as well as no font. The name of a MX text string must start with a * so 12d Model uses * and the first three characters of the text string's name.
7. 2d and 3d strings in 12d Model go out to MX as 2d and 3d strings respectively.
8. 4d strings in 12d Model go out to MX as 4d strings except that the text is restricted to four characters.
9. Alignment and super alignments can be written out to MX as MX 3d, 6d or 12d string.
10. For super strings:

Point id's are ignored in all cases.

On the Genio output panel, this is a tick box *Include segment text* and if it is ticked then segment text is written out as MX text strings, otherwise segment text is ignored.

On the Genio output panel, this is a tick box *Include vertex text* and if it is ticked then the super string is written out as a MX 4d string and with the first four characters as the vertex text for a point.

Attributes are ignored in all cases.

Diameter and culvert **width** and **height** are ignored.

Colour and **segment colour** are ignored.

If there is an **invisibility** segment, the string is broken into two.

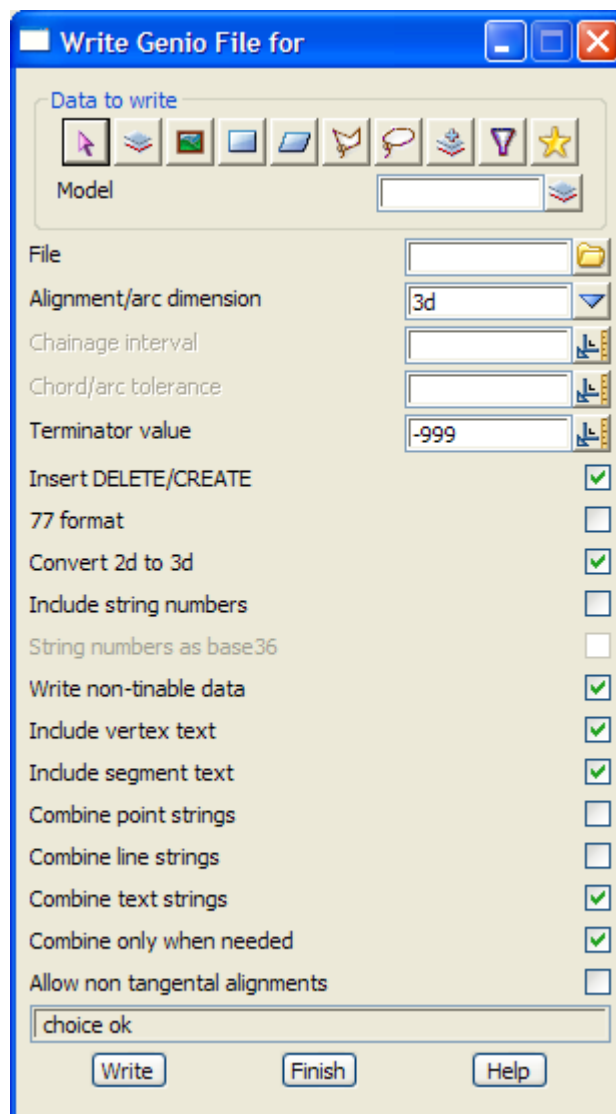

Tinability is a real problem. MX has no such concept apart from the entire string being a point string or a line string. There is a tick box to write out non-tinable data. If a segment is non tinable, the string is broken into two.

Arcs in super strings or arc strings or circles are broken into line segments using the chord to arc tolerance in the genio output panel, or the system default if there is no value in the panel. Super strings with a fixed z-value and no vertex text (i.e. that is no z-value at each point, just the one z for the entire string) go out at MX 2d strings.

Super strings with a z-value at each vertex and no vertex text (that is a z-value at each point) go out as MX 3d string

Super strings with a z-value at each vertex and vertex text (that is a z-value at each point and text at each point) go out as MX 4d strings with the four characters of the vertex text as the forth dimension.

On selecting the Genio output option, the **Write Genio File for** panel is displayed.

The fields and buttons used in the two panels panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to “Data Source” in the chapter “Tools and Concepts”

- Data source** input
source of data is to be written out to a file.
- File** input *.mos files
name of the genio file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.
- Alignment/arc dimension** input 3d 3d,6d,12d
*if 3d is selected, alignment and arc strings as written out as MX 3d string as a series of straight lines (x, y, z at each point).
If 6d is selected, alignment and arc strings are written out as MX 6d strings (chainage, x, y, z, bearing, and radius at each point).
If 12d is selected, alignment and arc strings are written out as MX geometry strings (called 12d strings in MX). This is the only way that full horizontal and vertical geometry can be transferred to MX.*
- Chainage interval** input
if 3d is selected as the Alignment/arc dimension, the alignments and arcs are approximated using the Chainage interval and the Chord/arc tolerance.
- Chord/arc tolerance** input
if 3d is selected as the Alignment/arc dimension, the alignments and arcs are approximated using the Chainage interval and the Chord/arc tolerance.
- Terminator value** input -999
value to use to terminate strings in the genio file.
- Insert DELETE/CREATE** tick box tick
if tick, the genio commands DELETE and CREATE are written at the top of the file to correctly define the moss models for the data.
- 77 format** tick box
if tick, use the MX 77 formats for the genio strings.
- Convert 2d to 3d** tick box tick
if tick, write strings with a fixed z-value (2d strings) out in MX 3d string format in the genio file.
- Include string numbers** tick box
if tick, the MX string name includes the surveyors string number. It still can be only four characters.
- Write non-tinable data** tick box tick
*if tick, strings that are non-tinable are written out.
If not ticked, strings that are non-tinable are not written out.*
- Include vertex text** tick box tick
if tick, write out strings with vertex text as MX 4d string with the first four characters of the vertex text as the text on the MX 4d string, otherwise do not write the text out.
- Include segment text** tick box tick
if tick, write out segment text as text strings otherwise do not write the text out.
- Combine point strings** tick box
if tick, point strings of the same name in 12d are combined into one point string when written out.
- Combine line strings** tick box
if tick, strings of the same name in 12d are combined into one MX string (using MX discontinuities to separate the strings) when written out. This is trying to get over the MX four character name limitation.
- Combine text strings** tick box tick
if tick, text strings of the same name in 12d are combined into one MX text string when written out.

This is trying to get over the MX four character name limitation.

Combine only when needed tick box tick

*if **tick**, when there are more strings of the same name in 12d than the MX four character name restriction would allow, the strings are combined into one MX string when written out. This is trying to get over the MX four character name limitation.*

Allow non tangential alignments tick box

*if **tick**, alignments where some elements are not tangential are written out.*

*if **not tick**, alignments with non tangential elements are not written out.*

Write button

write out in genio format all the data specified by the Data source, to the file given in the file field. If the file already exist, the data will be appended to the file.

LandXML Output

write_landXML_for

Position of option on menu: File I/O =>Data output =>LandXML

LandXML is a general format that attempts to cover civil and surveying entities.

Unfortunately every vendor has their own extensions which makes the format of only limited value unless LandXML readers are tailored for each vendor variation.

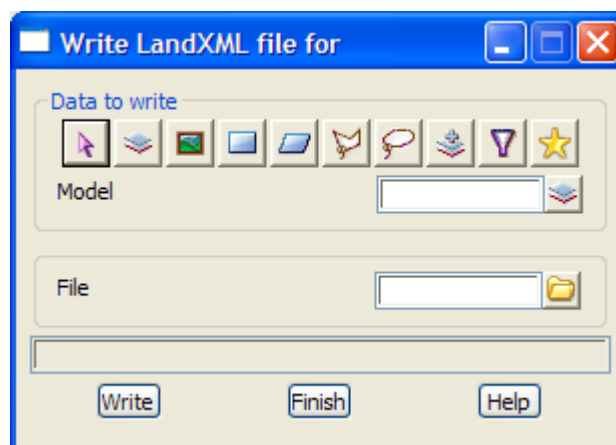

LandXML only covers some of the data in 12d Model and so is of limited value.

12d Model has special LandXML writers for LINZ-XML (for LandOnline NZ) and Leica-XML.

One benefit is that for it may allow access to data from vendors who only have non-published proprietary formats (AutoCAD, Microstation).

This option is under continual developed as the LandXML standard keep changing.

On selecting the LandXML option, the **Read LandXML File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
File	input		*.xml
<i>name of the LandXML file to write to</i>			
Write	button		
<i>write the selected data to a LandXML file.</i>			

MapInfo Output

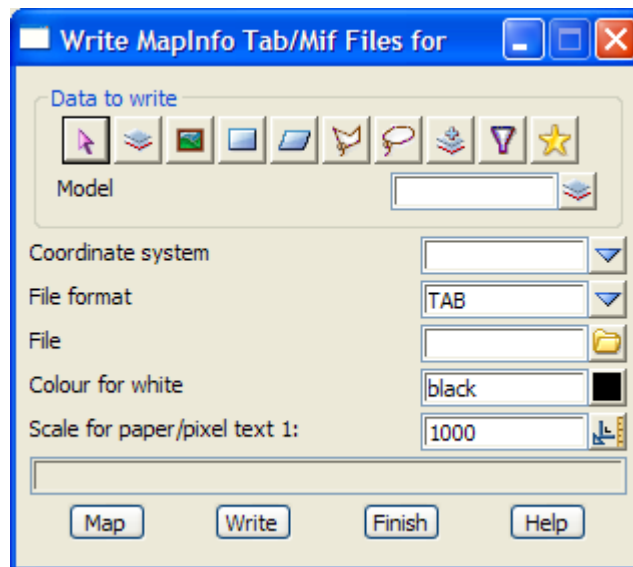

write_MapInfo_tab_mif_files_for

Position of option on menu: File I/O =>Data output =>MapInfo

This Option is currently under development.

The *MapInfo MID/MIF* format is used for sending data to MapInfo.

On selecting the MapInfo MID/MIF option, the **Write MapInfo Tab/Mif Files for** panel is displayed.

The Data source field can then be modified for either *View*, *String* or *Global*.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
	<i>source of data is to be written out to a file.</i>		

Co-ordinate system	choice box		
---------------------------	------------	--	--

MapInfo file of co-ordinate definitions. The co-ordinate system that the current data is in is selected from the list.

Note - data in MapInfo is stored in longitude and attitude. When MapInfo reads data in it needs to know the co-ordinate system that the data is in so that it can convert the data to longitude/attitude as it reads the file. The list of co-ordinate systems in the Co-ordinate system pop-up is in the file *mapinfo.4d*. *Mapinfo.4d* has exactly the same format as the file *MAPINFOW.PRJ* used by MapInfo.

*If there are any co-ordinate systems missing that are in your MapInfo system, simply copy the file *MAPINFOW.PRJ* from your MapInfo system into the 12d Model **User** folder and give it the name *mapinfo.4d* instead of *MAPINFOW.PRJ**

File format	choice box	TAB	TAB, MIF
	<i>MapInfo format to use for writing out the data.</i>		

File	choice box		*.tab, *.mif files
	<i>name of the file to write the data out to.</i>		

Colour for white colour box available colours
colour to use in MapInfo for white in 12d Model (because MapInfo has a white background).

Write button
write out, in MapInfo file format, all the string data specified by the Data source.

Civilcad

civilcad_write_panel

Position of option on menu: File I/O =>Data output =>Civilcad V5

Civilcad output is a *unsupported* option supplied to users with the Civilcad input option. Civilcad input is a chargeable module.

Because of the limitations of the CivilCAD ascii format, the CivilCAD output option can only output a limited number of 12d Model data types.

The Civilcad output option writes some 12d Model data to a CivilCAD 5.0 ascii file. Because CivilCAD ascii can only take points, lines between two points and arcs, only 12d Model data that can output that way can be written out.

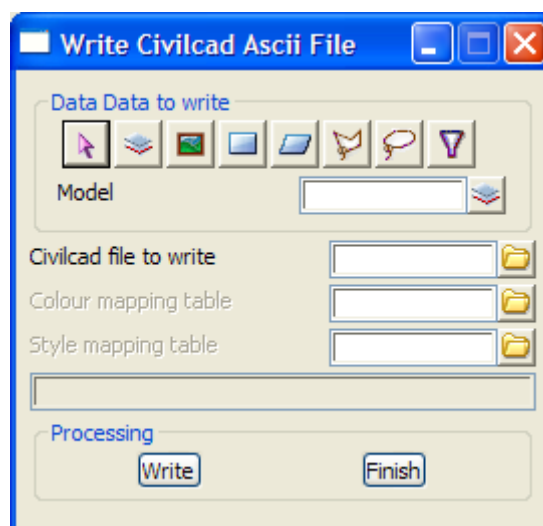

The only 12d Model data types that can be written out to Civilcad ascii are:

- 2d strings
- 3d strings
- arcs
- circles
- polylines
- the line work from super strings
- text

Note that the following 12d Model data that **can not** be output to CivilCAD ascii:

- alignments
- super alignments
- drainage/sewer strings
- pipeline strings
- pipe strings
- attributes
- most super string properties
- triangulations
- rasters

On selecting the Civilcad output option, the **Write CivilCAD ascii File** panel is displayed.

The fields and buttons used in the two panels panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data to write	choice	Model	Model, View
	<i>the type of data to be written out to a file.</i>		
Data type source	input		
	<i>source of data is to be written out to a file.</i>		
CivilCAD file	input		*.as5 files
	<i>name of the file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.</i>		
Write	button		
	<i>write out in CivilCAD format the data in the model/view given in the model/view field, to the file given in the file field.</i>		

Geocomp

geocomp_write_panel

Position of option on menu: File I/O =>Data output =>Geocomp

Geocomp output is a *unsupported* option supplied to users with the Geocomp input option. Geocomp input is a chargeable module.

Because of the limitations of the Geocomp points and strings files, the Geocomp output option can only output a limited number of 12d Model data types.

The Geocomp output option writes some 12d Model data to Geocomp Points and Strings files. Because Geocomp can only take points, lines between two points and arcs, only 12d Model data that can output that way can be written out.

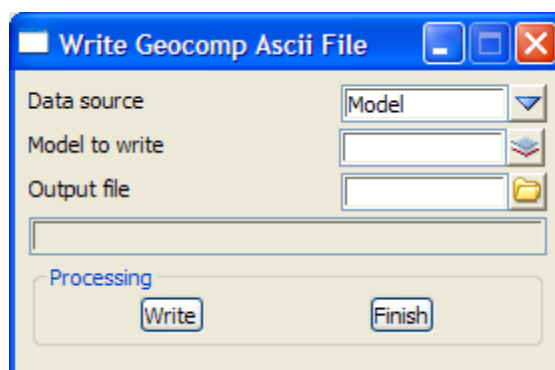

The only 12d Model data types that can be written out to Geocomp points and strings files are:

- 2d strings
- 3d strings
- arcs
- circles
- polylines
- the line work from super strings
- text

Note that the following 12d Model data types that **can not** be output to Geocomp:

- alignments
- super alignments
- drainage/sewer strings
- pipeline strings
- pipe strings
- attributes
- most super string properties
- triangulations
- rasters

On selecting the Geocomp output option, the **write Geocomp ascii file** panel is displayed.

The fields and buttons used in the two panels panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to write <i>the type of data to be written out to a file.</i>	choice	Model	Model, View
Data type source <i>source of data is to be written out to a file.</i>	input		

Output file input *.as5 files
name of the file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.

Write button
write out Geocomp Points and Strings files the data in the model/view given in the model/view field, to the file given in the output file field.

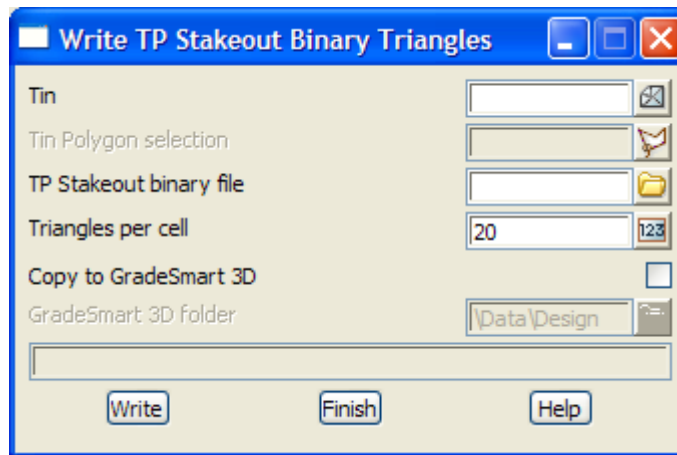

TP Stakeout Triangles Output

write_tp_stakeout_binary_triangles

Position of option on menu: File I/O =>Data output =>TP Stakeout triangles

The *TP Stakeout triangles* option writes out a tin as a TP Stakeout binary file.

On selecting the TP Stakeout triangles output option, the **Write TP Stakeout Binary Triangles** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source

input

source of data is to be written out to a file.

Tin

input

available tins

name of the tin to write out in TP Stakeout binary format.

Tin polygon selection

poly string-select

if selected, only triangles with their centroid inside this string are written out.

TP Stakeout binary file

input

*.tsb

name of the file for the triangles.

Triangles per cell

a TP Stakeout parameter.

Write

button

write out the tin in TP Stakeout binary format.

TP Stakeout Strings Output

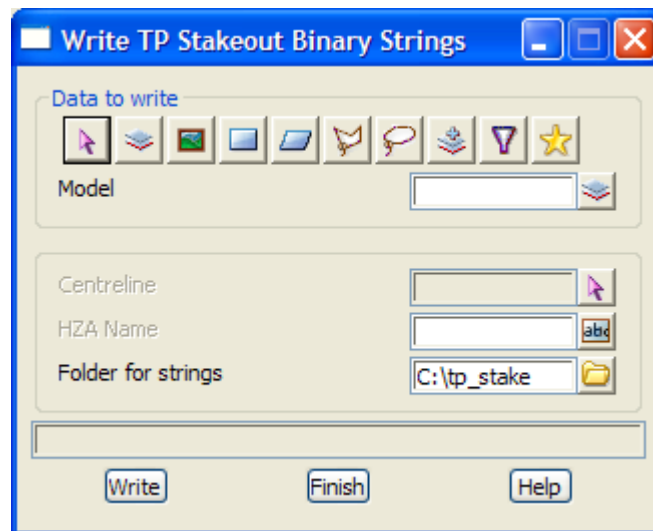

write_tp_stakeout_binary_strings

Position of option on menu: File I/O =>Data output =>TP Stakeout strings

Note - this is a chargeable option

The *TPStakeout strings* option writes out selected strings as a TP Stakeout binary file.

On selecting the TP Stakeout strings output option, the **Write TP Stakeout Binary Strings** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Centreline	string select		
-------------------	---------------	--	--

centreline string to use as the reference chainage for other strings.

HZA name			
-----------------	--	--	--

Folder for stings	folder		
--------------------------	--------	--	--

name of the folder to write out the strings to.

Write	button		
--------------	--------	--	--

write out the strings in TP Stakeout binary format.

Old Outputs

old_data_output

Position of menu: File I/O =>Data output =>Old

The Old menu contains superseded options. The Old walk-right menu is

DXF 12-14 Output

[write_dxf_12_14_file_for](#)

Position of option on menu: File I/O =>Data output =>Old =>DXF 12-14

SUPERSEDED OPTION

The DXF 12-14 output format is for writing data out in a format compatible with AutoCAD. The DXF file produced **does not** have a full DXF header with the required line types, text styles, fonts already defined. Hence the DXF file needs to be loaded into an **existing** Autocad drawing.

AutoCAD Release 10 introduced binary DXF files as a means of addressing the problems of large file sizes, slow processing and limited accuracy that occur when using the ASCII DXF format.

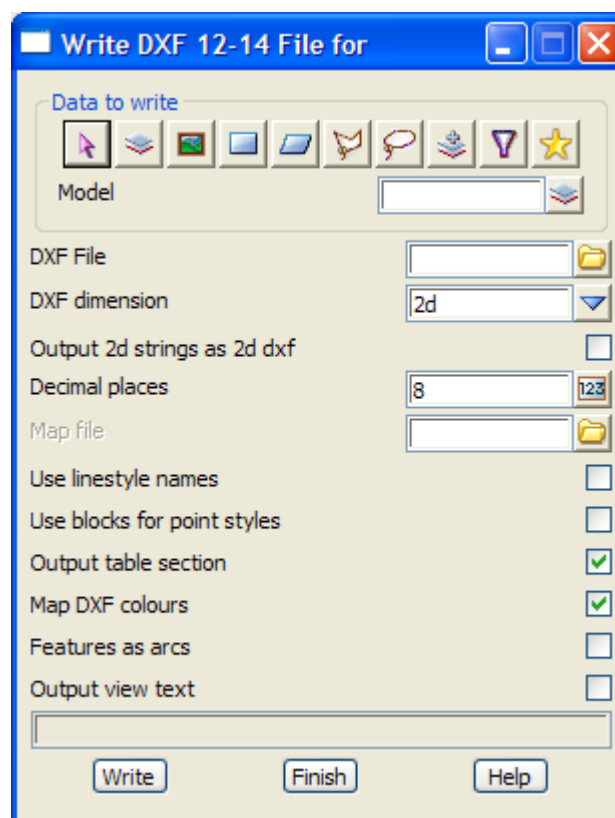

12d Model can write binary DXF files. See the Precision field below.

12d Model line strings are output as POLYLINES, point strings as a series of Autocad POINTs and triangles as 3DFACES.

By default, the string or triangle colour is used in the Autocad colour record. The DXF layer used is the items model name with any spaces in the model name replaced by a minus (-). However, a DXF output map file with matches on string name can be used to give DXF layers, colours and line type (see next section).

At this stage, 4d, interface and alignment strings are only output as Autocad POLYLINES.

On selecting the DXF 12-14 output option, the **Write DXF 12-14 File for** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be written out to a file.

- DXF File** input *.dxf files
name of the file for the information to be written out to. If the file already exists, the data will be appended to the file.
- DXF Dimension** input 2d 2d, 3d
*if 3d, strings will be written out as three dimensional DXF polylines. Alignment strings and arcs will be approximated by short lines.
 If 2d, the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as dxf polylines with bulges for the arcs.*
- Decimal places** input 8
*the number of decimal places to be used for co-ordinates etc. in the DXF file.
 If this number is **negative**, a binary DXF file will be written. The actual number specified becomes irrelevant in this case, since full precision is preserved in a binary DXF file.*
- Map file** input *.mf files
if non-blank, the name of a file to be used as a 12d Model to DXF output map file.
- Use linestyle names** tick box
*if **tick**, a 12d Model string's linestyle name is used as the DXF element's line type ("1" goes to CONTINUOUS).
 if not **tick**, all DXF line types are CONTINUOUS.*
- Use blocks for point styles** tick box
*if **tick**, for each 12d Model point string, an Autocad block of the same name as the 12d Model string's linestyle is placed at each point.*
- Output table section** tick box tick
*if **tick**, an AutoCAD table section is written out at the top of the DXF file.*
- Map DXF colours** tick box tick
*if **tick**, a mapping is made between the first seven default 12d Model colours and the corresponding DXF colours. The other 12d Model colours are mapped to the DXF colour of the same colour number.
 If not **tick**, the nth 12d Model colour is mapped to the nth DXF colour.*
- Features as arcs** tick box
*if **tick**, feature strings output as arcs in DXF.
 if not **tick**, the centre of the feature string is output as a point.*
- Output view text** tick box
*if **tick**, any view text turned on (point numbers, z-values etc.) are output as text in DXF.
 if not **tick**, view text is not output.*
- Write** button
write out, in DXF format, the data in the model/view given in the model/view field, to the file given in the file field.

DXF Output Map File

When using the output options to write out a DXF file, an output map file can be used, with **12d** Model string names as the entity-name to match the key, so that the user can specify Autocad layer, colour and style. BYLAYER can be used with colour and style.

The key can have wild cards (*) and wild characters (?) as for the input map files. The fields in the DXF output map file are (ACD = Autocad):

field 1	key - string name	can include wild cards * and wild characters ?
field 2	new name	not output to DXF
field 3	ACD layer	* for 12d Model name
field 4	ACD colour	number between 0 and 256, * for 12d Model colour mapped to ACD, BYLAYER for ACD BYLAYER
field 5	ACD line type	* for 12d Model linestyle, BYLAYER for ACD BYLAYER
field 6	ACD text style	not yet used, * for 12d Model text style

The DXF file produced needs to be loaded into an existing Autocad drawing which has the ACD layers and linetypes defined.

An example of an DXF output map file is.

//	1	2	3	4	5	6
//	key	name	layer	colour	linetype	textstyle
	cont*	CONT	CONTOURS	1	1	*
	EB*	TOP	ROAD	2	CONTINUOUS	*
	103	TOP	*	3	*	*
	fe*	TOP	FENCE	*	BYLAYER	*
	SURV*	TOP	SURVEY	BYLAYER	DASH	*

DXF Output

write_dxf_file_for

Position of option on menu: File I/O =>Data output =>Old =>DXF

SUPERSEDED OPTION

The DXF output format is for writing data out in a format compatible with AutoCAD version 15. The DXF file produced **does not** have a full DXF header with the required line types, text styles, fonts already defined. Hence the DXF file needs to be loaded into an existing Autocad drawing.

This option is the one used in 12d Model V3.1. It is now superseded by the DWG/DXF output option.

AutoCAD Release 10 introduced binary DXF files as a means of addressing the problems of large file sizes, slow processing and limited accuracy that occur when using the ASCII DXF format.

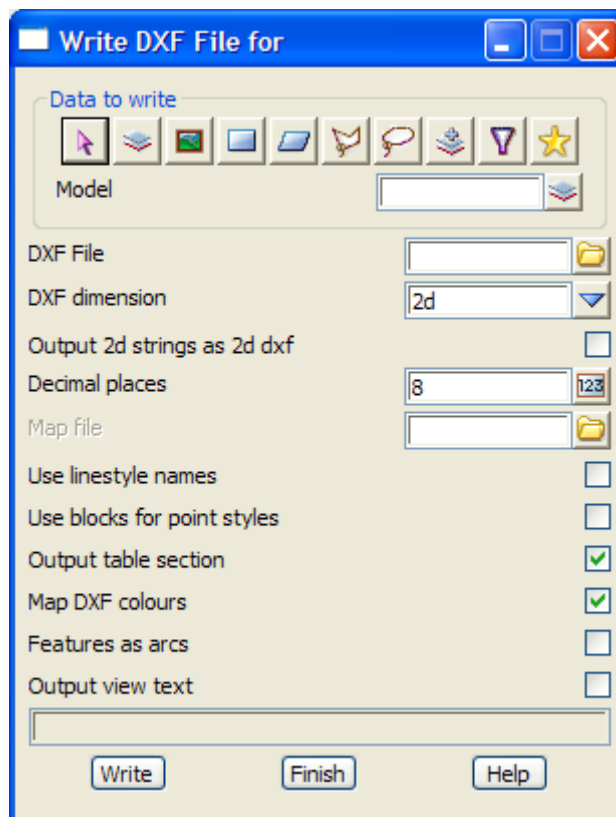

12d Model can write binary DXF files. See the Precision field below.

12d Model line strings are output as POLYLINES, point strings as a series of Autocad POINTs and triangles as 3DFACES.

By default, the string or triangle colour is used in the Autocad colour record. The DXF layer used is the items model name with any spaces in the model name replaced by a minus (-). However, a DXF output map file with matches on string name can be used to give DXF layers, colours and line type (see next section).

At this stage, 4d, interface and alignment strings are only output as Autocad POLYLINES.

On selecting the DXF output option, the **Write DXF file for** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
	<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>		
Data source	input		
	<i>source of data is to be written out to a file.</i>		
DXF File	input		*.dxf files
	<i>name of the file for the information to be written out to. If the file already exists, the data will be appended to the file.</i>		
DXF Dimension	input	3d	2d, 3d
	<i>if 3d, strings will be written out as three dimensional DXF polylines. Alignment strings and arcs will be approximated by short lines.</i>		
	<i>If 2d, the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as dxf polylines with bulges for the arcs.</i>		
Decimal places	input	8	
	<i>the number of decimal places to be used for co-ordinates etc. in the DXF file.</i>		
	<i>If this number is negative, a binary DXF file will be written. The actual number specified becomes irrelevant in this case, since full precision is preserved in a binary DXF file.</i>		
Map file	input		*.mf files
	<i>if non-blank, the name of a file to be used as a 12d Model to DXF output map file.</i>		
Use linestyle names	tick box		
	<i>if tick, a 12d Model string's linestyle name is used as the DXF element's line type ("1" goes to CONTINUOUS).</i>		
	<i>if not tick, all DXF line types are CONTINUOUS.</i>		
Use blocks for point styles	tick box		
	<i>if tick, for each 12d Model point string, an Autocad block of the same name as the 12d Model string's linestyle is placed at each point.</i>		
Output table section	tick box	tick	
	<i>if tick, an Autocad table section is placed at the beginning of the DXF file.</i>		
Map DXF colours	tick box	tick	
	<i>if tick, a mapping is made between the first seven default 12d Model colours and the corresponding DXF colours. The other 12d Model colours are mapped to the DXF colour of the same colour number.</i>		
	<i>If not tick, the nth 12d Model colour is mapped to the nth DXF colour.</i>		
Features as arcs	tick box		
	<i>if tick, feature strings output as arcs in DXF.</i>		
	<i>if not tick, the centre of the feature string is output as a point.</i>		
Output view text	tick box		
	<i>if tick, any view text turned on (point numbers, z-values etc.) are output as text in DXF.</i>		
	<i>if not tick, view text is not output.</i>		
Write	button		
	<i>write out, in DXF format, the data in the model/view given in the model/view field, to the file given in the file field.</i>		

DXF Output Map File

When using the output options to write out a DXF file, an output map file can be used, with **12d Model** string names as the entity-name to match the key, so that the user can specify Autocad layer, colour and style. BYLAYER can be used with colour and style.

The key can have wild cards (*) and wild characters (?) as for the input map files. The fields in the DXF output map file are (ACD = Autocad):

field 1	key - string name	can include wild cards * and wild characters ?
field 2	new name	not output to DXF
field 3	ACD layer	* for 12d Model name
field 4	ACD colour ACD,	number between 0 and 256, * for 12d Model colour mapped to BYLAYER for ACD BYLAYER
field 5	ACD line type	* for 12d Model linestyle, BYLAYER for ACD BYLAYER
field 6	ACD text style	not yet used, * for 12d Model text style

The DXF file produced needs to be loaded into an existing Autocad drawing which has the ACD layers and linestyles defined.

An example of an DXF output map file is.

//	1	2	3	4	5	6
//	key	name	layer	colour	linetype	textstyle
	cont*	CONT	CONTOURS	1	1	*
	EB*	TOP	ROAD	2	CONTINUOUS	*
	103	TOP	*	3	*	*
	fe*	TOP	FENCE	*	BYLAYER	*
	SURV*	TOP	SURVEY	BYLAYER	DASH	*

Genio V3.1 Output

write_genio_file_v31_for

Position of option on menu: File I/O =>Data output =>Old =>Genio V31

SUPERSEDED OPTION

Genio i/o is a separate chargeable module.

This is the genio output module from 12d Model V3.1. This module has been replaced by the new genio module but the genio v3.1 will be left in V4.0 in case there are any problems with the new module.

The genio v3.1 output option uses a non-default format to write out the strings in a model or on a view, to a genio file. A genio 001 option is used to specify the record format.

The first thirty two characters of the model name are converted to upper case and used as the Moss model name.

In Moss, string labels can have a maximum of four characters. Since 12d Model places no restrictions on string name length, the following rules are used to produce genio string labels.

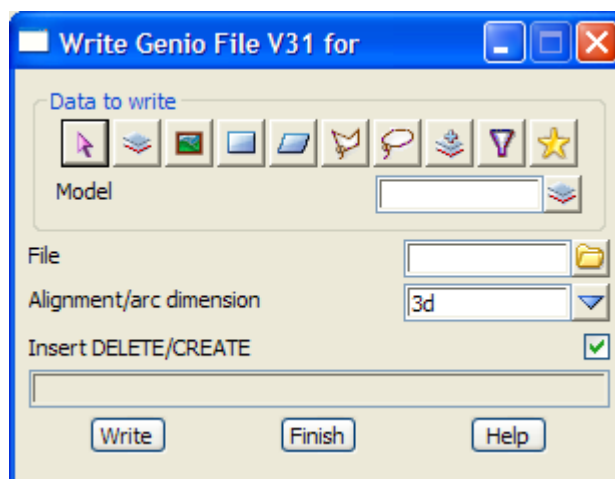

For a line-string, the first four characters of its string name are used as the genio string label. The four characters are mapped to upper case.

Similarly for point-strings whose names start with **P**. Otherwise the genio string label is **P** plus the first three letters of the point-string name. The three letters are mapped to upper case.

The name of a Moss text string must start with a * so 12d Model uses * and the first three characters of the text string's name.

An alignment string can be written out as either a moss 3d, 6d or 12 string.

On selecting the Genio V31 output option, the **Write Genio File V31 for** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be written out to a file.

File	input		*.mos files
-------------	-------	--	-------------

name of the file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.

Alignment dimension input 3d 3d,6d,12d

if 3d is selected, alignment strings are written out as a 3d string as a series of straight lines.

If 6d is selected, alignment strings are written out as Moss 6d strings.

If 12d is selected, alignment strings are written out as Moss geometry strings. This is the only way that full horizontal and vertical geometry can be transferred to Moss.

Insert DELETE/CREATE tick box tick

if tick, the genio commands DELETE and CREATE are written at the top of the file to correctly define the moss models for the data.

Write button

write out in genio format the data in the model/view given in the model/view field, to the file given in the file field. If the file already exist, the data will be appended to the file.

Eagle Output

write_eagle_command_file_for

Position of option on menu: File I/O =>Data output =>Old =>Eagle

Eagle is a 3D CAD package used throughout Australia, Asia and Europe.

Using the Eagle output option, **12d Model** produces an Eagle command file which is used by Eagle to create an Eagle model. Since Eagle supports 3D faces, the triangles created in **12d Model** can be transferred to Eagle for use in shaded models and walk-throughs.

Instead of colours, Eagle uses pens, dash styles, line thicknesses and frags. To allow the user to map **12d Model** colours to appropriate Eagle settings, an **Eagle map file** setting out the **12d Model** and Eagle relationships can be provided.

The eagle map file is a user created file consisting of a list of **12d Model** colours and the Eagle pen, dash style, pen thickness and frag to be used for the colour.

The map file is set out with one **12d Model** colour per line. The line begins with the **12d Model** colour followed by the Eagle pen number, dash style, thickness and frag to be used for the **12d Model** colour. Each item is separated by one or more spaces.

For example, if the **12d Model** colour **red** is to be mapped to Eagle pen 3, dash style 4, thickness 2 and frag 1, then the line in the eagle map file would be

```
red      3      4      2      1
```

If a map file is used, as each string is written out, the map file is searched sequentially until a colour match is made.

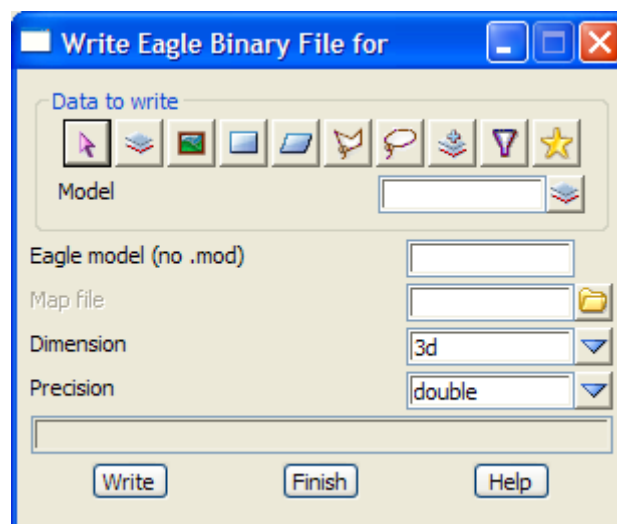

If no match is found, the colour of the string is used as a pen number and default values used for dash, thickness and frag.

Comments can be included in the map file by preceding the comment with a double forward slash (i.e. //). Anything on the line following the // will be ignored.

For example,

```
// 12d colour  pen      dash      thick      frag
red           3        4        2        1
green        4        1        1        2
```

On selecting the **Eagle** option, the **Write Eagle Command File for** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
Eagle Command File	input		*.cmd files
<i>name of the Eagle command file to write the model/view out to. If the file already exists, the data will be appended to the bottom of it. To be consistent with the Eagle file naming convention, the file name should end in .cmd</i>			
Eagle model	input		
<i>name of the Eagle model to be used for the data. Only the characters A-Z, a-z, 0-9 and - are allowed in an Eagle model name. Do not include a .mod in the name.</i>			
Map file	input		*.emf files
<i>if non-blank, the name of the map file to be used for all string colours. If blank, no map file is used.</i>			
Write	button		
<i>write out the data from the model/view given in the model/view field to the file given in the eagle command file field. The Eagle model has the name given in the Eagle model field. If the file already exists, the data is appended to the file.</i>			

Eagle Binary Output

write_eagle_binary_file_for

Position of option on menu: File I/O =>Data output =>Old =>Eagle Binary

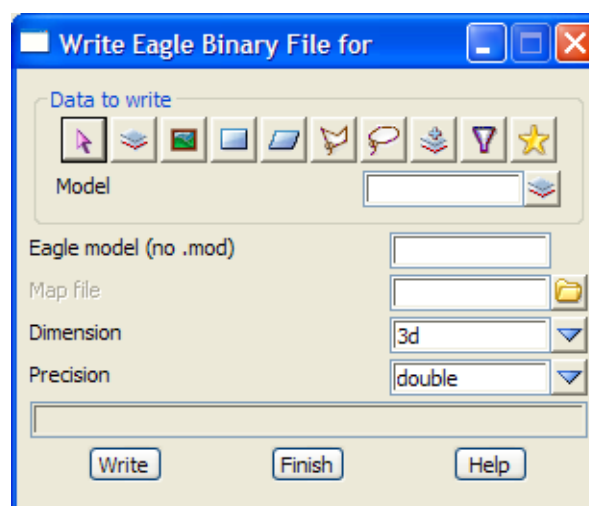

Eagle binary i/o is a separate chargeable module.

Using the Eagle binary output option, **12d** Model produces Eagle binary models. Since Eagle supports 3D faces, the triangles created in **12d** Model can be transferred to Eagle for use in shaded models and walk-throughs.

Since Eagle uses pens, dash styles, line thicknesses and frags rather than colours, an **eagle map file** is used to define the relationships between **12d** Model colours and Eagle pens, dash styles, thickness and frags. The map file is the same as described in the eagle output option.

The **12d** Model string name is written to the second attribute of the corresponding eagle item.

On selecting the Eagle binary option, the **Write Eagle Binary File for** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be written out to a file.

Eagle model	input		
--------------------	-------	--	--

stem of the name of the eagle model to write the model/view data out to. Because an eagle model has a maximum size, more than one model may be created. The eagle model names will have a sequence number appended to the name stem given in the eagle model field.

Map file	input		*.emf files
-----------------	-------	--	-------------

if non-blank, the name of the map file to be used for all string colours. If blank, no map file is used.

Dimension	input	3d	2d/3d
------------------	-------	----	-------

if 3d, strings will be written out as three dimensional eagle lines. The alignment strings and arcs will be approximated by short lines.

If 2d, the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as eagle plan arcs.

Precision	input	double	single/double
------------------	-------	--------	---------------

the precision of the eagle models.

Write button

write out the data from the model/view given in the Model/view field to the file given in the eagle model field.

10 Digitizer

digitizer

Position of menu: **File I/O =>Digitizer**

The Digitizer option is used with a digitizing table to create **12d** Model strings from existing maps or plans.

Contours (2d strings), feature strings (3d strings), spot heights (points strings), 4d strings, circles, arcs and text can all be digitized with this option.

The digitized data can be added to a new or existing **12d** Model project.

The digitizing process consists of a number of steps.

- ▲ providing a digitizer definition file
- ▲ selecting the type of digitizer to be used
- ▲ registering a new plan or map on the digitizer, or continuing with a previously registered plan (resuming).
- ▲ selecting a default digitizing tolerance, default model, colour and name for digitized strings.
- ▲ digitizing the information

These steps are described totally in the next five sections and are then summarized.

A summary of the step is given at the end of this chapter in the section “Summary” .

The digitizer can be set up using WinTab which is preferred method, or by using a definition in the 12d digitizer definitions file, digitize.4d. A quick description of the digitizer definition file is given in the section “Digitizer Definitions” . The format for the digitizers_definitions file is given in the section “Digitizer Definitions File” .

The Digitizer walk-right menu is laid out to reflect the standard sequence of digitizer operations.

define digitizers and plans
default tolerance, model, colour etc.
digitize strings
some digitizer button operations

For the option *Setups*, go to the section “Setups” .
Defaults “Defaults” .
Capture “Capture” .
Buttons “Buttons” .

Digitizer Definitions

Most digitizers now support the WinTab definition for communicating with Windows and that is the preferred method to be used with 12d Model.

If the digitizer supports WinTab then the WinTab drivers need to be installed before the digitizer can be used by 12d Model. The WinTab drivers are supplied with the digitizer, not by 12D

Solutions.

Once the WinTab drivers are installed, no further information is required by 12d Model and the rest of this section can be ignored.

Unfortunately if WinTab is not supported, each brand of digitizer has its own method of communicating with a computer and a software package.

To allow for a variety of digitizers not supported by WinTab, 12D Solutions has its own ascii format for defining the important features of a particular digitizer. The digitizer definitions file is also used to tailor digitizer button usage at a particular site.

For example, the **digitizer file** defines which buttons on the digitizer puck are used to:

digitize new (add) points	add button
end the digitizing of a string	end button
turn tolerance on/off	tolerance button
delete the last digitized point	delete point button

When 12d Model starts up, it checks to see if an environment variable called DIGITIZERS_4D exists and if it does, then the file it points to is used to provide the definitions for the digitizers.

If the environment variable is not set, then 12d Model searches for a file called **digitize.4d** in the standard 12d Model search sequence for set up files.

Only digitizers that have been defined in the digitizers definitions file can be selected for use from within 12d Model.

The format for the digitizers definitions file is given in the section “**Digitizer Definitions File**” .

Setups

digitizer_setups

Position of menu: **File I/O =>Digitizer =>Setups**

The setups menu contains options to select the digitizer to be used, register the co-ordinate system on a new plan or map sheet and for resuming the registration for a plan or map sheet already registered.

The setups walk-right menu is

define which digitizer is being used
register a new plan
resume an existing registration

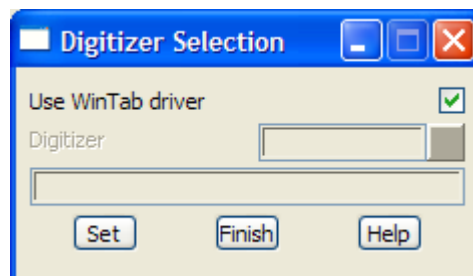

Each options will now be described in detail.

Digitizer Selection

digitizer_selection

Position of option on menu: **File I/O=>Digitizer=>Setups=>Digitizer selection**

On selecting the digitizer selection option, the **digitizer selection** panel is displayed.

This panel displays the current digitizer selected and allows a different one to be selected from those defined in the digitizers definitions file.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Use Wintab drive	tick box		
-------------------------	----------	--	--

if tick then user WinTab drivers.

If not ticked, then the Digitizer field is enabled and must have a digitizer selected.

Digitizer	input	current digitizer	available digitizers
------------------	-------	-------------------	----------------------

*the name of the current digitizer is displayed in this field. The current digitizer is changed by selecting a different name from the pop-up for the digitizer field and then selecting the **Set** button.*

This field is only used if 'Use WinTab' driver is not ticked.

Set	button		
------------	--------	--	--

if 'Use Wintab driver' is set to tick and the Wintab drivers exist, then the 'Wintab Monitor' panel is placed on the screen. The WinTab Monitor displays the digitizer co-ordinates and the digitizer button being used. The information describing the use of the digitizer buttons is written to the Output Window (see below). Do not close the Wintab Monitor panel or the digitizer will stop being read.

If 'Use Wintab driver' is set to tick and the Wintab drivers **don't** exist, an error message is displayed.

If 'Use Wintab driver' is not set to tick, then after selecting this button, the digitizer given in the digitizer field will be used as the current digitizer.

Typical Message to Output Window if WinTab Drivers are Installed

Interface: Wintab 32-bit Digitizer Services.

Number of devices: 1

Device 1: GTCO MM-compatible Tablet; Version 1.00.00.08; Format: MM; Firmware: MM III

Use Button 2 for End string

Use Button 3 for Delete point from string

Use Button 4 for Close string

Register Plan

digitizer_register_plan

Position of option on menu: **File I/O=>Digitizer=>Setups=>Register plan**

Before the information on a plan or map can be digitized, the relationship between the co-ordinate system of the plan and the digitizer must be determined.

In 12d Model, this relationship is given by specifying the plan co-ordinates and then the position on the digitizer of three or more points. These special points are known as control points.

The affine transformation for the control points is then calculated and if accepted by the user, is used to convert digitizer co-ordinates to plan co-ordinates.

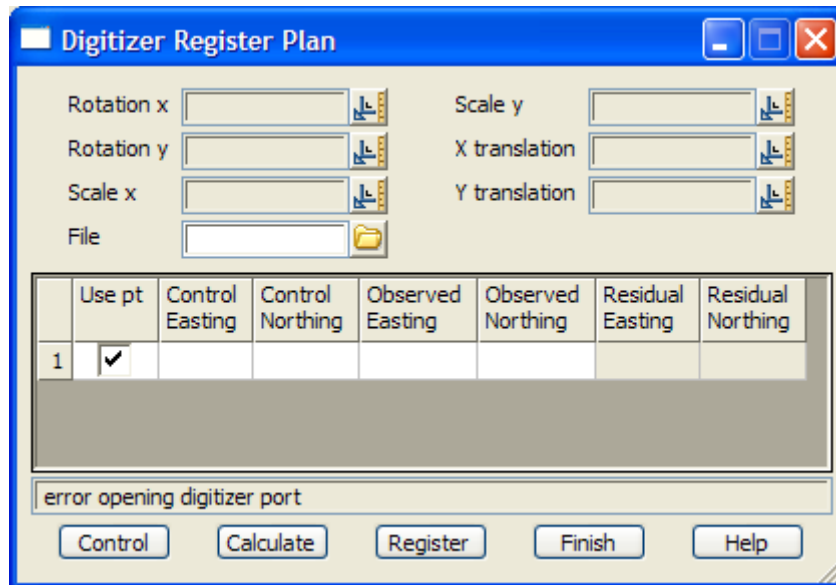

This process is called "registering a plan".

Once a plan has been registered, the information is saved to a file. This file can be used in the resume plan option to register the plan without having to re-enter the control points.

Warning

If the plan is moved on the digitizer, it must be re-registered since the current affine transformation will be invalid.

After selecting the register plan option, the **digitizer register plan** panel is displayed.

The main purpose of this panel is to display and register the affine transformation parameters. The fields and buttons used in the **digitizer register plan** panel will be discussed after the selection of the control points.

After selecting the register plan option, the **digitizer register plan** panel is placed on the screen and the option sits waiting for the user to enter the information for each control point.

This is achieved by

- ▲ selecting the control point with the mouse if it already exists in **12d Model**, or by typing in its plan co-ordinates (easting northing)

and then

- ▲ selecting the control point's position on the digitizer tablet using the digitizers **add point** button. Alternatively, if the control points already exist in **12d Model**, they can be selected rather than using typed input

This process is repeated for each control point and is terminated by selecting cancel from the pick ops pop-up menu instead of selecting a new control point.

The **calculate** button calculates the affine transformation for all the control points in the grid with the Use pt ticked on.

The affine parameters are

- ▲ the rotation of the x axis of the plan co-ordinates with respect to the digitizer x axis
- ▲ the rotation of the y axis of the plan co-ordinates with respect to the digitizer y axis
- ▲ the x and y scale factors for the plan co-ordinates with respect to the digitizer coordinates
- ▲ the x and y translations for the plan co-ordinates with respect to the digitizer coordinates

Once calculated, these values are displayed in the **digitizer register plan** panel.

If further control points are required, selecting the **control** button on the **digitizer register plan** panel will restart the control point picking mechanism. Each new control point will be added to the grid.

The new affine transformation can be calculated by selecting the **calculate** button on the **digitizer register plan** panel.

Finally, once the user is satisfied with the affine transformation, it can be **registered** and stored in an ascii file for future use by entering a filename into the file field of the **digitizer register plan** panel and then selecting the **register** button from that panel.

Summarising, the fields and buttons in the **digitizer register plan** panel have the following functions

Field Description	Type	Defaults	Pop-Up
Rotation x/y <i>the rotation of the x/y axis of the plan co-ordinates with respect to the digitizer x/y axis</i>	output		
Scale x/y <i>the x/y scale factor for the plan co-ordinates with respect to the digitizer coordinates</i>	output		
Translation x/y <i>the x/y translation for the plan co-ordinates with respect to the digitizer coordinates</i>	output		
File <i>the name of the file to record the affine parameters.</i>	input	*.aff	
Control <i>restarts the selection process for choosing more control points.</i>	button		
Calculate <i>calculates the affine parameters based on the control point selection.</i>	button		
Register <i>write the affine transformation to the file given in the file field and register the affine transformation as the current one to be used for the digitising session.</i>	button		
Finish <i>remove the panel from the screen.</i>	button		

Warning

The affine transformation must be registered using the **register** button before the **finish** button is selected or it will be lost.

Resume Plan

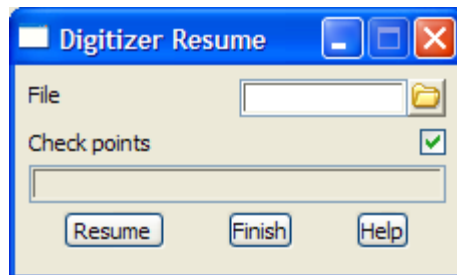

digitizer_resume

Position of option on menu: **File I/O=>Digitizer=>Setups=>Resume**

When digitising a large plan, it is often necessary to spread the digitising over more than one session in 12d Model.

If the plan has not been moved on the digitizer since it was registered, the affine transformation can be restored with the resume plan option rather than having to register the plan again.

On selecting the resume plan option, the **digitizer resume** panel is displayed.

To resume digitizing with an affine transformation recorded during an earlier registration

session, simply enter the name of the affine file into the file field on the **digitizer resume** panel and then select the **resume** button.

Warning

If the plan is moved on the digitizer, it must be re-registered since the current affine transformation will be invalid.

Defaults

digitizer_defaults

Position of menu: **File I/O=>Digitizer=>Deafults**

The defaults menu sets default model, colour etc. and tolerance which are used when digitizing.

The defaults walk-right menu is

default model, colour etc.
not yet used
minimum distance between points
set digitizer to stream mode

Each options will now be described.

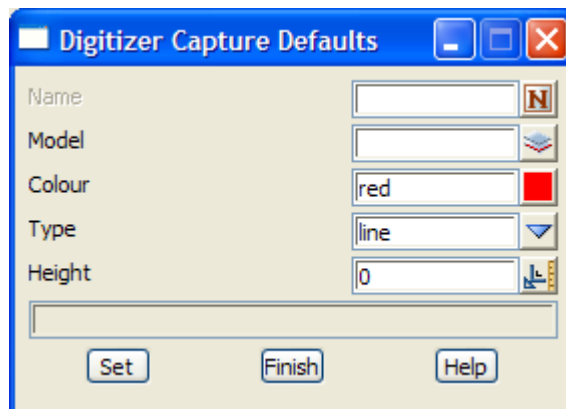

Capture Defaults

digitizer_capture_defaults

Position of option on menu: **File I/O=>Digitizer=>Deafults=>Capture defaults**

For any new string a name, model, colour, breakline type and default height are needed. When digitizing, the same values are often required for a large number of the strings. The **capture defaults** panel is used to set default values for digitized strings.

On selecting the capture defaults option, the **digitizer capture defaults** panel is displayed.

In the digitizing capture options, whenever a new string is selected, the values for name, model, colour, breakline type and height are taken from the **digitizer capture defaults** panel.

Bell

Not yet implemented

Tolerance

digitizer_tolerance_defaults

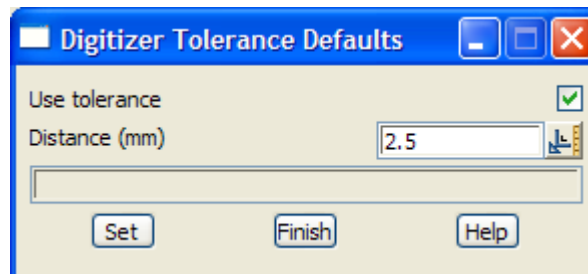

Position of option on menu: **File I/O=>Digitizer=>Deafults=>Bell**

When points are being digitized, a new point is often only required when it is a certain distance

from the previous point on the digitizer. This is especially important for stream digitizing when hundreds of points per second may be captured.

The tolerance option allows the user to specify the minimum plan distance (in millimetres) between successive digitized points in a string.

On selecting the tolerance option, the **digitizer tolerance defaults** panel is displayed.

The fields and buttons used in this panel have the following meanings.

Field Description	Type	Defaults	Pop-Up
Use tolerance	tick-cross	tick	
<i>if tick, a new point taken from the digitizer is only accepted if it is at least the distance given in the distance field away from the previous recorded point in the string.</i>			
Distance (mm)	input	2.5	
<i>the minimum separation distance, in millimetres, between successive digitized points in a string.</i>			
Set	button		
<i>set the use tolerance and distance values.</i>			

Stream

Position of option on menu: **File I/O=>Digitizer=>Deafults=>Stream**

Not yet documented.

Capture

digitizer_capture

Position of menu: **File I/O=>Digitizer=>Capture**

The capture menu is for digitizing strings into 12d Model.

The capture walk-right menu is

capture

The first time any of the option from this menu is selected, the **capture** panel is placed on the screen.

This panel is used to display the transformed co-ordinates for each digitized point that passes the tolerance test, and some special digitizer messages (for example, tolerance on/off).

To **change** the type of string being captured, simply select the new type from the **digitize capture** panel. This is normally only done at the end of capturing a string, not part way through.

To **terminate the digitizing session**, select **finish** on the **capture** panel.

Each of the methods for capturing data available in the digitizer capture menu will now be described.

For the option <i>2d</i> , go to the section	"2d"
<i>3d</i>	"3d"
<i>4d</i>	"4d"
<i>Arc</i>	"Arc"
<i>Circle</i>	"Circle"
<i>Text</i>	"Text"

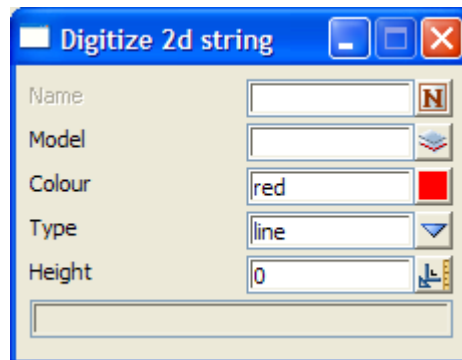

2d

digitize_2d_string

Position of option on menu: **File I/O=>Digitizer=>Capture=>2d**

This option is used to digitize 2d strings.

On selecting the 2d option, the **digitize 2d string** panel is displayed.

The fields and buttons in the **digitize 2d string** panel have the following meanings.

Field	Description	Type	Defaults	Pop-Up
Name		input	name of new string	name from capture defaults
Model	<i>model for the new string</i>	input	capture defaults model	available models
Colour	<i>colour of the new string</i>	input	capture def colour	available colours
Type	<i>breakline type of the new string.</i>	input	capture def type	point, line
Height	<i>height of the 2d string.</i>	input	capture def height	

If the **digitize 2d string** panel is created by the 2d option, the values in the name, model, colour, type and height fields are taken from the **digitizer capture defaults** panel.

Any of the values in the **digitize 2d string** can be modified before digitizing the 2d string begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new string.

The co-ordinates of the selected point are then displayed in the **capture** panel and the **digitize 2d string** panel removed from the screen.

Further points are digitized by either pressing the **add** button again or if stream mode is on, holding the **add** button down and moving along the string being digitized.

The 2d string is terminated when the **end** button is pressed on the digitizer puck.

After selecting the **end** button, the **digitize 2d string** panel is again placed on the screen with the filed values the same as the 2d string just digitized.

The digitizing process is repeated for the new 2d string.

3d

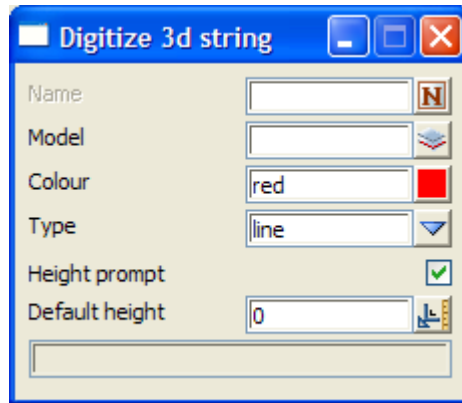

digitize_3d_string

Position of option on menu: **File I/O=>Digitizer=>Capture=>3d**

This option is used to digitize 3d strings.

Digitizing 3d strings is similar to 2d strings except that different z-values can exist at each of the digitized points.

On selecting the 3d option, the **digitize 3d string** panel is displayed.

The fields and buttons in the **digitize 3d string** panel are similar to the **digitize 2d string** panel except for the fields

Field Description	Type	Defaults	Pop-Up
Height prompt	tick-cross	tick	

if tick, after each point is digitized, an enter height box is placed on the screen. The height of the digitized point is typed into the box.

If not tick, the default height is used as the z-value for the digitized point.

Default height	input	capture default height	
-----------------------	-------	------------------------	--

height of the point if the height prompt is set to no.

If the **digitize 3d string** panel is created by the 3d option, the values in the name, model, colour, type and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing 2d strings, any of the values in the **digitize 3d string** can be modified before digitizing begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new string.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize 3d string** panel removed from the screen.

If the height prompt field is set to tick, an enter height box is placed on the screen with the previous typed height in it. The height for the digitized point in typed into the box, terminated by a <return>. The enter height box then disappears.

Further points are digitized by either pressing the **add** button again or if stream mode is on, holding the **add** button down and moving along the string being digitized.

Again, if the height prompt is set to yes, the enter height box will appear after each digitized point.

The 3d string is terminated when the **end** button is pressed on the digitizer puck.

After selecting the **end** button, the **digitize 3d string** panel is again placed on the screen with the

field values the same as the 3d string just digitized.

The digitizing process is repeated for the new 3d string.

Warning

If stream digitizing is used for the 3d string, the height prompt should be set to not tick.

4d

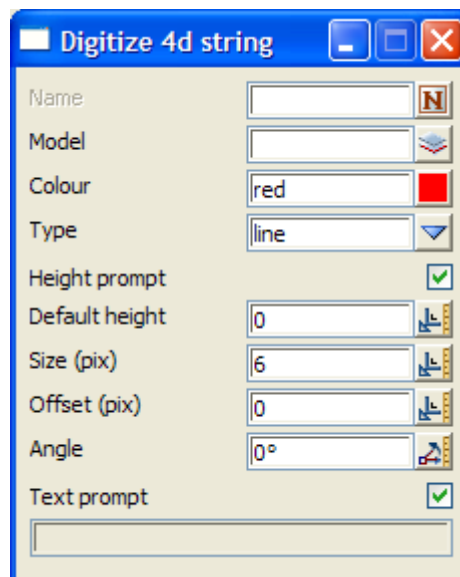

digitize_4d_string

Position of option on menu: **File I/O=>Digitizer=>Capture=>4d**

This option is used to digitize 4d strings.

Digitizing 4d strings is similar to 3d strings except that as well as a different z-value at each point, a text string also exits at each of the digitized points.

On selecting the 4d option, the **digitize 4d string** panel is displayed.

The fields and buttons in the **digitize 4d string** panel are similar to the **digitize 3d string** panel except for the fields

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Text prompt	input	yes	yes, no
--------------------	-------	-----	---------

if tick, after each point is digitized, an enter text box is placed on the screen. The text for the digitized point is typed into the box.

If not tick, no text is used at the digitized point.

Size (pix)	input	default text size
-------------------	-------	-------------------

height (in pixels) of the text at each point.

Angle	input	0
--------------	-------	---

angle of the text at each point.

Offset (pix)	input	0
---------------------	-------	---

offset (in pixels) of the text from the digitized point.

If the **digitize 4d string** panel is created by the 4d option, the values in the name, model, colour, type and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing 3d strings, any of the values in the **digitize 4d string** can be modified before digitizing begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new string.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize 4d string** panel removed from the screen.

If the height prompt field is set to tick, an enter height box is placed on the screen with the previous typed height in it. The height for the digitized point is typed into the box, terminated by a <return>. The enter height box then disappears.

If the text prompt field is set to tick, an enter text box is placed on the screen. The text for the digitized point is typed into the box, terminated by a <return>. The enter text box then disappears.

Further points are digitized by either pressing the **add** button again or if stream mode is on, holding the **add** button down and moving along the string being digitized.

Again, the enter height and enter text boxes will appear after each digitized point if the height prompt and text prompts are set to tick.

The 4d string is terminated when the **end** button is pressed on the digitizer puck.

After selecting the **end** button, the **digitize 4d string** panel is again placed on the screen with the values in the fields from the 4d string just digitized.

The digitizing process is repeated for the new 4d string.

Warning

If stream digitizing is used for the 4d string, the height prompt and text prompt should be set to not tick.

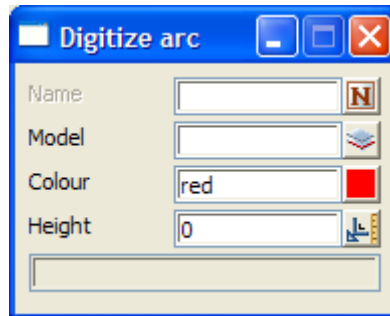

Arc

digitize_arc

Position of option on menu: **File I/O=>Digitizer=>Capture=>Arc**

This option is used to digitize arcs by digitizing three points on the arc - the arc start point, a point on the arc and the arc end point.

On selecting the arc option, the **digitize arc** panel is displayed.

The fields and buttons in the **digitize arc** panel are similar to the **digitize 3d string** panel except for the field

Field Description	Type	Defaults
Height	input	capture default height
<i>height given to the two end points of the arc.</i>		

If the **digitize arc** panel is created by the arc option, the values in the name, model, colour and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing 3d strings, any of the values in the **digitize arc** panel can be modified before digitizing an arc begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new arc.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize arc** panel removed from the screen.

Next a point on the arc between the arc end points is digitized followed by the arc end point.

After the end point is digitized, the arc is automatically created and the **digitize arc** panel again placed on the screen with the field values the same as the arc just digitized.

The digitizing process is repeated for the new arc.

Warning

Stream digitizing should not be used for arcs.

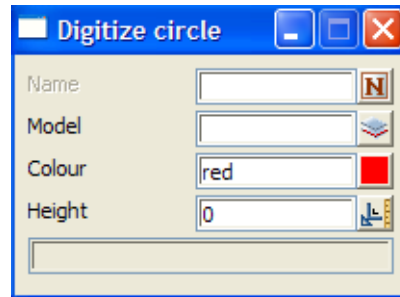

Circle

digitize_circle

Position of option on menu: **File I/O=>Digitizer=>Capture=>Circle**

The circle option is used to digitize circles by digitizing the centre point and one point on the circle.

On selecting the circle option, the **digitize circle** panel is displayed.

The fields and buttons in the **digitize circle** panel are the same as the **digitize arc** panel.

If the **digitize circle** panel is created by the circle option, the values in the name, model, colour and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing arcs, any of the values in the **digitize circle** panel can be modified before digitizing of the circle begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the circle point of the new circle.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize circle** panel removed from the screen.

Next a point on the circle is digitized. The circle is then fully defined and automatically created.

The **digitize circle** panel is again placed on the screen with the field values the same as the circle just digitized.

The digitizing process is repeated for the new circle.

Warning

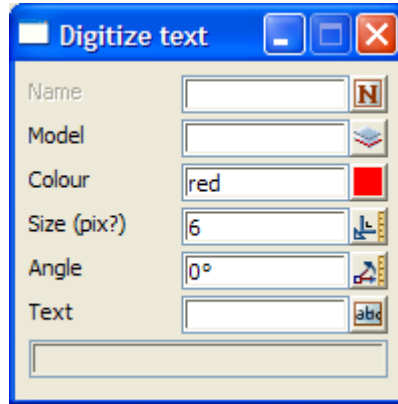

Stream digitizing should **not** be used for circles.

Text

digitize_text

Position of option on menu: **File I/O=>Digitizer=>Capture=>Text**

Not yet implemented

Buttons

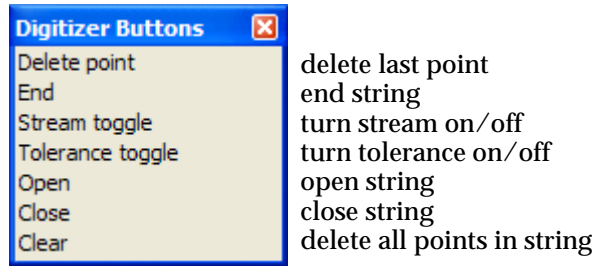

digitizer_buttons

Position of menu: **File I/O=>Digitizer=>Buttons**

The various options on the buttons menu can be used instead of pushing buttons on the digitizer puck.

The main use for this is when the digitizer puck has only a small number of buttons.

The buttons walk-right menu is

Summary

The steps for digitizing are

1. Point to digitizers definitions file

The file containing the definitions of the digitizers is created and either called **digitize.4d**, or the environment variable **DIGITIZERS_4D** is set to point to the file.

2. Select a digitizer

Use the menu item **File I/O =>Digitizer=> Setups=> Digitizer selection**

3. Register a new plan or resume an old plan

To register a new plan, use menu item **File I/O =>Digitizer=> Setups=> Register plan**

After selecting the option, the software is waiting for the user to give the co-ordinates and position of control points on the digitizer.

Control Point Loop

(a) type in easting northing of the control point

(b) pick point on the digitizer

The loop is terminated by getting up the pick ops menu with the mouse and picking **Cancel**

Then select **calculate** from the **digitizer control point table** panel and check the calculated affine parameters in the **digitizer register plan** panel.

Once happy with the affine parameters, save them away by typing a filename (ending in **.aff**) into the file field of the **digitizer register plan** panel and then select the **register** button.

Alternatively, to resume digitizing a previously registered plan that has not moved on the digitizing tablet, use menu item **File I/O =>Digitizer =>Setups=> Resume plan**

Type the affine file name into the file field of the **digitizer resume** panel and select **resume**.

4. Set the capture defaults

Menu items under **Digitizer =>Defaults**

5. Digitize a bounding polygon for the area to be digitized

Use the menu item **Digitizer =>Capture =>2d**

This step is not strictly necessary, however, the polygon can be used to easily fit the digitized data onto a view.

6. Digitize the data

Use the menu items under **Digitizer =>Capture**

Digitizer Definitions File

Unfortunately, each brand of Digitizer has its own method of communicating with a computer and a software package.

To allow for a variety of digitizers, 4D Solutions has its own ascii format for defining the important features of a particular digitizer.

When 12d Model starts up, it checks to see if an environment variable called DIGITIZERS_4D exists and if it does, then the file it points to is used to provide the definitions for the digitizers.

```
DIGITIZERS_4D      filename
```

If the environment variable is not set, then 12d Model searches for a file called **digitize.4d** in the standard 12d Model search sequence for set up files.

Only digitizers that have been defined in the digitizer definitions file can be selected for use from within 12d Model.

The digitizers definition file format is a simple ascii format and consists of one or more digitizer definitions. Each digitizer definition in the file begins with the key word **digitizer** followed by the digitizer name and then appropriate digitizer commands enclosed within curly braces { }.

Available Digitizer Commands

Commands to define communication with the digitizer:

```
port          text
baud          300 | 600 | 1200 | 2400 | 4800 | 9600 | 19200 | 38400
charbits      5 | 6 | 7 | 8
parity        none | even | odd
stopbits      1 | 2
```

Commands to define the size of the digitizing area:

```
xdimension    integer          // length of digitizer area in mm
ydimension    integer          // height of digitizer area in mm
resolution    real            // resolution in mm
```

Commands to define contents of the text string returned when digitizing:

```
stringlength  integer          // length of the text string returned
buttonstart   integer          // position in text for button id
buttonend     integer
xstart        integer          // position for x value
xend          integer
ystart        integer          // position for y value
yend          integer
```

Command to define sequences to send to digitizer:

```
startup       text            // digitizer start up sequence
finishup      text            // digitizer finish up sequence
pointmode     text            // text to put digitizer into point mode
streammode    text            // text to put into stream mode (track mode)
```

Commands to define the meaning of the button values returned from the digitizer:

These commands may occur more than once since some digitizers have more than one return

value for the same thing.

addpoint	text	// digitize a point
end	text	// end the string being digitized
delpoint	text	// delete the last point digitized
toggletol	text	// toggle tolerance
togglstream	text	// toggle stream mode
clearstr	text	// clear all points in the current string
openstr	text	// open the current string
closestr	text	// closes the current string

Notes

1. spaces in text - any text string that includes spaces or only numbers, must be enclosed in double quotes “.
2. comments - anything after // until the end of the line is ignored.
3. blank lines - blank lines are ignored

11 Edit

The Edit menu contains the Undo and Redo options.

Infinite **Undo** and **Redo** facilities have been implemented for many of the **12d** Model options.

However, because much of the power of **12d** Model comes from being able to leave options hanging and editing more than one string at a time, this made the standard concept of *Undo/Redo* of limited benefit to **12d** Model users.

Consequently, the following methodology has been adopted for **Undo** and **Redo** in **12d** Model:

Independent undo and redo lists are maintained for each string being edited and these list are cleared once the editor is left.

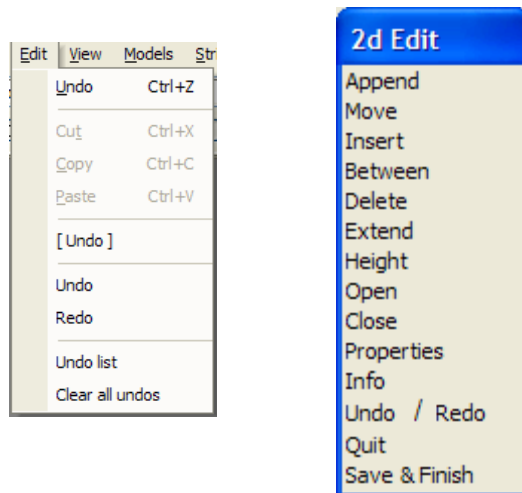

There is also a main undo/redo list which is used for all other options that can be undone. The main undo/redo lists are cleared when the **12d** Model session is exited.

Please continue to the next section “Undo and Redo for Editors” .

Undo and Redo for Editors

Each editor contains its own Undo/Redo option on its **nd Edit** menu and whilst a string is being edited, the editor maintains its own undo/redo lists.

For example, for a 2d string, the Undo/Redo option is just above the Quit option.

As each edit is made to the string, the state of the string before the edit is added to the top of the string's **undo** list and the **redo** list is emptied.

If **undo** is selected from the **nd edit** menu, the last edit operation for that string will be **undone** and the undone operation added to the top of the string's **redo** list.

If another **undo** is selected before another edit is made to the string, what is now was last operation on the string will be **undone** (is was the second last operation before the previous **undo**) and the undone operation added to the top of the string's **redo** list.

If **redo** is selected from the **nd edit** menu, then the top operation on the **redo** list is redone, and the state of the string before the redo is added to the top of the undo list.

Hence edits for the string can be **undone** and **redone** whilst in the edit session for the string.

When the edit session is completed by selecting either **quit** or **finish** from the **nd edit** menu, the undo and redo lists for the edit session are deleted and the operations for the edit session can no longer be undone or redone.

Note

If more than one string is being edited at the same time, each string editor maintains its own undo/redo lists so that the undo/redo operations for the different strings do not get intertwined.

Hence if **undo** or **redo** is selected from a particular string's **nd edit** menu, the **undo** or **redo** applies **only** to the operations performed on that particular string, no matter what other **nd edit** options were performed on other strings.

Please continue to the next section "Undo and Redo for other Options".

Undo and Redo for other Options

undo

As well as the undo/redo lists maintained by the string editors, there is another set of undo/redo list maintained for all other options that support undo and redo. These are called the **main undo** and **redo** lists.

For a description of the undo in 12d Model, please go to the section "Edit".

The **undo** option which controls the main undo/redo lists, is the one on the Edit menu from the main menu.

If **undo** is selected from the **undo** menu, the last undoable option performed (apart from editor operation on strings) will be **undone** and the undone operation added to the top of the main

redo list.

If another **undo** is selected before another undoable option is performed, what is now was last operation will be **undone** (is was the second last operation before the previous undo) and the undone operation added to the top of the main **redo** list.

If redo is selected from the **undo** menu, then the top operation on the main **redo** list is redone, and the state before the redo is added to the top of the undo list.

Hence many operations can be **undone** and **redone**.

When the **12d** Model session is completed by selecting either exit from the **12d** Model menu, the undo and redo lists for the session are deleted and the operations for the session can no longer be undone or redone.

For the option <i>Undo</i> , go to the section	“Undo” .
<i>Redo</i>	“Redo”
<i>Undo list</i>	“Undo List”
<i>Clear all undos</i>	“Clear all Undos”

For some restrictions on the Undo/Redos, please continue to the section “Some Restrictions on Undo and Redo” .

Undo

If **undo** is selected from the **undo** menu, the **undo** panel showing the last operation to *undo* is displayed.

For some restrictions on the Undo/Redos, please continue to the section “Some Restrictions on Undo and Redo” .

Redo

redo

If **redo** is selected from the **undo** menu, the **redo** panel showing the last operation to *redo* is displayed.

For some restrictions on the Undo/Redos, please continue to the section “Some Restrictions on Undo and Redo” .

Undo List

undo_list

If **undo list** is selected from the **undo** menu, a list of all the items on the undo list is displayed in the **undo list** panel.

Clear all Undos

`clear_all_undo_s_redo_s`

Selecting **clear all undo** from the **undo** menu will bring up a **clear all undo's/redo's yes-no** panel.

If **yes** is selected, the main undo and redo lists will be cleared.

Some Restrictions on Undo and Redo

Undo and Redo are available for most of the **Strings** options and most of the **Utilities** options.

Undo is available for all **File=>Input** options but there are no Redos for these Undos.

Undo is available for all **Utilities=>Global** options that use the **Output** option with the **Mode** set to one of the three copy modes. There are no Redos with these Undos.

There are no Undos for **Models=>Delete** and **Models=>Clean**.

12 Models

models

Position of menu: Model

In 12d Model, models contain all the terrain and design information in the form of strings and tins.

The models walk-right menu contains the options needed to create new models, rename models, report, clean models and delete models permanently from the computer disks.

The models walk-right menu is

on Main menu

floating Models menu

list of models and model info information on models
 in table form, gives min, max x,y,z for each model
 " " gives min, max x,y,z for each string in model
 create a model
 rename a model
 rename many models
 options to add, remove and save models
 sharing models
 clean all items in a model

delete models from disk

on 12d Model menu and floating menu

For the option *Models*, go to section

Model info

Model info table

String info table

Rename

Global rename

Utilities

Sharing

Clean

Delete

"Models"

"Model Info"

"Model Info Table"

"String Info Table"

"Create"

"Rename"

"Global Rename"

"Utilities"

"Sharing"

"Clean"

"Delete"

Models

model_list

Position of menu: Model =>Models

The Models walk-right menu provides options to list all the models in the project and list all the

models in the project area but not added to the project (removed models).

If a model is selected from the project model list, then it is automatically loaded into the **Model Information** panel.

The models walk-right menu is

list of models in project
list of non-project models

Project Models

project_models

Position of option on menu: Model =>Models =>Project models

The project models walk-right menu provides a list of all the models in the project and if a model name is selected from the list, a model information panel is fired up with the selected model name already in the model field.

Removed Models

removed_models

Position of option on menu: Model =>Models =>Removed Models

The removed models walk-right menu provides a list of all the models in the project area that are not in the project.

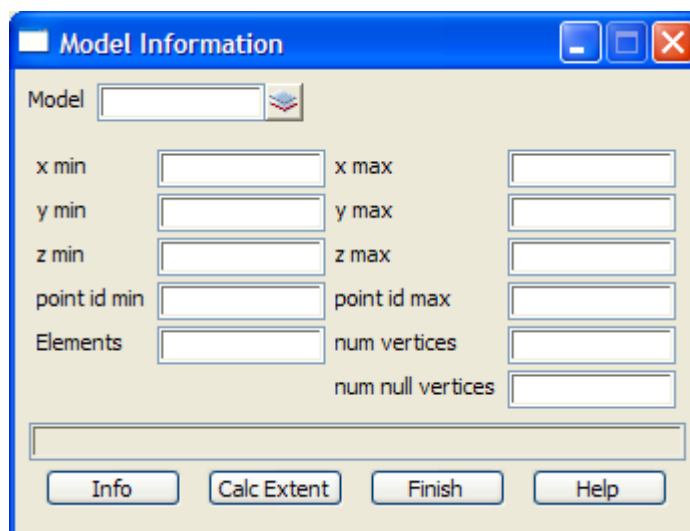

They would be mainly models that were in the project but have been removed from the project but not deleted from the disk.

Model Info

model_information

Position of option on menu: Model =>Model Info

Selecting model info fires up the **model information** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Model	input	available models
	<i>input the name of the model to get information about</i>	
xmin/ymin/zmin, xmax/ymax/zmax	output	
	<i>returns the model limits</i>	
point id min/max	output	
	<i>minimum/maximum integer point id in the model</i>	
Elements	output	
	<i>returns the number of elements in the model</i>	
num vertices	output	
	returns the number of vertices in the model	
num null vertices	output	
	returns the number of null vertices in the model	
Info	button	
	<i>get the information for the model given in the Model field.</i>	
Calc Extent	button	
	<i>recalculate the x, y, z bounding box for the model given in the Model field.</i>	

How to Use the Panel

The model information for the model given in the model field is retrieved and placed in the appropriate panel fields when the model name is entered into the model field from the pop-ups, or a <return> is entered after entering the model name into the model field, or on selecting the **Info** button.

Model Info Table

model_information_table

Position of option on menu: Model =>Model Info Table

The Model info table option displays the minimum and maximum x, y and z values for every model in the project in one scrolling table.

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the sort menu on the column header fields.

Selecting Model info table fires up the **Model Information Table** panel.

Model Name	Read only	Loaded	Min X	Min Y	Min Z	Max X	Max Y	Max Z	Creat
2d	unknown	yes	-null	-null	-null				Fri Apr
3d	unknown	yes	0	0	0	0	0	0	Fri Apr
4d	unknown	yes	-null	-null	-null				Fri Apr
Alignment	unknown	yes	-null	-null	-null				Fri Apr
Arc	unknown	yes	-1	0	0	1	1	0	Fri Apr
Circle	unknown	yes	-1	-1	0	1	1	0	Fri Apr
Drainage	unknown	yes	-null	-null	-null				Fri Apr
Face	unknown	yes	0	0	0	0	0	0	Fri Apr
Feature	unknown	yes	-1	-1	0	1	1	0	Fri Apr
Interface	unknown	yes	0	0	0	0	0	0	Fri Apr
Pipe	unknown	yes	0	0	0	0	0	0	Fri Apr
Pipeline	unknown	yes	-null	-null	-null				Fri Apr
Polyline	unknown	yes	-null	-null	-null				Fri Apr

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model <i>all the models in the project are listed in the model column.</i>	column header		sort menu
Minimum x, Minimum y, Minimum z Maximum x, Maximum y, Maximum z <i>the minimum/maximum values for the model are displayed in the columns</i>	column header		sort menu
Created/Updated <i>date the model was first created/updated</i>	date		
Update <i>recalculate the minimum/maximum information in the table.</i>	button		

Note

This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.

String Info Table

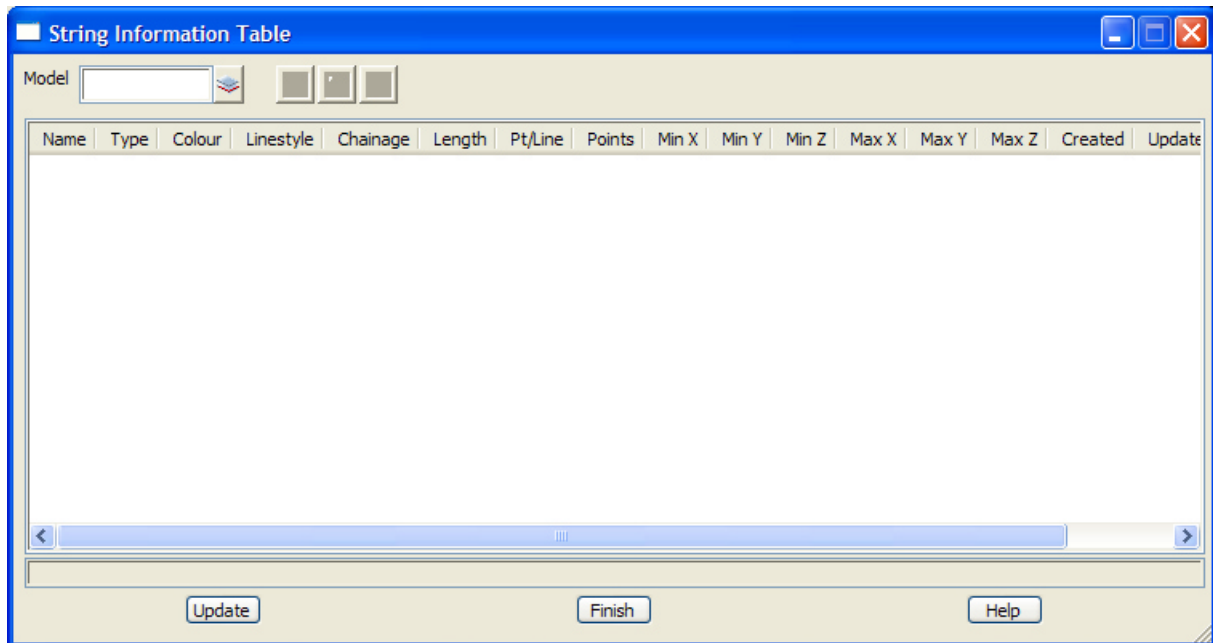

string_information_table

Position of option on menu: Model =>String info table

The string info table option displays the minimum and maximum x, y and z values for every string in a given model in one scrolling table.

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the sort menu on the column header fields.

Selecting string info table fires up the **string information table** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model <i>give the name of the model to calculate the minimum/maximum string information for the table.</i>	input		available models
Name <i>all the strings in the selected model are listed in the name column.</i>	column header		sort menu
Minimum x, Minimum y, Minimum z Maximum x, Maximum y, Maximum z <i>the minimum/maximum values for each string in the model are displayed in the columns</i>	column header		sort menu
Created/Updated <i>date the string was first created/updated</i>	date		
Update <i>recalculate the minimum/maximum information in the table.</i>	button		

Note

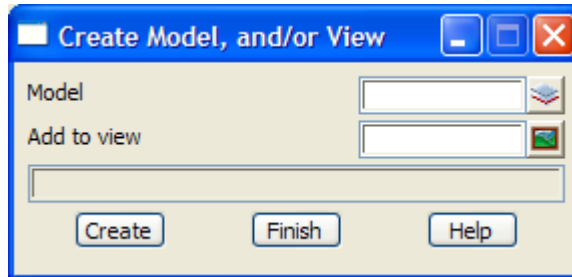

This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.

Create

create_model_and_or_view

Position of option on menu: Model =>Create

On selecting the create option, the **create model** panel is displayed. This panel can be used to create new models and add a model to a view.

The fields and buttons used in this panel have the following functions.

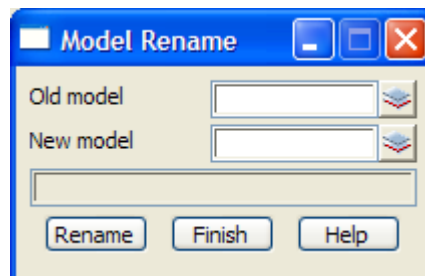

Field Description	Type	Defaults	Pop-Up
Model	input		
<i>name of the model to be created and/or added to a model and/or view.</i>			
Add to view	input		available views
<i>if non-blank, the name of the view to which the model given in the model-field will be added.</i>			
Create	button		
<i>If the model given in the Model field does not exist, it will be created.</i>			
<i>If the add to view field is non-blank, then the model given in the model field will be added to the view given in the add to view field.</i>			

Rename

model_rename

Position of option on menu: Model =>Rename

On selecting the rename option, the **model rename** panel is displayed. This panel can be used to change the names of existing models

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old model	input		available models
<i>name of the model to be renamed.</i>			

New model input

new name for the model

Rename button

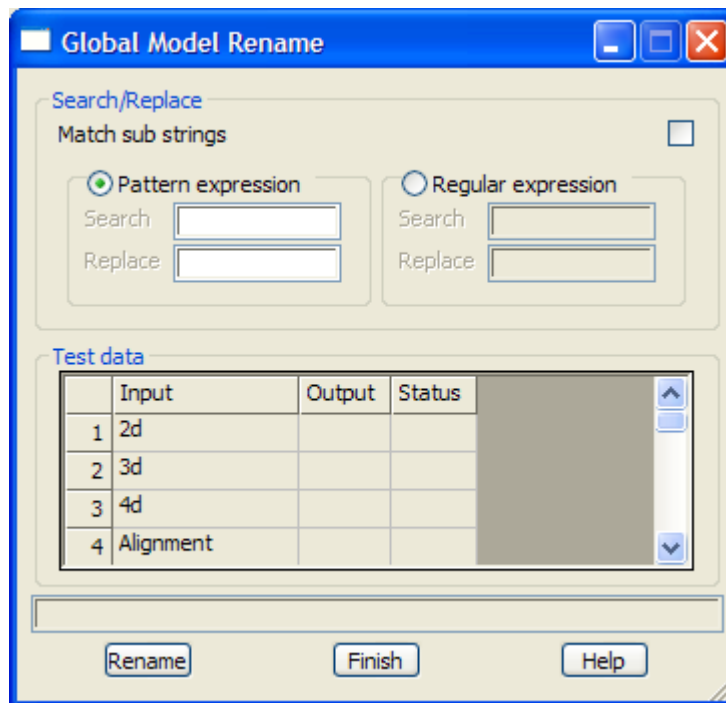

Change the name of the model in the old model field to the name given in the new model field.

Global Rename

global_model_rename

Position of option on menu: Model =>Global rename

On selecting the global rename option, the **Global Model Rename** panel is displayed. This panel is used to change the names of many existing models by matching according to a "pattern" expression or a "regular" expression.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Match sub strings	tick box		
--------------------------	----------	--	--

*if **tick**, the Search expression is used to match against part of each model name.
If **not tick**, the Search expression is used to match against the entire model name.*

Pattern expression	radio button		
---------------------------	--------------	--	--

*if set on, then **Pattern** expressions given in the Search and Replace fields are used to modify model names. Pattern expressions include the standard wild card * and wild character !.*

Search	input		
---------------	-------	--	--

pattern to search for in the model names. For example " tin" will select all models with a name ending with "tin "*

Replace	input		
----------------	-------	--	--

replacement for the search pattern found in the model name. For example, "tin " takes the matched part of the model name and adds " tin " to the front of it.

Hence the Search pattern " tin" and Replace pattern "tin *" finds all models with names ending in " tin" and renames them with the name starting with "tin " (and the " tin" at the end of the name is dropped off).*

Regular expression	radio button		
---------------------------	--------------	--	--

*if set on, then **Regular** expressions given in the Search and Replace fields are used to modify model names.*

Search input

regular expression to search for in the model names.

Replace input

replacement for the search expression found in the model name.

Test data grid

The Test data grid shows the effect of the Search and Replace on all the model names in the project.

*The **Input** column shows the existing model name.*

*The **Output** column shows the name after applying the Search and Replace.*

*The **Status** column displays if their has been a **match** or **no match**.*

Rename button

change the name of all the models in the project according to the selected Search and Replace fields.

Utilities

model_utilities

Position of menu: Model =>Utilities

The utilities menu contains miscellaneous options involving models.

The utilities walk-right menu is

create/edit attributes for models
 add removed and other project models to project
 copy model from another project
 remove models from project
 save models to disk
 add/removes, saves, cleans, deletes models

For the option <i>Attributes</i> , go to	"Attributes"
<i>Add</i>	"Add"
<i>Copy project model</i>	"Copy Project Model"
<i>Remove</i>	"Remove"
<i>Save</i>	"Save"
<i>Project model utilities</i>	"Save"

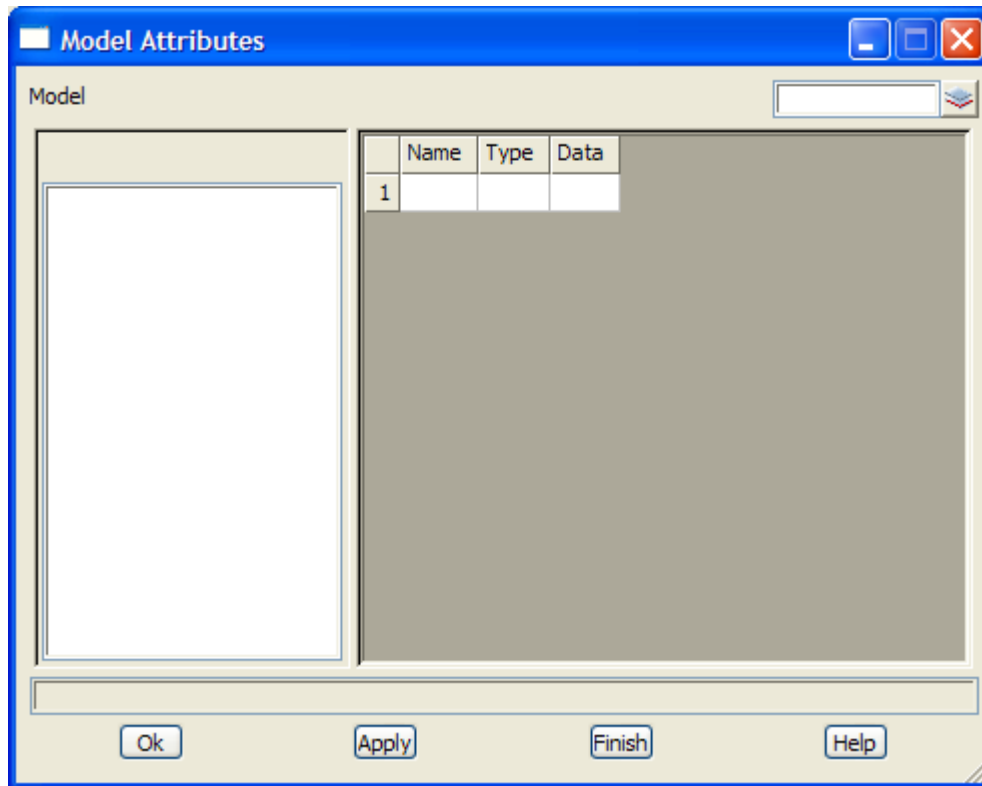

Attributes

model_attributes

Position of option on menu: Model =>Utilities =>Attributes

The Attributes options displays, creates and edits attributes for models.

On selecting Attributes, the **Model Attributes** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model <i>model to create/edit attributes of</i>	model box		all available models
Name <i>name of the attribute</i>			
Type <i>type of attribute - integer, real or text</i>			integer, real, text
Data <i>value for the attribute</i>			
OK <i>set the attributes to the values in the panel and then exit the panel.</i>		button	
Apply <i>set the attributes to the values in the panel but don't exit the panel.</i>		button	

Add

model_adds

Position of menu: Model =>Utilities =>Add

Models can be added to the project and to views.

The model adds walk-right menu is

Add To Project

add_model_to_the_project

Position of option on menu: Model =>Utilities =>Add =>Add to project

The add to project option is used to add a removed model back into the project.

On selecting the add to project option, the **add model to the project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Removed model	input		removed models
<i>name of the model not in the project that is to be added to the project.</i>			
Add	button		
<i>add the model given in the removed model field to the working project.</i>			

Add All To Project

add_all_models_to_project

Position of option on menu: Model =>Utilities =>Add => Add all to Project

The add all to project option is used to add all the removed models back into the project.

On selecting the add all to project option, the **add all models to project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Add	button		
<i>after selecting this button, all removed models in the working project will be added to the project.</i>			

Add to View

add_model_to_a_view

Position of option on menu: Model =>Utilities =>Add =>Add to view

On selecting the add to view option, the **add model to a view** panel is displayed.

The fields and buttons used in this panel have the following functions.

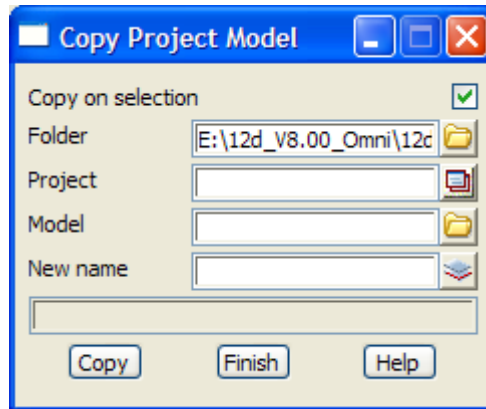

Field Description	Type	Defaults	Pop-Up
Model <i>name of the model to be added to a view.</i>	input		available models
Add to view <i>name of the view to which the model given in the model field will be added.</i>	input		available views
Add <i>add the model given in the model field to the view given by the add to view field.</i>	button		

Copy Project Model

copy_project_model

Position of option on menu: Model =>Utilities =>Copy Project Model

On selecting the copy project model option, the **copy project model** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	input		current directories
<i>name of the folder that the project to get the model from, is in.</i>			
Project	input		current projects
<i>name of the project in the folder given in the folder field, that the model is to be copied from.</i>			
Model	input		available models
<i>name of the model to be copied.</i>			
New name	input		
<i>if non-blank, the new name to be given to the copied model</i>			
Copy	button		
<i>copy to this project, the model given in the model field from the project given in the project field.</i>			

Remove

model_removes

Position of menu: Model =>Utilities =>Remove

Models can be removed from the project and from views.

The model removes walk-right menu is

The options in the menu will now be described.

Remove Model from Project

remove_model_from_project

Position of option on menu: Model =>Utilities =>Remove =>Remove from project

On selecting the remove from project option, the **remove model from project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

name of the model to be remove from the working project.

Remove button

after selecting this button, the model given in the model field will be removed from the working project.

Remove All Models From Project

remove_all_models_from_project

Position of option on menu: Model =>Utilities =>Remove =>Remove from all projects

On selecting the remove all option, the **remove all models from project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Remove	button		

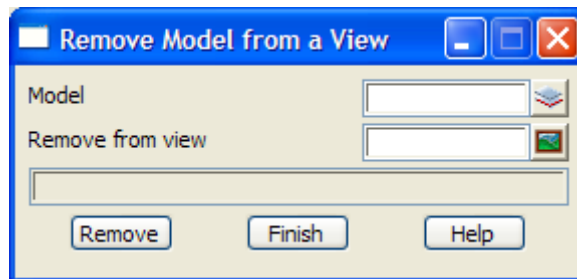

after selecting this button, all models in the working project will be removed. Next, all views will be refreshed. Finally, unless an error occurs, the panel will be removed.

Remove From View

[remove_model_from_a_view](#)

Position of option on menu: Model =>Utilities =>Remove =>Remove from view

On selecting the remove from view option, the **remove model from a view** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

name of the model to be removed from a view.

Remove from view	input		available views
-------------------------	-------	--	-----------------

name of the view from which the model given in the model field will be removed.

Remove	button		
---------------	--------	--	--

remove the model given in the model field from the view given in the remove from view field.

Save

model_saves

Position of menu: Model =>Utilities =>Save

Models can be saved on disk so that they can be used for future project work or in other projects.

The model saves walk-right menu is

The options in the menu will now be described.

Save a Model

save_model

Position of option on menu: Model =>Utilities =>Save =>Save a model

On selecting the save a model option, the **save model** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model <i>name of the model to be saved.</i>	input		available models
Save <i>after selecting this button, the model given in the model field will be saved to disk.</i>	button		

Save All Models

save_all_models

Position of option on menu: Model =>Utilities =>Save =>Save all models

On selecting the save all models option, the **save all models** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Save button

after selecting this button, all models in the working project that have been modified since they were last saved, will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

Sharing

shared_models

Position of menu: Model =>Sharing

Sharing allows models from a project (the server project) to be added to other projects (client projects).

Before any models can be added to a client project, they must first be tagged in the server project as allowed to be shared.

The Sharing walk-right menu is

allow models in this project to used by other projects
 add a shared model from another project
 remove a shared model from another project
 updated shared models from other projects

For the option *Share*, go to

Add

Remove

Synchronize

“Share Models”

“Add Shared Models”

“Remove Shared Models”

“Synchronize Shared Models”

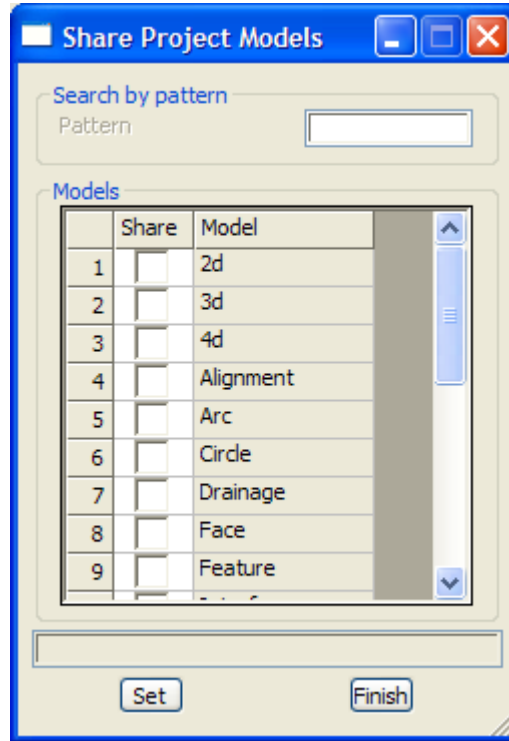

Share Models

share_project_models

Position of option on menu: Model =>Sharing =>Share

Before models in a server project can be added to client projects, the models must be made available for sharing in the server project by using the Share option.

Selecting Share displays the **Share Project Models** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

*All the models in the project are listed in the **Share Project Models** panel and if a model has been tagged for Sharing, a tick will be displayed in the **Share** column of the grid.*

Pattern

*if a pattern is typed then all the models matching the pattern will have a tick placed in the **Share** column. If * is typed then all models are ticked for sharing.*

Share	grid column
--------------	-------------

*tick if the model is to be made available for sharing when the **Set** button is pressed.*

*Clicking RB on **Share** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.*

Model	grid column
--------------	-------------

this column lists all the models in the project

Set	button
------------	--------

*clicking **Set** tags all the models with a tick in the **Tick** column as being available for sharing. Those models without a tick will not be available for sharing.*

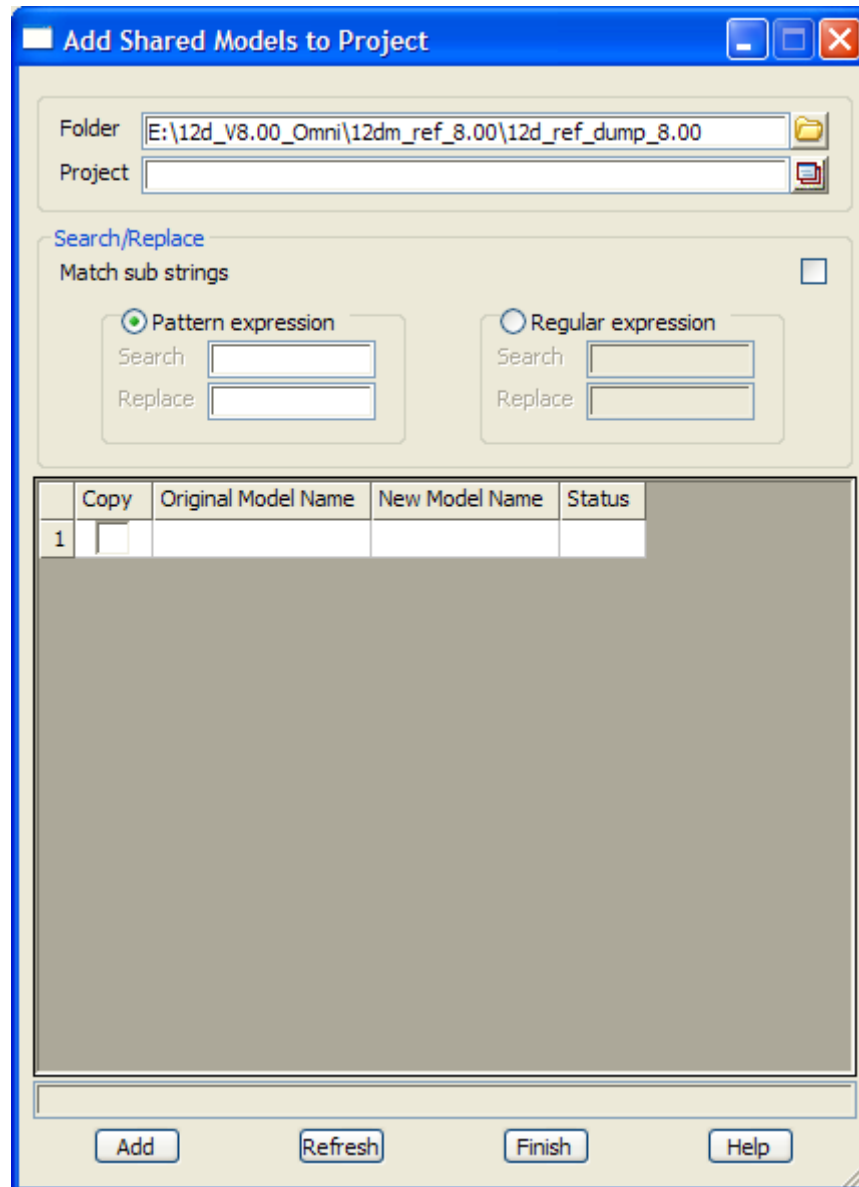

Add Shared Models

add_shared_models_to_project

Position of option on menu: Model =>Sharing =>Add

The Add option is used to add shared models (from a server project) to the project (a client project).

Selecting Add displays the **Add Shared Models to Project** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	folder box		select folder

*folder to look for 12d Model projects. When a folder is selected, all the 12d Model projects in the folder will be displayed in a **Projects** pop-up list.*

Project	folder box		select folder
----------------	------------	--	---------------

12d Model project to search for shared models

Search and Replace section:

Match sub strings	tick box
--------------------------	----------

*if **tick**, the Search expression is used to match against part of each model name.
If **not tick**, the Search expression is used to match against the entire model name.*

***Pattern expressions** or **Regular expressions** can be used to create New Model Names when a shared model is added to the project*

***Search** - type in the expression*

Replace - type in the expression to replace the **Search** expression.

Copy tick boxes in grid column

if tick, the model will be added to the project when the **Add** button is pressed.

Clicking RB on **Copy** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.

Note - a shared model that has been previously added can only be removed by using the Model =>Sharing =>Remove option.

Original Model Name grid column

this column lists all the models in the server project that are available for adding to this client project.

New Model Name grid column

if **non blank**, the name to use instead of the **Original Model Name** when the model is added to the project.

If **blank**, the **Original Model Name** is used for the model when it is added to the project.

Status output grid column

displays if there is a **match** or **no match** when a pattern or regular expression is used

Add button

clicking **Add** adds all the models with a tick to this project (a client project).

Refresh button

clicking **Refresh** refreshes the list of all models available for sharing in the selected 12d Model project

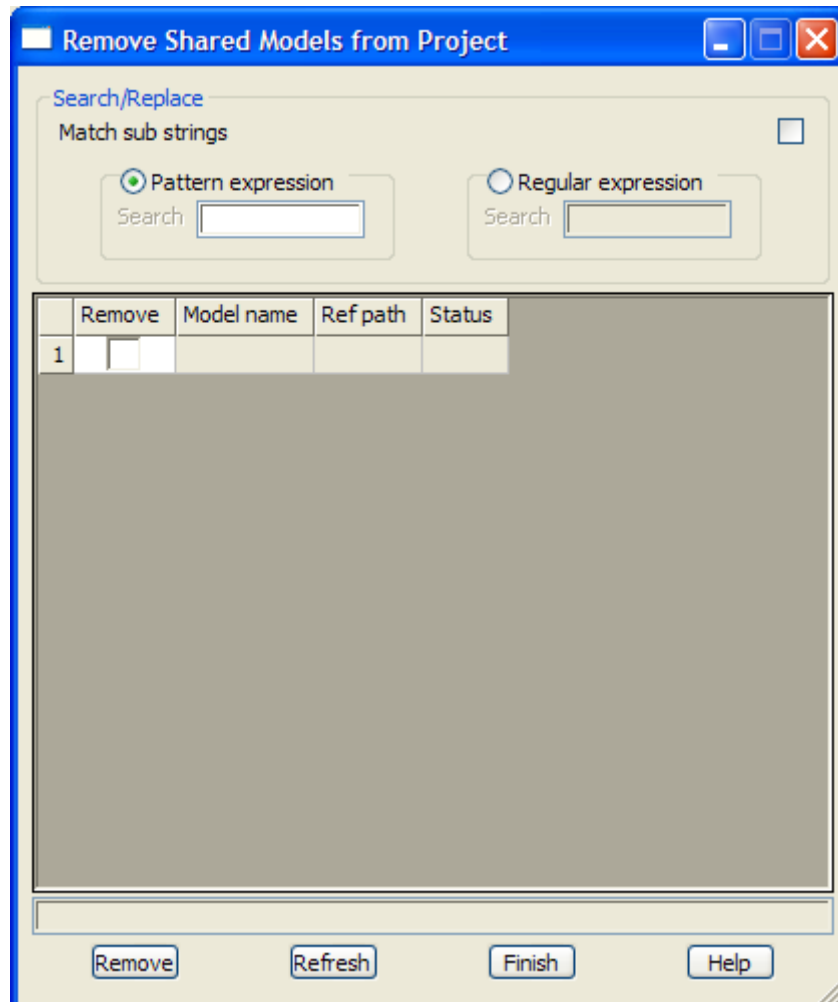

Remove Shared Models

remove_shared_models_from_project

Position of option on menu: Model =>Sharing =>Remove

The Remove option is used to remove shared models from the project. The shared models would have been previously added to the project with the Model =>Sharing =>Add option.

Selecting Remove displays the **Remove Shared Models from Project** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Search and Replace section:

Match sub strings tick box

*if **tick**, the Search expression is used to match against part of each model name.*

*If **not tick**, the Search expression is used to match against the entire model name.*

***Pattern expressions** or **Regular expressions** can be used to select and tick shared models.*

Remove tick boxes in grid column

*if tick, the model will be removed from the project when the **Remove** button is pressed.*

*Clicking RB on **Copy** at the top of the column brings up a menu to **Toggle** the ticks, **Set all***

the ticks on, **Clear** to turn all the ticks off.

Model Name grid column

this column lists all the models in this project that have been added from other (server) projects

Ref path

this column lists the full path name to the server project and the original model name in the server project

Remove button

*clicking **Remove** removes all the models with a tick from this project (a client project).*

Refresh button

*clicking **Refresh** refreshes the list of all shared models previously added to the project*

Synchronize Shared Models

`synchronize_shared_models`

Position of option on menu: Model =>Sharing =>Synchronize

The **Synchronize** option is used to updated any added shared models. The shared models would have been previously added to the project with the Model =>Sharing =>Add option.

Three environment variables control the synchronization of updates of added shared models and tins. For more information on synchronizing, go to the section “Share Settings” .

Selecting **Synchronize** displays the **Synchronize Shared Models** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Synchronize	tick boxes in grid column		
--------------------	---------------------------	--	--

*if tick and the model has changed in the server project, then it will be re-copied from the server project when the **Synchronize** button is pressed.*

*Clicking RB on **Copy** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.*

Model	grid column		
--------------	-------------	--	--

this column lists all the models in this project that have been added from other (server) projects

Synchronize	button		
--------------------	--------	--	--

*clicking **Synchronize** re-copies any models with a tick from the server projects*

Refresh	button		
----------------	--------	--	--

*clicking **Refresh** refreshes the list of all shared models previously added to the project*

Clean

clean_model

Position of option on menu: Model => Clean

The clean option is used to delete all the strings in a model but the model itself is not deleted. The model is still attached to any views it had been added to.

To help protect the user against disasters, when a model is selected for cleaning, a **yes-no** pop-up menu is invoked to confirm that the user did intend cleaning out the model.

Wild cards (*) and wild characters (!) can be used to select the models to clean and then a list of selected models is displayed for confirmation.

If cleaning is confirmed, all the strings in the selected models are deleted.

On selecting the clean model option, the **clean model** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

*name of the model to be cleaned out. Wild cards * and characters ? can be used to give a list of models to be cleaned.*

Clean	button
--------------	--------

*after selecting this button, all strings in the model given in the model field will be deleted. A **yes-no** pop-up is used to confirm that cleaning is required.*

Delete

model_deletes

Position of menu: Model => Delete

Using the delete option, models can be deleted from disk so that they no longer can be accessed or take up disk space.

To help protect the user against disasters, when a model is selected for deletion, a **yes-no** pop-up menu is used to confirm that deleting the model is intended. If deletion is confirmed, the selected model is deleted from the project and the disk.

The model delete walk-right menu is

For the option *Delete a model*, please continue to the section “Delete a Model” .

Delete empty models, please continue to the section “Delete Empty Models” .

Delete all models, please continue to the section “Delete All Models” .

Delete a Model

delete_model

Position of option on menu: Model =>Delete =>Delete a Model

The delete a model option can be used to delete a model in the working project.

Wild cards (*) and wild characters (!) can be used to select the models to delete and then a list of selected models is displayed for confirmation.

On selecting the delete a model option, the **delete model** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

*name of the model to be deleted. Wild cards * and characters ? can be used to give a list of models to be deleted.*

Delete	button
---------------	--------

*after selecting this button, the model given in the model field will be deleted from the computer disk. A **yes-no** pop-up is used to confirm that deletion is required.*

Delete Empty Models

del_empty_model_panel

Position of option on menu: Model =>Delete =>Delete Empty Models

The delete empty models option displays a list of all the empty models in the project and can delete selected empty models or all of them.

On selecting the delete empty models option, the **delete empty models** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
List of empty models	models		available models
<i>the pop-up brings up a list of all the empty models in the project. A model can be selected from the list and it will be deleted after selecting the delete button.</i>			
Delete	button		
<i>delete the model given in the list of empty models field.</i>			
Delete all	button		
<i>delete all the empty models in the project.</i>			

Delete All Models

delete_all_models

Position of option on menu: Model =>Delete =>Delete All Models

The delete all models option will delete all the models in the project. It does not delete models that are in the project area but not yet added to the project.

On selecting the delete all models option, the **delete all models** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Delete	button		
<i>after selecting this button, a yes-no pop-up is used to confirm that deletion is required. If it is, all models in the working project will be deleted from disk. All views will be refreshed and unless an error occurs, the panel will be removed.</i>			

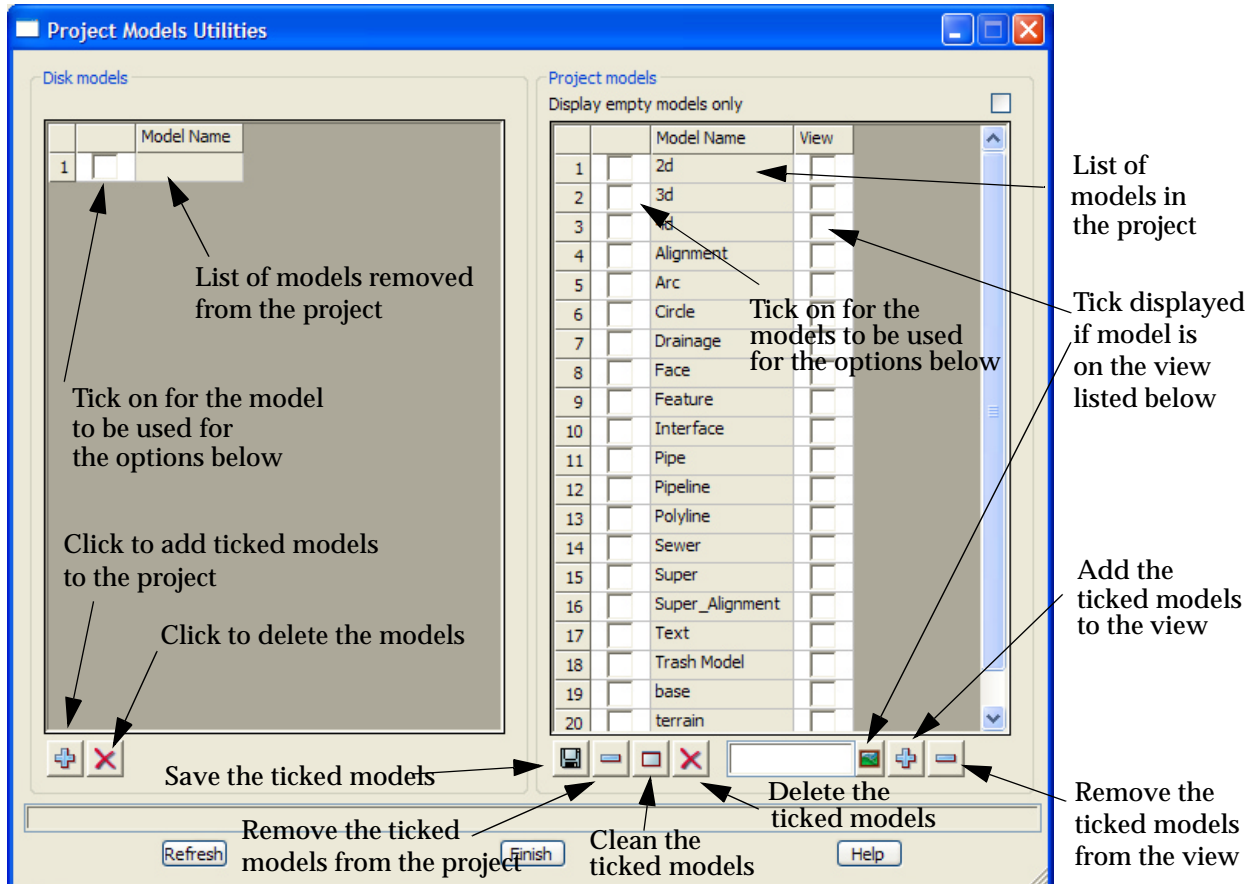

Project Model Utilities

project_models_utilities

Position of option on menu: Model =>Utilities =>Project model utilities

The Project Model Utilities panels can add/remove models from the project, clean and delete models, add/remove models from views.

On selecting Project model utilities, the **Project Model Utilities** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Disk Models section

options add removed models to the project and delete removed models

Project Models section

options to save/remove/clean/delete models, add/remove models from a view

Display empty models only tick box

if tick, only empty models are listed.

Refresh button

refresh the model properties displayed in the panel

13 Views

views

Position of menu: View

Views are the drawing display areas in 12d Model.

The views walk-right menu contains options to list existing views and create new views. The view drawing and manipulation options are in the View menus attached to each view.

The views walk-right menu is

on Main menu

create new views
turn Toolbars on/off
toggle Status Bar on/off
create floating Views menu (see right)

list of defined views
info about the data on the view
create plan, perspective, section views
write out a view in raster format
rename a view
delete a view
save/restore list of models on view
transfer models between views
helpful visualisation options
User defined Views menu

on 12d Model menu
and floating menu

For the option *New*, go to the section

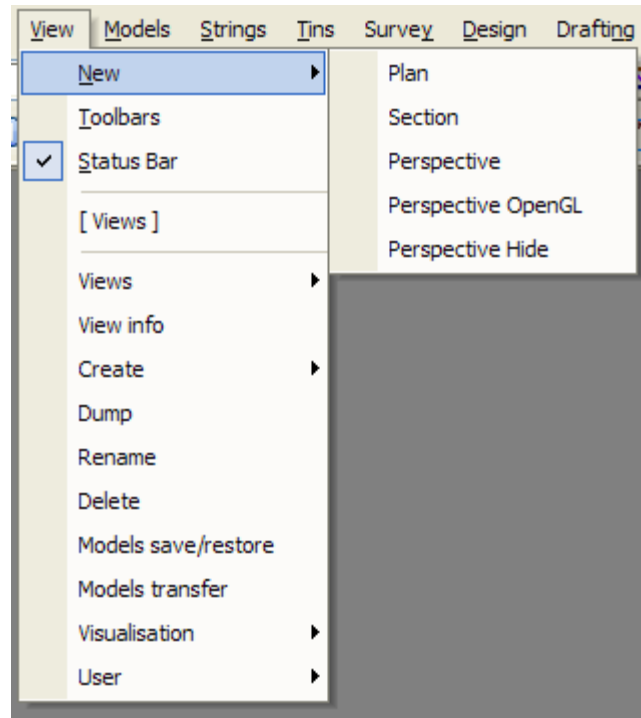

Toolbars
Status bar
Views
View info
Create
Dump
Rename
Delete
Models save/restore
Model transfer
Visualisation

"New"
"Toolbars"
"Status Bar"
"Views"
"View Info"
"Create"
"Dump"
"Rename"
"Delete"
"Models Save/Restore"
"Models Transfer"
"Visualisation"

New

Position of option on menu: View =>New

The New walk-right menu provides options to create views of type *Plan*, *Section*, *Perspective*, *Perspective OpenGL* and *Perspective Hide*.

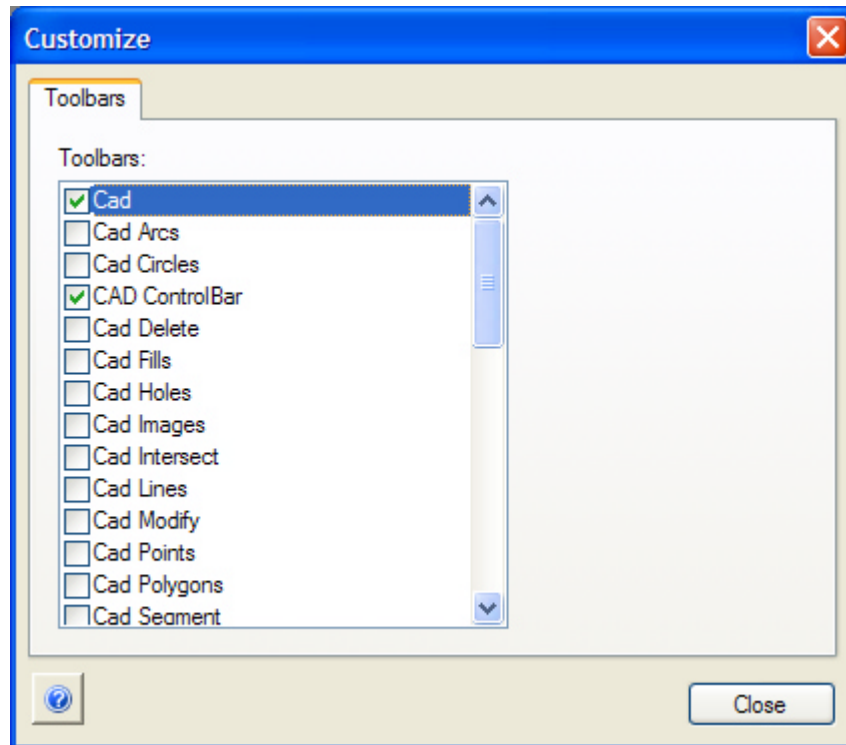

After selecting one of the options, a new view of the appropriate type with the next sequential view number is created in the Views Area.

Toolbars

Position of option on menu: View =>Toolbars

Clicking on Toolbars brings up the **Toolbars** panel

Clicking the tick on/off for a given toolbar or controlbar in the *Toolbars* list turns the toolbar or controlbar on/off.

Status Bar

Position of option on menu: View =>New

Toggles the *Status Bar* on/off.

Views

view_list

Position of option on menu: View =>Views

The Views walk-right menu provides a list of all the views defined in this session of **12d** Model.

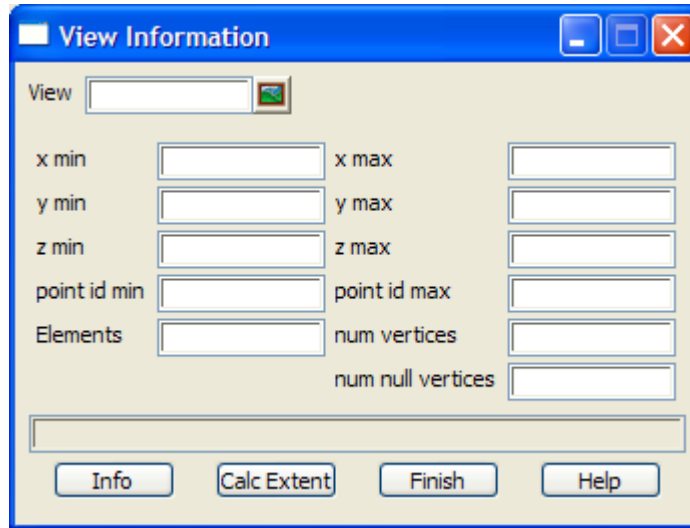

For each view in the list, a further walk-right menu lists all the models added to that view.

View Info

view_information

Position of option on menu: View =>View Info

Selecting view info fires up the **view information** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input		available views

input the name of the view to get information about

xmin/ymin/zmin, xmax/ymax/zmax	output		
---------------------------------------	--------	--	--

returns the limits of all the models on the view

point id min/max	output		
-------------------------	--------	--	--

minimum/maximum integer point id in the model

Elements	output		
-----------------	--------	--	--

returns the number of elements in all the models on the view

num vertices	output		
---------------------	--------	--	--

returns the number of points in all the models on the view

num null vertices	output		
--------------------------	--------	--	--

returns the number of null vertices in all the models on the view

Info	button		
-------------	--------	--	--

get the information for the view given in the view field.

Calc Extent	button		
--------------------	--------	--	--

recalculate the x, y, z bounding box for the models on the view given in the view field.

How to Use the Panel

The view information for the view given in the view field is retrieved and placed in the appropriate panel fields when the view name is entered into the view field from the pop-ups, or a <enter> is entered after entering the view name into the view field, or on selecting the **info** button.

Create

view_create

Position of menu: View =>Create

The floating Create menu item operates in two ways.

First, if Create itself is activated (by clicking LB when Create is highlighted), the **New View** panel appears. The **New View** panel can be used to create plan, perspective and sections views.

Secondly, the Create walk-right brings up a the View Create menu. This walk-right menu has separate options for creating plan, perspective and section views.

The Main menu option **View => Create** will only work the second way

The Create walk-right menu is

create a plan view
create a perspective view
create a perspective OpenGL view
create a section view

The **New View** panel obtained by clicking LB on the Create menu item and the three options on the View Create menu will now be described.

For the option *New view*, go to the section

Plan view

Perspective view

Perspective OpenGL view

Section view

“New View” .

“Plan, Perspective and Section Views”

“Plan, Perspective and Section Views”

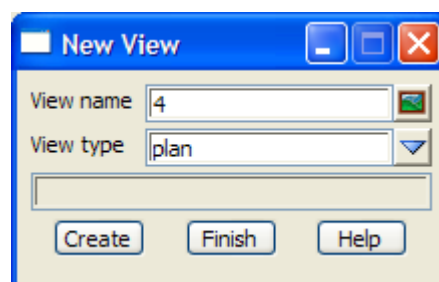

“Plan, Perspective and Section Views”

“Plan, Perspective and Section Views”

New View

new_view

On selecting the Create option, the **New View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

View name	view box	next view number	
------------------	----------	------------------	--

name of the new view to be created.

View type	choice box	plan	plan, persp, section, persp OpenGL
------------------	------------	------	------------------------------------

type of the view to be created. There are three types of views - plan, perspective, perspective OpenGL and sections views.

Create button

after selecting this button, a new view of the name and type given in the panel is created in the Views Area. The panel then disappears.

Plan, Perspective and Section Views

`new_plan_view`

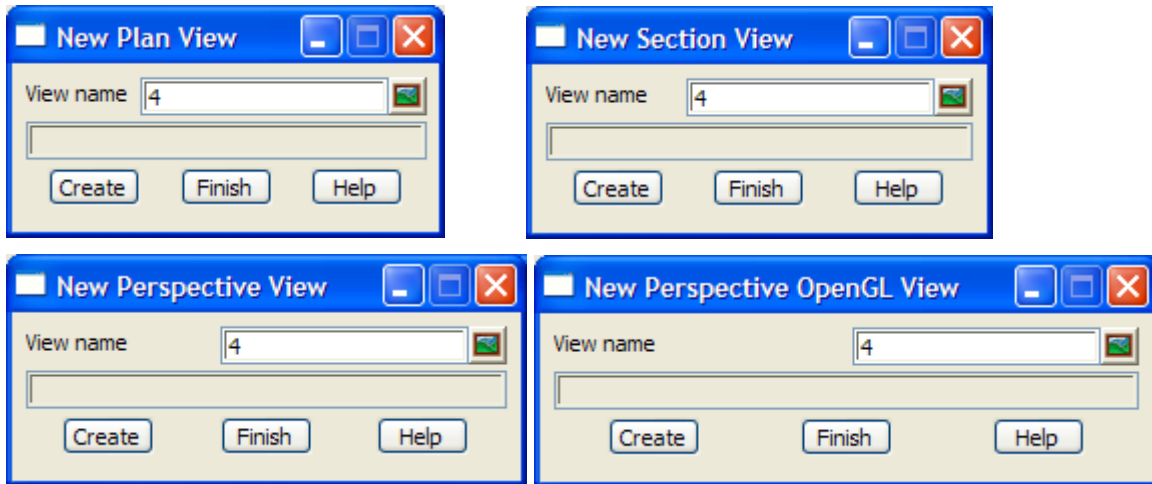

`new_section_view`

`new_perspective_opengl_view` `new_perspective_view`

Position of option on menu:

View =>Create =>Plan/Perspective/Perspective OpenGL/Section view

On the Plan/ Perspective/Perspective OpenGL/Section view option, the **New Plan/Perspective/Perspective OpenGL/ Section view** panel is displayed.

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
View name	input	next view number	

name of the new plan/perspective/section view to be created.

Create button

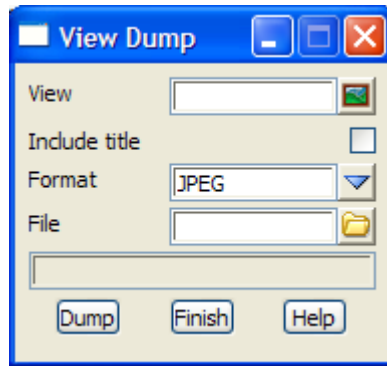

after selecting this button, the new view of the specified name is created in the Views Area. The panel then disappears.

Dump

`view_dump`

Position of option on menu: View =>Dump

This option is used to write the view out in a user selected raster format. The option is identical to the Dump option on the View System menu.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to be dumped</i>	view box		available views
Include title <i>if tick, include the view title area in the dump</i>	tick box		
Format <i>format of the dump of the view</i>	choice box	jpeg	bmp, gif, jpeg, jpeg 2000, png, tga
File <i>name of the file for the dump of the view</i>	file box		
Dump <i>dump the view in the given format</i>	button		

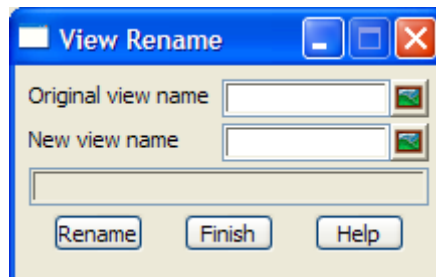

Rename

view_rename

Position of option on menu: View =>Rename

This option renames an existing view.

Selecting Rename brings up the **View Rename** panel:

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up

Original view name <i>current name of the view</i>	view box	available views
New view name <i>new name for the view</i>	view box	available views
Rename <i>rename the view</i>	button	

Delete

delete_view

Position of option on menu: View =>Delete

This option deletes an existing view.

Since the easiest method to delete a view is to use the **[X]** in the top right hand corner of the view, the *Delete View* option is mainly used in rare cases such as when the view is not responding due a graphics card problem.

Selecting Delete brings up the **Delete View** panel:

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
View name <i>name of the view to delete</i>	view box		available views
Delete <i>delete the view</i>	button		

Models Save/Restore

view_res_panel

Position of option on menu: View =>Models save/restore

This option is used to write out a list of models on the view and also to read in a list of models and add them to a given view.

On selecting the Models save/restore option, the **view save/restore models** panel is displayed.

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Save tab	tab		
View to save <i>view to write out list of model for.</i>	view		available views
File name for save <i>file for model list.</i>	file		*.vml files
Save <i>after selecting this button, the names of all the model on the view are written out to the file.</i>	button		
Restore tab	tab		
File name to restore <i>file of model list.</i>	file		*.vml files
View to add <i>view to add the models in the model list to.</i>	view		available views
Read <i>read the list of models.</i>	button		
Restore <i>add the models in the list just read in to the given view.</i>	button		

Models Transfer

view_model_transfer_panel

Position of option on menu: View =>Models transfer

This option is used to add all the models on one view to a different view.

On selecting the models transfer option, the **models transfer** panel is displayed.

The user is then asked to click in the view to get the models from (source view) and then to select the destination view where the models are to be added to.

Note - if the destination view is a new view, click on Fit first to give the new view a valid coordinate system.

Visualisation

visualisation

Position of menu: View =>Visualisation

This is a chargeable module which uses the Perspective OpenGL view to create realistic 3d pictures using raster drapes, bitmaps and extrusions along super strings.

The Visualisation walk-right menu is

For the option *Tin render settings*, go to the section “Render Settings” in the chapter “Triangles”

<i>Render drape</i>	“Render Drape”
<i>Texture map edit</i>	“Texture Map Edit”
<i>Billboards</i>	“Billboards”
<i>Extrusions</i>	“Extrusions”
<i>Utilities</i>	“Utilities”

Tin Render Settings

Position of option on menu: View =>Visualisation => Tin render settings

This option sets texture mappings for triangles in a tin. It has already been documented as

Tins =>Edit =>Render settings

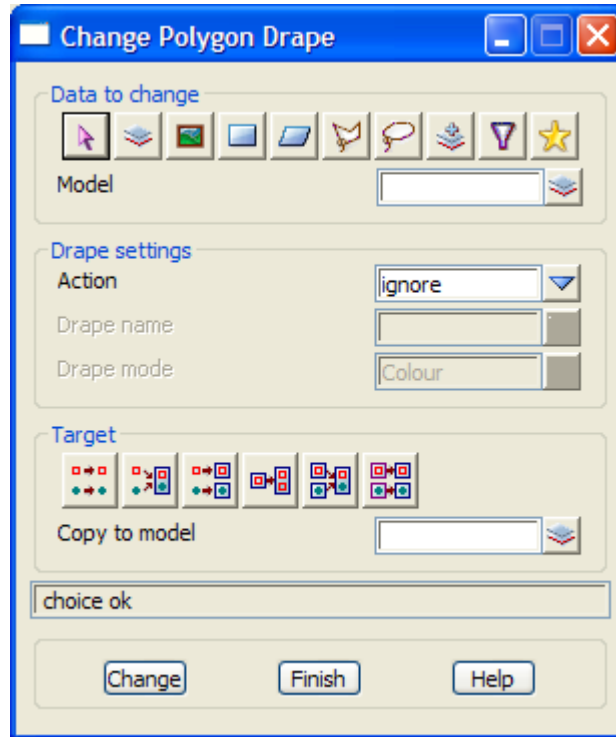

in the section “Render Settings” of the chapter “Triangles” .

Render Drape

change_polygon_drape

Position of option on menu: View =>Visualisation => Render drape

Selecting Render drape brings up the **Change Polygon Drape** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Action	choice box	ignore	set, clear, ignore
<i>if set, .</i>			
<i>If clear, .</i>			
<i>If ignore, .</i>			
Drape name			
Drape mode	choice box		colour, colour to texture
Target type			
<i>data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"</i>			
Target info	input		
<i>extra information required for the target.</i>			
Change	button		
<i>process the selected strings.</i>			

Texture Map Edit

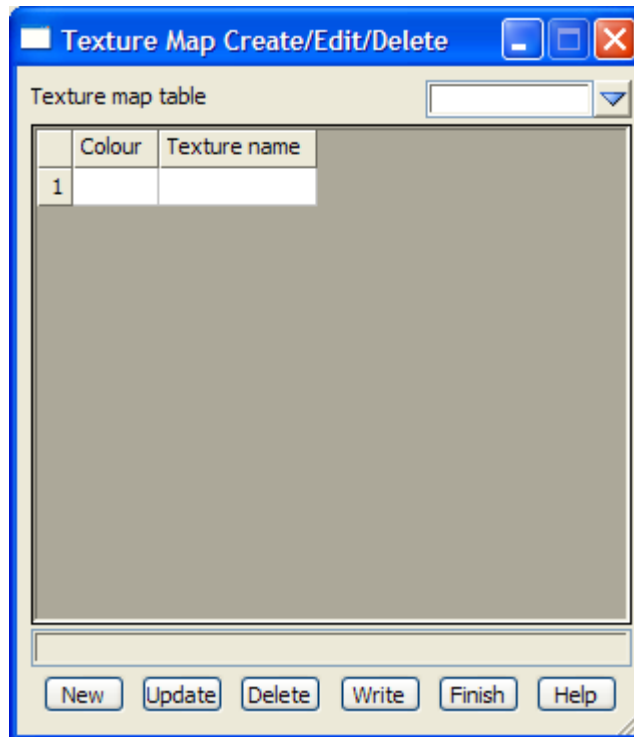

texture_map_create_edit_delete

Position of option on menu: Visualisation =>Texture map edit

This option edits the texture mapping file which contains the *texture map tables* that can be applied to the coloured triangles of a tin in renderings.

Each texture map table must have a unique name.

On selecting the Text map edit option, the **Texture Map Create/Edit/Delete** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Texture map table <i>name of the texture map table inside the texture map file.</i>			
Colour <i>colour to apply the texture to.</i>	colour box		available colours
Texture name <i>texture to apply to all triangles with the specified colour</i>	texture box		available textures
New <i>to create a new texture map table, click on the New button and then type the texture map table name into the Texture map table field. Then start filling in the Colour and Texture name columns.</i>	button		
Update <i>update the given Texture map table with the values in the Colour and Texture name columns.</i>	button		
Delete <i>Delete the texture map table named in the Texture map table field.</i>	button		
Write <i>write out the texture map information to the texture map file.</i>	button		

Billboards

billboards

Position of menu: View =>Visualisation =>Billboards

The billboard options plane an image onto a rectangular billboard. this can be used to display background scenes, signs etc.

The Billboard walk-right menu is

create a billboard and add an image to it
 add/remove a billboard to the vertices of a super string
 create a forest within a polygon
 place a billboard tree/shrub

- | | |
|----------------------|--|
| <i>Create</i> | “Create Billboards” . |
| <i>Add/Remove</i> | “Add and Remove Billboard from Super String” . |
| <i>Create forest</i> | “Create Forest” . |
| <i>Trees/shrubs</i> | “Trees/Shrubs as Faces and Billboards” |

Create Billboards

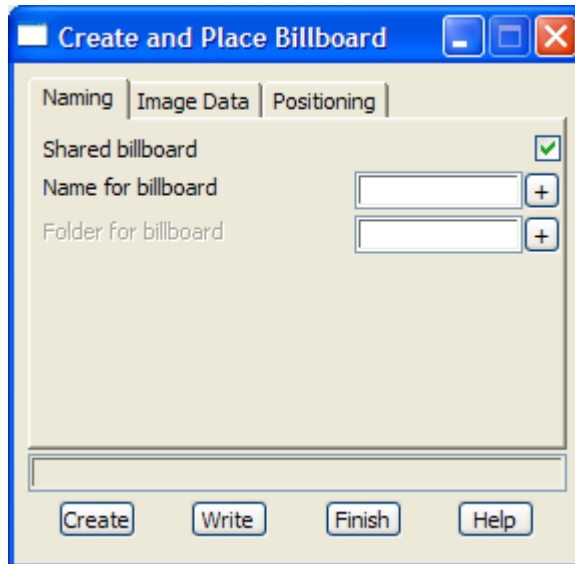

create_and_place_billboard

Position of option on menu: View =>Visualisation => Billboards =>Create and add

This option is under development.

This option creates billboards and adds images to them.

On selecting the Create and add option, the **Create and Place Billboards** panel is displayed.

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Naming tab	tab		
Image Data tab	tab		

Positioning tab

tab

Add and Remove Billboard from Super String

change_super_string_billboards

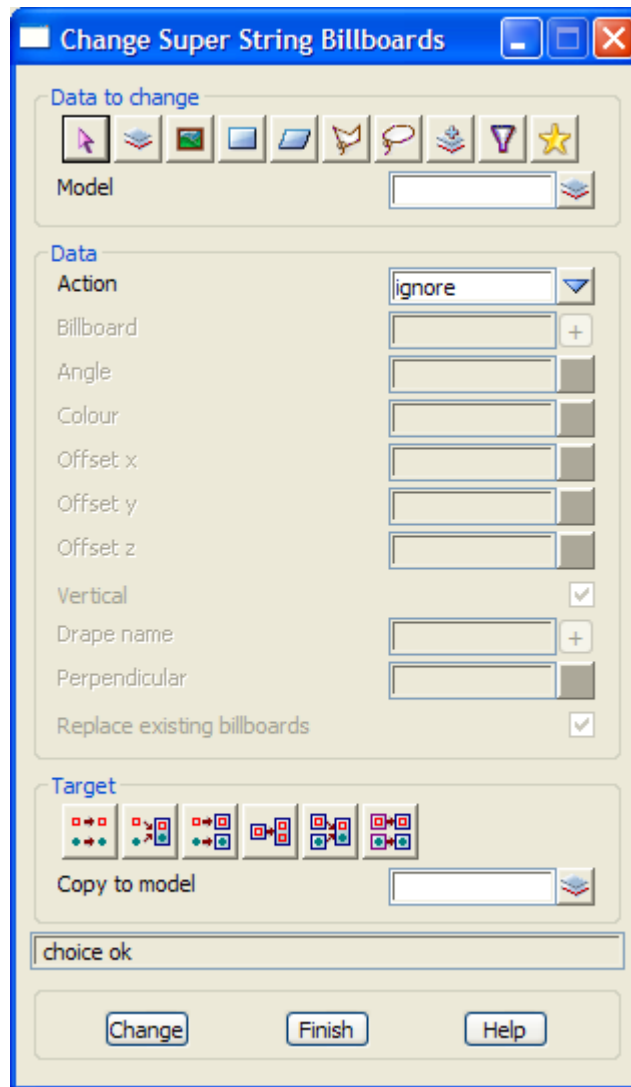

Position of option on menu: View =>Visualisation => Billboards =>Add/remove from super string

Each vertex of a super string can have its own billboard.

A billboard consists of an image and a width and height.

The **Add/remove from super string** option places a selected billboard in a vertical plane at a user given distance from each vertex of a super string. The vertical plane is at a given angle or perpendicular to a selected string. An example could be the image on a stop sign which is in the vertical plane.

Selecting Global Add/remove to ss brings up the **Change Super String Billboard** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

Action	choice box	ignore	set, clear, ignore
	<i>if set, the billboard is placed at each vertex in the super string.</i>		
	<i>If clear, the billboard information at each vertex is cleared.</i>		
	<i>If ignore, nothing is done to the billboard information.</i>		
Billboard	billboard box		
	<i>billboard to be used.</i>		
Angle	angle box		
	<i>angle to rotation the billboard - positive is counter clockwise. This is ignored if Perpendicular is used.</i>		
Size			
	<i>size of the symbol.</i>		
Colour	colour box		
	<i>colour for the back of the billboard.</i>		
Offset x, Offset y, Offset z			
	<i>x/y/z distance to place the billboard away from the super string vertex.</i>		
Vertical	tick box		
	<i>if tick, the string is placed vertically and nothing else is needed.</i>		
	<i>If not tick, .</i>		
Drape name	input		
	<i>if Vertical is not ticked, then</i>		
Perpendicular	string select box		
	<i>if a string is selected, then the billboard is placed on the line going through the vertex and perpendicular to the selected string. Angle is ignored.</i>		
Target type			
	<i>data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"</i>		
Target info	input		
	<i>extra information required for the target.</i>		
Change	button		
	<i>process the selected strings.</i>		

Create Forest

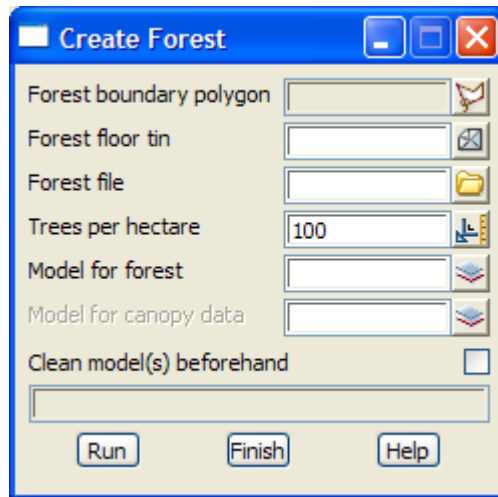

create_forest

Position of option on menu: Visualisation =>Billboards =>Create forest

Create forest creates randomly placed trees and shrubs in a selected polygon.

The forest make up is controlled by a user defined forest file which gives the types and distribution of trees, and variation in size and spread.

Selecting Create forest displays the **Create Forest** panel

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Forest boundary polygon <i>polygon to create the forest within</i>	string select		
Forest floor tin <i>tin to use for the z-value for the base of the trees</i>	tin box		available tins
Forest file <i>file to give the make up of the forest. For more information, go to the section "Create Forest File"</i>	file box		.forests files
Trees per hectare <i>density of the forest given by the number of trees per hectare</i>	input		
Model for forest <i>model to place the trees in</i>	model box		available models
Model for canopy data <i>if non blank, points are created for the tops of the trees in the forest. These can be used to triangulated to give a top of trees tin.</i>	model box		available models
Clean model (s) beforehand <i>if tick, the forest and forest canopy models are cleaned before the option is run</i>	tick box		
Run <i>run the option</i>	button		

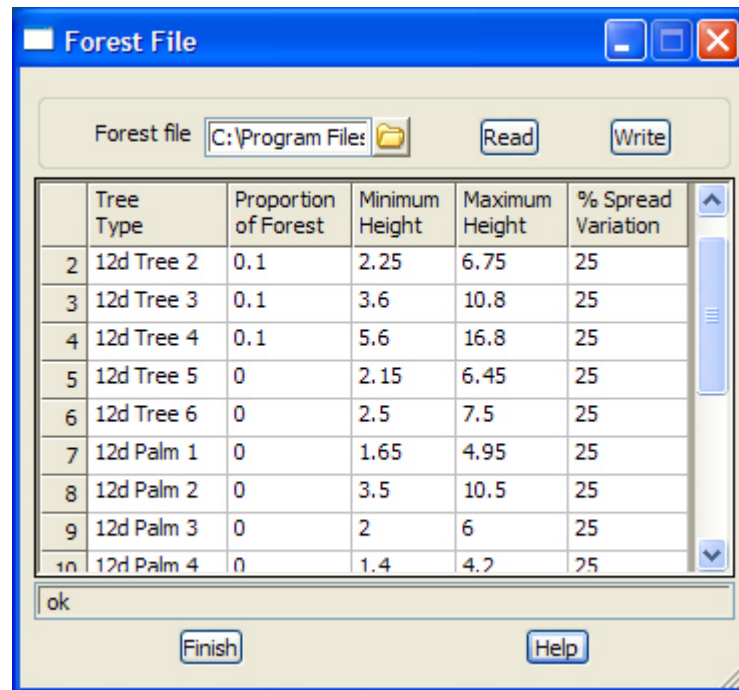

Create Forest File

forest_file

Position of option on menu: t

The Forest File gives the type and distribution of trees, and variation in size and spread.

Selecting brings up the **Forest File** panel

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Forest file polygon <i>file for the forest definition</i>	file box		all .forest files

Read <i>read in a forest file</i>	button		
---	--------	--	--

Write <i>write out a forest file</i> <i>read in a forest file</i>	button		
--	--------	--	--

Forest file grid:

Tree type <i>name of the billboard to place as a tree</i>	billboard cell	available billboards
---	----------------	----------------------

Proportion of forest <i>relative density of this tree in the forest (the actual proportion is this value over the sum of all the proportions)</i>	input cell	
---	------------	--

Minimum height <i>minimum height for this tree</i>	input cell	
--	------------	--

Maximum height <i>maximum height for this tree</i>	input cell	
--	------------	--

% spread variation

input cell

Trees/Shrubs as Faces and Billboards

12d_block_panel

trees_and_shrubs_panel

Position of option on menu: View =>Visualisation => Billboards =>Trees/shrubs

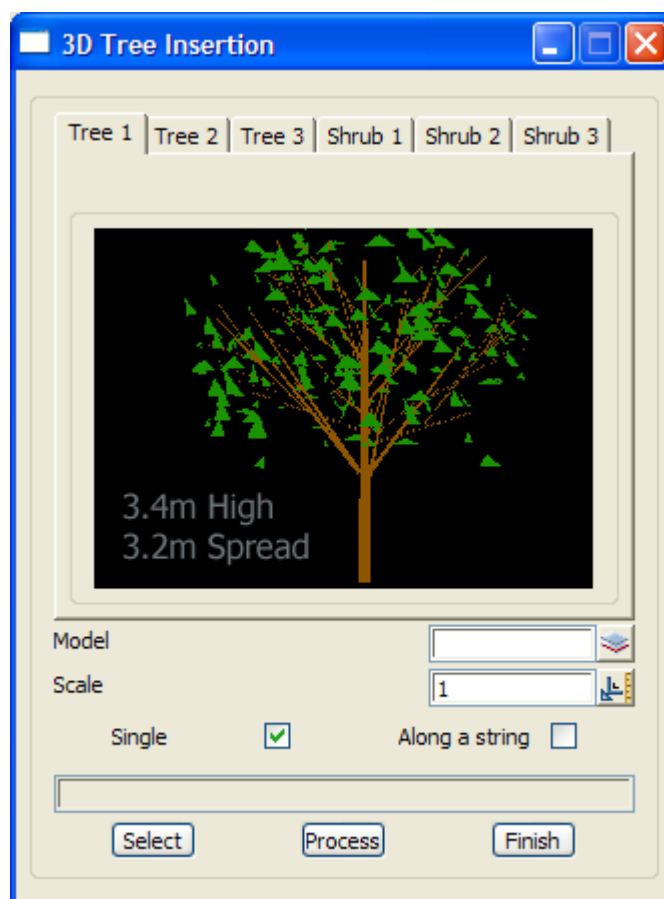

Position of option on menu: View =>Visualisation => Utilities =>Trees/shrubs faces

The Trees/shrubs - faces option inserts the trees and shrubs as face elements. This means that each tree may consist of hundreds or thousands of faces.

The Trees/shrubs option inserts the images of trees and shrubs as a fanned billboard. This means that each tree consists of only one points.

On selecting the Trees/shrubs faces option, the **3D Tree Insertion - Faces** panel is displayed.

On selecting the Trees/shrubs option, the **3D Tree Insertion** panel is displayed.

The fields and buttons used in these panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Tree and Shrub tabs

click on the tab to display the type of tree/shrub to be inserted. The picture shows the tree height and spread.

Model	model box		available models
--------------	-----------	--	------------------

model to add the tree/shrub to.

Scale - Factor	real value	1	measures
-----------------------	------------	---	----------

factor to blow the block up by.

Single	radio button		
---------------	--------------	--	--

if ticked then the tree is placed at the selected position.

Along a string	radio button		
-----------------------	--------------	--	--

if ticked then the tree is placed along a string. When the string is selected then a Tree Interval panel is

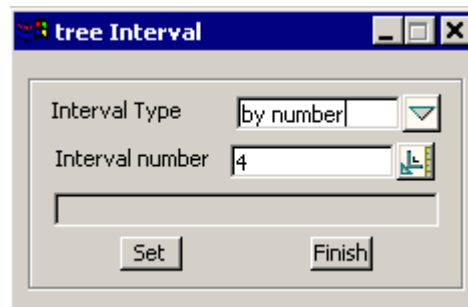

brought up to specify how the trees are placed along the string.

Select button
select the string or position for the tree.

Process button
insert the trees/shrubs.

tree_interval

Tree Interval

This panel is for specifying how often the trees/shrubs are to be inserted along the string.

Field Description	Type	Defaults	Pop-Up
Interval type	choice box	by number	by number by distance by special chg file by vertex

*if **by number**: an Interval number field is displayed on the panel and the tree is inserted that many times along the string.*

*if **by distance**: an Interval distance field is displayed on the panel and the tree is inserted with that distance separation along the string.*

*if **by special chg file**: a Special chg file field is displayed on the panel and the tree is inserted along the string at the chainages given in the file.*

*if **by vertex**: the tree is inserted at every vertex of the string.*

Set button
set the parameters for tree interval to those in the panel.

Extrusions

extrusions

Position of menu: View =>Visualisation =>Extrusions

The billboard options plane an image onto a rectangular billboard. this can be used to display background scenes, signs etc.

The Billboard walk-right menu is

extrude along s string
 add/remove a billboard to the vertices of a super string
 insert roadside furniture
 create a complicated extrusion
 extrude fences along strings
 tutorial on creating complicated extrusions

String along string	"Extrude string"
Library extrude	"Change Library Extrude"
Roadside furniture	"Roadside Furniture"
Create	"Create Group Extrusions"
Fences	"Fences"
Tutorial	"Tutorial to Create Group Extrusions"

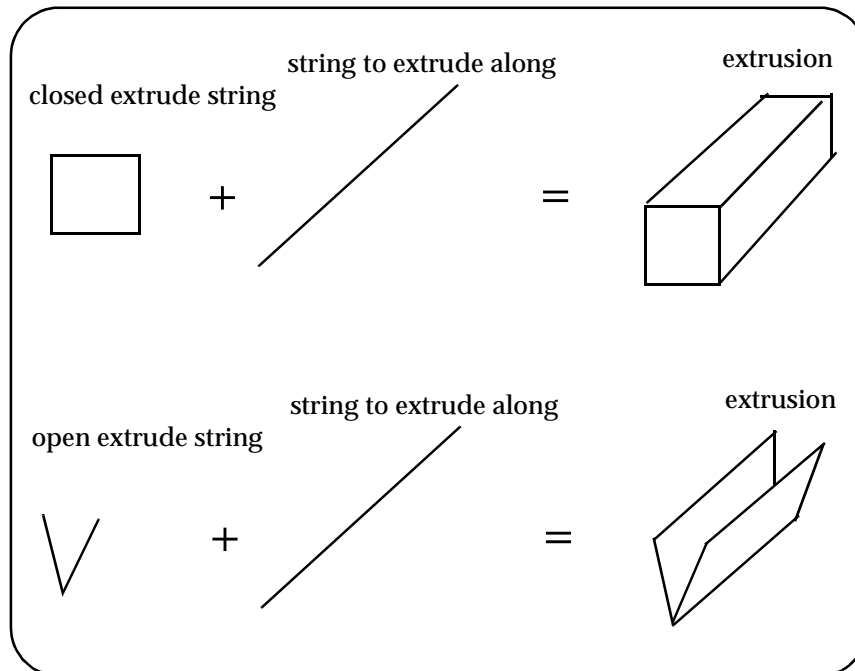

Extrude string

string_extrude

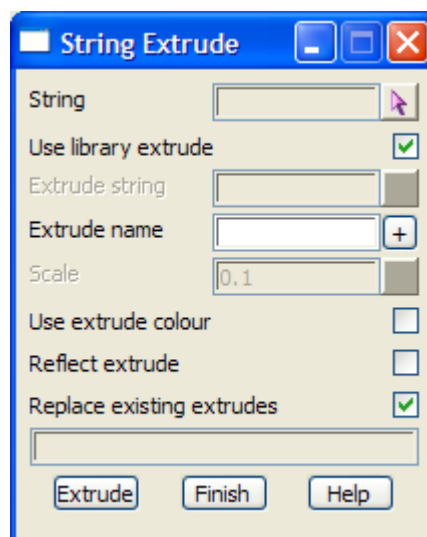

Position of option on menu: View =>Visualisation => Extrude string

The Extrude option extrudes a selected super string along a super string.

Only the (x,y) co-ordinates of the string used as the extrude as used and the (x,y) co-ordinates are then taken as (offset, height) in the plane perpendicular to the string to extrude along.

On selecting the Extrude option, the **String Extrude** panel is displayed.

The fields and buttons in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
String	<i>super string to extrude along</i>	string select		
Extrude	<i>super string representing the extrude.</i>	string select		
Factor	<i>value to factor the extrude string by.</i>	input	0.1	
Extrude	<i>Create the extrusion.</i>	button		

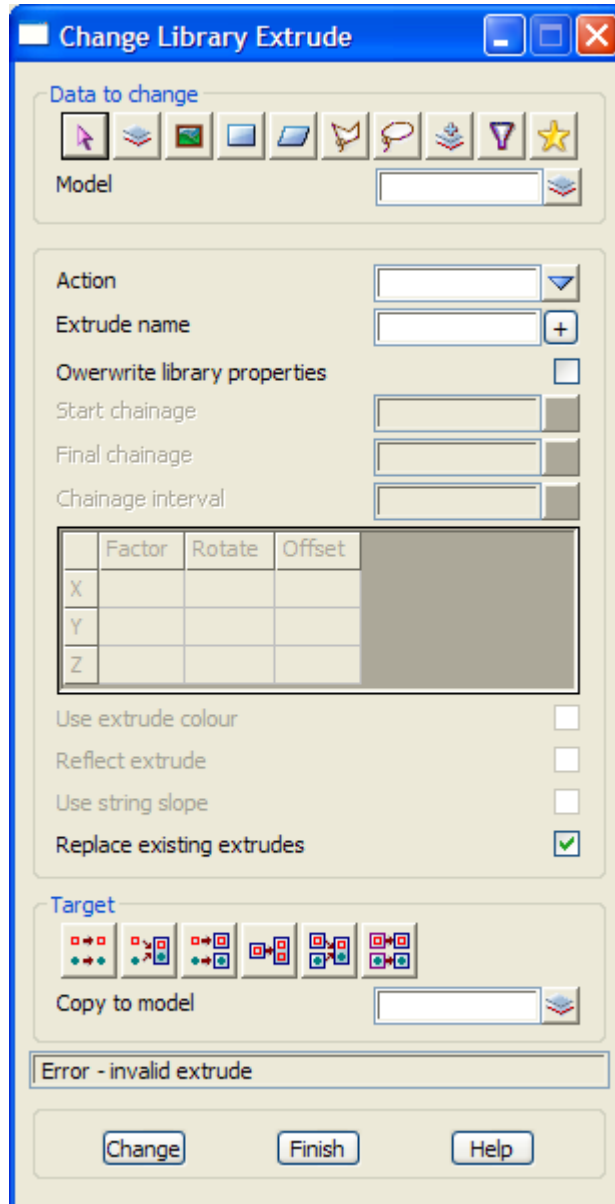

Change Library Extrude

change_library_extrude

Position of option on menu: Visualisation =>Library extrude

Apply or remove an extrusion from the library to a super string.

On selecting the Library extrude option, the **Change Library Extrude** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

Action	choice box	ignore	set, clear
---------------	------------	--------	------------

if set, the library extrude is applied to the super string.

If clear, all existing extrusions are removed from the super string.

- Extrude name** extrude box
extrude to be applied to the super string.
- Overwrite library properties** tick box
*if no tick, the placement properties are taken from the extrude in the library.
if tick, the placement uses the information in the grid on the panel.*
- Start/end chainage** chainage box
start/end chainage for applying the extrusion.
- Start/end chainage** chainage box
start/end chainage for applying the extrusion.
- Chainage interval**
only applicable when the extrusion in an interval extrude.
- Grid of X,Y,X against Factor, Rotate, Offset**
placement information for applying the extrude.
- Use extrude colour** tick box
*if tick, the placement uses the information in the grid on the panel.
if no tick, then the string segment colour is used for the extrusion.*
- Reflect extrude** tick box
if tick, the extrude is reflected in the local y axis before it is applied.
- Replace existing extrudes** tick box
if tick, all existing extrudes are cleared before the new one is applied.
- Target type**
data target type - for a full description go to “Data Target” in the chapter “Tools and Concepts”
- Target info** input
extra information required for the target.
- Change** button
process the selected string

Roadside Furniture

roadside_furniture_panel

Position of option on menu: View =>Visualisation => Extrusions =>Roadside furniture

This option is for inserting extruded objects that have been supplied by 12D Solutions Pty Ltd.

It includes street lights, log barriers, park bench, posts and columns, walls, timber fences, guard rails, signs etc.

The list of items that can be inserted is being continuously upgraded by 12D Solutions.

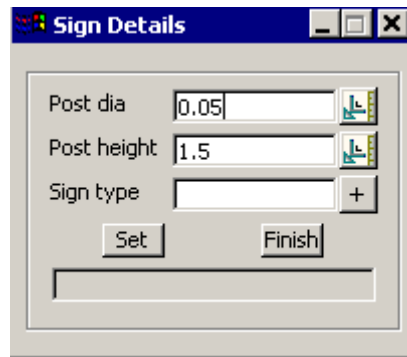

Selecting Roadside furniture brings up the **Roadside Furniture** panel.

Clicking on the tabs brings up the information required for that piece of roadside furniture.

For all the tabs other than *Park Bench*, *Street Light* and *Guard Rail*, once a tab had been selected, moving the cursor over the picture brings up a special panel for the extra information required. For example, for the *Sign* tab, moving the cursor over the picture brings up the **Sign Details** panel:

sign_details

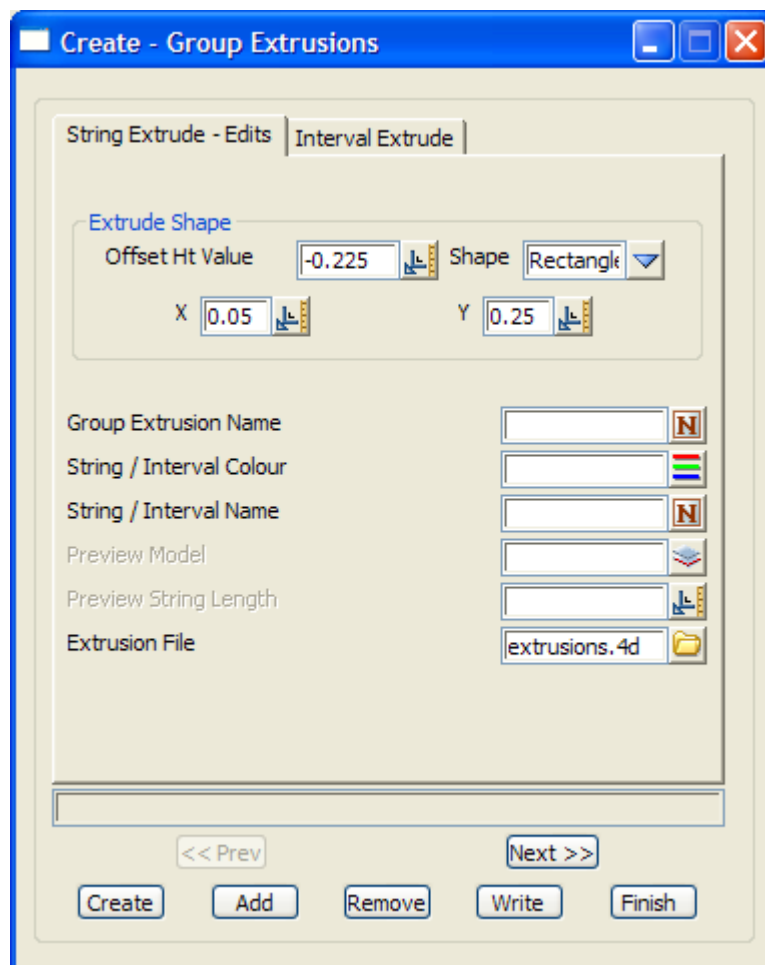

Create Group Extrusions

[extrusions_create_panel](#)

Position of option on menu: View =>Visualisation => Extrusions =>Create

The Create option creates groups extrusions.

Selecting Create brings up the **Create - Group Extrusions** panel.

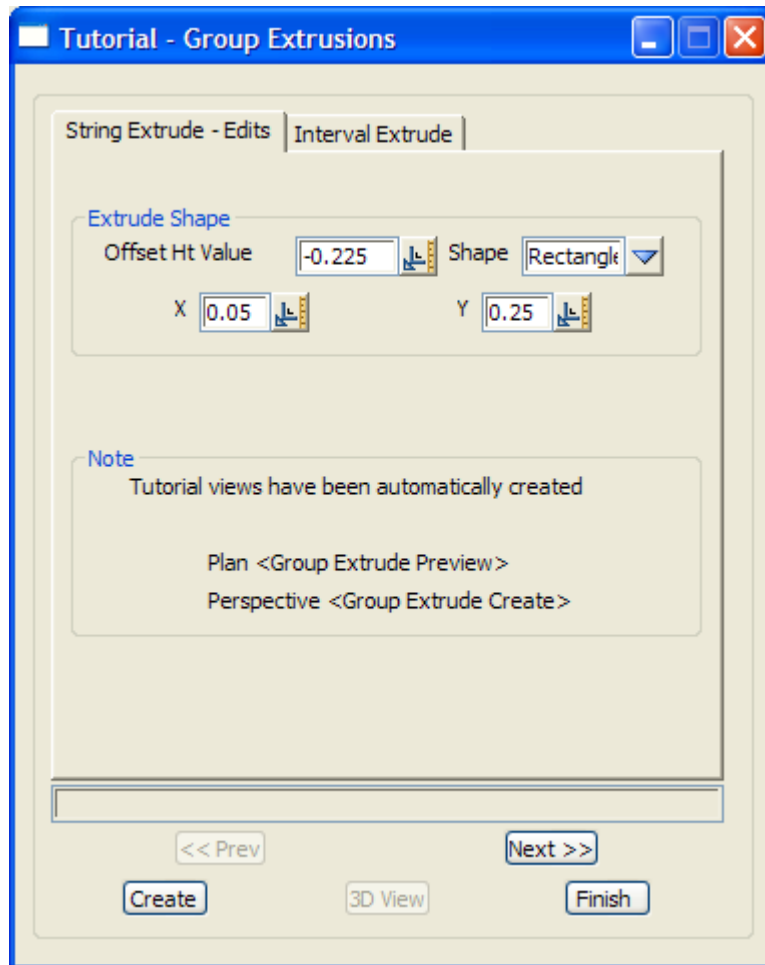

Tutorial to Create Group Extrusions

[extrusions_tutorial_panel](#)

Position of option on menu: View =>Visualisation => Extrusions =>Tutorial

The Tutorial option demonstrates how to create groups extrusions and will also create groups extrusions.

Selecting Tutorial brings up the **Tutorial - Group Extrusions** panel.

Fences

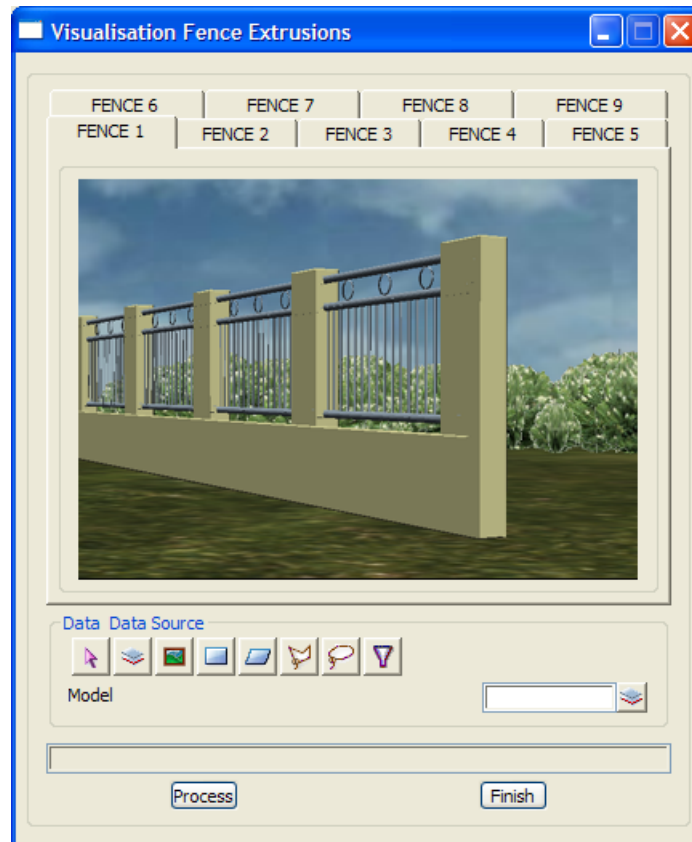

12d_vis_fences_panel

Position of option on menu: View =>Visualisation => Extrusions =>Fences

This option is for extruded 12d Sultans supplied fences along strings.

The list of fences is being continuously upgraded by 12D Solutions.

Selecting the Fences brings up the **Visualisation Fence Extrusions** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Clicking on the tabs brings up the type of fence to be extruded along selected super strings.

Data source type	Model
------------------	-------

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input
-------------	-------

source of super string to extrude fences along

Process	button
---------	--------

apply the fence to the selected super strings

Houses

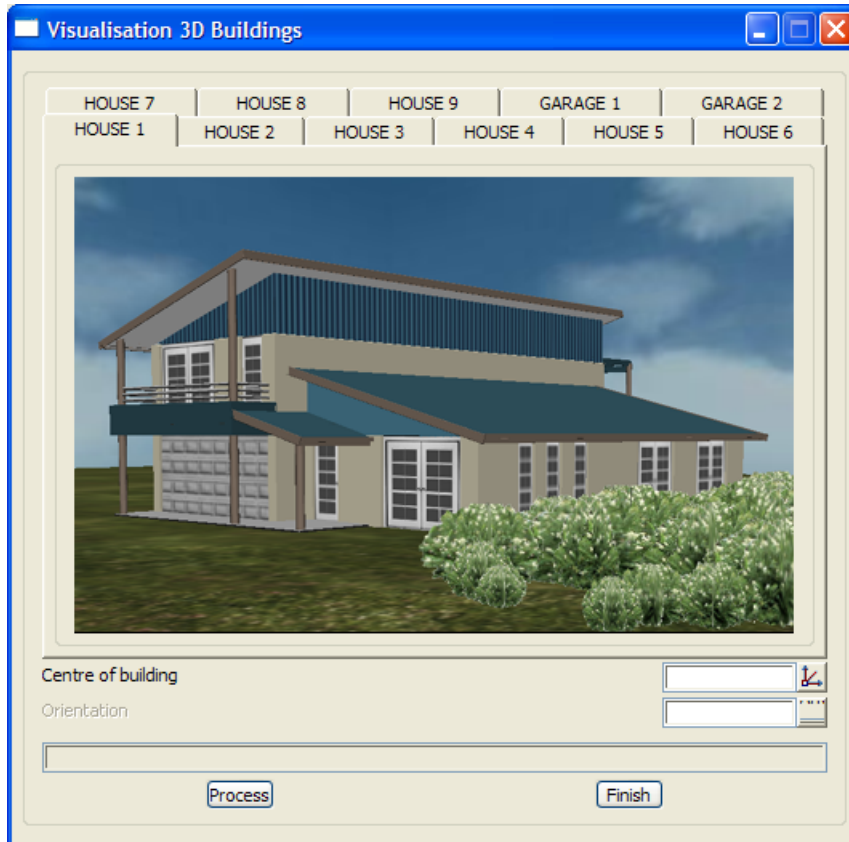

12d_vis_house_panel

Position of option on menu: View =>Visualisation => Utilities =>Houses

This option is for inserting 12d Sultans supplied houses.

The list of houses is being continuously upgraded by 12D Solutions.

Selecting the Houses brings up the **Visualisation 3D Buildings** panel.

The fields and buttons used in this panel have the following functions:

Clicking on the tabs brings up the type of house to be inserted.

Centre of building xyz box position select
give the x y z co-ordinates for the centre of the base of the inserted building

Orientation angle box angle select
give the angle to orient the building

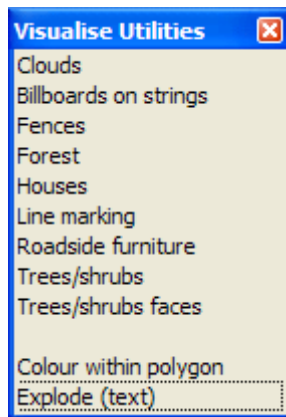

Process button
insert the selected building

Utilities

visualise_utilities

Position of menu: View =>Visualisation =>Utilities

The Utilities walk-right menu is

create clouds as background
 change billboards on super strings
 inserting fences
 create forest
 insert houses
 create strings for line marking
 insert fences, guard rails, signs, walls etc.
 insert trees and shrubs as billboards
 insert trees and shrubs as faces

 colour within a polygon
 explode text into vectors so it can be draped onto surface

For	<i>Clouds</i>	go to the section "Clouds"
	<i>Billboards on strings</i>	"Create Billboards"
	<i>Fences</i>	"Fences"
	<i>Forest</i>	"Create Forest"
	<i>Houses</i>	"Houses"
	<i>Line marking</i>	"Line Marking"
	<i>Roadside furniture</i>	"Roadside Furniture"
	<i>Trees/shrubs billboards</i>	"Trees/Shrubs as Faces and Billboards"
	<i>Trees/shrubs faces</i>	"Trees/Shrubs as Faces and Billboards"
	<i>Explode text</i>	"Explode Text" in the chapter "Utilities"
	<i>Colour within polygon</i>	"Colour Within Polygon" in the chapter "Triangles"

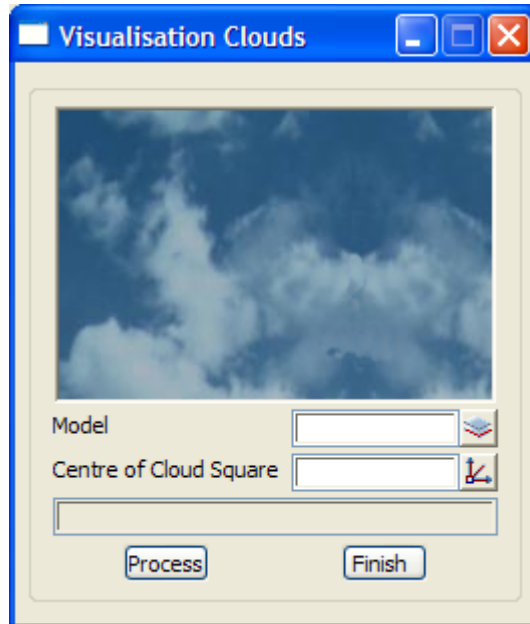

Clouds

clouds_panel

Position of option on menu: View =>Visualisation =>Utilities =>Clouds

This option is used to create a square box around the view with the cloud image on the inside of it. From within a scene, this will then appear as a sky with clouds as the background.

On selecting the Clouds option, the **Visualisation Clouds** panel is displayed:

The fields and buttons used in this panel have the following functions:

Model	model box	available models
	<i>model to place the cloud square in.</i>	
Centre of cloud square	xyz box	position select
	<i>give the x y z co-ordinates for the centre of the cloud square.</i>	
Process	button	
	<i>create the cloud square.</i>	

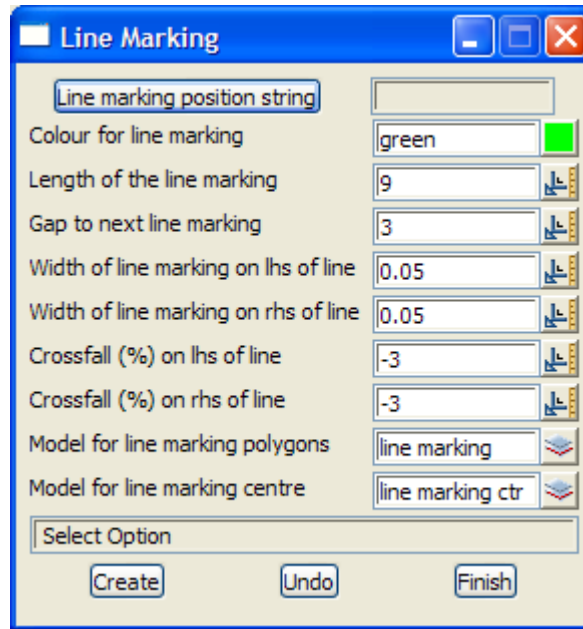

Line Marking

line_marking_panel

Position of option on menu: View =>Visualisation => Line marking

This option is used to create polygon data in 3d representing the line marking on a road. The polygons can then be included in the design tin for triangulating and the "Colour Triangles Within a Polygon" option used to colour the triangles for use in shades and renderings.

The line marking polygons created by the option represents a dashed line style centred around the selected line marking string marking the position of the dashed line. The length and separation of the dashed lines are user defined and the width of the dash is defined by a width to the left and a width to the right of the line marking string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
line marking position string	string select		
<i>select the string to define the position of the line marking on the road. The string will also provide z-values for use in creating the line marking.</i>			
Colour for line marking	input box	green	available colours
<i>colour for the line marking polygons.</i>			
Length of the line marking	input box	9	
<i>length of each line mark dash.</i>			
Gap to next line marking	input box	3	
<i>distance between the line marking dashes.</i>			
Width of line marking on lhs of line	input box	0.05	
<i>width of the line marking on the left hand side of the line marking position string.</i>			
Width of line marking on rhs of line	input box	0.05	
<i>width of the line marking on the right hand side of the line marking position string.</i>			
Crossfall (%) on lhs of line	input box	-3	
<i>cross fall for the part of the line marking on the left hand side of the line marking position string (so z-values for the polygon can be calculated).</i>			
Crossfall (%) on rhs of line	input box	-3	
<i>cross fall for the part of the line marking on the right hand side of the line marking position string (so z-values for the polygon can be calculated).</i>			
Model for line marking polygons	model box	line marking	available models
<i>model for the polygons representing the line marking.</i>			
Model for line marking centre	model box	line marking ctr	available models
<i>model for a string with just the part of the line marking position string which is inside the line marking polygons.</i>			

Create button
run the option and create the line marking polygons.

Undo button
undo the last set of polygons created since the panel was up.

Explode Text

Position of option on menu: View =>Visualisation =>Utilities =>Explode text

This option explodes text into lines and arcs. It has already been documented as

Utilities =>A-G => Explode text

in the section "Explode Text" of the chapter "Utilities" .

Colour Within Polygon

Position of option on menu: View =>Visualisation =>Utilities =>Colour within polygon

This option colours triangles in a tin. It has already been documented as

Tins =>Colour =>Colour within polygon

in the section "Colour Within Polygon" of the chapter "Triangles" .

14 Strings

strings

Position of menu: Strings

Strings are the basic modelling elements of 12d Model.

The strings walk-right menu contains options to create, edit and manipulate strings in a variety of ways including copying, moving strings between models and deleting strings.

The strings walk- right menu is

on Main menu

create floating menu Strings

CAD options
 create strings
 editing strings
 points edit
 whole string edits
 co-ordinate geometry
 convert between string types
 inquire on a string
 modifying string properties
 label strings
 rasters
 various string utilities
 user define string commands
 delete a string

on 12d Model menu and floating menu

For	<i>CAD</i>	"CAD"
	<i>Create</i>	"Create"
	<i>Editor</i>	"Editor"
	<i>Points edit</i>	"Points Edit"
	<i>Strings edit</i>	"Strings Edit"
	<i>Cogo</i>	"Cogo"
	<i>Convert</i>	"Convert"
	<i>Inquire</i>	"Inquire"
	<i>Properties</i>	"Properties"
	<i>Label</i>	"Label"
	<i>Rasters</i>	"Rasters"
	<i>Utilities</i>	"Utilities"
	<i>Delete</i>	"Delete"

Note

For the floating menu, the strings option has another mode of operation. Rather than moving onto the walk-right arrow, if LB is clicked when the strings button is highlighted on the 12d Model menu, the **string inquire** panel is displayed on the screen. Unfortunately this does not work on the *Main* menu.

CAD

cad

Position of option on menu: Strings =>CAD

In 12d Model there are CAD options which are available under both the Strings =>CAD menu and flyouts on the CAD Toolbar which by default, is on the left hand side of the 12d Model screen.

The CAD options create and edit strings using a variety of methods and are fully described in the section “CAD Options” .

The strings created by the CAD menu or CAD toolbars use values in the three controlbars (Cad Controlbar, Symbol Controlbar, and Text Controlbar) to define string attributes such as name, model and colour.

So the controlbars will be described in full in the section “CAD, Symbol and Text Controlbars” before the CAD options.

For basic information on toolbars and controlbars, see the section “Toolbars and Controlbars” in the chapter “Tools and Concepts” .

The CAD options create various elements using a number of methods. These options make use of Tool bars and Control bars. Tool bars just have icons on them but Control bars have icons and also controls such as a model box on them. The method groupings are shown on the toolbars (e.g. Points, Lines etc.).

For details on each of the walk rights menus on the CAD menu, go to the section “CAD Options”

For details on the Controlbars go to the section “CAD, Symbol and Text Controlbars”

CAD, Symbol and Text Controlbars

This default position of the controlbars is on the top left hand side of the screen under the main menu.

CAD Controlbar

The fields and buttons used in CAD controlbar have the following functions.

Field Description	Type	Defaults	Pop-Up
 name of string. If a valid name already exists in names.4d, the + button can be used to bring up a choice box of available names. On selection of a valid name, the rest of the values in the control bar will be filled out. e.g. colour, linetype etc.	name box		names.4d names

model box

cogo

existing models

this field can be recognised by the model icon button on the right hand side of the field. The user can select an existing model by selecting the model icon. If a new model is to be used, the user simply types the model name into the field.

colour box

red

standard 12d colours

this field can be recognised by the colour icon button on the right hand side of the field. The user can select a 12d standard colour model by selecting the colour icon

input

height measures menu

this field allows a height or z value to be assigned to the created elements. If a valid value exists, this value will be applied to the created element. This is regardless if the z value was specified in an XYZ box. If blank, the null value is used.

If no value is specified, the level will be interpolated where possible. A value of null can be entered into the height field as well so that created points will be given a null height value.

linetype box

1

valid linetypes

this field can be recognised by the linetype icon button on the right hand side of the field. The user can select a valid linetype by selecting the linetype icon.

weight box

this field can be recognised by the weight icon button on the right hand side of the field. The user can type in the required weight (millimetres on the plot). If blank, no weight is assigned.

tinability box

no, yes, points

*the choices in this field set the tinability for the string.
If **no**, no vertices or segments in the string are tinable.
If **yes**, all vertices and segments in the string are tinable.
If **point**, all vertices in the string are tinable but not the segments.*

button

the eye dropper allows the user to select an existing element which will define the cad control bar values.

Symbol Controlbar

The fields and buttons used in Symbol controlbar have the following functions.

Field Description	Type	Defaults	Pop-Up
The  symbols data box allows a symbols favourite to be selected and fill the other boxes. The symbols data box will be described after the other controls.			
	symbols box		valid symbols
<i>this field can be recognised by the symbol icon button on the right hand side of the field. The user can select a valid symbol by selecting the symbol icon.</i>			
	input		size measures menu
<i>this field gives the size of the created symbols. If a valid value exists, this value will be applied to the created symbol.</i>			

input

angle measures menu

this field gives the angle of the created symbols. If a valid value exists, this value will be applied to the created symbol.

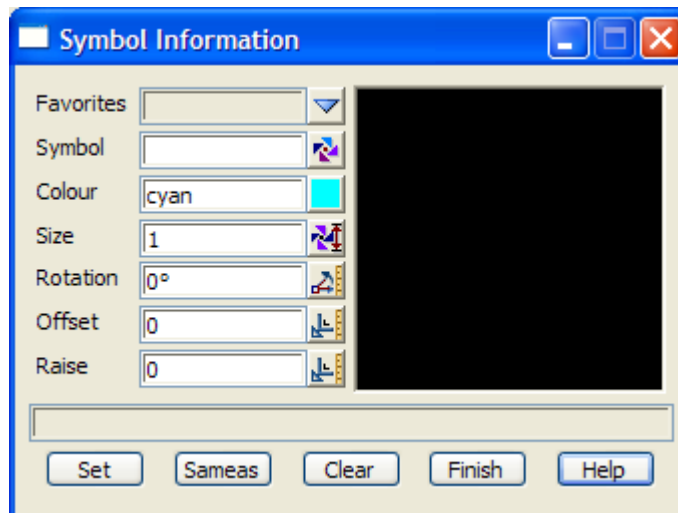

Symbols data box

*on pressing the button a list of available symbols data predefined names read from the **symbols_names.4d** file are displayed. If a symbols data is selected, the values are used for the other Symbol Controlbar fields.*

*If no names exist, the user can edit the current settings by selecting the edit button and bring up the **Symbols Information** panel. This allows for definition of symbol colour, sized, rotation, offset and raise.*

Text Controlbar

Text can occur as a text string, or on vertices and segments of a super string.

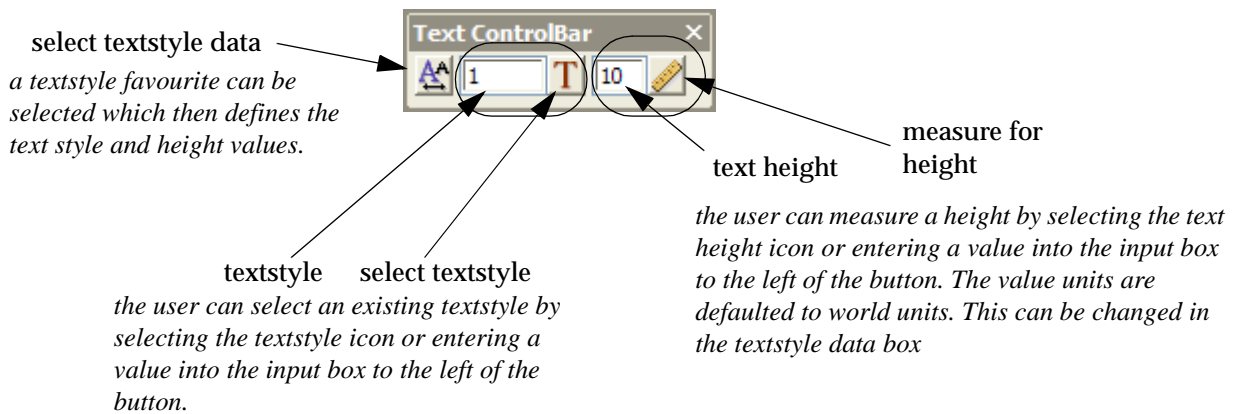

Each type of text has a vertex (these are displayed when Vertices are toggle on in a plan view), a justification point, a rotation, an offset and raise value.

The vertex and justification point only coincide if the offset and raise values are both zero. What parts of the text on a super string vertex or segment that can be independently modified depends

on the settings for the super string.

For the CAD text options, the created elements will have attributes as defined by the **Text Controlbar**. The default position of the Text Controlbar is in top middle of the screen under the main menu.

The **Text Controlbar** is

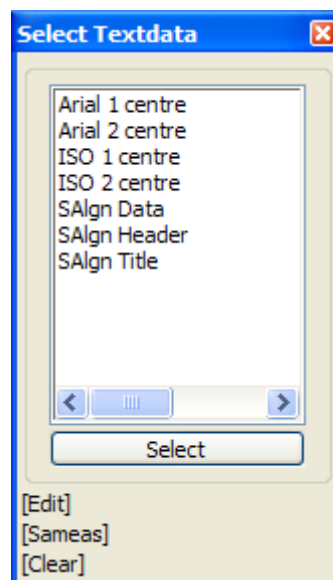

The operation of the Textstyle data box is as follows:

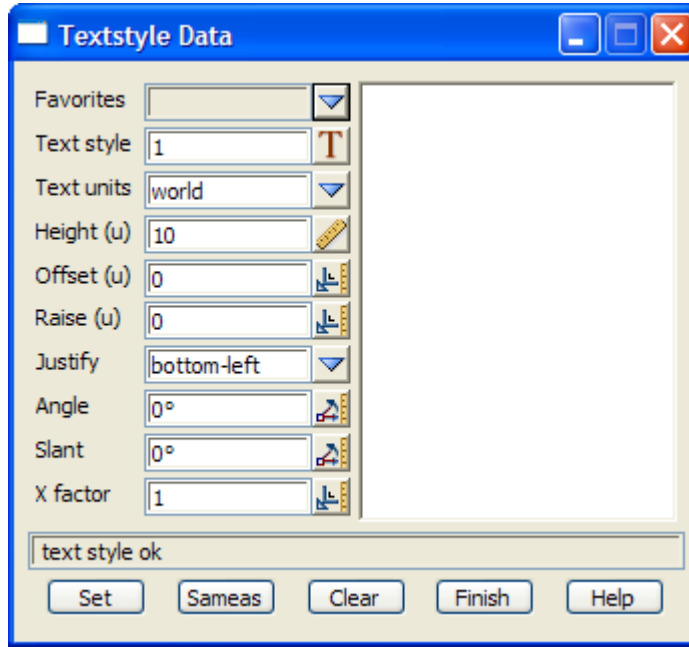

Textstyle data box

on pressing the button a list of available textdata predefined names read from the *textstyle_names.4d* file are displayed.

If no names exist, the user can edit the current settings by selecting the edit button and bring up the **Textstyle Data** panel. This allows for definition of textstyle, units, height offset raise etc.

CAD Options

The CAD options are available from the CAD menu or from the CAD toolbar. The CAD toolbar is a flyout toolbar.

The CAD walk-right menu is

and the CAD Toolbar is

The string creation process is similar for each string type and for editing strings as well. On selecting the appropriate option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

For the option *Points* please go to the section "CAD Points" .

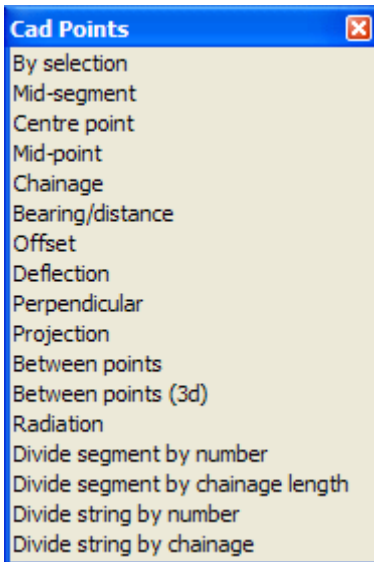

<i>Lines</i>	"CAD Lines" .
<i>Intersect</i>	"CAD Intersect"
<i>Circles</i>	"CAD Circles" .
<i>Arcs</i>	"CAD Arcs" .
<i>Polygons</i>	"CAD Polygons" .
<i>Text</i>	"CAD Text" .
<i>Symbols</i>	"CAD Symbol" .
<i>Fills</i>	"CAD Fills" .
<i>Images</i>	"CAD Images" .
<i>Modify</i>	"CAD Modify" .
<i>Change points</i>	"CAD Edit Points" .
<i>Change segments</i>	"CAD Segment Edits" .
<i>Change strings</i>	"CAD Edit Strings" .
<i>Delete</i>	"CAD Delete" .

CAD Points

cad_points

Position of option on menu: Strings =>CAD =>Points

The Points walk-right menu is

Menu of Options to Create New One Point Strings

at a user selected position
 at middle of a selected segment
 at the centre point of an arc
 at the position of a chainage along a selected string
 at a distance between two selected positions
 distance between two selected positions with interpolated z
 dropped perpendicularly onto a selected string
 projected a chainage distance along a selected string
 a given distance at right angles to a selected string
 a given distance at a given angle to a selected ring
 a given bearing and distance from a selected position
 many points at given brgs and dists from a selected position
 pts which divide selected seg into a number of equal segs
 pts which divide selected seg into segs of given length
 pts which divide selected string into a number of equal pieces
 pts which divide selected string into pieces of given length

For the option <i>By Selection</i> , please go to the section	"By Selection"
<i>Mid segment</i>	"Mid Segment"
<i>Centre point</i>	"Arc Centre"
<i>Mid point</i>	"Mid point"
<i>Chainage</i>	"Chainage"
<i>Bearing distance</i>	"Locate by Bearing/Distance"
<i>Offset</i>	"Create an Offset Point"
<i>Deflection</i>	"Create a Deflection Point"
<i>Drop perpendicular</i>	"Drop Perpendicular"
<i>Projection</i>	"Projection Locate"
<i>Between points</i>	"Between Points"
<i>Between points (3d)</i>	"Between Points (3d)"
<i>Radiation</i>	"Radiation"
<i>Divide segment by number</i>	"Divide Segment by Number"
<i>Divide segment by chainage length</i>	"Divide Segment by Chainage Length"
<i>Divide string by number</i>	"Divide String by Number"
<i>Divide string by chainage length</i>	"Divide String by Chainage Length"

By Selection

Cad_Point_Position

Position of option on menu: Strings =>CAD =>Points =>By selection

or by selection of appropriate icon from the toolbar. 

This option creates a single vertex (point) string.

On selecting By selection, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the point is created at the selected position. The model, colour, height etc. are defined in the **Cad Control Bar**.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Specification of a position can also be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. **NOTE:** The z value will default to the value entered into the **Cad Control Bar** whether or not it is specified in the XYZ box. If no height value exists in the **Cad Control Bar** then a value will be interpolated if possible, otherwise a null value will be assigned.

Mid Segment

Cad_Point_Middle_Segment

Position of option on menu: Strings =>CAD =>Points =>Mid segment

or by selection of appropriate icon from the toolbar. 

This option creates a point in the middle of a selected line or arc segment.

On selecting Mid segment, the user is prompted to select a segment and a vertex is created at the mid point of the segment. The model, colour, height etc. are defined in the **Cad Control Bar**.

Arc Centre

Cad_Point_Centre_Segment

Position of option on menu: Strings =>CAD =>Points =>Centre point

or by selection of appropriate icon from the toolbar. 

This option creates a point at the centre of a selected arc or circle.

On selecting Centre point, the user is prompted to select an arc and a vertex is created at the centre of the arc. The model, colour, height etc. are defined in the **Cad Control Bar**.

Mid point

Cad_Point_Middle

Position of option on menu: Strings =>CAD =>Points =>Mid point

or by selection of appropriate icon from the toolbar. 

This option creates a point in the middle of two selected positions.

On selecting Mid point, the user is prompted to select the first position and then the second position. A vertex is created at the mid point of the two selected positions. The model, colour, height etc. are defined in the **Cad Control Bar**.

Chainage

cad_locate_chainage

Position of option on menu: Strings =>CAD =>Points =>Chainage

or by selection of appropriate icon from the toolbar. 

This option creates a new point at the position of a user specified chainage of an existing string. On selecting Chainage, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

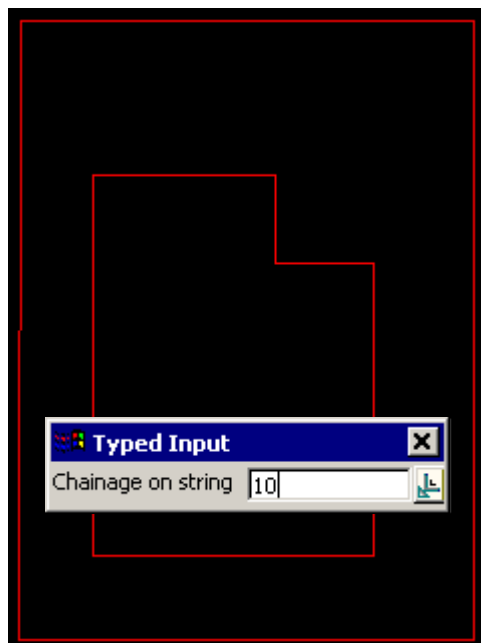

STEP 1:

The user selects a valid string (left mouse button) and accepts that string (Middle mouse button or enter).

STEP 2:

The user enters a chainage value where a point should be placed followed by the enter key. This chainage is with respect to the selected string.

STEP 3:

A new one point string is created at the positioned on the string at the given chainage.

To create another point, the user is prompted for the string as per **STEP 1**.

Locate by Bearing/Distance

Cad_Point_Locate_Bearing_Distance

Position of option on menu: Strings =>CAD =>Points =>Bearing distance

or by selection of appropriate icon from the toolbar. 

This option calculates a point string that is located a given bearing and distance from a start position.

On selecting Bearing/distance, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

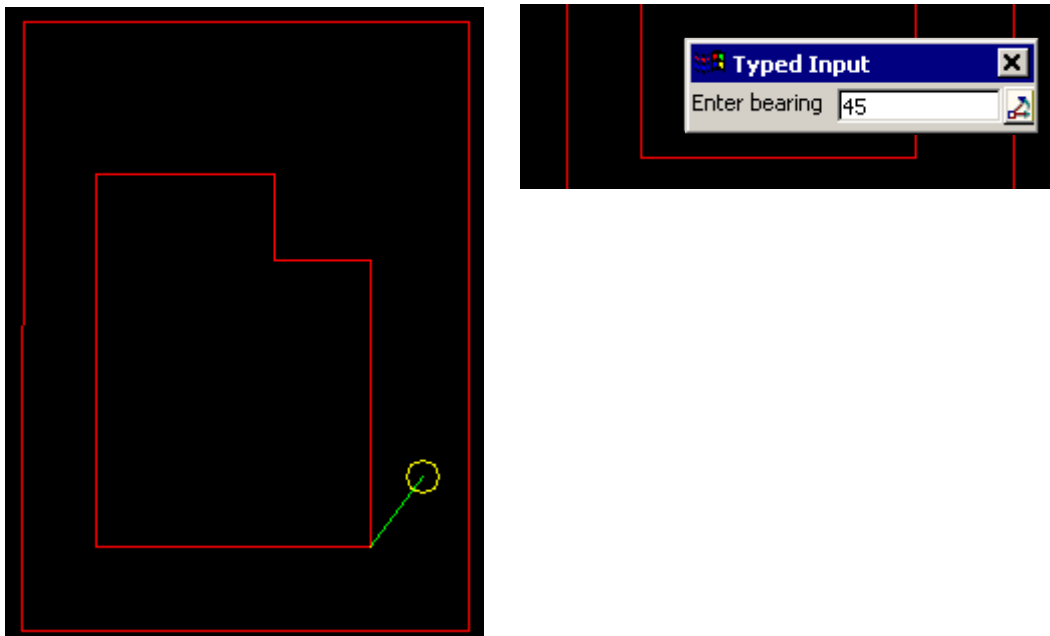

A start position is selected and accepted.

**STEP 2:**

A bearing is selected with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: The **Page up** and **page down** keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point

perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

A distance is selected and accepted with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the distance entry box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

**STEP 4:**

A point string is created using the information supplied. By entry into the input boxes:

Or by using the perpendicular/tangential tools:

Create an Offset Point

Cad_Point_Locate_Offset

Position of option on menu: Strings =>CAD =>Points =>Offset

or by selection of appropriate icon from the toolbar. 

This option creates a one point string that is located by reference to a string, a control point, a chainage distance along the string from the control point and an offset to the selected string.

After selection and acceptance of a string, a control point is selected and accepted. This point is dropped perpendicular onto the string. The distance along the string is measured from this dropped point. Positive distances are in the direction that the string was picked. Finally a offset to the string can be specified for the placement of the new point string.

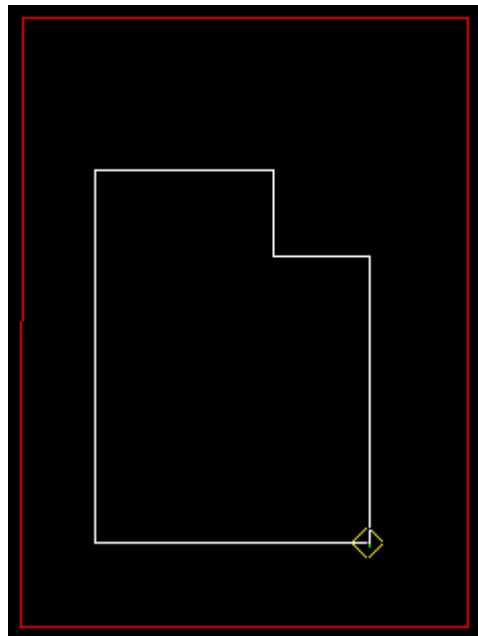

On selecting Offset, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

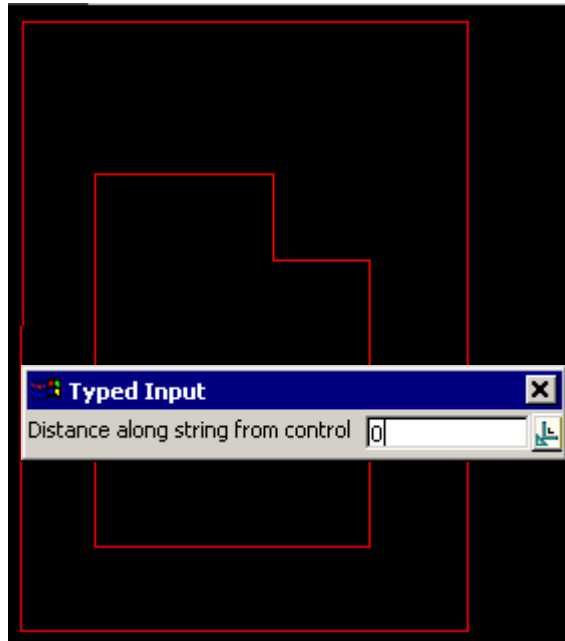

The user selects and accepts a string with direction. This defines what side the offset applies to.

**STEP 2:**

The user picks and accepts a control point to be dropped onto the selected string.

**STEP 3:**

A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the enter key.

STEP 4:

An offset relative to the selected string (and direction) is specified in the input box followed by the enter key.

STEP 5:

A point string is created using the information supplied.

Create a Deflection Point

Cad_Point_Locate_Deflection

Position of option on menu: Strings =>CAD =>Points =>Deflection

or by selection of appropriate icon from the toolbar. 

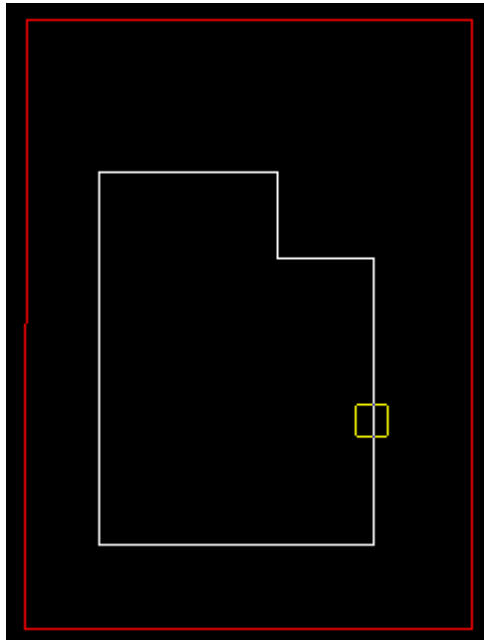

This option creates a one point string that is located by reference to a string, a control point, a distance along the string from the control point, a deflection angle and deflection distance.

After selection of a string, a control point is selected. This point is dropped perpendicular onto the string. A distance along the string can be entered to move the measure point. Positive distances are in the direction that the string was picked. A deflection angle is specified which is a clockwise angle from the measure point. The deflection distance is the distance from the measure point to the point which is to be created.

On selecting Deflection, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The user selects and accepts a string with direction.

STEP 2:

The user picks and accepts a control point to be dropped onto the selected string.

STEP 3:

A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the enter key.

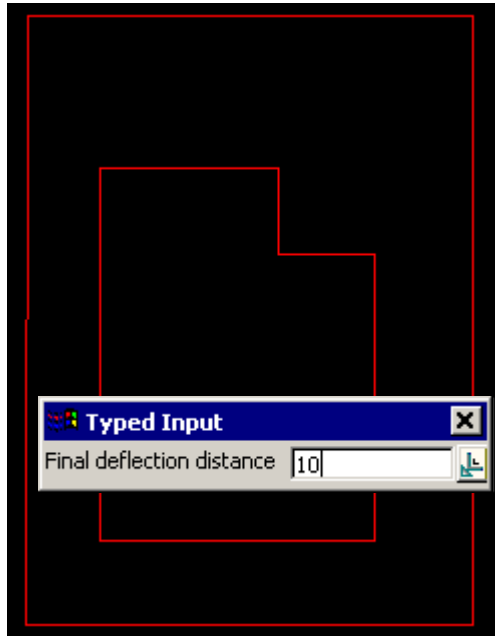

**STEP 4:**

A deflection angle is specified. This angle is clockwise, relative to the direction of the string selection pick. The value is entered into the input box followed by the enter key.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

**STEP 5:**

A deflection distance is supplied. Positive is in the direction of the string selection pick. The value is entered into the input box followed by the enter key.

STEP 6:

A point string is created using the information supplied.

Drop Perpendicular

Cad_Point_Locate_Perpendicular

Position of option on menu: Strings =>CAD =>Points =>Perpendicular

or by selection of appropriate icon from the toolbar. 

This option creates a one point string by dropping from a user selected position perpendicularly onto a user selected string.

On selecting Perpendicular, the user is prompted for the relevant data in the screen message box

located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The user selects a string and accepts (with direction) to have the point dropped onto.

STEP 2:

The user picks and accepts a position to drop onto the nominated string

STEP 3:

A point string is created at the perpendicular drop point.

Projection Locate

Cad_Point_Locate_Projection

Position of option on menu: Strings =>CAD =>Points =>Projection

or by selection of appropriate icon from the toolbar. 

This option creates a one point string that is located by firstly dropping a point onto a string and then giving a distance along the string from the dropped point.

On selecting Projection, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

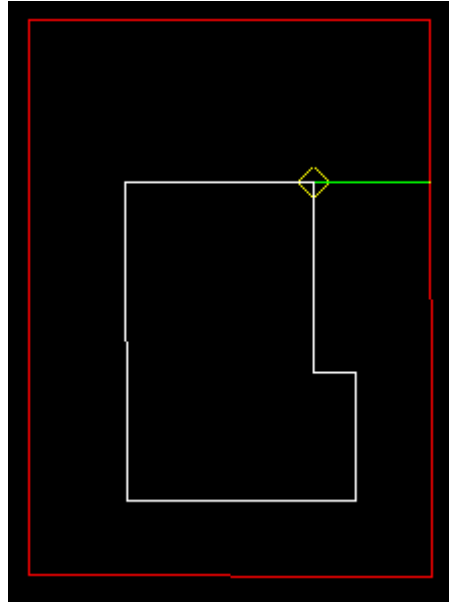

STEP 1:

The user selects and accepts a string (with direction) to have the point dropped onto

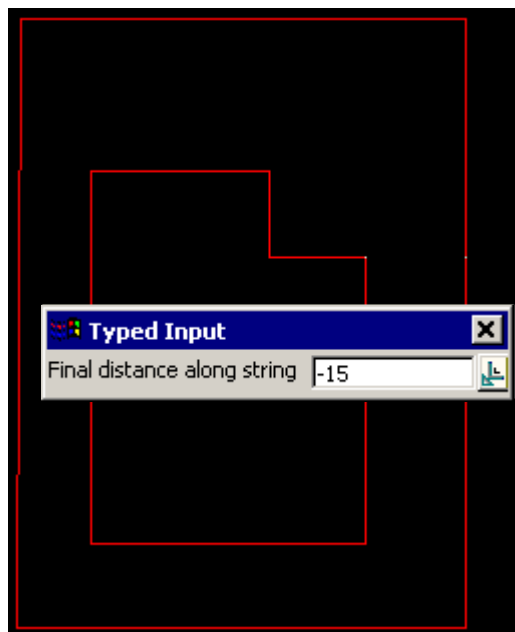

STEP 2:

The user picks and accepts a position to drop onto the nominated string

**STEP 3:**

The user is prompted for the distance along the string. Positive distances are in the direction that the string was picked. A value is entered into the input box followed by the enter key.

**STEP 4:**

The point string is created the nominated distance along the string from the dropped point.

Between Points

Cad_Point_Between_Points

Position of option on menu: Strings =>CAD =>Points =>Between points
or by selection of appropriate icon from the toolbar. 

This option creates a one point string that is on the line between two selected positions and a given distance from the first point.

On selecting Between points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or enter).

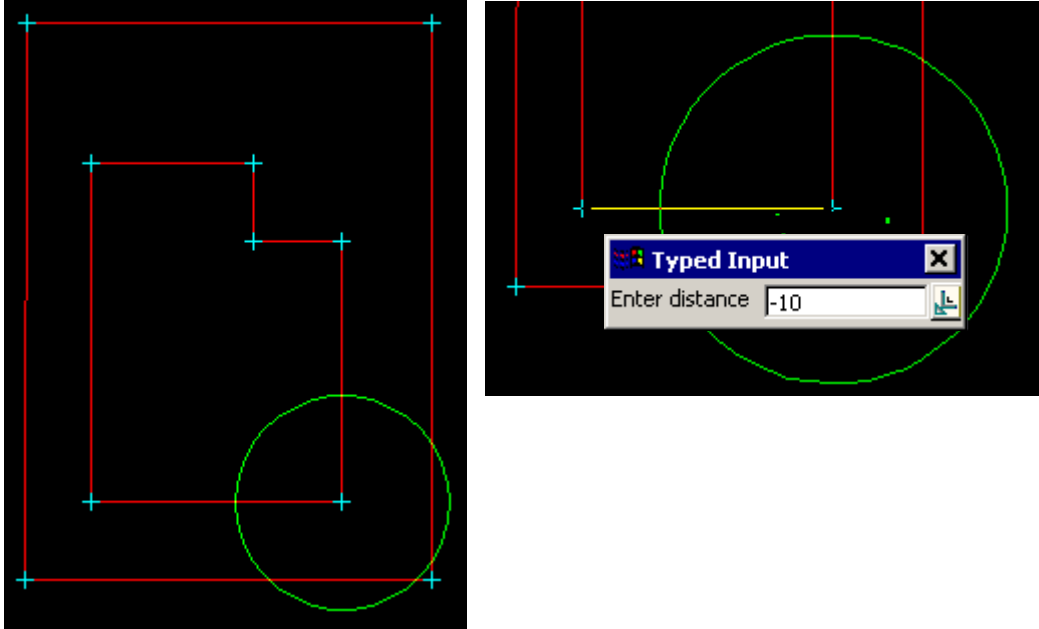

**STEP 2:**

The user picks a 2nd point and accepts that point (Middle mouse button or enter) to define the reference line.

**STEP 3:**

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

**STEP 4:**

A point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.

**Between Points (3d)****Cad_Point_Between_Points_3d**

Position of option on menu: Strings =>CAD =>Points =>Between points
or by selection of appropriate icon from the toolbar. 

This option creates a one point string that is on the line between two selected positions and a given distance from the first point. The z-value of the string is interpolated from the two selected positions.

On selecting Between points (3d), the user is prompted for the relevant data in the screen

message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or enter).

**STEP 2:**

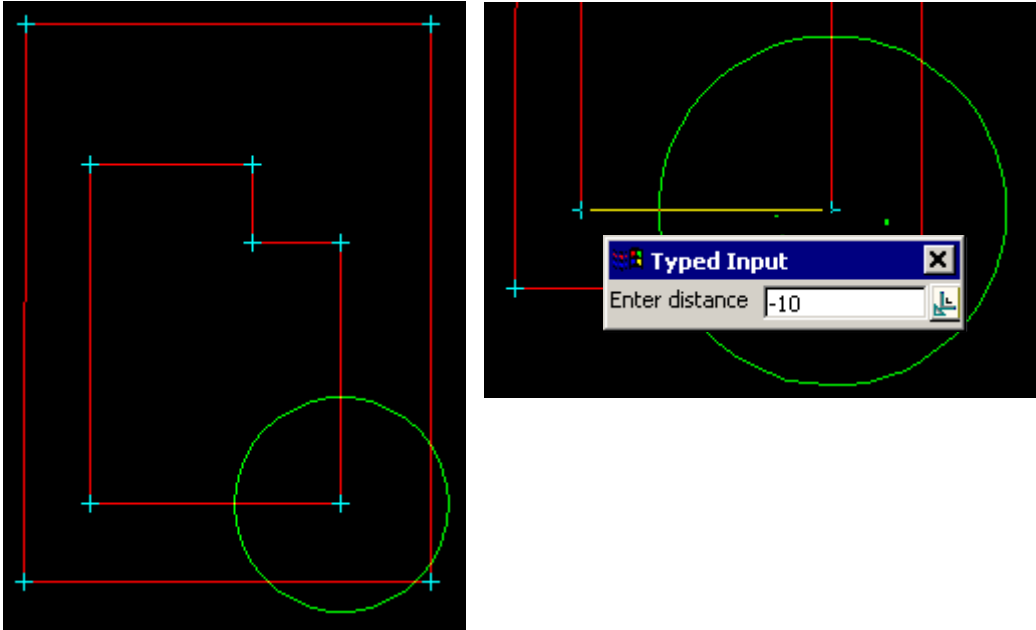

The user picks a 2nd point and accepts that point (Middle mouse button or enter) to define the reference line.

**STEP 3:**

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and

then the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

STEP 4:

A point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.

Radiation

`cad_radiation`

Position of option on menu: Strings =>CAD =>Points =>Radiation

or by selection of appropriate icon from the toolbar. 

This option creates a series of one point strings that are located by given bearings and distances from a chosen start position.

On selecting Radiation, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A start position is selected and accepted.

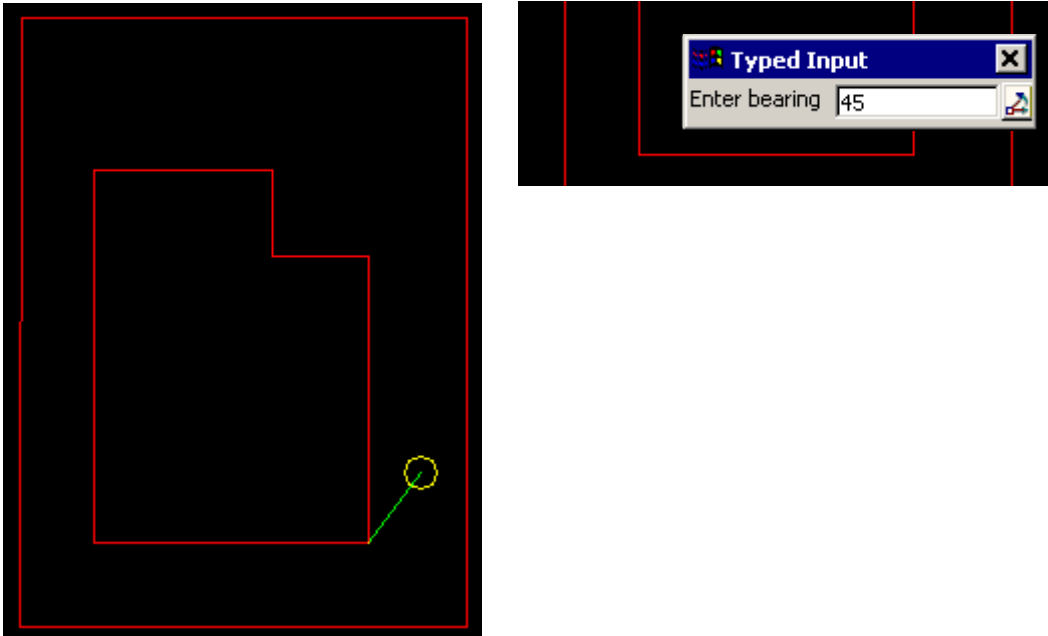

STEP 2:

A bearing is selected with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

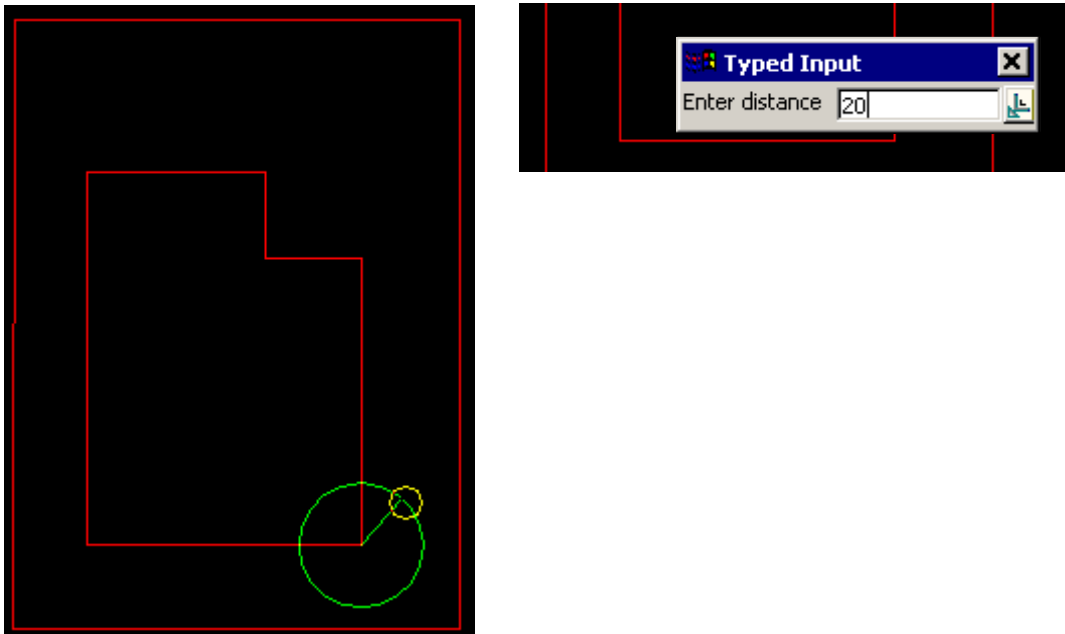

STEP 3:

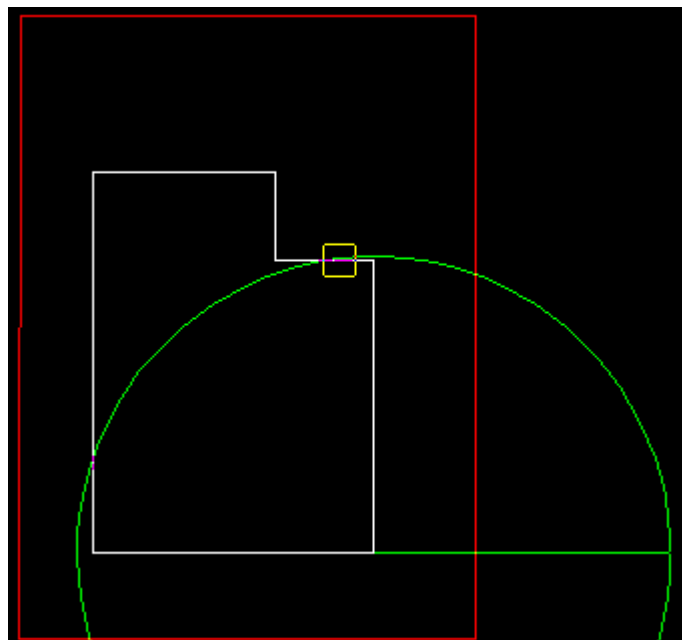

A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic

value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

STEP 4:

A point string is created using the information supplied.

STEP 5

The next bearing and distance is prompted for as per step 3 and 4. Consequent points are created from the original start point selected.

Divide Segment by Number

`cad_divide_segment_by_number`

Position of option on menu: Strings =>CAD =>Points =>Divide segment by number
or by selection of appropriate icon from the toolbar. 

This option creates one point strings which will break up a super string *segment* into equal pieces based on a user given number of intervals. The first and last points are not created since they are taken to be the end points of the selected segment. So for five intervals, four new one point strings are created. The option works for line or arc segments of a super string.

NOTES:

1. No vertices are inserted into the selected super string - the option *Strings =>Strings edits =>Segment strings* does that.
2. This option is for super strings only.

On selecting Divide segment by number, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

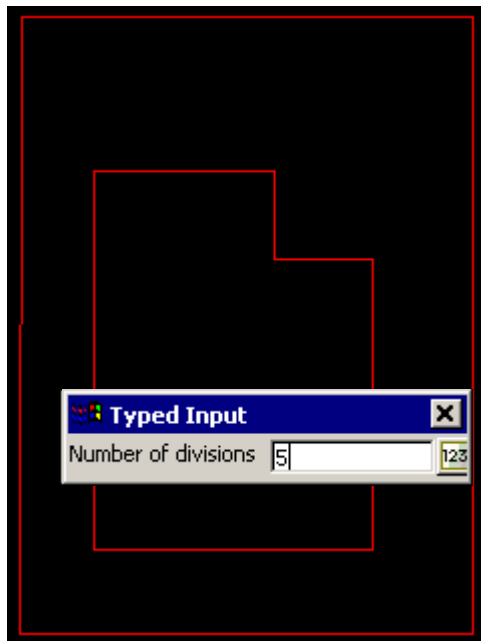

STEP 1:

A super string segment is selected and accepted.

STEP 2:

The user is prompted for the number of divisions. The value is entered into the input box followed by the enter key.

STEP 3:

Given the above information, the new points are created.

Divide Segment by Chainage Length

`cad_divide_segment_by_chainage_length`

Position of option on menu: Strings =>CAD =>Points =>Divide segment by chainage length or by selection of appropriate icon from the toolbar. 

This option creates one point strings which will break up a super string **segment** into pieces based on a user given chainage length. The process starts from the 1st point of the segment and continues until no more pieces can be created without going past the last point of the segment (the last piece may not be the correct length). This options works for line or arc segments of a super string.

NOTES:

1. No vertices are inserted into the selected super string - the option *Strings =>Strings edits =>Segment strings* does that.
2. This option is for super strings only.

On selecting Divide segment by chainage length, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A super string segment is selected and accepted.

STEP 2:

The user is prompted for the chainage distance. The value is entered into the input box followed by the enter key.

STEP 3:

Given the above information, the new points are created.

Divide String by Number

Cad_Divide_String_by_Number

Position of option on menu: Strings =>CAD =>Points =>Divide string by number

or by selection of appropriate icon from the toolbar. 

This option creates one point strings which will break up a super string into equal pieces based on a user given number of divisions. The first and last points are not created since they are taken to be the end points of the selected string. So for five intervals, four new one point strings are created.

NOTES:

1. No vertices are inserted into the selected super string - the option *Strings =>Strings edits =>Segment strings* does that.
2. This option is for super strings only.

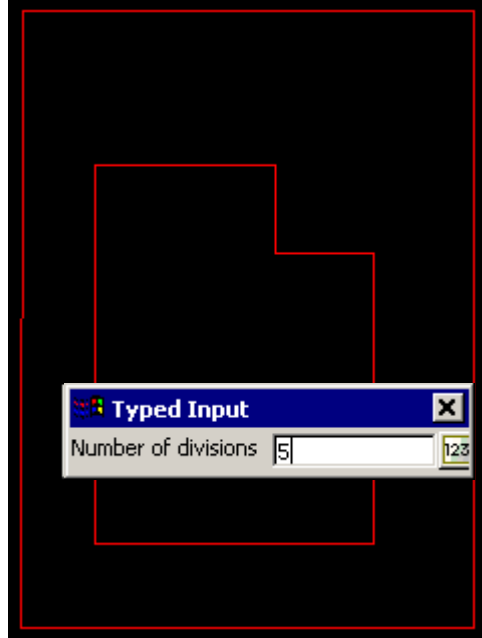

On selecting Divide string by number, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A super string is selected and accepted.

STEP 2:

The user is prompted for the number of divisions. The value is entered into the input box followed by the enter key.

**STEP 3:**

Given the above information, the new points are created.

Divide String by Chainage Length

Cad_Divide_String_by_Chainage_Length

Position of option on menu: Strings =>CAD =>Points =>Divide string by chainage length
or by selection of appropriate icon from the toolbar. 

This option creates one point strings which will break up a *super string* into pieces based on a user given chainage length. The process starts from the 1st vertex of the strings and continues until no more pieces can be created without going past the last vertex of the string (the last piece may not be the correct length).

NOTES:

1. No vertices are inserted into the selected super string - the option *Strings =>Strings edits =>Segment strings* does that.
2. This option is for super strings only.

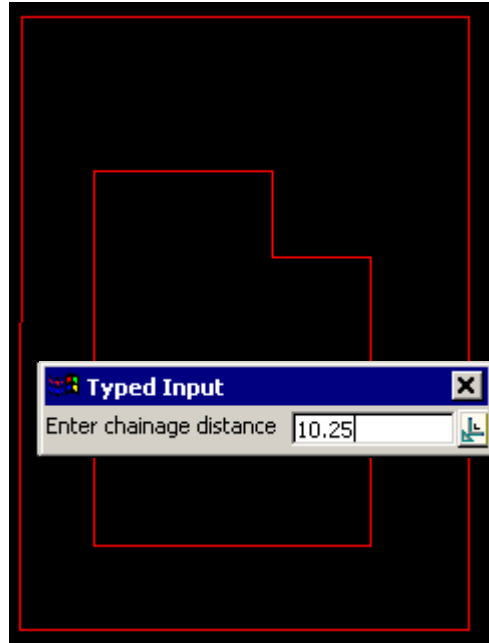

On selecting Divide string by chainage length, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A super string is selected and accepted.

STEP 2:

The user is prompted for the chainage distance. The value is entered into the input box followed by the enter key.

STEP 3:

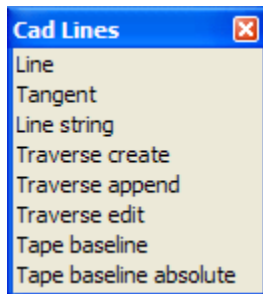

Given the above information, the new points are created.

CAD Lines

cad_lines

Position of option on menu: Strings =>CAD =>Lines

The Lines walk-right menu is

Menu of Options to Create Strings

create a two point (vertex) super string

create tangent to two selected items (points and/or arcs)

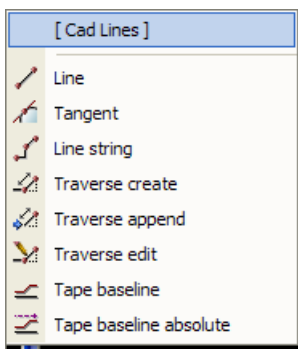

create a many point super string

create many pt super string by bearing distances from previous pt

append to a super string using bearing distance entry

modify the bear/distance of a selected segment

create many pt super str with pts a dist along and dist offset to a

For the option <i>Line</i> , go to the section	"Create Line"
<i>Tangent</i>	"Tangent"
<i>Line String</i>	"Line String"
<i>Traverse</i>	"Traverse"
<i>Traverse append</i>	"Traverse Append"
<i>Traverse edit</i>	"Traverse Edit"
<i>Tape baseline</i>	"Taped Baseline"
<i>Tape baseline absolute</i>	"Taped Baseline Absolute"

Create Line

Cad_Line_2_Positions

Position of option on menu: Strings =>CAD =>Lines =>Line

or by selection of appropriate icon from the toolbar. 

This option creates two vertex super strings with a line between the two vertices.

On selecting Line, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the point is created at the selected position. The model, colour, height etc. are defined in the **Cad Control Bar**.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Specification of a position can also be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel. **NOTE:** The z value will default to the value entered into the **Cad Control Bar** whether or not it is specified in the XYZ box. If no height value exists in the **Cad Control Bar**

The 2nd point is selected in the same way as the 1st point. The line is created after successful selection and acceptance of the 2nd point. The option remains current so that a number of lines can be created.

Line String

Cad_Create_Line_String

Position of option on menu: Strings =>CAD =>Lines =>Line String

or by selection of appropriate icon from the toolbar. 

This option creates a string of many points.

On selecting Line String, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The position of each vertex of the string is selected and accepted in order from the first to the last vertex.

Traverse

Cad_Traverse

Position of option on menu: Strings =>CAD =>Lines =>Traverse

or by selection of appropriate icon from the toolbar. 

This option creates a string by giving the bearing and distance of each vertex from the previous vertex. The position of the first vertex is the start of the string and then the bearing and distance is given to define the position of the next vertex. The created vertex then become the position to take the next bearing and distance from.

On selecting Traverse, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A start position is selected and accepted. This becomes the first vertex of the string.

**STEP 2:**

A line is drawn from the vertex to the current mouse position. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

Note: The **Page up** and **page down** keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user

selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

**STEP 4:**

A point string is created using the information supplied.

**STEPS 4-5:**

The next bearing and distance is prompted for as per step 4 and 5. The start point is now the last created point. A number of segments can be entered in this way.

Traverse Append

Cad_Traverse_Append

Position of option on menu: Strings =>CAD =>Lines =>Traverse append

or by selection of appropriate icon from the toolbar. 

This option adds vertices to the **end** of a super string by giving the bearing and distance of each vertex from the previous vertex. When a string is selected, the end of the string becomes the position that the bearing distance is taken from. The created vertex then become the position to take the next bearing and distance from.

On selecting Traverse append, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

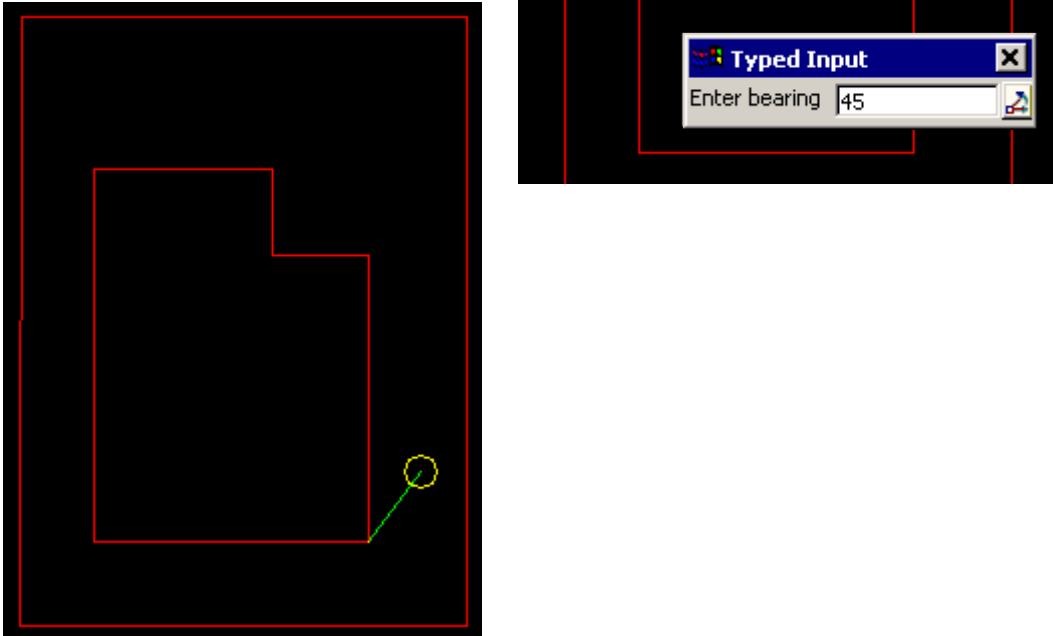

A string to append vertices to is selected and accepted. The end of this string becomes the position to define the first bearing distance from.

STEP 2:

A line is drawn from the last vertex to the current mouse position. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

**STEP 4:**

A point string is created using the information supplied.

**STEPS 4-5:**

The next bearing and distance is prompted for as per step 4 and 5. The start point is now the last created point. A number of segments can be entered in this way.

Traverse Edit

Cad_Traverse_Edit

Position of option on menu: Strings =>CAD =>Lines =>Traverse edit
or by selection of appropriate icon from the toolbar. 

This option changes the bearing and length of a selected line segment of a super string.

On selecting Traverse edit, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A line segment of a string is selected and accepted. This segment is the one to have its bearing distance redefined.

STEP 2:

A **Bearing** and then the **Distance** typed input boxes are presented with the current values for the line segment displayed. After new values are entered (or just <enter> if the original value is to be maintained) then the new bearing and distance values are applied to the start vertex of the segment to produce a new end vertex. The rest of the string keeps the same bearing/distances are in the original string.

Note: The Page up and page down keys can be used when the input bearing box comes up to add or subtract intervals of 90 degrees.

Taped Baseline

Cad_Tape_Baseline

Position of option on menu: Strings =>CAD =>Lines =>Taped baseline
or by selection of appropriate icon from the toolbar. 

This option creates a line string by entering distances between points and the offset distance to a user defined reference line string.

On selecting Taped baseline, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A start position of the reference line is selected and accepted.

Note: Originating at the start point, the reference line will extend to infinity after intercepting the 2nd point. The offset values are made relative to this reference line. The reference line will be removed once the option has been terminated.

**STEP 2:**

The interception point for the reference line is selected and accepted.

**STEP 3:**

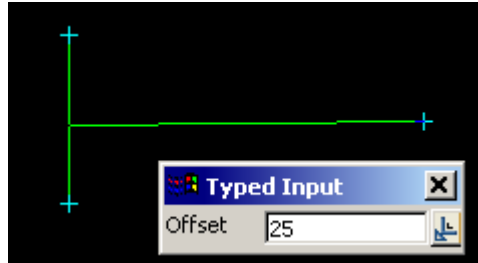

After the start and interception points are accepted, the reference line is constructed and the Distance Input box appears. A distance value is to be entered into the Input box, followed by the enter key. For the first point, the distance entered is relative to the start point of the reference line. A positive value means a distance towards the intercept point (from the start point).

Note: The distance is always relative to the previously entered vertex (positive is from start point to intercept point along the reference line).

**STEP 4:**

After the distance value has been entered, the Offset Input box will appear. Type the required offset value into the Input box and press the enter key.

Note: The offset distance is always relative to the reference line (negative is to the left).

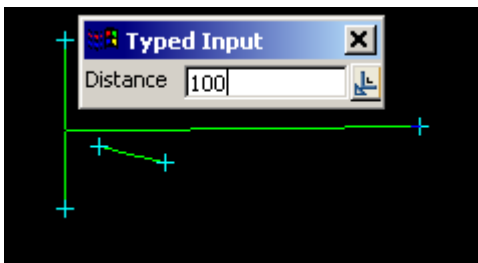

STEP 5:

Steps 3 and 4 should be repeated until the required number of vertices have been created in the line string.

STEP 6:

The option can be terminated by click on the close button **X** on the Input box, followed by the Esc key.

Taped Baseline Absolute

Cad_Tape_Baseline_Absolute

Position of option on menu: Strings =>CAD =>Lines =>Taped baseline absolute
 or by selection of appropriate icon from the toolbar. 

This option creates a line string by entering distances from the start point and the offset distance to a user defined reference line string.

On selecting Taped baseline absolute, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A start position of the reference line is selected and accepted.

Note: Originating at the start point, the reference line will extend to infinity after intercepting the 2nd point. The offset values are made relative to this reference line. The reference line will be removed once the option has been terminated.

STEP 2:

The interception point for the reference line is selected and accepted.

STEP 3:

After the start and interception points are accepted, the reference line is constructed and the Distance Input box appears. A distance value is to be entered into the Input box, followed by the enter key. For the absolute option, all distances entered are relative to the start point of the reference line. A positive value means a distance towards the intercept point (from the start point).

Note: For the absolute option, distances are always relative to the start point of the reference line (positive is from start point to intercept point along the reference line).

STEP 4:

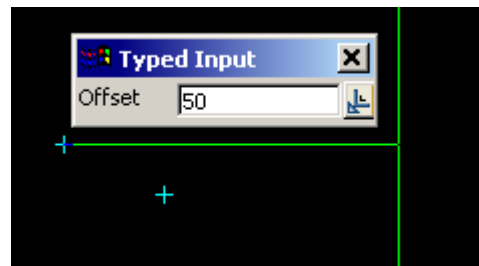

After the distance value has been entered, the Offset Input box will appear. Type the required offset value into the Input box and press the enter key.

Note: The offset distance is always relative to the reference line (negative is to the left).

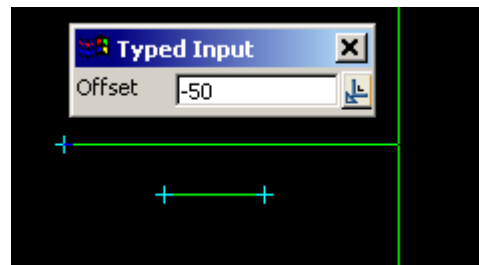

STEP 5:

Steps 3 and 4 should be repeated until the required number of vertices have been created in the line string.

STEP 6:

The option can be terminated by click on the close button **X** on the Input box, followed by the Esc key.

Tangent

Cad_Line_Tangent

Position of option on menu: Strings =>CAD =>Lines =>Tangent

or by selection of appropriate icon from the toolbar. 

This option creates the tangential line between two elements.

NOTE: This option is for super strings only. When Selecting an arc or circle, the selection must be a line snap with direction. If a point is selected on the arc/circle the line will be draw between the selected points and not the tangent.

On selecting Tangent, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A start position of the reference line is selected and accepted.

STEP 2:

The user selects and accepts the arc/circle segment with direction. The direction is required because there are two possible solutions. In this case, the direction was anti clockwise.

STEP 3:

After accepting the segment, a line is draw from the 1st selected point to the tangent point. Note that in this example, the arc is produced around so that a solution can be found.

CAD Intersect

cad_intersect

Position of option on menu: Strings =>CAD =>Intersect

The Intersect walk-right menu is

Menu of Options to Create One Points Strings by Intersections

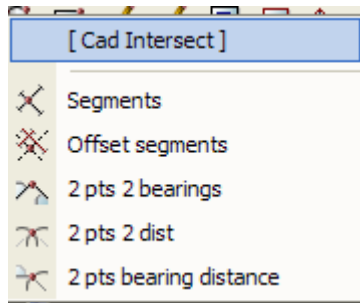

by intersecting two selected segments

by intersection two offsetted selected segments

by given bearings from two selected positions

create a point given distances from two selected positions

by select posn and bearing and another selected posn and dist

For the option *Segments*, go to the section "Intersect Segments"

Offset segments

"Intersect Offset Segments"

2 pts 2 bearings

"2 Points and 2 Bearings"

2 pts 2 dist

"2 Points and 2 Distances"

2 pts bearing distance

"2 Points, One Bearing and One Distance"

Intersect Segments

Cad_Intersect_Segments

Position of option on menu: Strings =>CAD =>Intersect =>Segments

or by selection of appropriate icon from the toolbar.

This option creates a point at the intersection of the projections of two line or arc segments.

On selecting Segments, the user is prompted for the relevant data in the screen message box

located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st segment is selected and accepted.

STEP 2:

The 2nd segment is selected and accepted.

STEP 3:

A point is created at the intersection of the two segments (if a solution exists). Note that the 2nd segment in this case has been projected to enable a solution to be calculated.

Intersect Offset Segments

Cad_Intersect_Segments_Offset

Position of option on menu: Strings =>CAD =>Intersect =>Offset segments

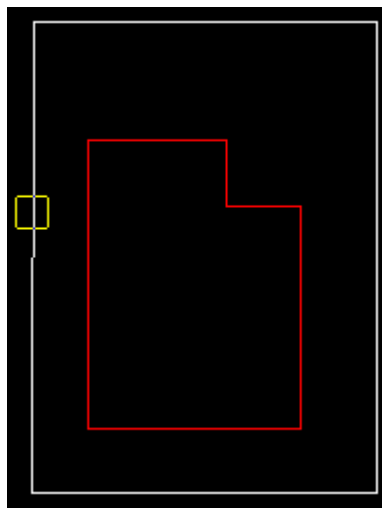

or by selection of appropriate icon from the toolbar. 

This option creates a point at the intersection of the offsets of two selected segments.

On selecting Offset segments, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st segment is selected and accepted with direction. This sets the positive direction of the offset to the right of the direction of pick.

STEP 2:

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the enter key.

**STEP 3:**

The 2nd segment is selected with direction and accepted. This sets the positive direction of the offset to the right of the direction of pick.

**STEP 4:**

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the enter key.

**STEP 5:**

A point is created at the intersection of the projected lines offset to the segments (if a solution exists).

2 Points and 2 Bearings

Cad_Intersect_Bearings

Position of option on menu: Strings =>CAD =>Intersect =>2 pts 2 bearings
or by selection of appropriate icon from the toolbar. 

This option creates a point by using two points and two bearings.

On selecting 2 pts 2 bearings, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

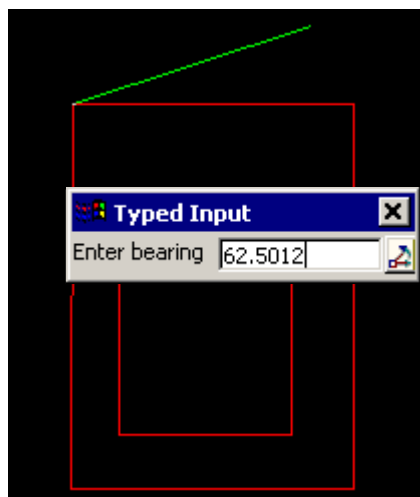

The 1st point is selected and accepted.

**STEP 2:**

A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

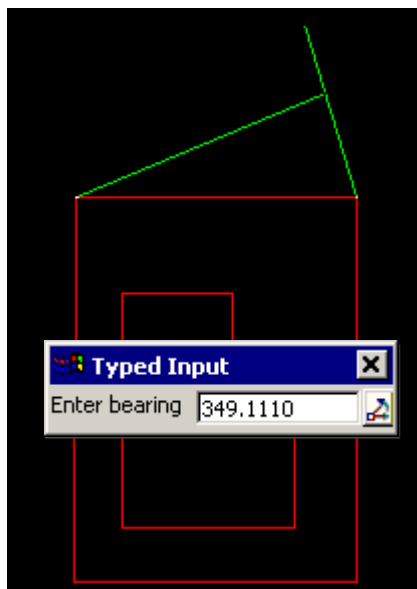

STEP 3:

The 2nd point to create the point from is selected and accepted.

STEP 4:

A bearing from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.

STEP 5:

The point is created if there is a valid solution.

2 Points and 2 Distances

Cad_Intersect_Distances

Position of option on menu: Strings =>CAD =>Intersect =>2 pts 2 dist
or by selection of appropriate icon from the toolbar. 

This option creates a point using two points and two distances.

On selecting 2 pts 2 dist, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected and accepted.

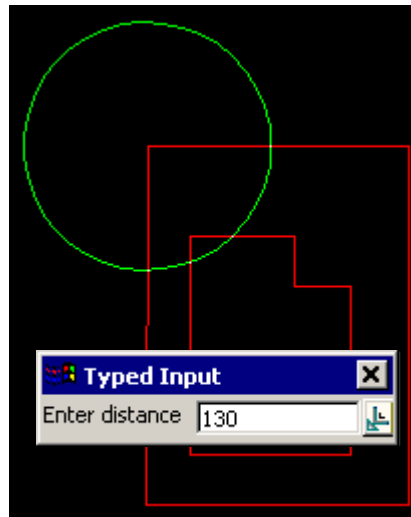

STEP 2:

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the

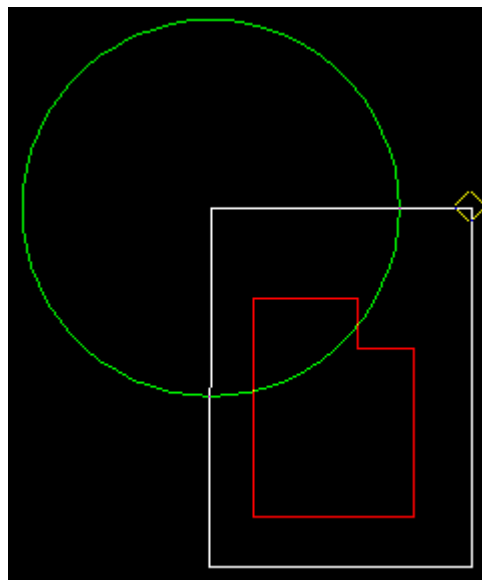

input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

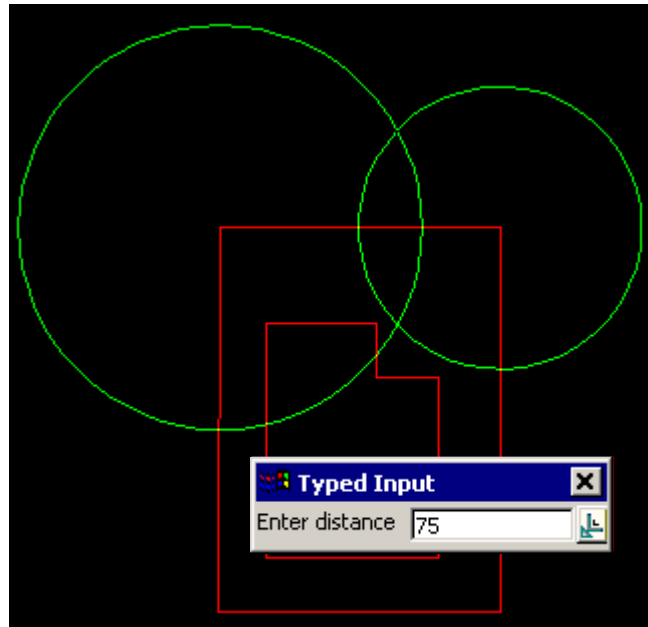

STEP 3:

The 2nd point to create the point from is selected.

STEP 4:

A distance from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.

**STEP 5:**

As there is two solutions, the user can select the correct one depending on the method of construction. This can be done by the direct entry of distances or by use of the mouse.

1. Distance entry. After the entry of the 1st distance, the 2nd point is selected. Following the selection of the 2nd point, the 2nd radius is shown (rubber banding). The user can select one of the two solutions by choosing with a **LB** mouse click over the approximate position of the required solution. The solution chosen is the closest solution to the selected point. The final radius can then be entered via the keyboard by simply starting typing which brings up the radius entry panel automatically. This panel can also be activated by pressing the space bar.
2. Use of the mouse. The 1st point is selected and the radius entered by using the mouse or by direct entry from the keyboard. The 2nd point is then selected and the 2nd radius is displayed (rubber banding). A solution can be chosen by selecting with a **LB** mouse click over the required solution. The final solution will be the closest one to the selection. **MB** to accept the intersection and create the point.

**STEP 6:**

The point is created if there is a valid solution.

2 Points, One Bearing and One Distance

Cad_Intersect_Bearing_Distance

Position of option on menu: Strings =>CAD =>Intersect =>2 pts bearing distance
or by selection of appropriate icon from the toolbar. 

This option creates a point from a given point and a bearing, and a second point and a distance.

On selecting 2 pts 2 bearing distance, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected and accepted.

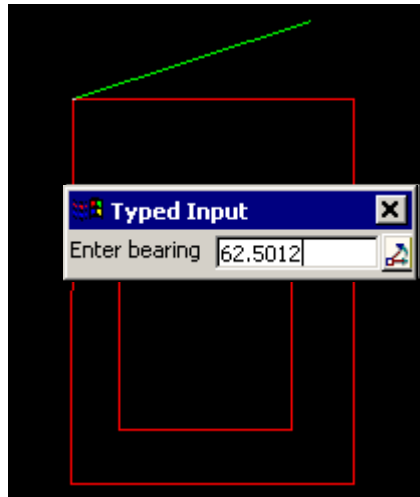

STEP 2:

A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

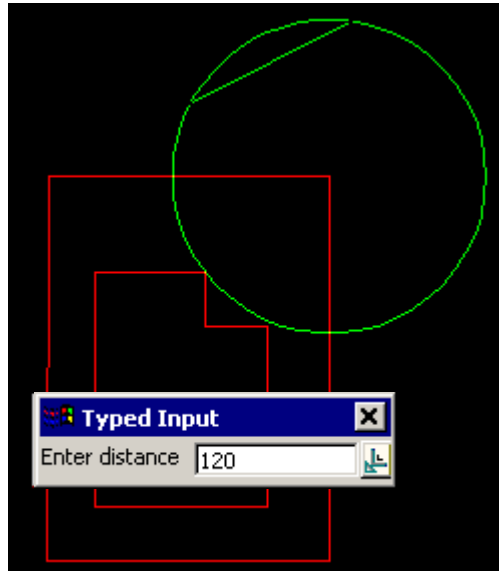

The 2nd point to create the point from is selected and accepted.

STEP 4:

A distance from the 2nd point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

A line is drawn between the two possible solutions.

STEP 5:

As there is two solutions, the user can select the correct one with the mouse.

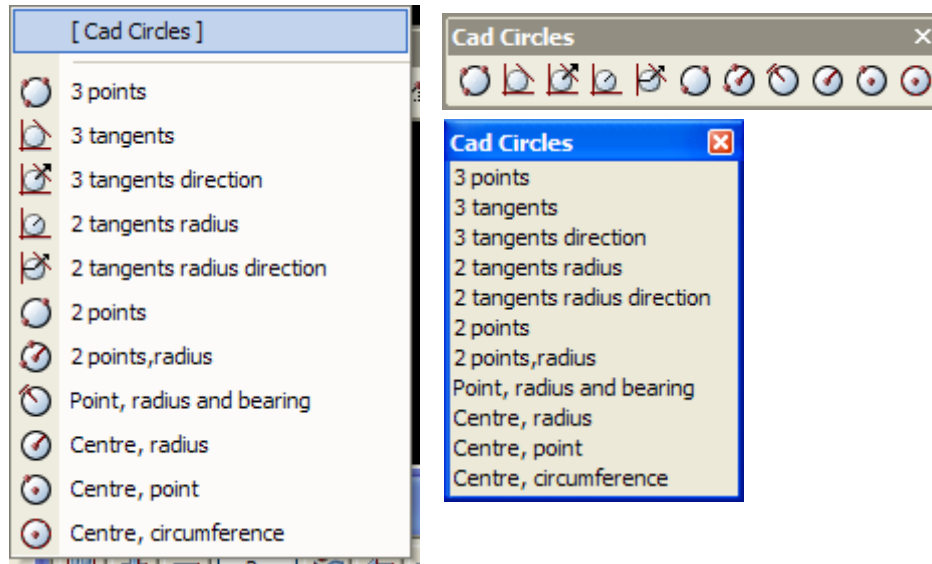

CAD Circles

cad_circles

Position of option on menu: Strings =>CAD =>Circles

3 Points on the Circle

Cad_Circle_3_Points

Position of option on menu: Strings =>CAD =>Circles =>3 points

or by selection of appropriate icon from the toolbar. 

This option creates the circle through three selected points.

On selecting 3 points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

The 2nd point is selected and accepted.

After the 2nd point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.

STEP 3:

The 3rd point is selected and accepted.

STEP 4:

A circle is constructed through the three selected points

Circle by 3 Tangents

Cad_Circle_3_Tangents_Logical

Position of option on menu: Strings =>CAD =>Circles =>3 Tangents

or by selection of appropriate icon from the toolbar. 

This option creates a circle that is tangential to three selected segments.

On selecting 3 tangents, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

STEP 2:

The 2nd tangent is selected and accepted.

STEP 3:

The 3rd tangent is selected and accepted.

STEP 4:

A circle is constructed that touches each of the three selected tangents.

Circle by 3 Tangents with Direction

Cad_Circle_3_Tangents_Directional

Position of option on menu: Strings =>CAD =>Circles =>3 tangents direction
or by selection of appropriate icon from the toolbar. 

This option creates a circle that is tangential to three selected segments. The segments are selected in order and with direction and the circle is to the right of the direction of the selected segments.

On selecting **3 tangents direction**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see 'Picking with Direction' in Chapter 3 - **Tools and Concepts** on page 77.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

STEP 2:

The 2nd tangent is selected and accepted.

STEP 3:

The 3rd tangent is selected and accepted.

STEP 4:

If a solution exists, a circle is constructed using the given information.

Circle by 2 Tangents and a Typed Radius

Cad_Circle_2_Tangents_Radius_Logical

Position of option on menu: Strings =>CAD =>Circles =>2 tangents radius

or by selection of appropriate icon from the toolbar. 

This option creates a circle with a given radius that is tangential to two selecting segments.

On selecting **2 tangents radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the 1st tangent with the mouse (Left Button) and accept it (Middle Button).

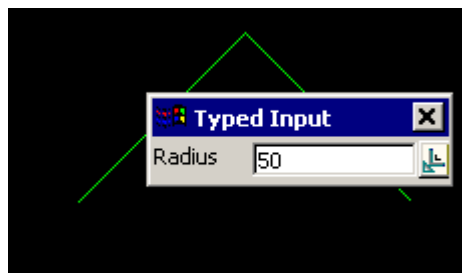

STEP 2:

Select the 2nd tangent and accept it.

**STEP 3:**

After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the radius by measuring existing elements.

**STEP 4:**

If a solution exists, a circle is fitted touching the two selected tangents using the given radius and directions.

Circle by 2 Tangents and a Typed Radius with Direction

Cad_Circle_2_Tangents_Radius_Directional

Position of option on menu: Strings =>CAD =>Circles =>2 tangents radius direction

or by selection of appropriate icon from the toolbar. 

This option creates a circle with a given radius that is tangential to two selected segments that are picked with direction.

On selecting **2 tangents radius direction**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see 'Picking with

Direction' in Chapter 3 - **Tools and Concepts** on page 77.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

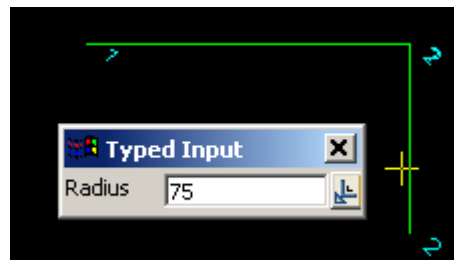

STEP 2:

The 2nd tangent is selected and accepted.

STEP 3:

After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 4:

If a solution exists, a circle is constructed using the given information.

Circle by 2 Diametrically Opposed Points

Cad_Circle_2_Points

Position of option on menu: Strings =>CAD =>Circles =>2 points

or by selection of appropriate icon from the toolbar. 

This option creates a circle by selecting two points that define the diameter of the circle.

On selecting 2 points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor (cursor position taken as the other end of a diameter). This will continue until the 2nd point is selected and accepted.

STEP 2:

The 2nd point is selected and accepted.

STEP 3:

The circle is constructed through the two selected points. The two points define the diameter.

Circle by 2 Points on the Circle and a Typed Radius

Cad_Circle_2_Points_Radius

Position of option on menu: Strings =>CAD =>Circles =>2 points, radius

or by selection of appropriate icon from the toolbar. 

This option creates a circle of a given radius that goes through two selected points.

On selecting 2 points, radius, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.

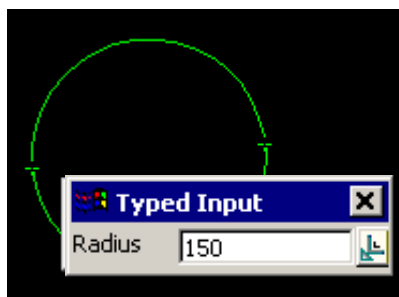

STEP 2:

The 2nd point is selected and accepted.

STEP 3:

After the 2nd point is accepted, the Radius Input box will appear. The radius value is entered into the input box followed by the enter key.

STEP 4:

If a solution exists, the circle is fitted through the two selected points using the given radius.

Circle by Point, Tangential Bearing at the Point and Typed Radius

Cad_Circle_Point_Radius_Bearing

Position of option on menu: Strings =>CAD =>Circles =>Point, radius and bearing
or by selection of appropriate icon from the toolbar. 

This option creates a circle of a given radius, a selected point on the circle and the bearing of the tangent to the circle at that point.

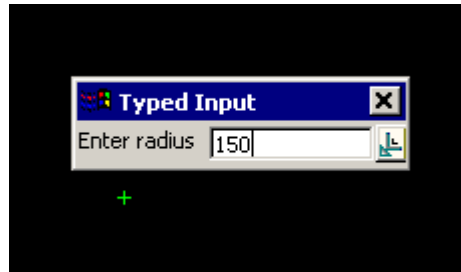

On selecting Point, radius and bearing, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

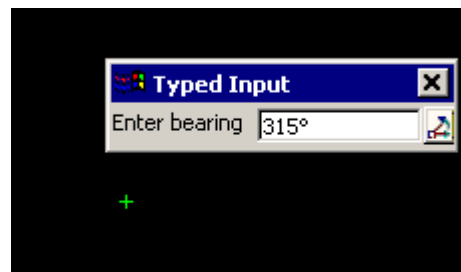

**STEP 2:**

After the 1st point is accepted, the **Enter radius** input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**

After the radius has been entered, the **Enter bearing** input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Enter Bearing input box comes up to add or subtract intervals of 90 degrees.

**STEP 4:**

If a solution exists, a circle is fitted from the given bearing at the selected point using the selected radius.

Circle by Centre and Typed Radius

Cad_Circle_Centre_Radius

Position of option on menu: Strings =>CAD =>Circles =>Centre, radius
or by selection of appropriate icon from the toolbar. 

This option creates a circle of a given radius and a selected centre point

On selecting **Centre, radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**

The circle is constructed through the centre point using the specified radius.

Circle by Centre and Point on Circle

Cad_Circle_Centre_Point

Position of option on menu: Strings =>CAD =>Circles =>Centre, point

or by selection of appropriate icon from the toolbar. 

This option creates a circle by selecting a centre point and then using the cursor to select a second point that in on the circle.

On selecting Centre, point, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the point into the Input box and press the enter key.

STEP 3:

A circle is constructed using the two points defined by the user.

Circle by Centre and Typed Circumference

Cad_Circle_Centre_Circumference

Position of option on menu: Strings =>CAD =>Circles =>Centre, circumference

or by selection of appropriate icon from the toolbar. 

This option creates a circle by selecting the centre point and giving a circumference value.

On selecting Centre, circumference, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

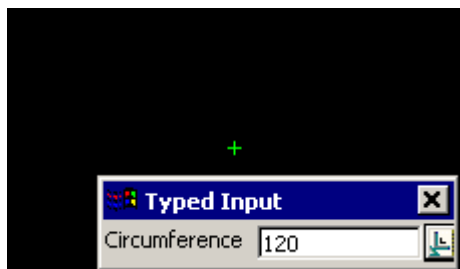

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted, the **Circumference** Input box will appear. Type the circumference length into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

A circle is constructed using the centre point and the given circumference.

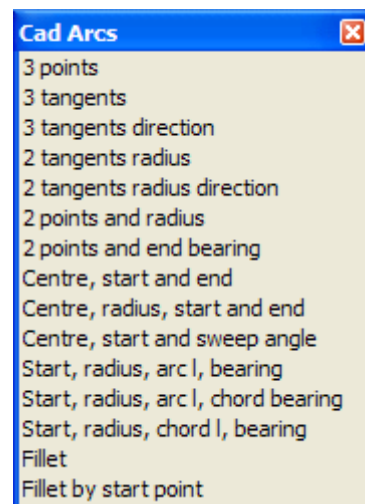

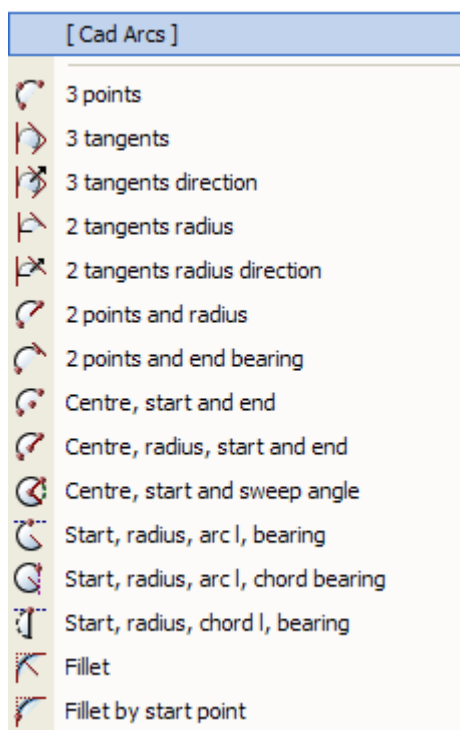

CAD Arcs

cad_arcs

Position of option on menu: Strings =>CAD =>Arcs

The arc options creates **super string arcs**, not arc strings. The options Strings =>Create =>Arcs create arc strings.

The Arcs walk-right menu is

Arc by 3 points

Cad_Arc_3_Points

Position of option on menu: Strings =>CAD =>Arcs =>3 points

or by selection of appropriate icon from the toolbar. 

This option creates the arc through three selected points and the first and third points are the start and end of the arc.

On selecting 3 points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

The 2nd point is selected and accepted.

After the 2nd point is accepted an arc will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.

STEP 3:

The 3rd point is selected and accepted.

**STEP 4:**

An arc is constructed through the three selected points.

Arc by 3 Tangents

Cad_Arc_3_Tangents_Logical

Position of option on menu: Strings =>CAD =>Arcs =>3 tangents

or by selection of appropriate icon from the toolbar. 

This option creates an arc that is tangential to three selected segments. The first and third segments are the start and end of the arc.

On selecting 3 tangents, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

**STEP 2:**

The 2nd tangent is selected and accepted.

**STEP 3:**

The 3rd tangent is selected and accepted.

**STEP 4:**

The arc is constructed touching the three selected tangents.

Arc by 3 Tangents with Direction

Cad_Arc_3_Tangents_Directional

Position of option on menu: Strings =>CAD =>Arcs =>3 tangents direction

or by selection of appropriate icon from the toolbar. 

This option creates an arc that is tangential to three selected segments. The segments are selected in order and with direction and the arc is to the right of the direction of the selected segments. The first and third segments are the start and end of the arc.

On selecting 3 tangents direction, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The arc will be constructed to the right of the tangent. A user may reverse the direction of the tangent by selecting a tangent *with direction*. For further notes on picking tangents with direction, see 'Picking with Direction' in Chapter 3 - **Tools and Concepts** on page 77.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

**STEP 2:**

The 2nd tangent is selected and accepted.

**STEP 3:**

The 3rd tangent is selected and accepted.

**STEP 4:**

If a solution exists, an arc is constructed using the given information.

Arc by 2 Tangents and a Typed Radius

Cad_Arc_2_Tangents_Radius_Logical

Position of option on menu: Strings =>CAD =>Arcs =>2 tangents radius

or by selection of appropriate icon from the toolbar. 

This option creates an arc with a given radius that is tangential to two selecting segments. This is

the same as a fillet.

On selecting 2 tangents radius, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

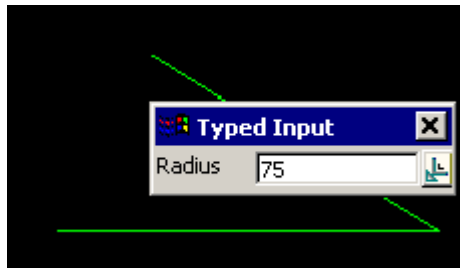

STEP 2:

The 2nd tangent is selected and accepted.

STEP 3:

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 4:

If a solution exists, the arc is fitted through the two selected tangents using the given radius.

Arc by 2 Tangents and a Typed Radius with Direction

Cad_Arc_2_Tangents_Radius_Directional

Position of option on menu: Strings =>CAD =>Arcs =>2 tangents radius direction

or by selection of appropriate icon from the toolbar. 

This option creates an arc with a given radius that is tangential to two selected segments that are picked with direction.

On selecting 2 tangents radius direction, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The arc will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see 'Picking with Direction' in Chapter 3 - **Tools and Concepts** on page 77.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

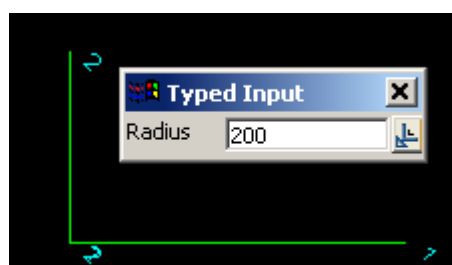

STEP 2:

The 2nd tangent is selected and accepted.

STEP 3:

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 4:

If a solution exists, the arc is fitted through the two selected tangents using the given radius.

Arc by 2 Points and a Typed Radius

Cad_Arc_2_Points_Radius

Position of option on menu: Strings =>CAD =>Arcs =>2 points and radius

or by selection of appropriate icon from the toolbar. 

This option creates an arc of a given radius that starts and ends on two selected points.

On selecting 2 points and radius, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**

The 2nd point is selected and accepted.

**STEP 3:**

After the start point is accepted, the Arc Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 4:**

If a solution exists, an arc is constructed using the given information.

Arc by 2 Points and an End Bearing

Cad_Arc_2_Points_End_Bearing

Position of option on menu: Strings =>CAD =>Arcs =>2 points and end bearing

or by selection of appropriate icon from the toolbar. 

This option creates an arc that starts and end on two selected points and has a given bearing of the tangent at the end point (the end bearing).

On selecting 2 points and end bearing, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

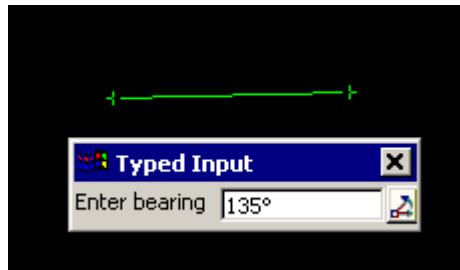

**STEP 2:**

The 2nd point is selected and accepted.

**STEP 3:**

After the 2nd point is accepted, the Enter bearing input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Enter Bearing input box comes up to add or subtract intervals of 90 degrees.

**STEP 4:**

If a solution exists, the arc is fitted through the two selected points with the end point of the given bearing.

Arc by Centre, Start and End Points

Cad_Arc_Centre_End_Points

Position of option on menu: Strings =>CAD =>Arcs =>Centre, start and end
or by selection of appropriate icon from the toolbar. 

This option creates an arc by selecting in order, the centre point and the start and end points. The radius of the arc is the distance between the centre and the start point.

On selecting Centre, start and end, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ

Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.

STEP 2:

Select and accept the start point. This point defines the radius and the start of the arc.

STEP 3:

The end point of the arc is specified.

STEP 4:

The arc is constructed using the given information.

Arc by Centre, Typed Radius, Start and End Points

Cad_Arc_Centre_Radius_End_Points

Position of option on menu: Strings =>CAD =>Arcs =>Centre, radius, start, end
or by selection of appropriate icon from the toolbar. 

This option allows the creation of an arc given a centre point, radius, start and end points.

This option creates an arc of a given radius by selecting in the centre point and the start and end positions.

On selecting Centre, radius, start, end, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.

STEP 2:

A radius value is selected with the mouse or entered in via the keyboard. To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the enter key. The browse button  on the Input box can be used to define the arc distance by measuring existing elements.

STEP 3:

A start point defines the start of the sweep angle to define where to start the arc. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 4:**

The end point of the arc is specified. The start and end points define the sweep angle to define the arc. The rubber banding of the arc will use the cursor position as the end position until a end point is selected and accepted. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The end point does not have to be on the arc itself. It is used to define the sweep angle.

**STEP 5:**

The arc is constructed using the given information.

Arc by Centre, Start point and Sweep Angle

Cad_Arc_Centre_Start_Sweep

Position of option on menu: Strings =>CAD =>Arcs =>Centre, start, sweep
or by selection of appropriate icon from the toolbar. 

This option creates an arc by selecting a centre point and a start point and giving a sweep angle. The radius of the arc is the distance between the centre and start point.

On selecting Centre, start, sweep, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a

centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.

STEP 2:

The 2nd point is selected with the mouse or entered in via the keyboard. This point defines the radius as well as the start point of the arc. To specify the 2nd point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 3:

After the 2nd point is accepted, the **Sweep Angle** input box will appear. Type the sweep angle value into the input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

STEP 4:

The arc is created using the information supplied

Arc by Start Point, Typed Radius, Arc Length and Start Bearing

Cad_Arc_Start_Radius_Bearing

Position of option on menu: Strings =>CAD =>Arcs =>Start, radius, arc l, bearing
or by selection of appropriate icon from the toolbar. 

This option creates an arc of a given radius, starting at a selected point and bearing of the tangent at the start point and going for a given arc length.

On selecting the Start, radius, arc l, bearing option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the start point is accepted, the Arc Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

After the radius has been entered, the Arc Length Input box will appear. Type the arc length into the Input box and press the enter key. The browse button  on the Input box can be used to

define the arc distance by measuring existing elements.

STEP 4:

After the arc length is accepted, the Bearing Input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.

STEP5:

The arc is created with the given information.

Arc by Start Point, Typed Radius, Arc Length and Chord Bearing

Cad_Arc_Start_Radius_Chord_Bearing

Position of option on menu: Strings =>CAD =>Arcs =>Start, radius, arc l, chord bearing
or by selection of appropriate icon from the toolbar. 

This option creates an arc of a given radius, starting from a selected point and with a given chord bearing at the start point and a given arc length.

On selecting Start, radius, arc l, chord bearing, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

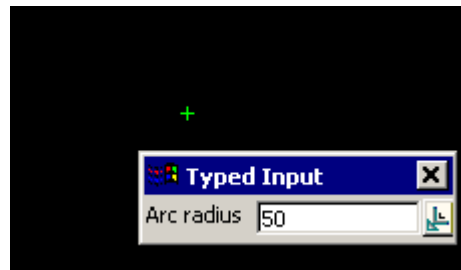

The start point is selected with the mouse or entered in via the keyboard. To specify the start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To

enter the start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

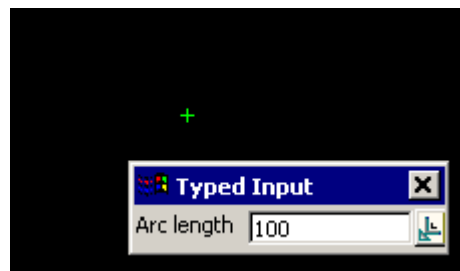

STEP 2:

After the start point is accepted, the **Arc Radius** Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

After the arc radius is entered, the **Arc Length** Input box will appear. Type the arc length into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc distance by measuring existing elements.

STEP 4:

After the arc length is entered, the **Chord Bearing** Input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Chord Bearing Input box comes up to add or subtract intervals of 90 degrees.

**STEP 5:**

An arc is created with the given information.

Arc by Start Point, Typed Radius, Chord length and a bearing

Cad_Arc_Start_Radius_Chord_Length

Position of option on menu: Strings =>CAD =>Arcs =>start, radius, chord length, bearing
or by selection of appropriate icon from the toolbar. 

This option creates an arc of a given radius, starting from a selected point, with a given bearing of the tangent at the start point and a given chord length from the start point.

On selecting Start, radius, chord length, bearing, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**

After the start point is accepted, the **Arc Radius** Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**

After the radius has been entered, the **Chord Length** Input box will appear. Type the chord length into the Input box and press the enter key. The browse button  on the Input box can be used to define the chord length by measuring existing elements.

**STEP 4:**

After the chord length has been entered, the **Bearing** Input box will appear. Type the bearing of the start tangent into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.

**STEP 5:**

The arc is created with the given information.

Fillet by Typed Radius

Cad_Create_Fillet_by_radius

Position of option on menu: Strings =>CAD =>Arcs =>Fillet

or by selection of appropriate icon from the toolbar. 

This option creates an arc given a fillet radius

On selecting Fillet, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st segment where the fillet is to depart from is selected and accepted. This should be done by a pick with direction. The direction will influence the calculations as there are a number of solutions for intersecting segments. In the case shown, the direction was in a north-east direction.

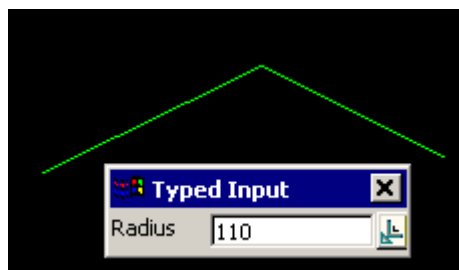

STEP 2:

The 2nd segment where the fillet is to arrive from is selected and accepted. This should be done by a pick with direction. The direction will again influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a south-east direction.

STEP 3:

After the 2nd segment is accepted, the Arc Radius Input box will appear. Type the radius of the fillet in the Input box (positive radius for curves curving to the right) and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 4:

The fillet arc is placed between the selected segments.

Fillet by Start Tangent Point

Cad_Create_Fillet_by_Start_Point

Position of option on menu: Strings =>CAD =>Arcs =>Fillet by start point

or by selection of appropriate icon from the toolbar. 

This option creates an arc that is a fillet between two selected sections and with a selected fillet start point (which will be a tangent point of the created arc).

On selecting Fillet by start point, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st segment where the fillet is to depart from is selected and accepted. This should be done by a pick with direction. The direction will influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a north-east direction.

**STEP 2:**

The 2nd segment where the fillet is to arrive from is selected and accepted. This should be done by a pick with direction. The direction will again influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a south-east direction

**STEP 3:**

The tangent start point of the fillet is selected and accepted.

STEP 4:

The fillet arc is placed between the selected segments.

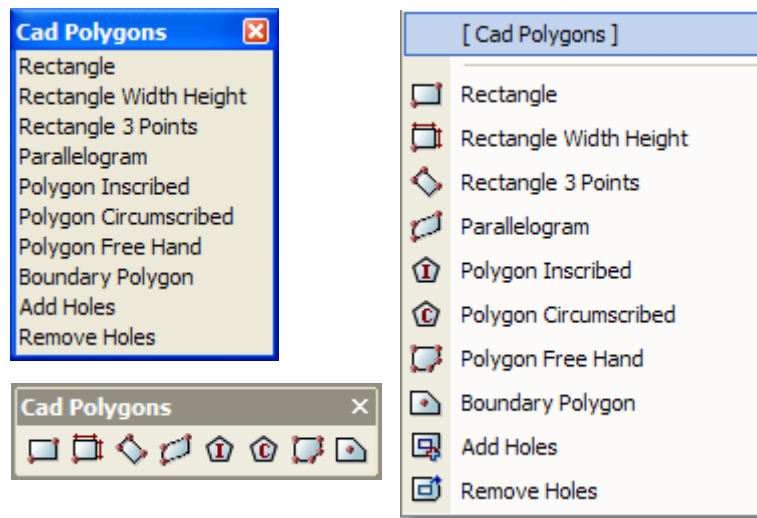

CAD Polygons

cad_polygons

Position of option on menu: Strings =>CAD =>Polygons

The Cad polygons walk-right menu is

For the option *Rectangles*, go to the section “Create Rectangle” .

<i>Rectangle width height</i>	“Rectangle by Width and Height” .
<i>Rectangle 3 points</i>	“Rectangle by 3 Points” .
<i>Parallelogram</i>	“Create Parallelogram” .
<i>Polygon inscribe</i>	“Polygon Inscribed in a Circle” .
<i>Polygon circumscribe</i>	“Polygon Circumscribed About a Circle” .
<i>Polygon freehand</i>	“Free Hand Polygon” .
<i>Boundary polygon</i>	“Create Boundary Polygon” .
<i>Add holes</i>	“Add Holes”
<i>Remove holes</i>	“Remove Holes”

Create Rectangle

Cad_Create_Rectangle

Position of option on menu: Strings =>CAD =>Polygons =>Rectangle

or by selection of appropriate icon from the toolbar. 

This option creates a rectangle parallel to the x and y axis by selecting two end points of the rectangle.

On selecting **Rectangle**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a rectangle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 3:**

The **Corner radius** typed input panel is then displayed. If a radius is entered then it is used to fillet the four corners of the rectangle. To not fillet the rectangle corners, simply leave the **Corner radius** box empty and press the <enter> key.

**STEP 4:**

The rectangle is created with the given information.

Rectangle by Width and Height

Cad_Create_Rectangle_by_Width_and_Height

Position of option on menu: Strings =>CAD =>Polygons =>Rectangle Width Height
or by selection of appropriate icon from the toolbar. 

This option allows the creation of a rectangle given a start point, width and height.

This option creates a rectangle parallel to the x and y axis by selecting a start point and giving the width and height of the rectangle.

On selecting Rectangle Width Height, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The start point is selected with the mouse or entered in via the keyboard. To specify the start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

This point defines the bottom left point of the rectangle.

After the start point is accepted, the width will be displayed 'rubber banding' to right of the start point (positive distance). The width is equal to the distance from the start point to the position of the cursor. This will continue until the width is selected and accepted.

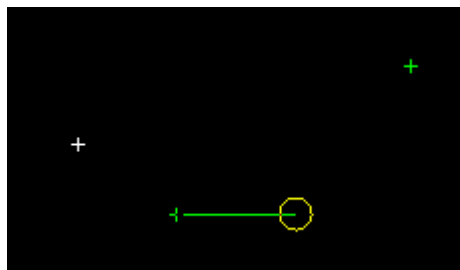

STEP 2:

The width is selected with the mouse or entered in via the keyboard. To specify the width with the mouse, a point must be selected and accepted. To enter the width with the keyboard, simply start typing or press the space bar to bring up the Distance Input box. Type the distance into the Distance Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

A negative distance (to the left of the 1st point) can be entered via the Distance Input box in two ways. Either type a negative distance, or use the browse button  to select a distance, then place a minus "-" sign in front of the distance value.

After the width is accepted, the width of the rectangle is confirmed and the height will be displayed 'rubber banding' upwards on the screen. The height is equal to the distance from the found width point to the position of the cursor. The rectangle will be created once the height is selected and accepted.

STEP 3:

The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the height with the keyboard, simply start typing or press the space bar to bring up the Distance Input box. Type the distance into the Distance Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

A negative distance (below of the 2nd point) can be entered via the Distance Input box in two ways. Either type a negative distance, or use the browse button  to select a distance, then place a minus "-" sign in front of the distance value.

**STEP 4:**

The **Corner radius** typed input panel is then displayed. If a radius is entered then it is used to fillet the four corners of the rectangle. To not fillet the rectangle corners, simply leave the **Corner radius** box empty and press the <enter> key.

**STEP 5:**

The rectangle is created with the given information.

Rectangle by 3 Points

Cad_Create_Rectangle_by_3_Points

Position of option on menu: Strings =>CAD =>Polygons =>Rectangle 3 Points

or by selection of appropriate icon from the toolbar. 

This option creates a rectangle by selecting three points. The first and second point define the base of the rectangle and the third point is on the opposite side of the rectangle.

On selecting **Rectangle 3 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted, the base of the rectangle will be displayed 'rubber banding' on the screen. The baseline length is equal to the distance from the 1st point to the position of the cursor. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

After the 2nd point is accepted, the baseline of the rectangle is confirmed and the height will be displayed 'rubber banding' on the screen. The height is equal to the distance from the 2nd point to the position of the cursor. The rectangle will be created once the height is selected and accepted.

**STEP 3:**

The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the 3rd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

**STEP 4:**

The **Corner radius** typed input panel is then displayed. If a radius is entered then it is used to fillet the four corners of the rectangle. To not fillet the rectangle corners, simply leave the **Corner radius** box empty and press the <enter> key.

**STEP 5:**

The rectangle is created with the given information.

Create Parallelogram

Cad_Create_Parallelogram

Position of option on menu: Strings =>CAD =>Polygons =>Parallelogram
or by selection of appropriate icon from the toolbar. 

This option allows the creation of a parallelogram given 3 points.

This option creates a parallelogram by selecting three points. The first and second point define the base of the parallelogram and the third point is the end point of the opposite side of the parallelogram.

On selecting **Parallelogram**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted, the base of the rectangle will be displayed 'rubber banding' on the screen. The baseline length is equal to the distance from the 1st point to the position of the cursor. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard,

simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

After the 2nd point is accepted, the baseline of the parallelogram is confirmed and the height will be displayed 'rubber banding' on the screen. The height is equal to the distance from the 2nd point to the position of the cursor. The parallelogram will be created once the height is selected and accepted.

STEP 3:

The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the 3rd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

STEP 4:

The **Corner radius** typed input panel is then displayed. If a radius is entered then it is used to fillet the four corners of the rectangle. To not fillet the rectangle corners, simply leave the **Corner radius** box empty and press the <enter> key.

STEP 5:

The parallelogram is created with the given information.

Polygon Inscribed in a Circle

Cad_Create_Polygon_Inscribed_in_Circle

Position of option on menu: Strings =>CAD =>Polygons =>Polygon Inscribed

or by selection of appropriate icon from the toolbar. 

This option creates a polygon with a user defined number of sides on the inside of a circle.

The polygon is constructed inside a circle, thus each corner of the polygon touches the circumference of the circle defined by the user. Conversely using the **Polygon circumscribed** option, the midpoint of each side of the polygon touches the circumference of the circle creating a polygon outside the circle.

On selecting **Polygon inscribed**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

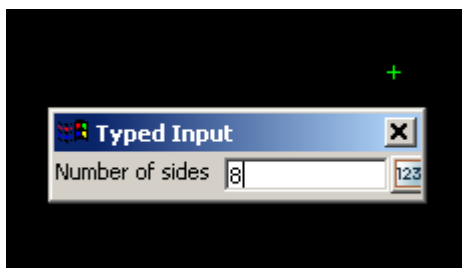

The centre point is selected with the mouse or entered in via the keyboard. To specify the centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted, the Number of Sides Input box will appear. Type in the desired number of sides for the polygon into the Input box and press the enter key.

After the number of sides have been selected, the polygon will be displayed 'rubber banding' on the screen. The polygon will be created once the radius is selected and accepted.

STEP 3:

Before a polygon can be created inside the circle, its radius must be defined by the user. To specify the radius with the mouse, a point must be selected and accepted. To enter the point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

Note: One of the polygon's corners will be located on the point selected to defined the circle's radius

**STEP 4:**

A polygon is created inside a circle with a radius defined by the user.

Polygon Circumscribed About a Circle

Cad_Create_Polygon_Circumscribed_about_Circle

Position of option on menu: Strings =>CAD =>Polygons =>Polygon circumscribed

or by selection of appropriate icon from the toolbar. 

This option creates a polygon with a user defined number of sides on the outside a circle.

The polygon is constructed outside a circle, thus the midpoint of each side of the polygon touches the circumference of the circle defined by the user. Conversely using the **Polygon inscribed** option, each corner of the polygon touches the circumference of the circle creating a polygon inside the circle.

On selecting Polygon circumscribed, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

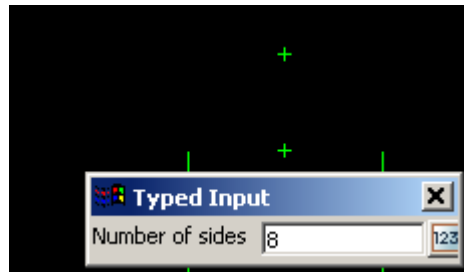

STEP 1:

The centre point is selected with the mouse or entered in via the keyboard. To specify the centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**

After the centre point is accepted, the Number of Sides Input box will appear. Type in the desired number of sides for the polygon into the Input box and press the enter key.

After the number of sides have been selected, the polygon will be displayed 'rubber banding' on the screen. The polygon will be created once the radius is selected and accepted.

**STEP 3:**

Before a polygon can be created outside the circle, its radius must be defined by the user. To specify the radius with the mouse, a point must be selected and accepted. To enter the point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

Note: One midpoint of the polygon's side will be located on the point selected to defined the circle's radius

**STEP 4:**

A polygon is created outside the circle with a radius defined by the user.

Free Hand Polygon

Cad_Create_Polygon

Position of option on menu: Strings =>CAD =>Polygons =>Polygon freehand
or by selection of appropriate icon from the toolbar. 

This option creates a closed polygon from selected vertices.

On selecting **Polygon freehand**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Pick and accept the position to form the vertices of the polygon. As each vertex is accepted, the polygon is automatically closed.

STEP 2:

The polygon is finished by pressing the <esc> key.

Create Boundary Polygon

Cad_Create_Boundary_Polygon

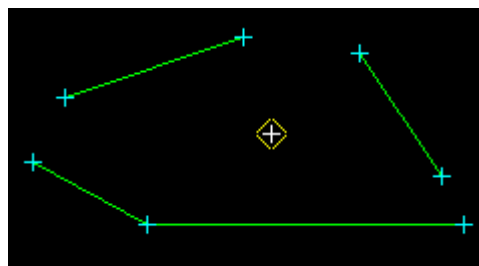

Position of option on menu: Strings =>CAD =>Polygons =>Boundary Polygon
or by selection of appropriate icon from the toolbar. 

This option tries to form a boundary from a selected set of segments.

On selecting **Boundary Polygon**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Pick a position inside the lines to form a bounding polygon.

STEP 2:

A circle is then drawn centred on the selected position with circumference going through the position of the cursor. Drag the cursor out until it encloses all the data to be used to create the closest bounding polygon around the centre.

STEP 3:

On accepting the circle position, an attempt is made to create the inner polygon using all the lines inside the circle. Parts of lines will only be used if they can be joined to the centre by a straight line which doesn't cross any other side.

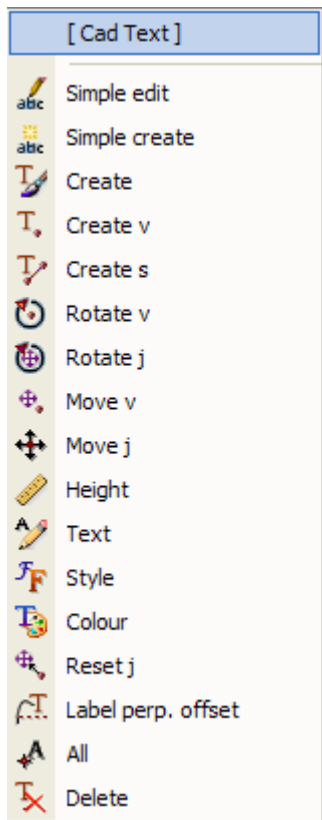

CAD Text

cad_text

Position of option on menu: Strings =>CAD =>Text

The Text walk-right menu is

Menu of Options to Create and Manipulate Text

edit text using grips

create text string and edit using grips

create text string at a selected position

create text at a user selected super string vertex

create text at a user selected super string segment

rotate text about its vertex

rotate text about its justification points (which may be offset from the vertex)

move text by its vertex

move text by its justification point (the vertex does not move)

change the height of text

change the characters of the text

change the style of text

change the colour of text

reset the text justification point so that it is on top of the vertex position

menu to make most of the above changes to one selected text

delete text

Text can occur as a text string, on vertices of a 4d string, and on vertices and segments of a super string. Each type of text has a vertex (these are displayed when **Vertices** are toggle on in a plan view), a justification point, a rotation, an offset and raise value. The vertex and justification point

only coincide if the offset and raise values are both zero. All text on a 4d string must have the same height, colour, angle, offset and raise. What parts of the text on a super string vertex or super string segment can be independently modified depends on the settings for the super string.

For some text options, the created elements will have attributes defined by the **Text Controlbar** (text type and size) and **CAD Controlbar** (model and colour). For more information, go to the section “Text Controlbar” and “CAD Controlbar” .

For the option *Simple edit*, please go to the section. “Simple Text Edit”

<i>Simple create</i>	“Simple Text Create”
<i>Create</i>	“Text Create”
<i>Create v</i>	“Create Text on Vertex of Super String”
<i>Centre s</i>	“Text Create on Segment of Super Strings”
<i>Rotate v</i>	“Rotate Text around Vertex”
<i>Rotate j</i>	“Rotate Text about the Justification Point”
<i>Move v</i>	“Move the Text Vertex Point”
<i>Move j</i>	“Move the Text Justification Point”
<i>Height</i>	“Height of Text”
<i>Text</i>	“Change Text”
<i>Style</i>	“Style of Text”
<i>Colour</i>	“Text Colour”
<i>Reset j</i>	“Reset Text Justification Point”
<i>Label perp. offset</i>	“Label Perpendicular Offset”
<i>All</i>	“All Text Edits”
<i>Delete</i>	“Text Delete”

Simple Text Edit

Cad_Edit_Simple_Text

Position of option on menu: Strings =>CAD =>Text =>Simple edit

or by selection of appropriate icon from the toolbar. 

This option edits text strings, and text on super string vertices or segments, using grips to quickly define the mode of editing (sizing, rotating or moving the justification point).

On selecting Simple edit, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

When the text to be edited is selected, grips for size, rotating and moving the justification point are displayed. The appropriate grip is then selected for quick editing.

Size Grip (diamond):

If the **Size grip** is selected, the text size is dynamically adjusted by moving the cursor. The size of the text is displayed as part of the *Enter height* prompt in the message area.

The text size is set when a position is accepted.

An **exact** text size can be entered by hitting the <space bar> or by starting to type a size. This brings up the **Enter distance** typed input box. The size is typed in and the <enter> key pressed.

To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the text is being dynamically sized, the **current** size of the text can be displayed by pressing the **d** key which brings up the **Enter distance** typed input box with the current text size in it.

The size can be modified and the value used by pressing the <enter> key.

To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box.

Rotate Grip (circle):

If the **Rotate grip** is selected, the text bearing is dynamically adjusted by moving the cursor. The bearing of the text is displayed as part of the *Enter bearing* prompt in the message area.

The text bearing is set when a position is accepted.

An **exact** bearing can be entered by hitting the <space bar> or by starting to type a bearing. This brings up the **Enter bearing** typed input box. The *bearing* is typed in and the <enter> key pressed.

To return to dynamic rotating without entering a bearing, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the text is being dynamically rotated, the **current** bearing of the text can be displayed by pressing the **d** key which brings up the **Enter bearing** typed input box with the *current* text bearing in it.

The *bearing* can be modified and the value used by pressing the <enter> key.

To return to dynamic rotation without entering a bearing, simply select the **X** on the top of the input box.

Justification Grip (square):

If the **Justification grip** is selected, the text justification point is dynamically adjusted by moving the cursor. The (x,y) position of the text is displayed in the message area.

The text justification point is set when a position is accepted.

An **exact** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x* and *y* coordinates are typed in, separated by

a space, and the <enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

Simple Text Create

Cad_Create_Simple_Text

Position of option on menu: Strings =>CAD =>Text =>Simple create

or by selection of appropriate icon from the toolbar. 

This option creates text strings and then displays grips to quickly allow editing of text size, rotation and justification point.

The text style and height are taken from the **Text controlbar** and the model and colour from the **CAD controlbar** (see “CAD, Symbol and Text Controlbars”, “Symbol Controlbar” and “CAD Controlbar”).

The text will be placed with the vertex and justification point at the selected position.

After defining one piece of text, the option restarts so that another of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Simple create, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

An insertion point for the text is selected and accepted and an **Enter text** typed input box is then displayed on the screen.

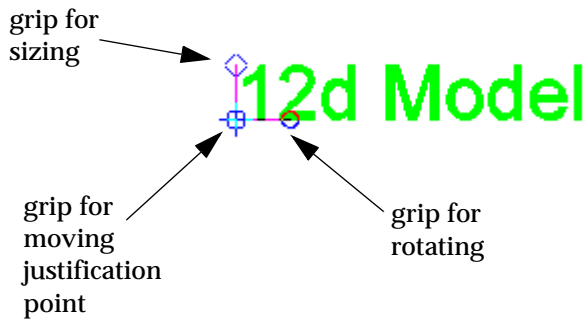

The text is typed into the box and the <enter> key pressed.

The text will be placed with the vertex and justification point at the selected position and using values such as colour, model, text height and text style given in the **CAD controlbar** and **Text controlbar** (See “CAD, Symbol and Text Controlbars”)

When the text is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section “Simple Text Create”.

Text Create

Cad_Create_Text

Position of option on menu: Strings =>CAD =>Text =>Create

or by selection of appropriate icon from the toolbar. 

This option creates text strings at a selected insertion point (a cursor snap is valid).

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Create, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

STEP 1:

An insertion point is selected and accepted. The text will be placed relative to the insertion point given other parameters such as justification, as defined in the textstyle data panel

STEP 2:

The actual text is entered into the text input box followed by the enter key.

STEP 3:

The text is created using the specified settings.

Create Text on Vertex of Super String

Cad_Create_Text_on_Vertex

Position of option on menu: Strings =>CAD =>Text =>Create v

or by selection of appropriate icon from the toolbar. 

This option creates text at a vertex of a super string. One piece of text is allowed per super string vertex, so if this option is used on existing vertex text, the existing value is displayed in the text input box.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Create v, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

An insertion point is selected and accepted. The point snap is forced on so that a vertex can be selected. The text will be placed relative to the insertion point given other parameters such as justification, as defined in the textstyle data panel

STEP 2:

The actual text is entered into the text input box followed by the enter key.

STEP 3:

The text is created using the specified settings.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Text Create on Segment of Super Strings

Cad_Create_Text_on_Segment

Position of option on menu: Strings =>CAD =>Text =>Create s

or by selection of appropriate icon from the toolbar. 

This option creates text at the mid point of a selected super string segment. One piece of text is allowed per super string segment, so if this option is used on existing segment text, the existing value is displayed in the text input box.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Create s, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

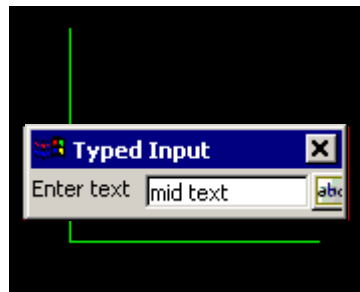

STEP 1:

A super string segment is selected and accepted. The line snap is forced on so that a segment can be selected. The text will be placed relative to the insertion point which is the midpoint of the segment given other parameters such as justification, as defined in the textstyle data panel

STEP 2:

The actual text is entered into the text input box followed by the enter key.

STEP 3:

The text is created using the specified settings.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Rotate Text around Vertex

Cad_Rotate_Text_about_Vertex

Position of option on menu: Strings =>CAD =>Text =>Rotate v

or by selection of appropriate icon from the toolbar. 

This option rotates text about its vertex. This applies to text strings, super string segment or vertex text and 4d string vertex text. For super string segment text, the vertex is taken to be the mid point of the segment.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Rotate v, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A text string to be rotated is selected and accepted.

STEP 2:

The rotation bearing (the final bearing of the text) is specified by selection and acceptance of a point with the mouse or by entry into an input box followed by the enter key. To bring up the input box start typing or press the space bar. The value is entered into the input box followed by the enter key.

Note: The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing text by that amount, rather it will reposition the text at that bearing.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the angle

continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

The text is rotated to the specified bearing.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Rotate Text about the Justification Point

Cad_Rotate_Text_about_Justify

Position of option on menu: Strings =>CAD =>Text =>Rotate j

or by selection of appropriate icon from the toolbar. 

This option rotates text about its justification point. Note that the vertex point and the justification point do not coincide when either the raise or offset for the text is not zero.

Note: The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing text by that amount, rather it will reposition the text at that bearing.

On selecting Rotate j, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

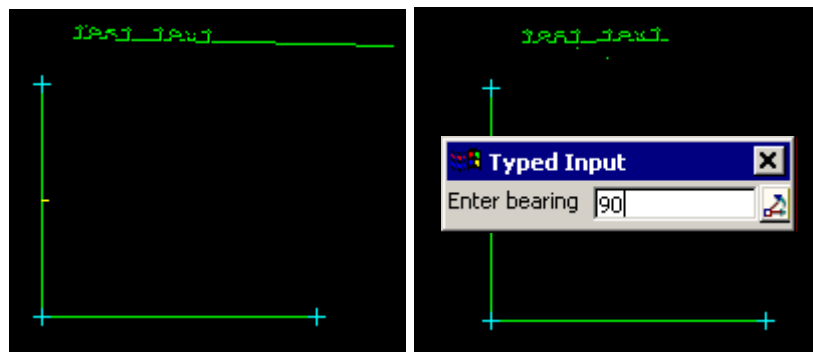

The text to be rotated is selected and accepted.

**STEP 2:**

The rotation bearing (the final bearing of the text) is specified by selection and acceptance of a point with the mouse or by entry into an angle box followed by the enter key. To bring up the angle box start typing or press the space bar. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: The Page up and page down keys can be used when the bearing input box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

The text is rotated to the specified bearing.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Move the Text Justification Point

Cad_Move_Text_Justify_Point

Position of option on menu: Strings =>CAD =>Text =>Move j

or by selection of appropriate icon from the toolbar. 

This option moves the text justification point, and hence the text with it.

On selecting Move j, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The text to be moved is selected and accepted.

STEP 2:

The new position for the text is selected and accepted.

STEP 3:

The text is moved to the new position.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Move the Text Vertex Point

Cad_Move_Text_Vertex

Position of option on menu: Strings =>CAD =>Text =>Move v
or by selection of appropriate icon from the toolbar. 

This option moves the vertex that vertex text is attached to, and hence moves the text with it. The option works for text strings, vertex text for super strings and 4d string but will **not** work for segment text where there is no actual vertex at the mid segment position where the segment text is initially placed.

On selecting Move v, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The vertex text to be moved is selected and accepted.

**STEP 2:**

The new position for the vertex and the text is selected and accepted.

**STEP 3:**

The vertex and the vertex text is moved to the new position.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Height of Text

Cad_Height_of_Text

Position of option on menu: Strings =>CAD =>Text =>Height

or by selection of appropriate icon from the toolbar. 

This option changes the height of text.

On selecting Height, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

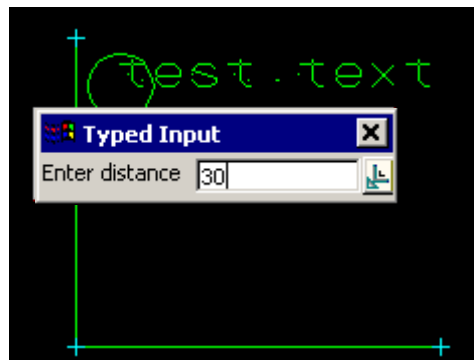

STEP 1:

The text of which the height is to be changed is selected and accepted.

**STEP 2:**

A height for the text is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the height will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the height value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

The text height is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Change Text

Cad_Change_Text

Position of option on menu: Strings =>CAD =>Text =>Text
or by selection of appropriate icon from the toolbar. 

This option edits the characters of selected text.

On selecting Text, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

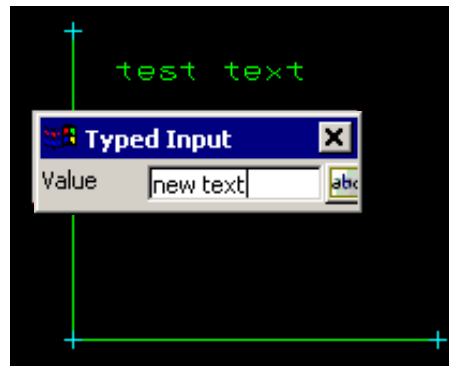

STEP 1:

The text to be changed is selected and accepted.

STEP 2:

The new text is entered into the text input box followed by the enter key.

STEP 3:

The text is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Style of Text

Cad_Style_of_Text

Position of option on menu: Strings =>CAD =>Text =>Style

or by selection of appropriate icon from the toolbar. 

This option changes the textstyle of selected text.

On selecting Style, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

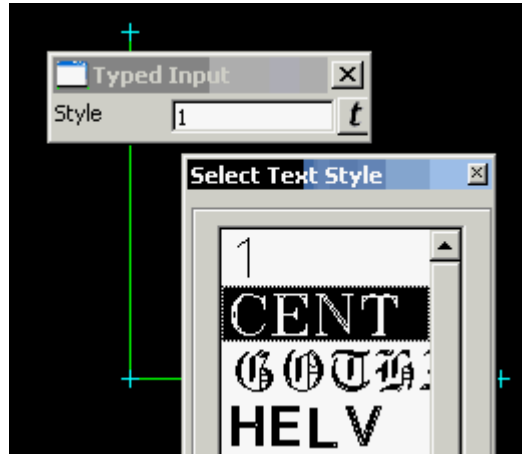

STEP 1:

The text to be changed is selected and accepted.

STEP 2:

The new textstyle is selected from the style pop-up list.

**STEP 3:**

The textstyle is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Text Colour

Cad_Colour_of_Text

Position of option on menu: Strings =>CAD =>Text =>Colour

or by selection of appropriate icon from the toolbar. 

This option changes the colour of selected text.

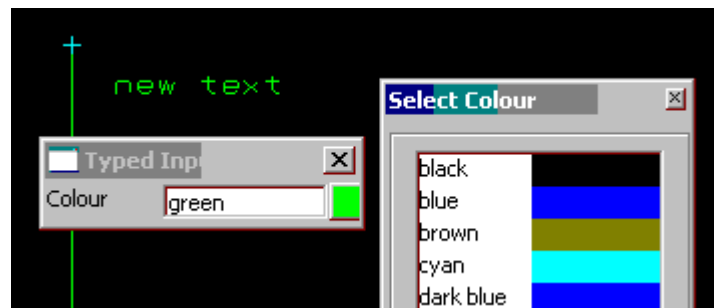

On selecting Colour, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The text to be changed is selected and accepted.

**STEP 2:**

The new colour for the text is entered into the text input box or by selecting the colour square on the input box to bring up the select colour choice box followed by the enter key.

**STEP 3:**

The text colour is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Reset Text Justification Point

Cad_Reset_Text_Justify_Point

Position of option on menu: Strings =>CAD =>Text =>Reset j

or by selection of appropriate icon from the toolbar. 

This option resets the text justification point back to being the same as the vertex for vertex text, and to the segment mid point for segment text. That is, the offset and raise for the selected text are both set to zero.

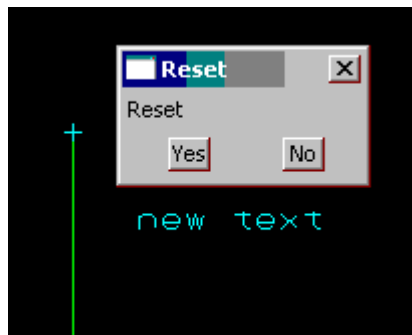

On selecting Reset j, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The text to be changed is selected and accepted.

**STEP 2:**

A warning message is shown giving the user the option of resetting the justification point or not.

**STEP 3:**

The text is reset if accepted.

Label Perpendicular Offset

Cad_Label_Perpendicular_Offset

Position of option on menu: Strings =>CAD =>Text =>Label perp. Offset
or by selection of appropriate icon from the toolbar. 

This option creates a perpendicular line from a selected segment to a selected position, and creates text with the value of the perpendicular distance between the segment and the selected position, on the line.

On selecting Label perp. Offset, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A string is selected and accepted.

After the string is accepted a perpendicular line will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until a 2nd point is selected and accepted.

STEP 2:

Select a 2nd point and accept it.

STEP 3:

A perpendicular line is constructed between the accepted string and point. The length value of this line will be displayed in text. This text can be modified or changed using the other CAD Text options.

STEP 4:

After the labelled perpendicular line is constructed, another perpendicular 'rubber banding' line will be displayed. This will continue until the option is terminated (via the Esc key).

To create another labelled perpendicular line, select another point and accept it.

**STEP 5:**

Another labelled perpendicular line is constructed. Another perpendicular 'rubber banding' line will be displayed. This will continue until the option is terminated (via the Esc key).

**All Text Edits**

Cad_All_Text_Edits

All_Text_Edits

Position of option on menu: Strings =>CAD =>Text =>All

or by selection of appropriate icon from the toolbar. 

This option positions text using a menu made up of most of text edits already described.

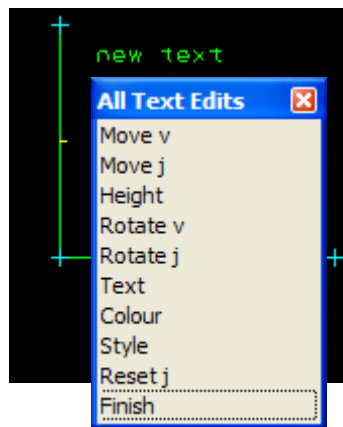

On selecting All, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The text to be changed is selected and accepted.

**STEP 2:**

After the selection and acceptance of a piece of text, the positioning menu is shown. This also allows various other text editing functions such as colour, height and text.

**STEP 3:**

The user can select the appropriate option from the menu and make the changes. The menu remains active allowing a number of operations to be made in succession.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Text Delete

Cad_Delete_Text

Position of option on menu: Strings =>CAD =>Text =>Delete
or by selection of appropriate icon from the toolbar. 

This option deletes selected text.

On selecting Delete, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The text to be deleted is selected and accepted.

STEP 2:

The selected text is deleted.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

CAD Symbol

cad_symbol

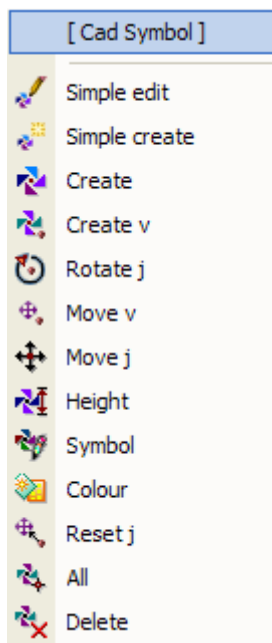

Position of option on menu: Strings =>CAD =>Symbol

The Symbol walk-right menu is

Menu of Options to Create and Manipulate Symbols

edit symbols using grips
 create symbols and edit using grips
 create a symbol at a selected position - a one point string is created
 create a symbol at a user selected super string vertex
 rotate symbol about its justification pt (which may be offset from the vertex)
 move symbol by its justification point (the vertex does not move)
 change the height of a symbol
 change the symbol
 change the colour of a symbol
 reset the symbol justification point so that it is on top of the vertex posn
 menu to make most of the above changes to one selected symbol
 delete a symbol

12d Model symbols are world styles at a vertex of a super string. The symbol is attached to a vertex (these are displayed when *Vertices* are toggle on in a plan view) and has a justification point, a rotation, a delta x and a delta y. The vertex and justification point only coincide if the delta x and delta y values are both zero.

In some symbol options, the symbol *type*, *size* and *angle* are defined by the **Symbol Controlbar** and *model* and *colour* from the **CAD Controlbar** (for more information, go to the section “Symbol Controlbar”).

The *symbols* are defined in the **symbols.4d** file.

For more information on the control bars, go to the sections “Symbol Controlbar” and “CAD Controlbar” .

For the option <i>Simple edit</i> , go to the section	“Simple Symbol Edit”
<i>Simple create</i>	“Simple Symbol Create”
<i>Create</i>	“Create Symbol”
<i>Create v</i>	“Create Symbol at the Vertex of a Super String”
<i>Rotate j</i>	“Rotate Symbol about the Justification Point”
<i>Move v</i>	“Move the Symbol Justification Point”
<i>Move j</i>	“Move the Symbol Justification Point”
<i>Height</i>	“Height of Symbol”
<i>Symbol</i>	“Change Symbol”
<i>Colour</i>	“Symbol Colour”
<i>Reset j</i>	“Reset the Symbol Justification Point”
<i>All</i>	“All Symbol Edits”
<i>Delete</i>	“Symbol Delete”

Simple Symbol Edit

Cad_Edit_Simple_Symbol

Position of option on menu: Strings =>CAD =>Text =>Simple edit

or by selection of appropriate icon from the toolbar. 

This option edits symbols using grips to quickly define the mode of editing (sizing, rotating or moving the justification point).

On selecting Simple edit, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

When the symbol to be edited is selected, grips for size, rotating and moving the justification point are displayed. The appropriate grip is then selected for quick editing.

Size Grip (diamond):

If the **Size grip** is selected, the symbol size is dynamically adjusted by moving the cursor. The size of the symbol is displayed as part of the *Enter height* prompt in the message area.

The symbol size is set when a position is accepted.

An **exact** symbol size can be entered by hitting the <space bar> or by starting to type a size. This brings up the **Enter distance** typed input box. The size is typed in and the <enter> key pressed.

To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the symbol is being dynamically sized, the **current** size of the text can be displayed by pressing the **d** key which brings up the **Enter distance** typed input box with the current dynamic symbol size in it.

The size can be modified and the value used by pressing the <enter> key.

To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box.

Rotate Grip (circle):

If the **Rotate grip** is selected, the symbol bearing is dynamically adjusted by moving the cursor. The bearing of the symbol is displayed as part of the *Enter bearing* prompt in the message area.

The symbol bearing is set when a position is accepted.

An **exact** bearing can be entered by hitting the <space bar> or by starting to type a bearing. This

brings up the **Enter bearing** typed input box. The *bearing* is typed in and the <enter> key pressed.

To return to dynamic rotating without entering a bearing, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the symbol is being dynamically rotated, the **current** bearing of the symbol can be displayed by pressing the **d** key which brings up the **Enter bearing** typed input box with the *current* symbol bearing in it.

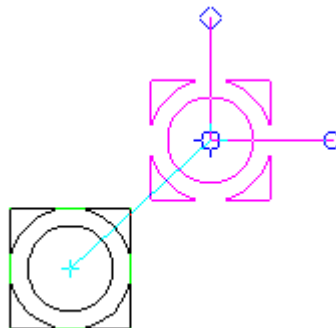

The *bearing* can be modified and the value used by pressing the <enter> key.

To return to dynamic rotation without entering a bearing, simply select the **X** on the top of the input box.

Justification Grip (square):

If the **Justification grip** is selected, the symbol justification point is dynamically adjusted by moving the cursor. The (x,y) position of the symbol is displayed in the message area.

The symbol justification point is set when a position is accepted.

An **exact** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x* and *y* coordinates are typed in, separated by a space, and the <enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

Simple Symbol Create

Cad_Create_Simple_Symbol

Position of option on menu: Strings =>CAD =>Text =>Simple create

or by selection of appropriate icon from the toolbar. 

This option creates symbols and then displays grips to allow quick editing of symbol size, rotation and justification point.

The symbol and symbol height and symbol angle are taken from the **Symbol controlbar** (See “CAD, Symbol and Text Controlbars”) and the model and colour (if the symbol does not have an inbuilt colour) from the **CAD controlbar** (see “CAD, Symbol and Text Controlbars”, “Symbol Controlbar” and “CAD Controlbar”).

The symbol will be placed with the vertex and justification point at the selected position.

After defining one symbol, the option restarts so that another symbol can be defined. Picking **Cancel** from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Simple create, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

An insertion point for the symbol is selected and accepted, the symbol is displayed on the screen.

Warning - if no symbol appears, then there is probably no symbol selected in the **Symbol controlbar**.

When the symbol is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then be selected for quick editing. For details on using the grips, go to the section “Simple Symbol Edit”.

Create Symbol

Cad_Create_Symbol

Position of option on menu: Strings =>CAD =>Symbols =>Create

or by selection of appropriate icon from the toolbar.

This option creates a symbol (as a one vertex super string) at a selected point (a cursor snap is valid).

After defining a symbol, the option restarts so that another symbol can be defined. Picking **Cancel** from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

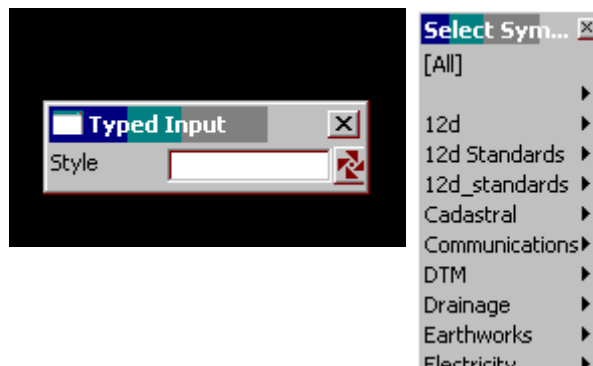

On selecting Create, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

An insertion point is selected and accepted. A one vertex super string is created and the symbol placed at that vertex. The symbol is placed relative to the insertion point given in the symbol definition (See symbols.4d file).

**STEP 2:**

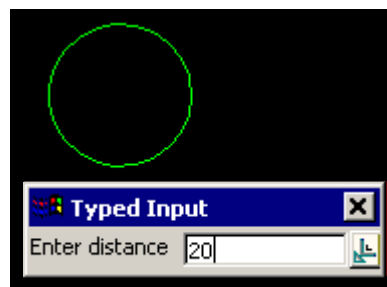

The symbol style (name) is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu

**STEP 3:**

A symbol size is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the size will appear. The user can also press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the size value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the symbol or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the size by the selection of a point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 4:

The symbol is created together with a point super string at the selected point.

Create Symbol at the Vertex of a Super String

Cad_Create_Symbol_on_Vertex

Position of option on menu: Strings =>CAD =>Symbols=> Create v
or by selection of appropriate icon from the toolbar. 

This option creates a symbol at a vertex of a super string. One symbol is allowed per super string vertex, so if this option is used on existing vertex symbol, the existing value is displayed in the symbol input box.

After defining a symbol, the option restarts so that another symbol can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

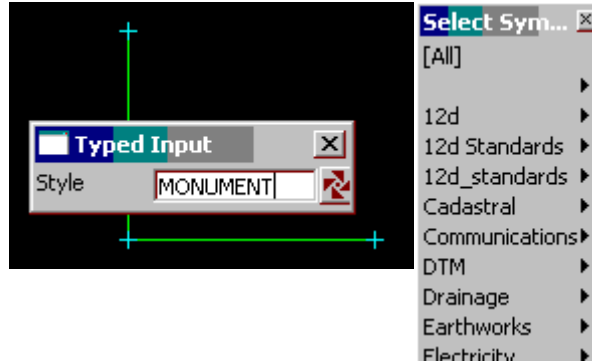

On selecting Create v, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

An insertion point is selected and accepted. The point snap is forced on so that a vertex can be selected. The Symbol will be placed relative to the insertion point given other parameters such as justification, as defined in the symbol definition.

**STEP 2:**

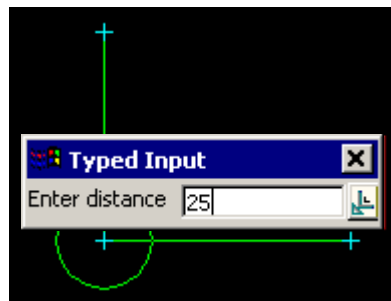

The symbol style is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu

**STEP 3:**

A symbol size is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the size will appear. The user can also press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the size value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the symbol or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the size by the selection of a point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

**STEP 4:**

The symbol is created at the vertex of the super string.

Rotate Symbol about the Justification Point

Cad_Rotate_Symbol_about_Justify

Position of option on menu: Strings =>CAD =>Symbols =>Rotate j

or by selection of appropriate icon from the toolbar. 

This option rotates a symbol about its justification point. The vertex point and the justification point often do not coincide. This occurs when non zero value is specified for either the x or y offset.

Note: The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing symbol by that amount, rather it will reposition the symbol at that bearing.

On selecting Rotate j, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The Symbol to be rotated is selected and accepted.

STEP 2:

The rotation bearing (the final bearing of the symbol) is specified by selection and acceptance of a point with the mouse or by entry into an angle box followed by the enter key. To bring up the angle box start typing or press the space bar. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: The Page up and page down keys can be used when the bearing input box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

The Symbol is rotated to the specified bearing.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Move the Symbol Justification Point

Cad_Move_Symbol_Justify_Point

Position of option on menu: Strings =>CAD =>Symbols =>Move j

or by selection of appropriate icon from the toolbar. 

This option moves a symbol by moving its justification point.

On selecting Move j, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The Symbol to be moved is selected and accepted.

STEP 2:

The new position for the Symbol is selected and accepted.

STEP 3:

The Symbol moves to the new position.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Move the Symbol Vertex Point

Cad_Move_Symbol_Vertex

Position of option on menu: Strings =>CAD =>Symbols =>Move v
or by selection of appropriate icon from the toolbar. 

This option moves a symbol by moving the vertex that the symbol is attached to. Hence the symbol and the justification point for the symbol will move.

On selecting Move V, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The Symbol to be moved is selected and accepted.

STEP 2:

The new position for the vertex of the Symbol is selected and accepted.

STEP 3:

The Symbol moves to the new position.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Height of Symbol

Cad_Height_of_Symbol

Position of option on menu: Strings =>CAD =>Symbols =>Height
or by selection of appropriate icon from the toolbar. 

This option changes the height of a symbol.

On selecting Height, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The Symbol of which the height is to be changed is selected and accepted.

**STEP 2:**

A height for the Symbol is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the height will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the height value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

The Symbol height is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Change Symbol

Cad_Change_Symbol

Position of option on menu: Strings =>CAD =>Symbols =>Symbol

or by selection of appropriate icon from the toolbar. 

This option changes the actual symbol defined at a super string vertex.

On selecting Symbol, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The Symbol to be changed is selected and accepted.

STEP 2:

The symbol style is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu

STEP 3:

The Symbol is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Symbol Colour

Cad_Colour_of_Symbol

Position of option on menu: Strings =>CAD =>Symbol =>Colour

or by selection of appropriate icon from the toolbar. 

This option changes the default colour of a symbol.

Important Note: if the symbol has inbuilt colours, changing the default colour will not change the symbols displayed colours. For this case, the definition of the symbol itself will need to be changed.

On selecting Colour, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

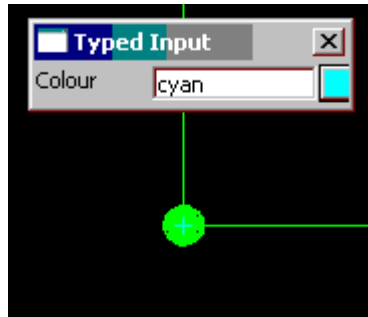

STEP 1:

The symbol to have the default colour changed is selected and accepted.

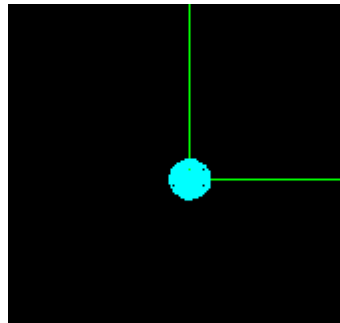

STEP 2:

The new colour for the Symbol is entered into the Symbol input box or by selecting the colour square on the input box to bring up the select colour choice box followed by the enter key.

**STEP 3:**

The Symbol colour is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Reset the Symbol Justification Point

Cad_Reset_Symbol_Justify_Point

Position of option on menu: Strings =>CAD =>Symbol =>Reset j

or by selection of appropriate icon from the toolbar. 

This option resets justification point of a selected symbol. That is, the x and y offsets for the justification point are set to zero.

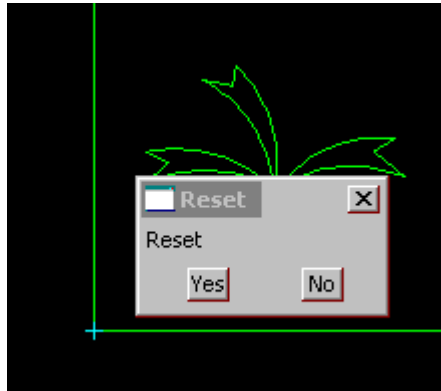

On selecting Reset j, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The Symbol to be changed is selected and accepted.

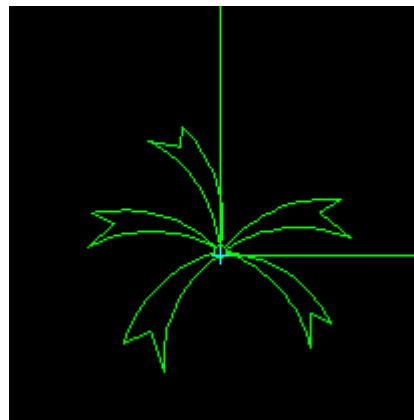

**STEP 2:**

A warning message is shown giving the user the option of resetting the justification point or not.

STEP 3:

The symbol is reset if accepted.

All Symbol Edits

Cad_All_Symbol_Edits

All_Symbol_Edits

Position of option on menu: Strings =>CAD =>Symbol =>All

or by selection of appropriate icon from the toolbar. 

This option allows a number of symbol editing options to be done in succession using a menu made up of many of the options defined above.

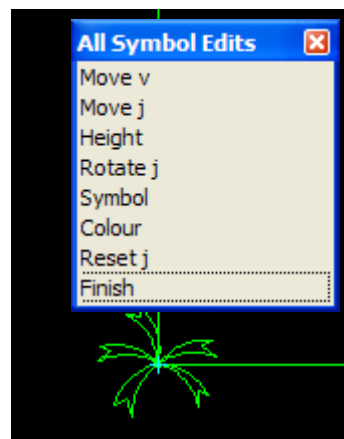

On selecting All, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The Symbol to be changed is selected and accepted.

**STEP 2:**

After the selection and acceptance of a symbol, the positioning menu is shown. This also allows various other symbol editing functions such as colour, height and rotate.

**STEP 3:**

The user can select the appropriate option from the menu and make the changes. The menu remains active allowing a number of operations to be made in succession.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Symbol Delete

Cad_Delete_Symbol

Position of option on menu: Strings =>CAD =>Symbol =>Delete

or by selection of appropriate icon from the toolbar. 

This option deletes symbols.

On selecting Delete, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The Symbol to be deleted is selected and accepted.

STEP 2:

The selected Symbol is deleted.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

CAD Holes

cad_fills

Position of option on menu: Strings =>CAD =>Holes

The Holes walk-right menu is

For the option *Add holes*, go to the section
Remove holes

"Add Holes"
"Remove Holes"

Add Holes

Cad_Add_Holes

Position of option on menu: Strings =>CAD =>Polygons =>Add holes

or by selection of appropriate icon from the toolbar. 

This option adds holes to a polygon.

On selecting **Add holes**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

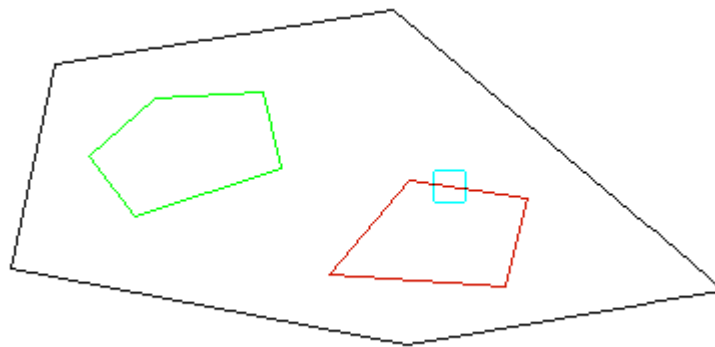

First select the parent string. That is the polygon that is to have holes added to it.

STEP 2:

Then select the polygons that are to be the holes in the parent polygon (the child strings).

The selection of holes is terminated by pressing the <esc> key.

It is easier to see the result by colour filling the parent polygon.

Remove Holes

Cad_Remove_Holes

Position of option on menu: Strings =>CAD =>Polygons =>Remove holes

or by selection of appropriate icon from the toolbar. 

This option removes all holes from a polygon with holes.

On selecting **Remove holes**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the parent string. That is the polygon that contains holes.

STEP 2:

On selecting and accepting the string, all holes are removed from the string. Super strings are created for each of the hole boundaries.

CAD Fills

cad_fills

Position of option on menu: Strings =>CAD =>Fills

The Fills walk-right menu is

For the option *Solid fill*, go to the section
Solid fill many

“Solid Fill”
“Solid Fill Many Strings”

Solid Fill

Cad_Solid_Fill

Position of option on menu: Strings =>CAD =>Fills =>Solid Fill

or by selection of appropriate icon from the toolbar. 

This option fills a super string with a user defined colour and blend.

On selecting Solid Fill, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select and accept a string.

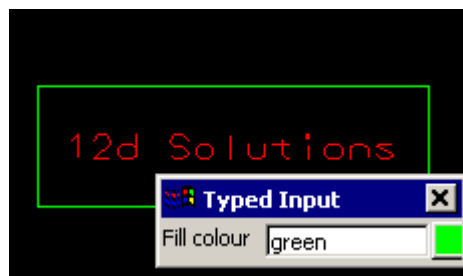

If the string selected is an enclosed shape, then the filled area is simply the closed shape. If the string isn't closed (such as two perpendicular lines), for the purposes of this option, the string will be temporarily closed and closed area coloured.

Note: If the string selected is a straight line, then its area is zero. When the colour fill of a line is completed, the line will simply disappear. This is because there is no area to colour.

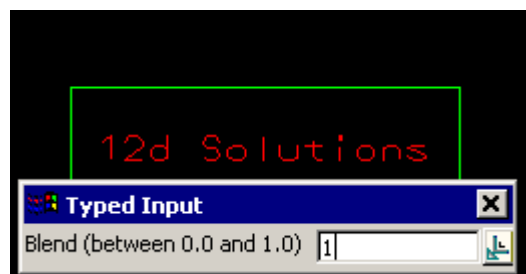

STEP 2:

After the string is accepted, the **Fill Colour** Input box will appear. Type the name of the required colour into the Input box and press the enter key. The browse button  on the Input box can be used to define the blend by measuring existing elements.

STEP 3:

After the colour is accepted, the Blend Input box will appear. This selection determines the transparency of the filled colour. A value between 0 (totally opaque) and 1 (totally transparent) must be selected.

STEP 4:

The selected super string is then filled.

Blend 0

Blend 1

Solid Fill Many Strings

Cad_Solid_Fill_Many

Position of option on menu: Strings =>CAD =>Fills =>Solid fill many

or by selection of appropriate icon from the toolbar. 

This option fills many selected super strings with the same user defined colour and blend.

On selecting Solid fill many, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

After selecting the option, the **Fill Colour** Input box is displayed.

Type the name of the required colour into the Input box and press the enter key. The browse button  on the Input box can be used to define the blend by measuring existing elements.

STEP 2:

After the colour is accepted, the **Blend** Input box will appear. This selection determines the transparency of the filled colour. A value between 0 (totally opaque) and 1 (totally transparent) must be selected.

STEP 3:

Select and accept a string and the string is coloured filled.

The selected super string is then filled.

Then select and accept the next string to fill and the same colour and blend is used to colour fill the next string

If the string selected is an enclosed shape, then the filled area is simply the closed shape. If the string isn't closed (such as two perpendicular lines), for the purposes of this option, the string will be temporarily closed and closed area coloured.

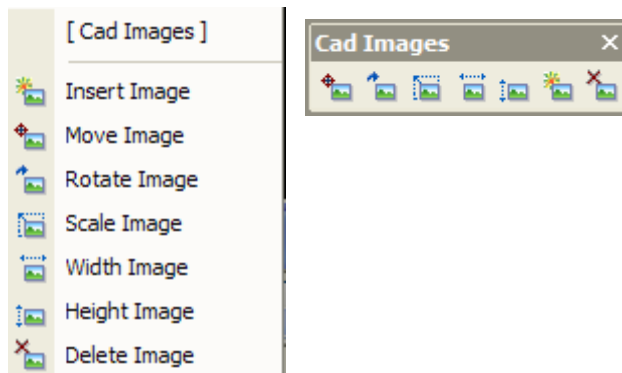

Note: If the string selected is a straight line, then its area is zero. When the colour fill of a line is completed, the line will simply disappear. This is because there is no area to colour.

CAD Images

cad_images

Position of option on menu: Strings =>CAD =>Images

The Fills walk-right menu is

For the option *Insert Image*, go to the section
Move Image
Rotate Image

"Insert Image"
 "Move Image"
 "Rotate Image"

<i>Scale Image</i>	"Scale Image"
<i>Width Image</i>	"Width Image"
<i>Height Image</i>	"Height Image"
<i>Delete Image</i>	"Delete Image"

Insert Image

Cad_Insert_Plan_Image

Position of option on menu: Strings =>CAD =>Images =>Insert Image

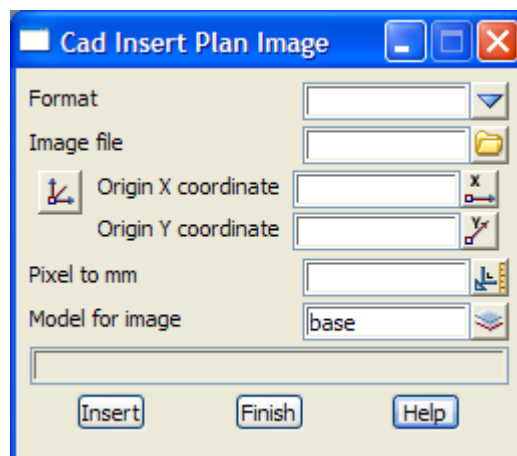

or by selection of appropriate icon from the toolbar. 

This option creates a on vertex super strings and inserts an images at the vertex.

On selecting **Insert Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

On selecting **Insert Image**, the **Cad Insert Plan Image** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	Input box		BMP, DIB, ECW, GIF, JPEG JPEG 2000, PNG, TGA TIFF, 12D

Select the type of image file to insert.

Image file Input box

Select the image filename to be inserted into the project.

X/Y co-ordinate XY Pick button

Select the x/y co-ordinate for origin (bottom left corner) of the image.

Origin X coordinate Input box

Enter the x coordinate for the bottom left of the image.

Origin Y coordinate Input box

Enter the y coordinate for the bottom left of the image.

Pixel to mm Input box

This determines the scale of the image.

Model for image Input box

Select the model for the image to be inserted into.

Insert button

When all the fields have been entered, the **insert** button will display the image into the defined model.

Move Image

Cad_Move_Plan_Image

Position of option on menu: Strings =>CAD =>Images =>Move Image

or by selection of appropriate icon from the toolbar. 

This option moves an inserted image by modifying the x and y offset for the image. The vertex that the image is attached to does not move.

On selecting Move Image, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the vertex that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

After a vertex of an image is accepted, an outline of the image is displayed and moves with the position of the cursor. This will continue until the new position is selected and accepted.

Select the new position and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The image is then displayed at its new position.

Note: The *CAD Move Image* option only moves **the image offset relative to the vertex**. Use the option *CAD Move* to **move the vertex** (and the corresponding image moves with it).

Rotate Image

Cad_Rotate_Plan_Image

Position of option on menu: Strings =>CAD =>Images =>Rotate Image

or by selection of appropriate icon from the toolbar. 

This option rotates an image around its justification point.

On selecting **Rotate Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the vertex that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

After the vertex of an image is accepted, an outline of the image is displayed. The outline is rotated dynamically as the position of the cursor changes. This will continue until a final position is selected and accepted.

Select the new rotated position and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input

box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The rotated image is then displayed.

Scale Image

Cad_Scale_Plan_Image

Position of option on menu: Strings =>CAD =>Images =>Scale Image

or by selection of appropriate icon from the toolbar. 

This option changes the size of an image.

On selecting **Scale Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

After the vertex of an image is accepted, an outline of the image is displayed. The size of the outline is determined by the position of the cursor. Both the height and the width of the image increase/decrease in the same ratio so that the image is not distorted.

Select the new size as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The scaled image is then displayed.

Width Image

Cad_Width_Plan_Image

Position of option on menu: Strings =>CAD =>Images =>Width Image

or by selection of appropriate icon from the toolbar. 

This option is user to increase or decrease the width of an image. The height of the image is not changed so the images will be stretched.

On selecting **Width Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

After the vertex of an image is accepted, the outline of the image is displayed. The width of the outline is determined by the position of the cursor. Whilst the height remains constant, the width of the outline increases and decreases dynamically as the position of the cursor changes.

Select the new width as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered in via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The image with the new width is then displayed.

Height Image

Cad_Height_Plan_Image

Position of option on menu: Strings =>CAD =>Images =>Height Image
or by selection of appropriate icon from the toolbar. 

This option allows the user to increase or decrease the height of an image. The width of the image is not changed so the images will be stretched.

On selecting **Height Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

After the vertex of an image is accepted, the outline of the image is displayed. The height of the outline is determined by the position of the cursor. Whilst the width remains constant, the height of the outline increases and decreases dynamically as the position of the cursor changes.

Select the new height as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered in via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The image with the new height is then displayed.

Delete Image

Cad_Delete_Plan_Image

Position of option on menu: Strings =>CAD =>Images =>Delete Image

or by selection of appropriate icon from the toolbar. 

This option deletes an image.

On selecting **Delete Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

When the selected image is accepted, it is then deleted.

Note that the **vertex** that the image was attached to is not deleted.

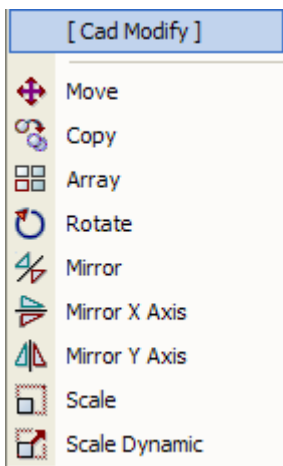

CAD Modify

cad_modify

Position of option on menu: Strings =>CAD =>Modify

The Modify walk-right menu is

For the option *Move*, please go to the section “Move” .

- | | |
|----------------------|-----------------|
| <i>Copy</i> | “Copy” |
| <i>Array</i> | “Array” |
| <i>Rotate</i> | “Rotate” |
| <i>Mirror</i> | “Mirror” |
| <i>Mirror X axis</i> | “Mirror X Axis” |

<i>Mirror Y axis</i>	"Mirror Y Axis"
<i>Scale</i>	"Scale"
<i>Scale dynamic</i>	"Scale Dynamic"

Move

Cad_Move

Position of option on menu: Strings =>CAD =>Modify =>Move
or by selection of appropriate icon from the toolbar. 

This option moves a selected string.

On selecting **Move**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A super string or circle is picked.

STEP 2:

A base position is picked and then an outline of the selected string will be drawn and moved with the cursor, plus a line will be drawn from the base position to the current cursor position.

Note: The base position is not required to lie on the string itself.

STEP 3:

A final cursor position is selected which defines a distance and direction from the base position to the final position.

STEP 4:

On accepting the final position, selected super string is moved by the determined distance and direction.

Copy

Cad_Copy

Position of option on menu: Strings =>CAD =>Modify =>Copy
or by selection of appropriate icon from the toolbar. 

This option copies a super string.

On selecting **Copy**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select a super string.

STEP 2:

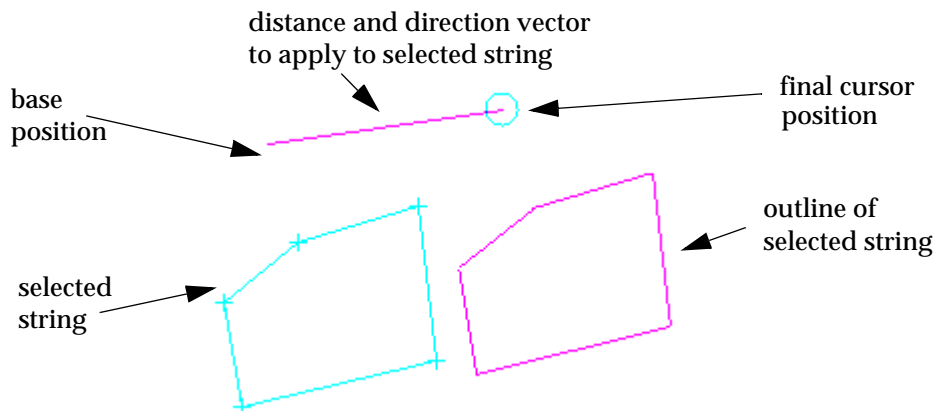

A base position is picked and then an outline of the selected string will be drawn and moved with the cursor, plus a line will be drawn from the base position to the current cursor position.

Note: The base position is not required to lie on the string itself.

STEP 3:

A final cursor position is selected which defines a distance and direction from the base position to the final position.

STEP 4:

On accepting the final position, a copy of the selected super string is moved by the determined distance and direction.

Array

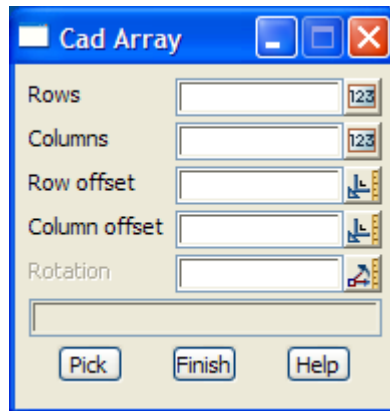

Cad_Array

Position of option on menu: Strings =>CAD =>Modify =>Array

or by selection of appropriate icon from the toolbar. 

This option copies a super string a number of times.

On selecting **Array**, the **Cad Array** panel is displayed.

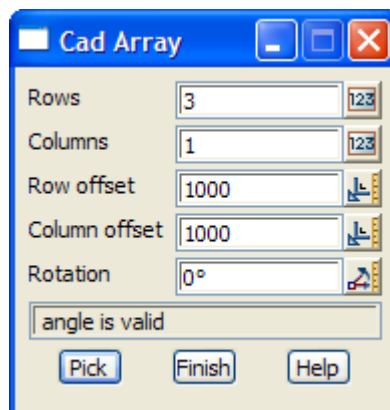

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Rows <i>number of rows</i>	Input box		
Columns <i>number of columns</i>	Input box		
Row offset <i>distance between the rows</i>	Input box		
Column offset <i>distance between the columns</i>	Input box		
Rotation <i>the angle to use for the rows and columns of copies</i>	angle box		
Pick <i>pick the super string to copy and when it is accepted the super string is copied</i>	button		

STEPS:

Fill in the fields in the **Cad Array** panel, click on **Pick** and select the super string to copy.

Rotate

Cad_Rotate

Position of option on menu: Strings =>CAD =>Modify =>Rotate
 or by selection of appropriate icon from the toolbar. 

This option rotates a super string.

On selecting **Rotate**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the super string to rotate.

STEP 2:

A base position is picked and then an outline of the selected string is drawn and rotated around the base position with the cursor, plus a line will be drawn from the base position to the current cursor position.

Note: The base position is not required to lie on the string itself.

When the line has a bearing of 90 degrees, the outline will be on top of the selected string (i.e. there is no rotation). As the line rotates around the base position, the outline rotates around the base position. This rotation will continue until the final point is selected and accepted.

STEP 3:

A final cursor position is selected which defines the rotation about the base position.

On accepting the final position, the selected string is rotated around the base position through the defined angle.

Mirror

Cad_Mirror

Position of option on menu: Strings =>CAD =>Modify =>Mirror

or by selection of appropriate icon from the toolbar. 

This option creates a mirrored image of a selected string.

On selecting **Mirror**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select a super string to mirror.

STEP 2:

Select the 1st point of the mirror axis.

The 1st point is selected with the mouse or entered in via the keyboard. To enter a point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a line will be drawn from the 1st point to the position of the cursor. This line forms the mirroring axis. The outline of the reflected image will be dynamically displayed according to the changing cursor position.

STEP 3:

Select and accept the 2nd point of the mirror axis.

STEP 4:

After the base point is accepted, the **Delete Source String** box will appear.

Select **yes** if you want the original super string to be deleted when the new mirrored string is constructed.

Select **no** if you want the original super string to remain when the new mirrored string is constructed.

STEP 5:

The selected super string will be mirrored using the information given.

Delete the source string

Don't delete the source string

Mirror X Axis

Cad_Mirror_X_Axis

Position of option on menu: Strings =>CAD =>Modify =>Mirror X axis

or by selection of appropriate icon from the toolbar. 

This option mirrors a string through the x axis.

On selecting Mirror X Axis, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select a super string to mirror through the x axis.

STEP 2:

After the string is accepted the position of the cursor on the y axis determines the position of the mirror (which runs parallel to the x axis). As the cursor moves along the y axis, a reflection of the selected string will be dynamically displayed. This will continue until a final position is selected, thus determining the mirror axis.

Select the final y-position of the mirror x-axis.

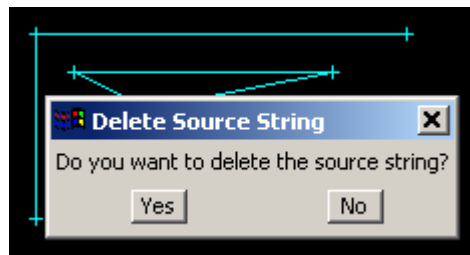

The final position is selected with the mouse or entered in via the keyboard. To enter a base point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 3:

After the final position is accepted, a **Delete Source String** box will appear.

Select **yes** if you want the original super string to be deleted when the new mirrored string is constructed.

Select **no** if you want the original super string to remain when the new mirrored string is constructed.

**STEP 4:**

The selected super string will be mirrored using the information given.

Delete the source string

Don't delete the source string

Mirror Y Axis

Cad_Mirror_Y_Axis

Position of option on menu: Strings =>CAD =>Modify =>Mirror Y Axis
 or by selection of appropriate icon from the toolbar. 

This option mirrors a string through the y axis.

On selecting Mirror Y Axis, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select a super string to mirror through the y axis.

STEP 2:

After the string is accepted the position of the cursor on the x axis determines the position of the mirror (which runs parallel to the y axis). As the cursor moves along the x axis, a reflection of the selected string will be dynamically displayed. This will continue until a final position is selected, thus determining the mirror axis.

Select the final x-position of the mirror y-axis.

The final position is selected with the mouse or entered in via the keyboard. To enter a base point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 3:

After the final position is accepted, a **Delete Source String** box will appear.

Select **yes** if you want the original super string to be deleted when the new mirrored string is constructed.

Select **no** if you want the original super string to remain when the new mirrored string is constructed.

STEP 4:

The selected super string will be mirrored using the information given.

Delete the source string

Don't delete the source string

Scale**Cad_Scale**

Position of option on menu: Strings =>CAD =>Modify =>Scale

or by selection of appropriate icon from the toolbar. 

This option increases or decreases the size of a string by a given scale.

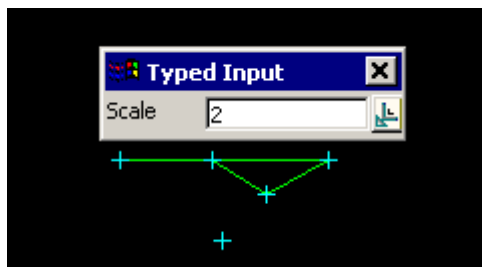

On selecting Scale, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select a super string to scale.

**STEP 2:**

After a string is accepted, the **Scale** Input box will appear. Type the desired scale into the input box and press the enter key. The browse button  on the Input box can be used to define the scale by measuring existing elements.

**STEP 3:**

After a scale value has been entered the user is required to select an origin position.

An origin position can be selected with the mouse or entered in via the keyboard. To enter a start

position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

The dimensions of the highlight string are defined by the scale value.

The position of the scaled highlight string moves dynamically as the position of the cursor moves. The origin position establishes the location of the scaled string relative to the original selected string.

For example, if you selected a scale of "2", the distance between the cursor and a point on the highlight string would be double the distance between the cursor and the corresponding point on the original super string.

STEP 4:

After the final position has been accepted, the original string will be removed and the newly scaled highlight string constructed.

Scale Dynamic

Cad_Scale_Dynamic

Position of option on menu: Strings =>CAD =>Modify =>Scale Dynamic

or by selection of appropriate icon from the toolbar. 

This option dynamically increases or decreases the size of a string.

On selecting Scale Dynamic, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select a super string to scale.

**STEP 2:**

An origin point is required to be defined. An origin point can be selected with the mouse or entered in via the keyboard. To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 3:**

After an origin point has been accepted, a projection point needs to be defined. The highlight string will be projected from the origin point. The size and position of the highlight string will move dynamically as the position of the cursor moves. The highlight string will increase in size if the cursor moves further from the origin point. Conversely, the highlight string will decrease in size if the cursor moves closer to the origin point. This will continue until a projection point is accepted.

**STEP 4:**

After the projection point has been accepted, the original string will be removed and the newly scaled highlight string will be constructed.

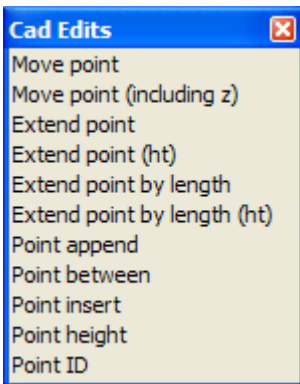

CAD Edit Points

cad_edits

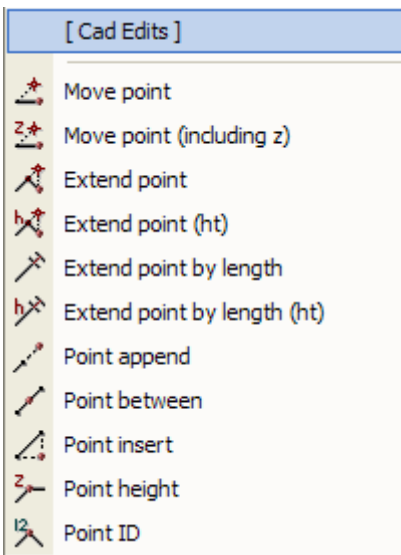

Position of option on menu: Strings =>CAD =>Change points

The Change points walk-right menu is

Menu of Options to Move Vertices

- move a vertex
- move a vertex along its segment - keep the same height
- move a vertex along its segment - interpolate/extrapolate the height
- move a vertex by a given chainage distance along a segment - keep ht
- move a vertex a given chainage dist along a segment - extrapolate ht
- append a vertex to an existing string
- create a vertex on the segment joining two adjacent vertices of a string
- insert a vertex between two adjacent vertices of a string
- edit the height of a vertex
- edit the point (vertex) id

These option allow the editing of vertices on super strings.

For the option *Move point*, go to the section "Move a Vertex Keeping its Height"
Move point (including ht) "Extend a Vertex and Keeping its Height"

<i>Extend point</i>	“Extend a Vertex and Keeping its Height”
<i>Extend point (ht)</i>	“Extend Segment and Extrapolating Heights”
<i>Extend point by length</i>	“Extend Segment by Length and Keeping Height”
<i>Extend point by length (ht)</i>	“Extend Segment by Length and Extrapolating Heights”
Point append	“Append a Vertex”
Point between	“New Vertex on a Segment (Between Two Vertices)”
Point Insert	“Insert a Vertex”
Point Height	“Change Height of a Vertex”
Point id	“Point Id”

Move a Vertex Keeping its Height

Cad_Move_Point_on_Super_String

Position of option on menu: Strings =>CAD =>Change points =>Move point

or by selection of appropriate icon from the toolbar. 

This option moves the vertex of a super string. The height of the vertex is not modified.

On selecting Move point, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A vertex on a super string is selected and accepted.

STEP 2:

The position of the selected vertex moves with the cursor until the final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the vertex by the using the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

STEP 3:

The selected vertex is moved to the new position.

Move a Vertex and Modify its Height

Cad_Move_Point_on_Super_String_including_z_

Position of option on menu: Strings =>CAD =>Change points =>Move point (including z)
or by selection of appropriate icon from the toolbar. 

This option moves the vertex of a super string and the height of the vertex is taken from the height of the final selected position.

On selecting Move point (including ht), the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A vertex on a super string is selected and accepted.

STEP 2:

The position of the selected vertex moves with the cursor until the final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the vertex by the using the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

STEP 3:

The selected vertex is moved to the new position and takes on the height of the string it is snapped to, or the Z value entered into the **Enter XYZ** box.

Extend a Vertex and Keeping its Height

Cad_Extend_Point_on_Super_String

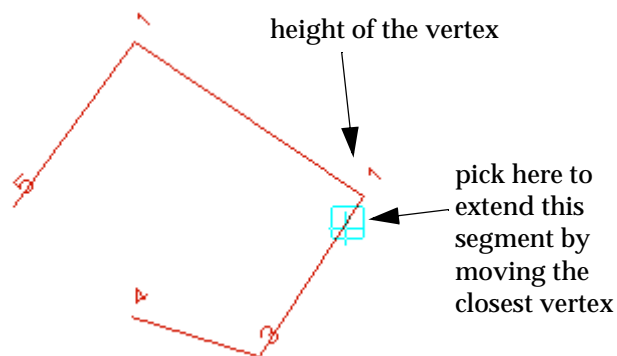

Position of option on menu: Strings =>CAD =>Change points =>Extend point
or by selection of appropriate icon from the toolbar. 

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex. The height of the vertex is not modified.

On selecting Extend point, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

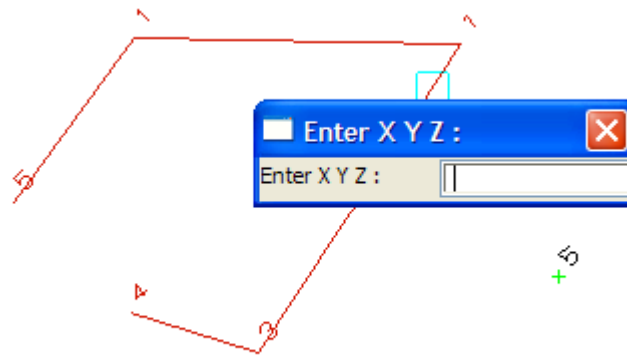

STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended. This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

STEP 2:

As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex. The final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the moved vertex into the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

**STEP 3:**

The selected vertex is moved to the new position. The height of the vertex is not changed.

Extend Segment and Extrapolating Heights

Cad_Extend_Point_on_Super_String_ht_

Position of option on menu: Strings =>CAD =>Change points =>Extend point (ht)

or by selection of appropriate icon from the toolbar. 

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex. The height of the vertex is extrapolated.

On selecting Extend point (ht), the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

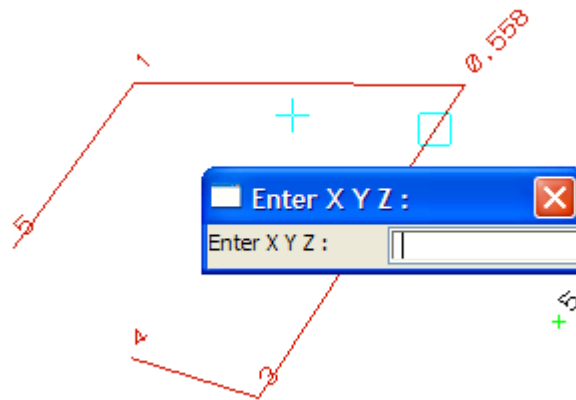

STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

**STEP 2:**

As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex. The final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the moved vertex into the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

The point selected is moved to the cursor position in a rubber banding fashion. The final position of the point is selected and accepted. Alternatively, the user can enter the final coordinate value of the moved point by the enter XYZ box. This box can be brought into view by simply typing a value or by pressing the space bar.

**STEP 3:**

The selected vertex is moved to the new position. The height of the vertex has been extrapolated from the heights at either end of the original segment.

Extend Segment by Length and Keeping Height

Cad_Extend_Point_by_Length

Position of option on menu: Strings =>CAD =>Change points =>Extend point by length
 or by selection of appropriate icon from the toolbar. 

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex by a user defined distance. The height of the vertex is not modified.

On selecting Extend point by length, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

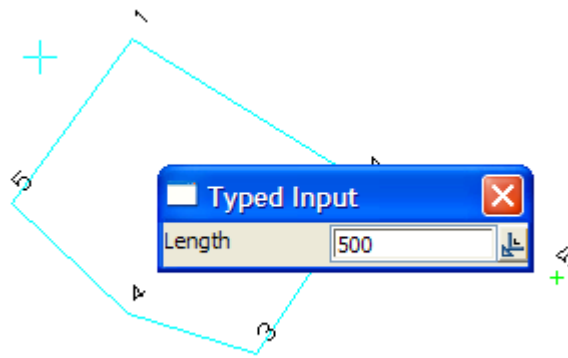

STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

STEP 2:

The user enters the distance to extend the segment. This value is positive in the direction that the string was created.

**STEP 3:**

The point selected is moved to the new position and the string topology maintained.

Extend Segment by Length and Extrapolating Heights

Cad_Extend_Point_by_Length_ht_

Position of option on menu: Strings =>CAD =>Change points =>Extend point by length (ht)
or by selection of appropriate icon from the toolbar.

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex by a user defined distance. The height of the vertex is extrapolated modified.

On selecting Extend point by length (ht), the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

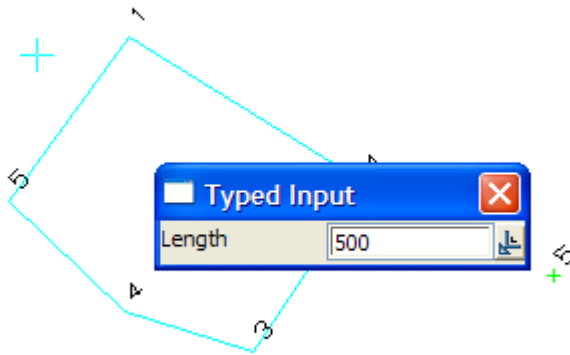

STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

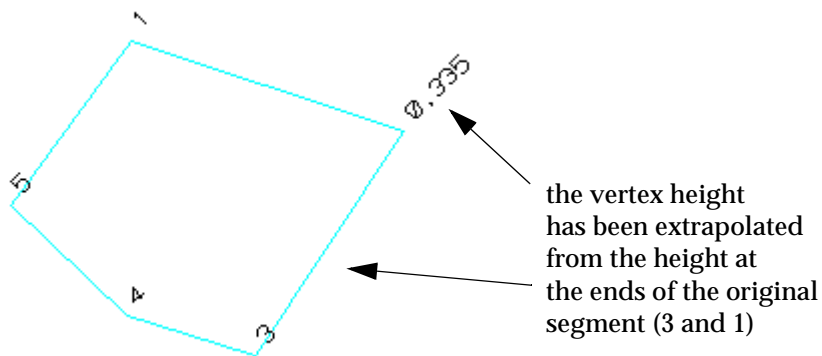

STEP 2:

The user enters the length value for which the point is to be extended by. This value is positive in the direction that the string was created.

STEP 3:

The point selected is moved to the new position and the height adjusted according to the grade of the extended segment.

Append a Vertex

Cad_Append

Position of option on menu: Strings =>CAD =>Change Points =>Point append
 or by selection of appropriate icon from the toolbar. 

This option adds vertices to an existing super string.

On selecting **Point append**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select a string by picking near the end of the string that vertices are to be added to (added to the beginning of the string - prepend, or added to the end of the string - append).

STEP 2:

After the string is accepted, a line is drawn from the end of the string to the current cursor position.

Select the position for the new vertex.

STEP 3:

After the new vertex is accepted, a line is drawn from that vertex to the current cursor position. That is, the process of adding points is repeated.

STEP 4:

This step should be repeated until the required number of vertices has been added.

STEP 5:

STEP 6:

After the required number of vertices have been added, the option is terminated for this string by pressing the <Esc> key.

New Vertex on a Segment (Between Two Vertices)

Cad_Between

Position of option on menu: Strings =>CAD =>Change Points =>Point between
or by selection of appropriate icon from the toolbar. 

This option adds a vertex to a string but it is constrained to be on an existing segment of the string. The height of the vertex is interpolated from the heights at the end of the segment.

On selecting **Point between**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the string on the segment of the string that is to have a vertex added to it. The new vertex will be constrained to be on the segment.

STEP 2:

After the segment is accepted, a perpendicular line is drawn from the selected segment of the string to the position of the cursor.

**STEP 3:**

A position is selected with the mouse or typed in via the keyboard and the new vertex is created by **dropping** the position **perpendicularly** onto the segment.

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the XYZ Input box and press the enter key.

Insert a Vertex

Cad_Insert

Position of option on menu: Strings =>CAD =>Change Points =>Point insert

or by selection of appropriate icon from the toolbar. 

This option inserts a vertex into to a string between two adjacent vertices but it is constrained to be on the existing segment joining the vertices. The height of the vertex is taken from the final selected position.

On selecting **Point insert**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select the string on the segment of the string that is to have a vertex added to it. The new vertex is **not** constrained to be on the segment.

**STEP 2:**

After a string is accepted, two lines will be drawn from the cursor position to either end of the selected segment.

STEP 3:

A final position is selected with the mouse or typed in via the keyboard and the new vertex is created at the final position.

Once the new vertex is created the original segment is no longer drawn.

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the XYZ Input box and press the enter key.

Change Height of a Vertex

Cad_Height

Position of option on menu: Strings =>CAD =>Change Points =>Point height
or by selection of appropriate icon from the toolbar. 

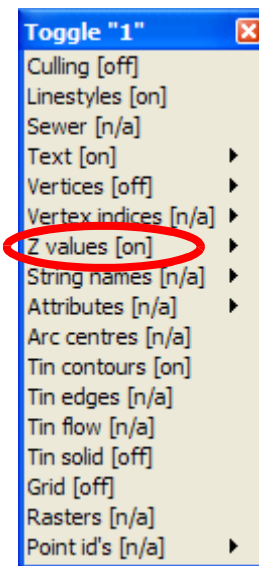

This option changes the height (z value) of a vertex.

On selecting **Point height**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

To see the effects of this option, use the **Toggle** menu to toggle on **Z values**. The height of each vertex (z value) is then displayed on the plan view so any modification to the height will be visible.

STEP 2:

Select a vertex with either the mouse or via the keyboard.

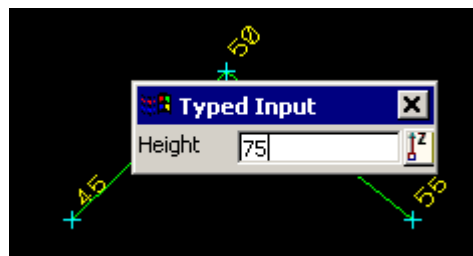

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the **Enter XYZ** Input box and press the enter key.

STEP 3:

After a point is accepted, the **Height** input box will appear with the current height displayed in it.

Type the new height (z value) of the vertex into the **Height** input box and press the enter key. The browse button  on the Input box can also be used to define the point's height.

STEP 4:

The height (z value) of selected point will have changed to the new value.

If z values have been turned on, the new value will be displayed in the view.

Point Id

Cad_Point_ID

Position of option on menu: Strings =>CAD =>Change Points =>Point id
 or by selection of appropriate icon from the toolbar. 

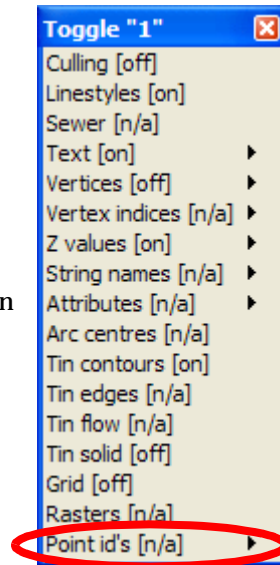

This option changes the point id of the vertex of a super string.

On selecting **Point id**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

To see the effects of this option, use the Toggle menu to toggle on **Point id's**. The Point id of each vertex is then displayed on the plan view so any modification to the point id will be visible.

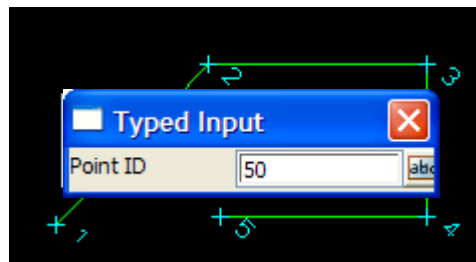

STEP 2:

Select a vertex with either the mouse or via the keyboard.

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the **Enter XYZ** Input box and press the enter key.

**STEP 3:**

After the vertex is accepted, the **Point id** input box will appear. Type the point id into the input box and press the enter key.

**STEP 4:**

The point id of selected vertex is changed to the new value. If Point id's have been turned on, the new value will be displayed in the view.

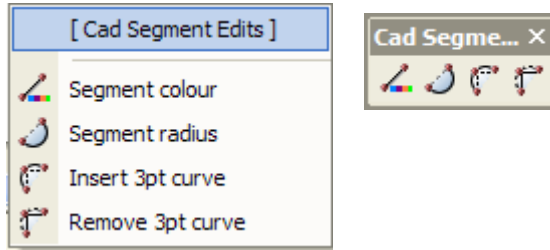

CAD Segment Edits

cad_segment_edits

Position of option on menu: Strings =>CAD =>Change segments

The Change segments walk-right menu is

For the option <i>Segment colour</i> , go to the section	“Segment Colour”
<i>Segment radius</i>	“Segment Radius”
<i>Insert 3pt curve</i>	“Insert 3pt Curve”
<i>Remove 3pt curve</i>	“Remove 3pt Curve”

Segment Colour

Cad_Segment_Colour

Position of option on menu: Strings =>CAD =>Change segments =>Segment colour
 or by selection of appropriate icon from the toolbar. 

This option changes the colour of a selected segment.

On selecting **Segment colour**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

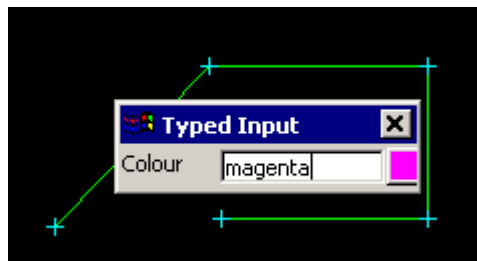

STEP 1:

Select the segment of the super string that is to have a colour change.

STEP 2:

After the segment is accepted, the **Colour** Input box will appear. Type the desired colour into the Input box and press the enter key. Alternatively you can select a colour from a list by clicking the browse button  on the Input box.

STEP 3:

The colour of the selected segment is drawn in the new colour.

Segment Radius

Cad_Segment_Radius

Position of option on menu: Strings =>CAD =>Change segments =>Segment radius

or by selection of appropriate icon from the toolbar. 

This option changes the radius of a segment.

On selecting **Segment radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

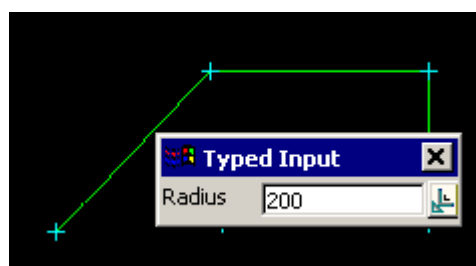

STEP 1:

Select the segment of the super string that is to have a change of radius.

STEP 2:

After the segment is accepted, the **Radius** box will appear. Type the desired radius into the Input box and press the enter key. The browse button  on the Input box can be used to define the radius by measuring existing elements.

STEP 3:

The selected segment is then drawn with the new radius.

Insert 3pt Curve

Cad_Insert_3pt_Curve

Position of option on menu: Strings =>CAD =>Change segments =>Insert 3pt curve

or by selection of appropriate icon from the toolbar. 

This option allows the creation of a 3 point curve using 2 existing segments.

On selecting **Insert 3pt curve**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select a vertex of a super string a vertex with a segment on either side, or segment of a super string.

If a **vertex** is selected, that vertex will be the middle vertex of the constructed 3 point curve. If a **segment** is selected, the closest vertex will become the **middle** vertex of the 3 point curve.

STEP 2:

After the vertex or segment is selected and accepted, an arc is through the three vertices is calculated and its radius used for the tow segments on either side of the vertex.

Remove 3pt Curve

Cad_Remove_3pt_Curve

Position of option on menu: Strings =>CAD =>Change segments =>Remove 3pt curve

or by selection of appropriate icon from the toolbar. 

This option removes the arcs from either side of a selected vertex. If a segment is selected, the closest vertex is used and the arcs removed from either side of the vertex,

On selecting **Remove 3pt curve**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select a vertex of a super string with arcs on one or two sides of the vertex.

STEP 2:

After the vertex is selected and accepted, arc on either side will removed (the radius is set to zero). Two line segments are then drawn.

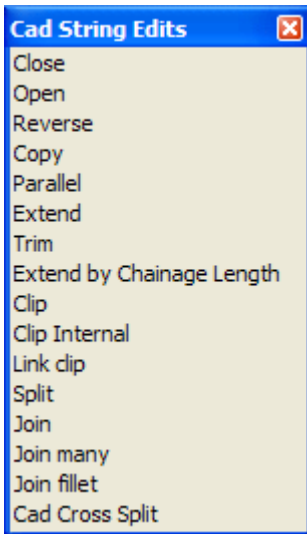

CAD Edit Strings

cad_string_edits

Position of option on menu: Strings =>CAD =>Change strings

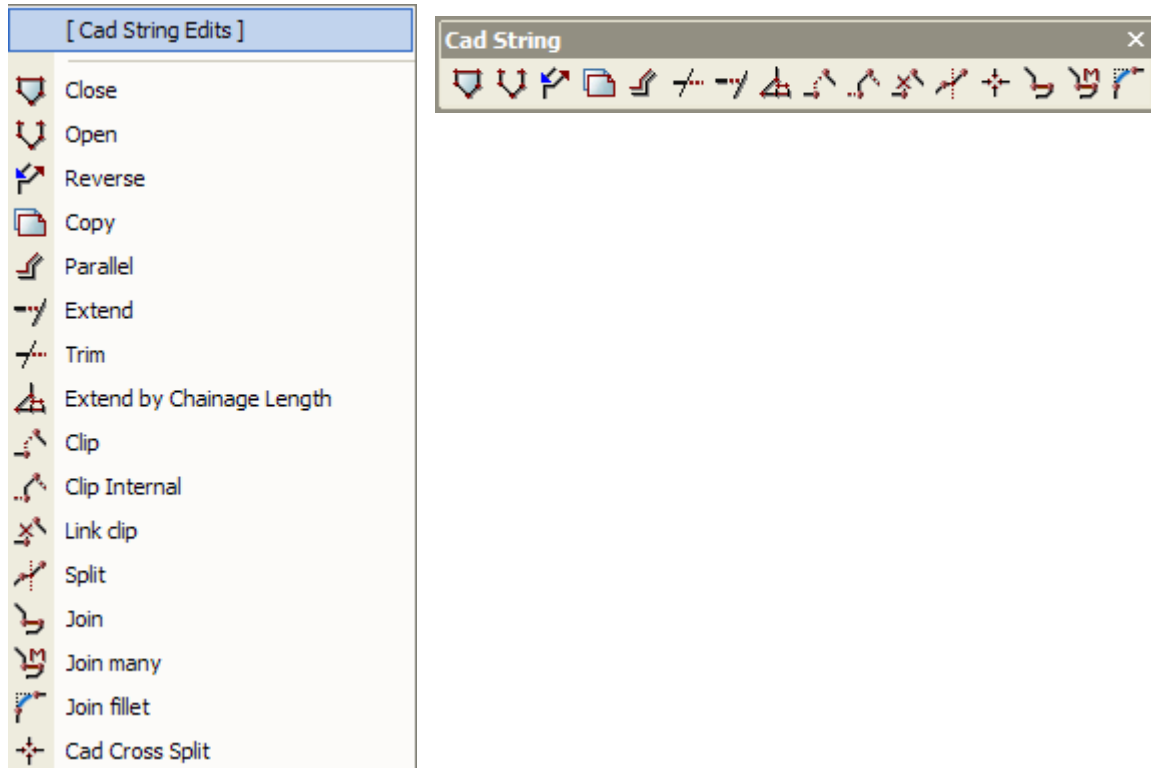

These option are currently under development.

The Change strings walk-right menu is

Menu of Options to Edit Strings

- close a string
- open a string
- reverse the direction of a string
- copy a string
- parallel a string
- extend a string until it cuts a selected string
- trim a string back to a selected string
- extend a string by a typed chainage distance
- clip a string
- delete a segment from string
- split a string
- join two strings
- join many strings
- fillet and join

For the option <i>Close</i> , go to the section	"Close String"
<i>Open</i>	"Open String"
<i>Reverse</i>	"Reverse a String"
<i>Copy</i>	"Copy a String"
<i>Parallel</i>	"Parallel a String"
<i>Extend</i>	"Extend a String"
<i>Trim</i>	"Trim a String"
<i>Extend by chainage length</i>	"Extend String by Chainage Length"
<i>Clip</i>	"Clip String"
<i>Clip internal</i>	"Delete an Internal Section of a String"
<i>Link clip</i>	"Delete a Segment"
<i>Split</i>	"Split String"
<i>Join</i>	"Join String"
<i>Join many</i>	"Join String Many"
<i>Join fillet</i>	"Join Fillet"
<i>Cad cross split</i>	"Split Crossing Strings"

Close String

Cad_String_Close

Position of option on menu: Strings =>CAD =>Change strings =>Close

or by selection of appropriate icon from the toolbar. 

This option closes an open string.

On selecting Close, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

An open string is selected and accepted.

**STEP 2:**

The string is closed

After closing of a string, the option restarts so that another string can be selected. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Open String

Cad_String_Open

Position of option on menu: Strings =>CAD =>Change strings =>Open

or by selection of appropriate icon from the toolbar. 

This option opens a closed string.

On selecting Open, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A closed string is selected and accepted.

**STEP 2:**

The string is opened by deleting the last segment of the closed string.

Note - this may not be where the string was selected.

After opening of a string, the option restarts so that another string can be selected. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Reverse a String

Cad_String_Reverse

Position of option on menu: Strings =>CAD =>Change strings =>Reverse

or by selection of appropriate icon from the toolbar. 

This option reverses the direction of a string

On selecting Reverse, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A string is selected and accepted.

STEP 2:

The string is reversed.

After reversing of a string, the option restarts so that another string can be selected. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Copy a String

Cad_String_Copy

Position of option on menu: Strings =>CAD =>Change strings =>Copy

or by selection of appropriate icon from the toolbar. 

This option copies a string. The copied strings takes its attributes from the **Cad Control Bar**.

Copy is particularly helpful in backing up strings.

On selecting Copy, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A string is selected and accepted. The copied string will take on the values in the control bar at the time of accepting.

STEP 2:

A copy of the original string will be saved into the model **bu hse string**.

Parallel a String

Cad_String_Parallel

Position of option on menu: Strings =>CAD =>Change strings =>Parallel

or by selection of appropriate icon from the toolbar. 

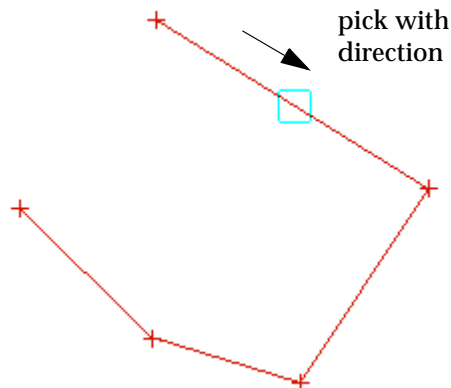

This option parallel a string by a given to a selected string.

Note that if there are arcs in the string, the string can not be paralleled by a distance that would collapse the arcs.

On selecting Parallel, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

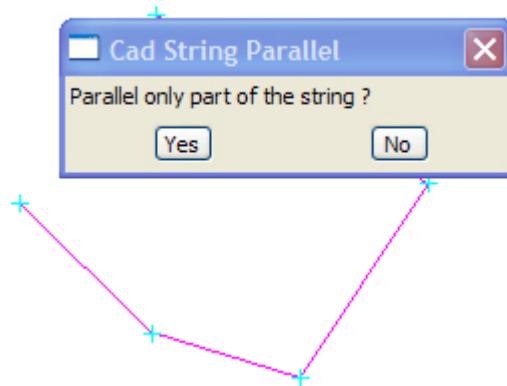

The string to parallel is picked with direction. The direction determines what it means to parallel to the right or left of the string.

**STEP 2:**

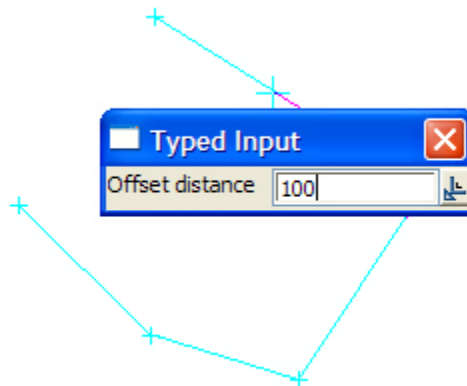

The parallel option can be applied to **all** of the selected string or only **part** of the string.

After the string is selected, a panel is displayed asking if only part of the string is to be paralleled.

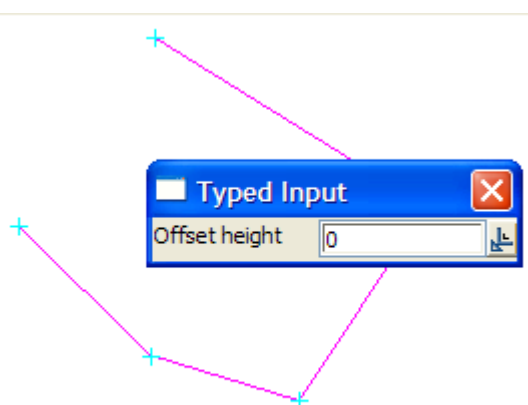

If only part of the string is to be paralleled (i.e. **yes** selected) the user picks the start and end positions of where the string is to be paralleled. This does not necessarily have to be at the end of the segments as the user can select a position anywhere on the segment to define these values. If the whole string is to be paralleled the user should select **no**.

**STEP 3:**

The user is prompted for the parallel distance. Positive distance is to the right of the selected string. Negative to the left.

**STEP 4:**

The user is prompted for the offset height. This height value will be added to the selected string values to produce the heights for the paralleled string.

**STEP 5:**

The paralleled string is then generated using the supplied information.

Extend a String

Cad_String_Extend

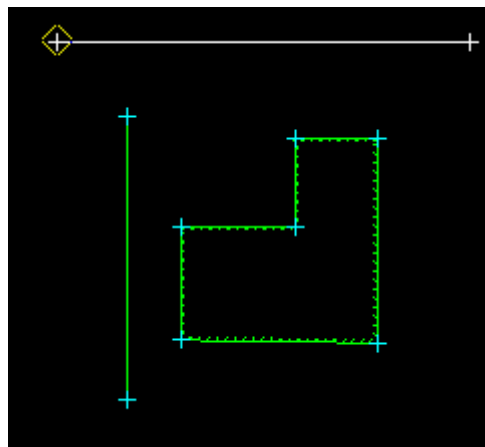

Position of option on menu: Strings =>CAD =>Change strings =>Extend
or by selection of appropriate icon from the toolbar. 

This option extends a string to a another nominated string.

On selecting Extend, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The string to extend to is selected and accepted.

STEP 2:

The string to extend to selected and accepted

STEP 3:

The string is extended.

Trim a String

Cad_String_Trim

Position of option on menu: Strings =>CAD =>Change strings =>Trim

or by selection of appropriate icon from the toolbar. 

This option trims a string to another nominated cutting string.

On selecting Trim, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The cutting string which will be used to define the trim extent is selected and accepted.

**STEP 2:**

The string to trim is selected. The position of the pick relative to the cutting string will dictate which part of the string will be trimmed. In this case, the selection is above the cutting string and so the trim will be of the top part of the string.

**STEP 3:**

The string is trimmed.

Extend String by Chainage Length

Cad_String_Extend_by_Chainage_Length

Position of option on menu: Strings =>CAD =>Change strings =>Extend by chainage length
or by selection of appropriate icon from the toolbar. 

This option extends a string by a given chainage value.

On selecting Extend by chainage length, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The string to extend is selected and accepted.

STEP 2:

The chainage length to extend the string is entered into the **Length** input Box. Positive is in the direction of the string. Negative in the opposite direction of the string.

STEP 3:

The string is extended by the given chainage amount.

Clip String

Cad_String_Clip

Position of option on menu: Strings =>CAD =>Change strings =>Clip
or by selection of appropriate icon from the toolbar. 

This option deletes part of a string.

On selecting Clip, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The string to be clipped is selected and accepted.

STEP 2:

The first and second positions defining what part of the string is to **remain** are selected and accepted.

The positions do not have to be at vertices but can be anywhere on segments

STEP 3:

The string is clipped.

Delete an Internal Section of a String

Cad_String_Clip_Internal

Position of option on menu: Strings =>CAD =>Change strings =>Clip internal
or by selection of appropriate icon from the toolbar. 

This option deletes an internal part of a string and leaves the two end sections.

On selecting Clip internal, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The string to be clipped is selected and accepted.

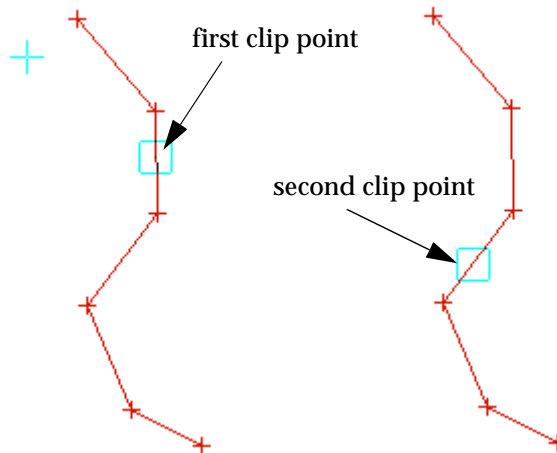

STEP 2:

The first and second position defining what part of the string is to **remain** is selected and accepted. This does not necessarily have to be at the end of the segments as the user can select a position anywhere on the segment to define these values.

The first and second positions defining what part of the string is to be **deleted** are selected and accepted.

The positions do not have to be at vertices but can be anywhere on the segments

STEP 3:

The part of the string between the two selected clip points is deleted leaving two strings.

Delete a Segment

Cad_String_Link_Clip

Position of option on menu: Strings =>CAD =>Change strings =>Link clip
or by selection of appropriate icon from the toolbar. 

This option deletes a segment from a string.

On selecting Link clip, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The **segment** to be deleted is selected and accepted.

STEP 2:

The selected segment is deleted.

Note - unless the selected string was a closed string, two strings are produced.

Split String

Cad_String_Split

Position of option on menu: Strings =>CAD =>Change strings =>Split

or by selection of appropriate icon from the toolbar. 

This option splits one string into two strings at a given split position.

On selecting Split, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The string to be split is selected and accepted.

**STEP 2:**

The split position is selected and accepted.

**STEP 3:**

The split is made at the position selected. If no vertex exists at that position, a vertex is created.

**Join String**

Cad_String_Join

Position of option on menu: Strings =>CAD =>Change strings =>Join
 or by selection of appropriate icon from the toolbar. 

This option joins two super strings together at their end points.

There are four possible ways of joining the strings and the required case is determined by picking the strings with direction.

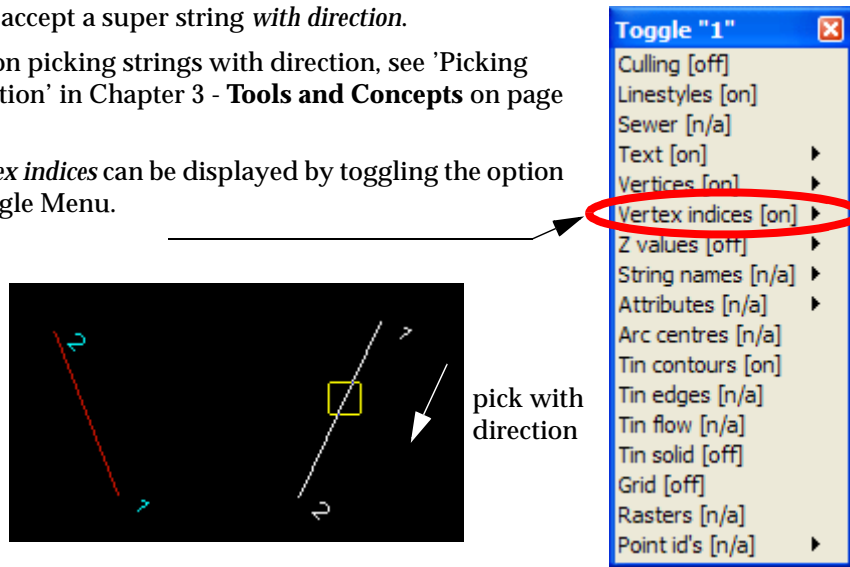

On selecting the **Join** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Select and accept a super string *with direction*.

For notes on picking strings with direction, see 'Picking with Direction' in Chapter 3 - **Tools and Concepts** on page 77.

Note: *Vertex indices* can be displayed by toggling the option on the Toggle Menu.

STEP 2:

Select and accept another super string *with direction*.

STEP 3:

The head of the first string (as determined by the picking direction) is then joined to the tail of the second string (as determined by the picking direction).

After the strings are joined, the vertex indices will change since the order of the vertices in the string is now different.

The colour of the constructed line is adopted from first selected super string. The colour of the second string will remain unchanged.

Note: The constructed line and selected strings are stored in the model of the first selected string.

Join String Many

Cad_String_Join_Many

Position of option on menu: Strings =>CAD =>Change strings =>Join many
or by selection of appropriate icon from the toolbar. 

This option joins many strings together. Picking with direction is used to specify which ends of the strings are joined.

On selecting the **Join many** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Pick a super string *with direction*.

For notes on picking strings with direction, see 'Picking with Direction' in Chapter 3 - **Tools and Concepts** on page 77.

Note: The *Vertex indices* can be displayed by toggling the option on the Toggle Menu.

pick with
direction

STEP 2:

Select and accept another super string, again picking *with direction*.

pick with
direction

STEP 3:

The **head** of the first string is then joined to the **tail** of the second string. What is the head or tail of the strings is determined by the *picking direction*.

After the strings are joined, the vertex indices to reflect the new order of the vertices in the string. The colour of the constructed segment will be the same as that of the first selected super string. The colour of the second string will remain unchanged.

Note: The constructed segment and selected strings are stored in the model which contains the 1st selected string.

STEP 4:

The *Join Many* option joins extra strings to the already selected (and joined) strings. The user may continue selecting additional strings to join together by select and accept additional super strings by picking with direction.

This option can be terminated by the user with the **Esc** key.

Note: Each further construction line adopts the same colour as the 1st selected string. Both the constructed line and selected strings are stored in the model which contains the first selected string.

Join Fillet

Cad_Join_Fillet

Position of option on menu: Strings =>CAD =>Change strings =>Join fillet

or by selection of appropriate icon from the toolbar. 

This option fillets, trims and joins strings.

There are eight possible ways of filleting the strings and the required case is determined by picking the strings with direction and by the sign of the radius.

On selecting the **Join strings** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Pick a super string *with direction*.

For notes on picking strings with direction, see 'Picking with Direction' in Chapter 3 - **Tools and Concepts** on page 77.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

pick with
direction

**STEP 2:**

Select and accept another super string, again picking *with direction*.

pick with
direction

**STEP 3:**

After the second super string is accepted, the **Radius** input box will appear. Type the *fillet radius* into the input box and press the enter key. The browse button  on the input box can be used to define the fillet radius by measurement of existing elements.

Note: A **positive** fillet radius value will curve to the right, where as a **negative** fillet radius will curve to the left.

A fillet arc with the radius is constructed and joined to the two strings and the ends of the two strings are automatically trimmed back to the arc.

The vertex indices will change to accommodate the new vertices in the string. The colour of the constructed line and 2nd selected string adopts the colour of the 1st selected super string.

Note: The constructed arc and selected strings are stored in the model of the first selected string.

Split Crossing Strings

Cad_String_Cross_Split

Position of option on menu: Strings =>CAD =>Change strings =>Cad cross split
or by selection of appropriate icon from the toolbar. 

This option splits two crossing strings at the position of their crossing.

On selecting Cad cross split, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

Pick the first string.

STEP 2:

Pick the second string.

STEP 3:

The two strings are then split where the strings crossed. This will create four strings.

CAD Delete

cad_delete

Position of option on menu: Strings =>CAD =>Delete

The Delete walk-right menu is

Menu of Options to Delete Vertices, Segments and Strings

delete a vertex
delete a segment
delete a string

For the option *Points*, please go to the section. "Delete Vertices" .

Segments

"Delete Segments" .

Strings

"Delete String" .

Delete Vertices

Cad_Vertex_Delete

Position of option on menu: Strings =>CAD =>Delete =>Points

or by selection of appropriate icon from the toolbar. 

This option deletes vertices of super strings.

On selecting Points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The vertex to be deleted is selected and accepted (This must be a super string).

STEP 2:

The vertex point is deleted and the string redrawn.

Delete Segments

Cad_Segment_Delete

Position of option on menu: Strings =>CAD =>Delete =>Segments
or by selection of appropriate icon from the toolbar. 

This option deletes segments of super strings.

On selecting Segments, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The segment to be deleted is selected and accepted.

STEP 2:

The segment is deleted leaving two separate strings in this case.

Delete String

Cad_String_Delete

Position of option on menu: Strings =>CAD =>Delete =>Strings
or by selection of appropriate icon from the toolbar. 

This option deletes selected strings. The string type does not specifically have to be a super string.

On selecting Strings, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The string to be deleted is selected and accepted.

STEP 2:

The string is deleted.

Delete Selection of Strings

Position of option on menu: Strings =>CAD =>Delete =>Selection

or by selection of appropriate icon from the toolbar. 

This option allows the deleting of selected objects specified in a source box. For help on this option see "Delete".

On selecting the **Delete** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

Create

string_create

Position of option on menu: Strings =>Create

The Create option is used to produce **new** strings. If a string already exists, the Editor option is used to modify it.

The Create walk-right menu contains options to create 2d, 3d, 4d, alignment, super alignment, circles, arcs, feature, pipe, polyline, super and text strings.

Each string type has its own special information so by choosing the appropriate type to be created, only information needed for that type of string is asked for.

Once a string has been created, it can be converted to most of the other string types using the string Convert option.

To create a new string of the same type and with similar header information as an existing string, the same as option is selected from the String Create menu.

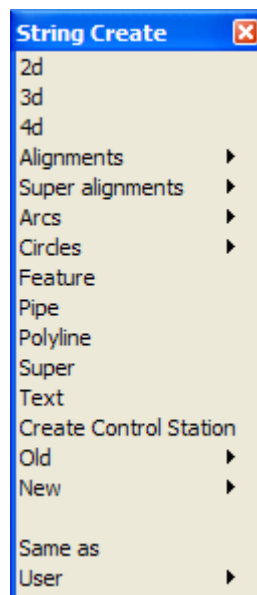

Notes

1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertex (point type) or with straight lines joining the vertices (line type).

Linestyles can be defined that drawn lines between the points even though the breakline type is **point**.

2. The string vertices are also called intersection points (IP's).

The String Create walk-right menu is

The string creation process is similar for each string type and for editing strings as well.

For	<i>Create 2d</i>	go to	"Create - 2d Super"
	<i>3d</i>		"Create - 3d Super"
	<i>4d</i>		"Create - 4d Super"
	<i>Alignment</i>		"Alignments"
	<i>Super alignment</i>		"Super Alignments"
	<i>Arcs</i>		"Create Arcs"
	<i>Circles</i>		"Create - Circles"

<i>Feature</i>	"Create - Feature"
<i>Pipe</i>	"Create - Pipe"
<i>Polyline</i>	"Create - Polyline"

<i>Text</i>	"Create - Text"
<i>Control stations</i>	"Create - Control Stations"
<i>Old</i>	"Old"
<i>Same as</i>	"Create - Same As"

Create - 2d Super

create_super_2d_string

Position of option on menu: Strings =>Create =>2d

A 2d string consists of a series of (x,y) vertices all with the same z-value (height). 2d strings are often referred to as “contour strings” because contours are the most common example of a string with a constant height.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create 2d Super String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 2d Super String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

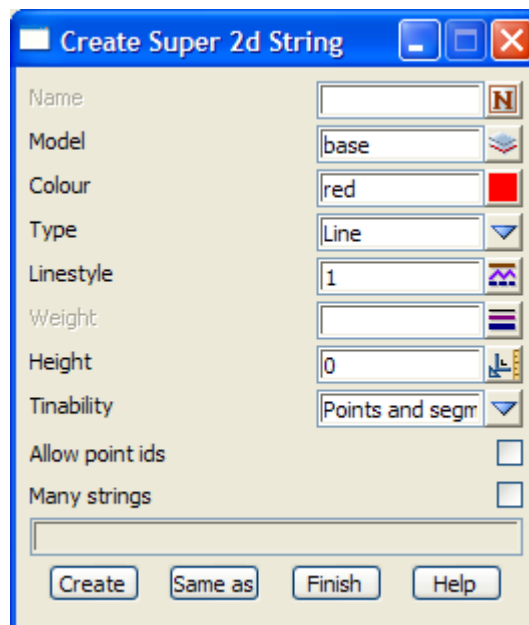

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style, breakline type and height field of the **Create 2d Super String** panel.

From **12d Model 8** onwards, the default is to create **2d super strings** rather than the **2d strings** used up to **12d Model 7**. A **2d super string** is a **super string** with **Constant height**. That is, there is only one z-value for the entire string. The advantage of using a **2d super string** is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older **2d string** create options are still available under

Strings =>Create =>Old

On selecting 2d string, the **Create Super 2d String** panel is displayed.

The default values for the panel fields are taken from the **CAD Controlbar** (see “**CAD, Symbol and Text Controlbars**”)

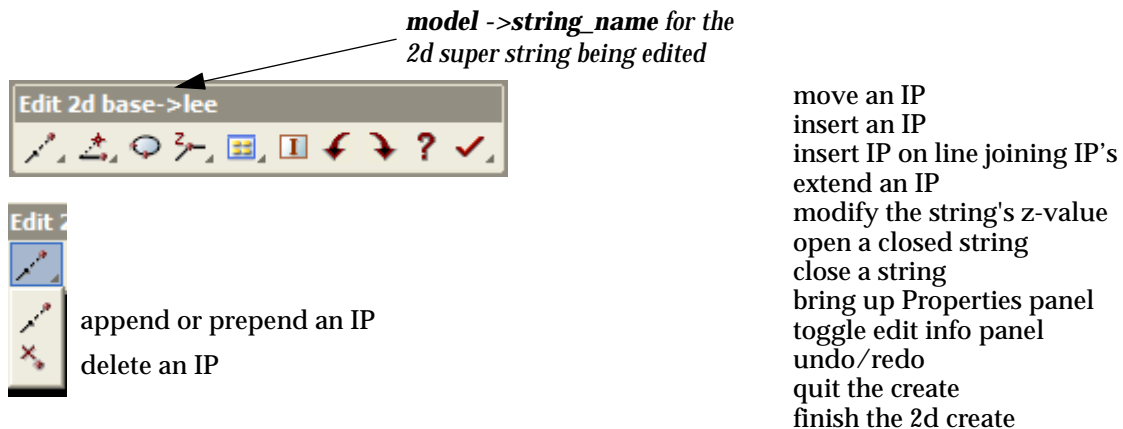

To create a **new 2d super string** (a **2d super string** is a **super string** with the **constant height** flag set on), the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create 2d Super String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string</i>	input	from CAD controlbar	
Model <i>name of the model that the new string is in</i>	model box	from CAD controlbar	available models
Colour <i>the colour of the new string</i>	colour box	from CAD controlbar	available colours
Type <i>breakline type (point-line type) of the string</i>	choice box	line	line, point
Linestyle <i>line style of the string</i>	input	from CAD controlbar	available line styles
Weight <i>thickness of the string</i>	input	from CAD controlbar	
Height <i>for a 2d super string, there is only one height (z-value) for the entire string.</i>	input	from CAD controlbar	
Tinability <i>if Vertices and segments, all the vertices and segments of the string are set to tinable. If Vertices only, all the vertices are set to tinable and the segments to not tinable. If Not tinable, all the vertices or segments are set to not tinable.</i>	choice box	Points and segments	Points and segments Points only Not tinable
Allow point ids <i>if tick, the 2d super string can have point ids for each vertex. If not tick, the 2d super string will not have point ids. This can be reversed if point ids are required in the future.</i>	tick box		
Many strings <i>if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick box		
Create <i>After the Create button is chosen, the Edit 2d menu is displayed.</i>	button		
Same as <i>After the Same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		
Finish <i>end the option, don't proceed to the edit stage.</i>	button		

Edit 2d Super

On selecting the **Create** button in the **Create 2d Super String** panel the Edit 2d menu is placed on the screen. The Edit 2d menu for a *2d super string* is

To create a new *2d super string*, select the **Append** icon.

The **Append** option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all 2d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **first** vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's Edit 2d menu are usable.

The options in the Edit 2d menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the Edit 2d menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the 2d Editor, go to the section

Create - 3d Super

[create_super_3d_string](#)

Position of option on menu: Strings =>Create =>3d

A 3d string consists of a series of (x,y,z) vertices.

The difference between a 2d and a 3d string is that for a 3d string, the z-value (height) can vary at each string vertex, whereas a 2d string has a constant height for the entire string. Hence a 2d string is simply a special case of a 3d string where the heights at all the vertices are the same.

Creating and editing a 3d string is very similar to a 2d string. The only major difference is that a height is required at each string point.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create 3d Super String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 3d Super String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the

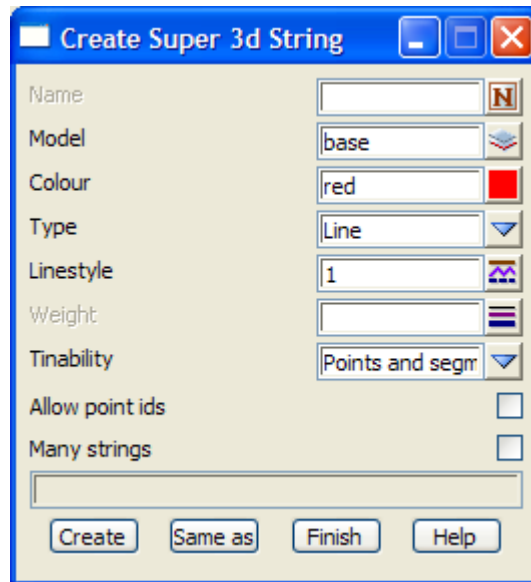

Create 3d Super String panel.

From **12d Model 8** onwards, the default is to create **3d super strings** rather than the **3d strings** used up to **12d Model 7**. The advantage is using a **3d super string** is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older **3d string** create option is still available under

Strings =>Create =>Old

On selecting the 3d string option, the **Create 3d Super String** panel is displayed.

The default values for the panel fields are taken from the **CAD Controlbar** (see “**CAD, Symbol and Text Controlbars**”)

To create a **new 3d super string**, the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create 3d Super String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string</i>	input	from CAD controlbar	
Model <i>name of the model that the new string is in</i>	model box	from CAD controlbar	available models
Colour <i>the colour of the new string</i>	colour box	from CAD controlbar	available colours
Type <i>breakline type (point-line type) of the string</i>	choice box	line	line, point
Linestyle <i>line style of the string</i>	input	from CAD controlbar	available line styles
Weight <i>thickness of the string</i>	input	from CAD controlbar	
Tinability <i>if Vertices and segments, all the vertices and segments of the string are set to tinable.</i>	choice box	Points and segments	Points and segments Points only Not tinable

If **Vertices only**, all the vertices are set to tinnable and the segments to not tinnable.

If **Not tinnable**, all the vertices or segments are set to **not tinnable**.

Allow point ids tick box

if **tick**, the super string can have point ids for each vertex.

If **not tick**, the super string will not have point ids. This can be reversed if point ids are required in the future.

Many strings tick box

if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

after the **Same as** button is chosen, another string is selected and information about it is used for the fields in this panel

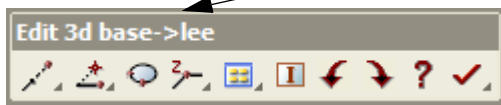

Finish button

end the option, **don't** proceed to the edit stage

Edit 3d Super

On selecting the **Create** button in the **Create 3d Super String** panel the Edit 3d menu is placed on the screen. The Edit 3d menu for a *3d super string* is

model ->string_name for the 3d super string being edited

move an IP
insert an IP
insert IP on line joining IP's
extend an IP
modify the string's z-value
open a closed string
close a string
bring up Properties panel
toggle edit info panel
undo/redo
quit the create
finish the 2d create

append or prepend an IP
delete an IP

To create a new *3d super string*, select the **Append** icon.

The **Append** option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all 3d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **first** vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's Edit 3d menu are usable.

The options in the Edit 3d menu are not only used for placing the initial vertices of the string, but

for editing the string once it is created. Since the **Append** and other options in the **Edit 3d** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the 3d Editor, go to the section

Create - 4d Super

create_super_4d_string

Position of option on menu: Strings =>Create =>3d

A 4d string consists of a series of (x,y,z) points and a text label at each point.

Creating and editing a 4d string is very similar to a 3d string.- the major difference is that a height **and** a text label is required at each string point.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create 4d Super String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 4d Super String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

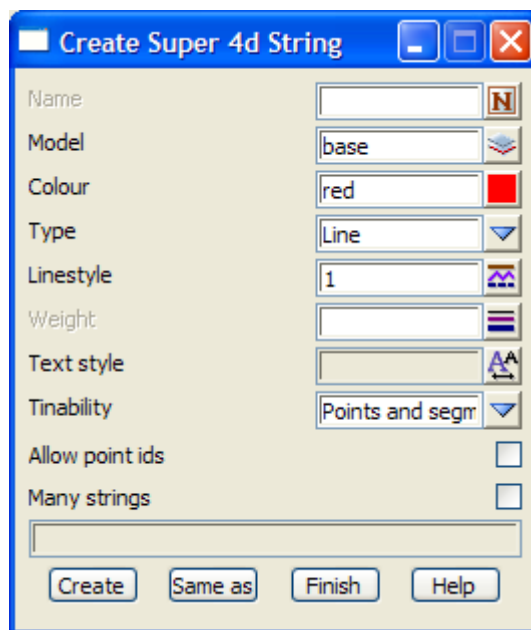

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create 4d Super String** panel.

From **12d Model 8** onwards, the default is to create **4d super strings** rather than the **4d strings** used up to **12d Model 7**. The advantage is using a **4d super string** is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older **4d string** create option is still available under

Strings =>Create =>Old

On selecting the 4d string option, the **Create 4d Super String** panel is displayed.

The default values for the panel fields are taken from the **CAD Controlbar** (see "**CAD, Symbol and Text Controlbars**")

To create a **new 4d super string**, the panel fields are filled in and the **Create** button selected.

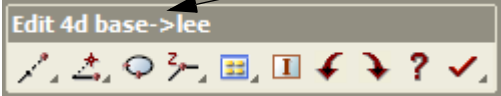

The fields and buttons used in the **Create 4d Super String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string</i>	input	from CAD controlbar	
Model <i>name of the model that the new string is in</i>	model box	from CAD controlbar	available models
Colour <i>the colour of the new string</i>	colour box	from CAD controlbar	available colours
Type <i>breakline type (point-line type) of the string</i>	choice box	line	line, point
Linestyle <i>line style of the string</i>	linestyle box	from CAD controlbar	available line styles
Weight <i>thickness of the string</i>	input	from CAD controlbar	
Text style <i>textstyle to use for text</i>	textstyle box		
Tinability <i>if Vertices and segments, all the vertices and segments of the string are set to tinable. If Vertices only, all the vertices are set to tinable and the segments to not tinable. If Not tinable, all the vertices or segments are set to not tinable.</i>	choice box	Points and segments	Points and segments Points only Not tinable
Allow point ids <i>if tick, the super string can have point ids for each vertex. If not tick, the super string will not have point ids. This can be reversed if point ids are required in the future.</i>	tick box		
Many strings <i>if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick box		
Create <i>after the Create button is chosen, the Edit 4d menu is displayed</i>	button		
Same as <i>after the Same as button is chosen, another string is selected and information about it is used for the fields in this panel</i>	button		
Finish <i>end the option, don't proceed to the edit stage</i>	button		

Edit 4d Super

On selecting the **Create** button in the **Create 4d Super String** panel the Edit 4d menu is placed on the screen. The Edit 4d menu for a *4d super string* is

model ->string_name for the 4d super string being edited

- move an IP
- insert an IP
- insert IP on line joining IP's
- extend an IP
- modify the string's z-value
- open a closed string
- close a string
- bring up Properties panel
- toggle edit info panel
- undo/redo
- quit the create
- finish the 2d create

- append or prepend an IP
- append or prepend an IP plus text
- delete an IP

To create a new *4d super string*, select the **Append** or **Append + Text** icon.

The **Append** and or **Append + Text** option are used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex. **Append + Text** also asks for text at each vertex.

For all 4d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **first** vertex of the string (using the appropriate snaps).

If **Append + text** was selected, the user will then be prompted for the text to be placed at that vertex.

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Edit 4d** menu are usable.

The options in the **Edit 4d** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit 4d** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the 4d Editor, go to the section

Alignments

alignments

Position of menu: Strings =>Create =>Alignment

The alignment walk-right menu contains options to create an alignment string, plus quick methods of creating an alignment string with horizontal geometry already created for culdesacs, circles and fillets.

create alignment
 create culdesac
 create three centred curve
 create alignment forming a circle
 create alignment fillet
 create alignment for traffic island

For	<i>Alignment</i>	go to	"Create - Alignment" .
	<i>Culdesac</i>		"Create - Culdesac"
	<i>3 centre curve</i>		"Create - three centre curve"
	<i>Circle</i>		"Create - circle"
	<i>Fillet</i>		"Create - fillet"
	<i>Traffic island</i>		"Create - Traffic Island"

Create - Alignment

[create_alignment_string](#)

Position of option on menu: Strings =>Create =>Alignment =>Alignment

An alignment string is defined by specifying both its horizontal and vertical geometry.

The horizontal geometry consists of a series of (x,y) points (called horizontal intersection points) with circular curves and transition spirals applied to the intersection points.

Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points (called vertical intersection points) and either parabolic or circular curves applied to the vertical intersection points.

The horizontal geometry is defined in a plan view and the vertical geometry in a section view.

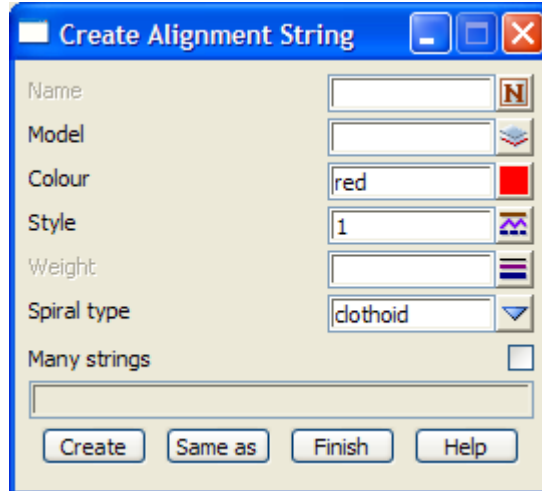

Alignment strings are often referred to as "centre-line strings" because road centre-lines are common examples of alignment strings.

Note vertical geometry can only be added to an **existing** string.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create Alignment String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Alignment String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Alignment String** panel.

On selecting the alignment string option, the **Create Alignment String** panel is displayed.

To create a new alignment string, the name, model, colour, style and transition spiral type of the new string are entered into the appropriate fields and the **Create** button selected.

The new fields and buttons used in the **Create Alignment String** panel have the following functions.

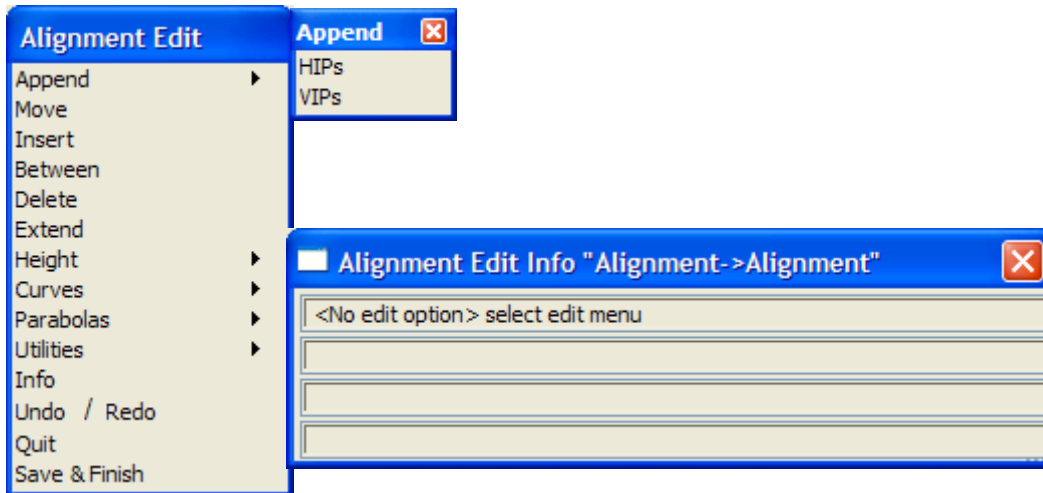

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
Spiral type <i>transition spiral type to be used for this alignment string.</i>	input	clothoid	available spirals
Many strings <i>if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick		
Create <i>After the create button is chosen, the alignment edit menu and alignment edit info panel are displayed.</i>	button		
Same as <i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		

Alignment Edit

Selecting the create button in the **create alignment string** panel the alignment edit menu and

alignment edit info panel are placed on the screen.

The alignment edit menu and alignment edit info panel for an alignment string are

To begin creating an alignment string, the user must select the `append=>HIPs` option from the Alignment Edit menu and start placing points in a plan view.

To create a new alignment string, select the `Append => HIPs` option from the Alignment Edit menu.

The `Append =>HIPs` option is used to add horizontal intersection points to either end of an existing alignment string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all alignment strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's Alignment Edit menu are usable.

The options in the Alignment Edit menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the `Append` and other options in the Alignment edit menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the Alignment Editor, go to the section "Alignment Edit"

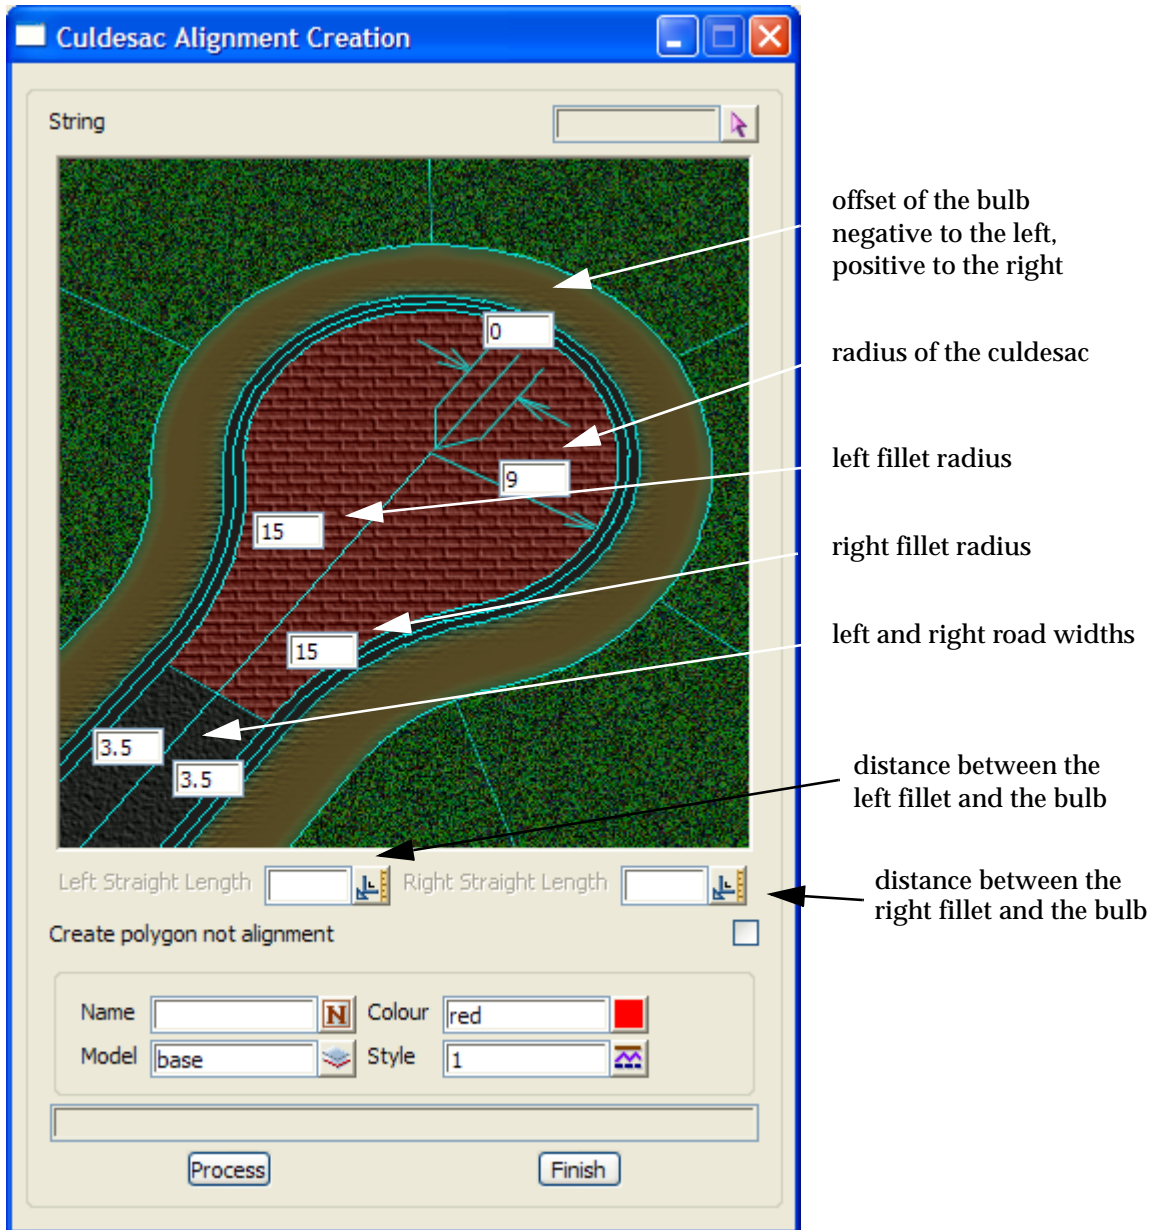

Create - Culdesac

culdesac_alignment_creation

Position of option on menu: Strings =>Create =>Alignment =>Culdesac

Create an alignment string for a culdesac for user defined road widths, culdesac radius and offset. No vertical geometry is defined.

On selecting the Culdesac option, the **Culdesac Alignment Creation** panel is displayed.

The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Offset	input box		
---------------	-----------	--	--

offset of the centre of the culdesac bulb. Use a negative value if the offset is to the left, positive if the

offset is to the right.

Radius input box

radius of the culdesac bulb

Left/Right fillet radii input box

radii for the left and right fillets from the roads to the culdesac bulb.

Left/Right road widths input box

left and right widths of the road.

Name/Model/Colour/Style input box

name/model/colour/style of the created alignment string.

Select string select

select with direction the string to create the culdesac for.

Preview string select

draw the culdesac with the given parameters in the panel draw box.

Process button

create the alignment string

Undo button

undo the last alignment string created whilst the panel has been active.

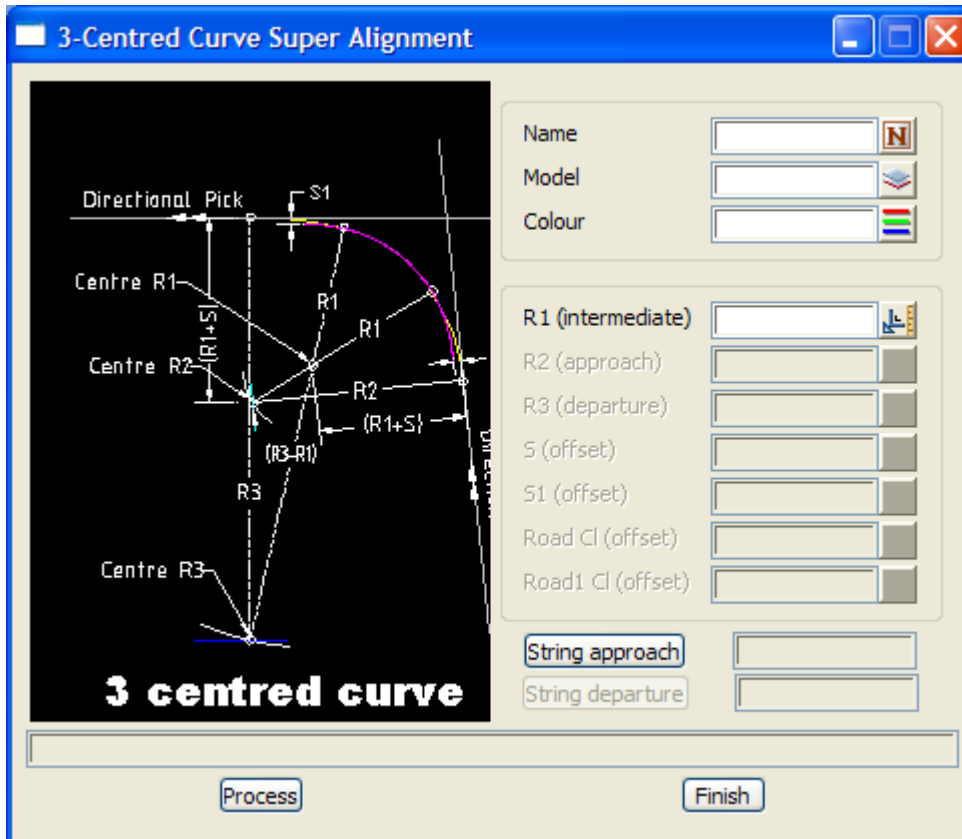

Create - three centre curve

3centre_curve_panel

Position of option on menu: Strings =>Create =>Alignment =>3 Centre Curve

Create an alignment string for a three centred curve for user defined parameters and selected strings.

On selecting the 3 centre curve option, the **3 centred curve construction** panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Name/Model/Colour/Style	input box		
<i>name/model/colour/style of the created alignment string.</i>			

R1 (intermediate)	input box		
<i>radius of the intermediate curve. If a value is entered and <enter> typed, values for R2, R3, S and S1 are computed and place in the appropriate fields</i>			

R2 (approach)	input box		
<i>radius of the approach curve.</i>			

R3 (departure)	input box		
<i>radius of the departure curve.</i>			

S (offset)	input box		
<i>approach offset.</i>			

S1 (offset)	input box		
<i>departure offset.</i>			

- Kerb line approach** string select
select the approach string
- Kerb line departure** string select
select the departure string
- Process** button
create the alignment string
- Undo** button
undo the last alignment string created whilst the panel has been active.

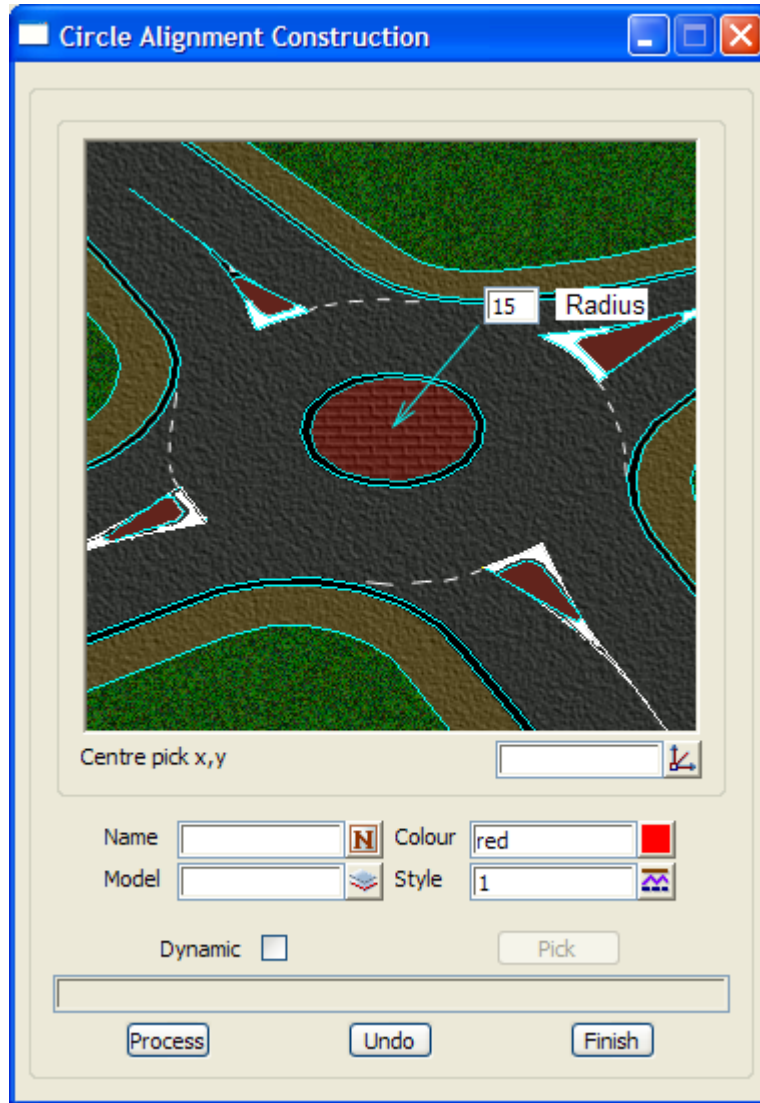

Create - circle

circle_align_panel

Position of option on menu: Strings =>Create =>Alignment =>Circle

Create an alignment string for a circle with a for user radius and selected centre or with a dynamic mode set, selected centre and interactively positioned circumference.

On selecting the curve option, the **circle alignment construction** panel is displayed.

The diagram indicates what the panel fields are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Radius <i>the radius of the circle.</i>	input box		
Centre pick x,y <i>if Dynamic in not ticked, select the centre of the circle.</i>	x,y,z box		

Name/Model/Colour/Style input box

name/model/colour/style of the created alignment string.

Dynamic tick box

if not tick, then the Centre pick x,y and radius fields are used to define the circle.

if tick, then the Pick button is used to select the centre and then the cursor is taken to be on the circle to dynamically define the radius.

Pick button

pick the circle centre when in dynamic mode.

Process button

create the alignment string.

Undo button

undo the last alignment string created whilst the panel has been active.

Create - fillet

fillet_alignment_construction

Position of option on menu: Strings =>Create =>Alignment =>Fillet

Create an alignment string for a fillet with a for user radius and selected in and out strings.

On selecting the fillet option, the **fillet alignment construction** panel is displayed.

The diagram indicates what the panel fields are for. Tool tips appear when the cursor is passed over the panel.fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select 1 <i>select the approach string. Pick with direction.</i>	string select		
Radius <i>the radius of the fillet.</i>	input box		
Select 2 <i>select the departure string. Pick with direction.</i>	string select		
Name/Model/Colour/Style <i>name/model/colour/style of the created alignment string.</i>	input box		
Process	button		

create the alignment string.

Undo button

undo the last alignment string created whilst the panel has been active.

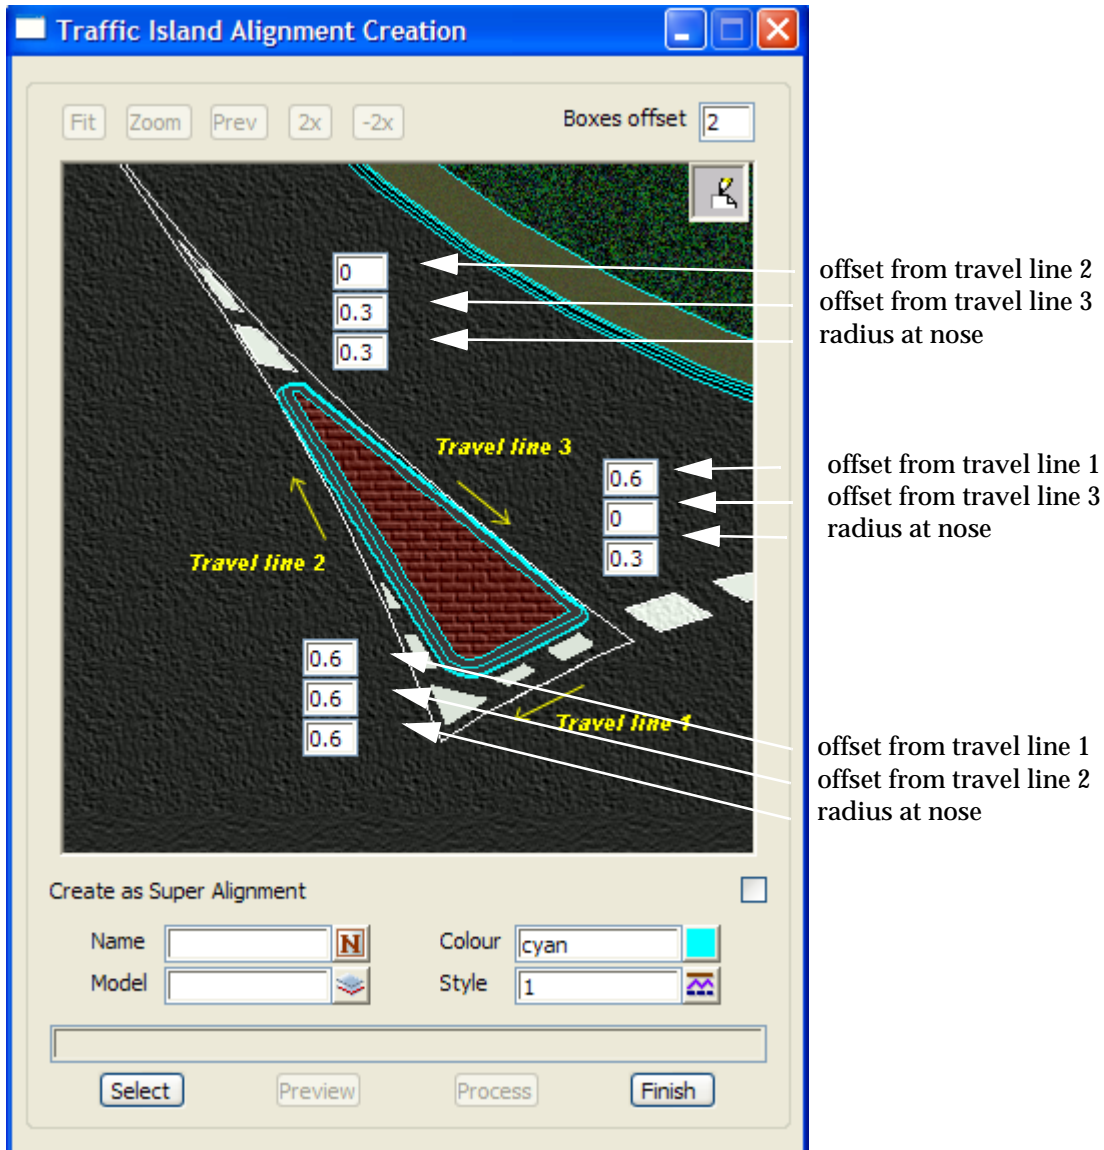

Create - Traffic Island

island_drawbox_panel

Position of option on menu: Strings =>Create =>Alignment =>Traffic Island

Create an alignment string for a traffic island between user selected strings and with user defined offsets from the strings and nose radii. No vertical geometry is defined.

On selecting the traffic island option, the traffic island alignment creation panel is displayed.

The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Offset from travel lines <i>offset distance from the selected travel lines.</i>	input box		
Radius at nose	input box		

radius of the corner of the traffic island between the selected travel lines.

Name/Model/Colour/Style input box

name/model/colour/style of the created alignment string.

Select strings select

select in order and with direction, the three strings to use in creating the traffic island. Terminate by clicking RB and selecting cancel from the pick ops menu.

Preview string select

draw the traffic island with the given parameters in the panel draw box.

Process button

create the alignment string

Undo button

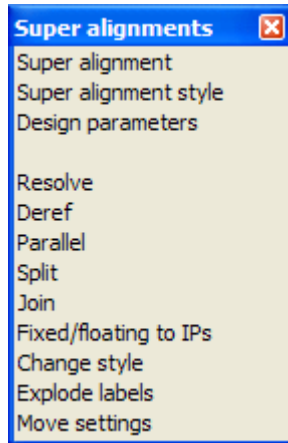

undo the last alignment string created whilst the panel has been active.

Super Alignments

super_alignments

Position of menu: Strings =>Create =>Super alignment

The Super Alignment walk-right menu contains options to create an alignment string, plus quick methods of creating an alignment string with horizontal geometry already created for culdesacs, circles and fillets.

create super alignment
create super alignment style
create design parameter file

resolve a super alignment
dereference a super alignment
parallel a super alignment
split a super alignment
join two super alignments
convert fixed/floating to IP's
change the style for super alignments
explode the labelling to text and lines
setting to lock the movement of IP's

For	<i>Super alignment</i> , go to	"Create - Super Alignment"
	<i>Super alignment style</i>	"Super Alignment Style"
	<i>Design parameters</i>	"Define Design Parameters"
	<i>Resolve</i>	"Resolve a Super Alignment"
	<i>Deref</i>	"Dereference a Super Alignment"
	<i>Parallel</i>	"Parallel a Super Alignment"
	<i>Split</i>	"Split a Super Alignment"
	<i>Join</i>	"Joining Two Super Alignments"
	<i>Fixed/floating to IP's</i>	"Convert Fixed/Floating Elements to IP's"
	<i>Change style</i>	"Change the Styles for Selected Super Alignments"
	<i>Explode labels</i>	"Explode the Super Alignments Labelling"
	<i>Move settings</i>	"Constrain the Movement of Super Alignment Points"

Create - Super Alignment

`create_super_alignment`

Position of option on menu: Strings =>Create =>Alignment =>Super alignment

An super alignment string, like the alignment string, is defined by specifying both its horizontal and vertical geometry.

For an **alignment** string, the alignment consists of only horizontal and vertical intersection points with parametrically defined objects consisting of transition spiral-arc-transition spiral for the horizontal geometry and parabolas or arcs for vertical geometry. The resultant elements are linked tangentially to form the horizontal and vertical geometry. The intersection points can be moved and the

The **super alignment** includes IP constructions but also allows much more complicated parametric design. Elements such as straights and arcs as well as intersection points can be defined and then joined by parametrically defined objects (consisting of combinations of transition spirals, arcs and straights in the horizontal geometry and parabolas, arcs and straights for the vertical geometry) which link tangentially to form the horizontal and vertical geometry.

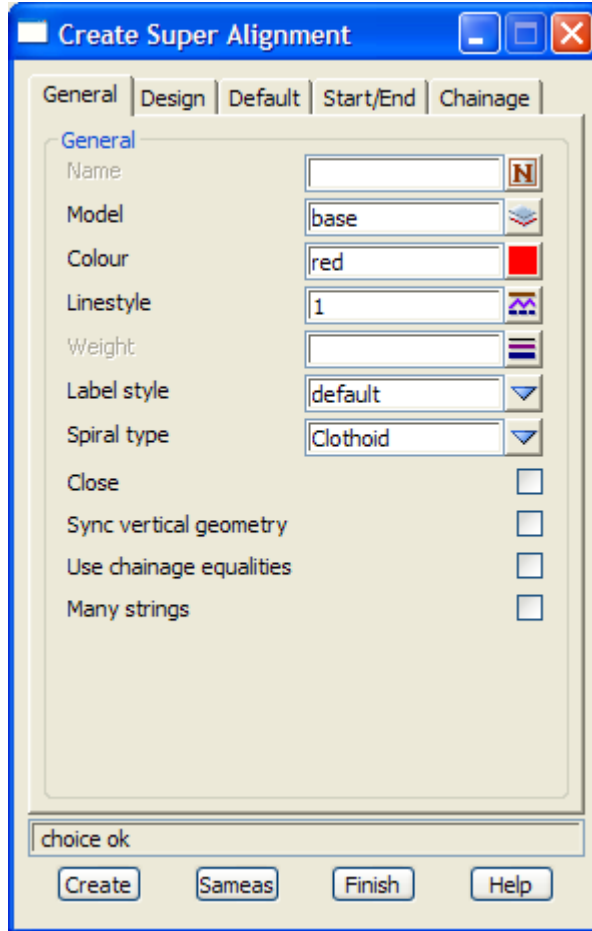

For both the alignment and super alignment, the horizontal geometry is defined in a **plan** view and the vertical geometry in a **section** view.

Note: vertical geometry can only be added to an **existing** super alignment string. That is, to a string with some horizontal geometry.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create Super Alignment** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super Alignment** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Super Alignment** panel.

On selecting the Super Alignment option, the **Create Super Alignment** panel is displayed.

To create a new super alignment string, the name, model, colour, style and transition spiral type of the new string are entered into the appropriate fields and the **Create** button selected.

The fields and buttons used in the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
General tab			
Name <i>the name of the new string</i>	input	from CAD controlbar	
Model <i>name of the model that the new string is in</i>	input	from CAD controlbar	available models
Colour <i>the colour of the new string</i>	input	from CAD controlbar	available colours
Linestyle <i>line style of the string</i>	linestyle box	from CAD controlbar	available line styles
Weight <i>thickness of the string</i>	input	0	
Spiral type <i>transition spiral type to be used for this alignment string</i>	choice box	clothoid	available spirals
Close <i>if tick, the super alignment is automatically closed.</i>	tick box		

Sync vertical geometry tick box

if **tick**, when the horizontal geometry is modified, an attempt is made to modify the chainage position of the vertical geometry so that remains locked to the same parts of the horizontal geometry as before the horizontal geometry was modified.

If **not tick**, after horizontal geometry is modified, the vertical will possibly be moved in relation to the horizontal geometry because the (x,y) position for a given chainage will change.

Use chainage equalities tick box

if **tick**, chainage equalities can be defined and the automatic labelling of the string will use the equalities. The use of equalities is still under development.

Many strings tick

if **tick** then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string

Design tab

the **Design** tab is only used if a design table has been set up and is to be used for automatically inserting curves and transition curves in horizontal, vertical curves in the vertical and super elevation and widening.

Use design table tick box

if **tick**, the given design table is used when creating horizontal and vertical geometry.

If **not tick**, no design table is used with **Alignment speed** elements.

Design table

*.design files

design table to use when creating horizontal and vertical geometry

Design speed

*.design files

the general design speed for the road. This is used with the design table when creating horizontal and vertical geometry

Horz speed curve choice box

minimum radius
maximum radius

For **Alignment speed** and **Curve speed HIPs**.

If **minimum radius**, when an arc is automatically placed on an HIP using the design table, the arc with the smallest radius for the design speed is used.

If **maximum radius**, when an arc is automatically placed on an HIP using the design table, the arc with the largest radius for the design speed is used.

Vert speed curve choice box

minimum kvalue
maximum kvalue

For **Alignment speed** and **Speed VIPs**.

If **minimum kvalue**, when a parabola is automatically placed on an VIP using the design table, the parabola with the smallest kvalue for the design speed is used.

If **maximum kvalue**, when a parabola is automatically placed on an VIP using the design table, the parabola with the largest kvalue for the design speed is used.

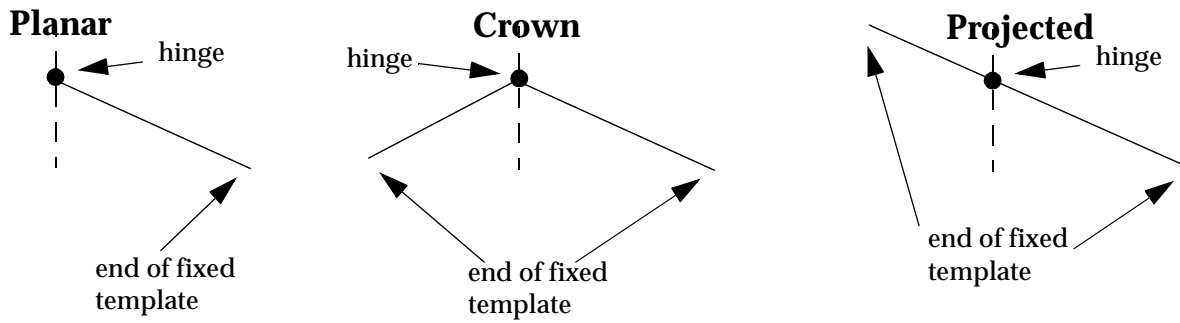

Slope type choice box

planar
crowned
projected

If **planar**, then the design table is only applied for half of the road (from the hinge string to the end of the fixed template). The side used is given by **Highside**.

If **crowned**, then the design table is used for each side of the roads (from the left most fixed template to the hinge string, and from the hinge string to the right most fixed template).

If **projected**, then the design table is first applied to half of the road given by **Highside** (from the hinge string to the end of the fixed template). Then the grade from the **Highside** is projected through the hinge string and used on the other side of the road.

Section View

Highside	choice box	left edge	left edge, right edge
<i>used if the Slope type is planar or projected.</i>			
Speed lookup	choice box		ceiling floor round up round down
Radius lookup	choice box		ceiling floor round up round down interpolate

*For non speed HIP's only (that is, not Alignment speed or Curve speed HIPs).
The radius has been defined by the user and*

Ease off	choice box	none maximum by length
-----------------	------------	------------------------------

method of transitioning between minimum and maximum super elevation.

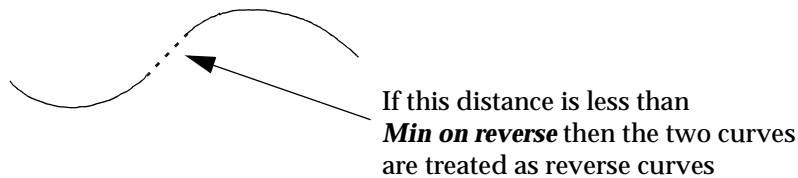

If none, no transition is done.

If maximum, maximum back to back curves are added to the super diagram between the minimum and maximum super elevation and are used to transition the super.

*If by length, the ease off distance is given by the **Ease off length** value.*

Ease off length	input
<i>the length of the ease off for the transition of super elevation when the by length method is selected</i>	

Min on reverse	input
<i>if the chainage distance between two curves of opposite sign is less than the Minimum on reverse value then the two curves are treated as reverse curves when applying the design rules.</i>	

Plan View

Min on broken back input

if the chainage distance between two curves of the same sign is less than the **Minimum on broken-back** value then the two curves are treated as broken-back curves when applying the design rules.

If this distance is less than **Min on broken-back** then the two curves are treated as broken back curves

Plan View**Default tab**

the **Default** tab defines the type of HIP's and VIP's that are place when laying down horizontal and vertical geometry.

HIP type

choice box

No curve
Alignment speed
Curve speed
Curve length
Curve radius
Curve spiral

The default HIP type given to any placed HIP's.

If **Curve speed**, the HIP is also given the speed from the **Speed** field on the **Default** tab.

If **Curve length**, the HIP is also given the curve length from the **Curve length** field on the **Default** tab.

If **Curve radius**, the HIP is also given the curve radius from the **Curve radius** field on the **Default** tab.

If **Curve spiral**, the HIP is also given the curve radius, leading and trailing spiral lengths from the **Curve radius**, **Leading spiral length** and **Trailing spiral length** fields on the **Default** tab.

Note on HIP types:

if an **HIP** is of type **No curve**, no arc is automatically placed on the HIP.

If an **HIP** is of type **Alignment speed**, arcs and spirals are automatically placed on HIP's using the **Design speed** for the super alignment.

If an **HIP** is of type **Curve speed**, arcs and spirals are automatically placed on the HIP using the design table, and the speed set for the HIP.

If an **HIP** is of type **Curve length**, arcs are placed on the HIP using the length for the HIP.

If an **HIP** is of type **Curve radius**, arcs are placed on the HIP using the radius for the HIP.

If an **HIP** is of type **Curve spiral**, arcs are placed on the HIP using the curve radius, and leading and trailing spiral length for the HIP.

VIP type

choice box

No VC
Alignment speed
Speed
Length
Radius
Kvalue
Maximum length
Asymmetric
Circular arc

The default VIP type given to any placed VIP's.

If **Speed**, the VIP is also given the speed from the **Speed** field on the **Default** tab.

If **Length**, the VIP is also given the parabolic length from the **Length** field on the **Default** tab.

If **Radius**, the VIP is also given the effective parabolic radius from the **Radius** field on the **Default** tab.
 If **Kvalue**, the VIP is also given the K value from the **K value** field on the **Default** tab.
 If **Asymmetric**, the VIP is also given the first and second parabolic length for the **Length** and **Length 2** field on the **Default** tab.
 If **Circular arc**, the VIP is also given the arc radius from the **Radius** field on the **Default** tab.

Note on VIP types:

if an **VIP** is of type **No VC**, no vertical curve is placed on the VIP.
 If an **VIP** is of type **Alignment speed**, parabolic curves are automatically placed on VIP's using the **Design speed** for the super alignment.
 If an **VIP** is of type **Speed**, parabolic curves are automatically placed on the VIP using the design table, and the speed set for the VIP.
 If an **VIP** is of type **Length**, a parabolic curve is placed on the VIP using the length for the VIP.
 If an **VIP** is of type **Radius**, a parabolic curve is placed on the VIP using the effective radius for the VIP.
 If an **VIP** is of type **Kvalue**, a parabolic curve is placed on the VIP using the kvalue for the VIP.
 If an **VIP** is of type **Max length**, a parabolic curve of maximum length is placed on the VIP.
 If an **VIP** is of type **Asymmetric**, two parabolic curve using lengths **Length** and **Length 2** for the VIP are placed on the VIP.
 If an **VIP** is of type **Circular arc**, an arc is placed on the VIP using the radius for the VIP.

Start/End tab

the **Start/End** tab defines where the usable horizontal and vertical geometry starts and ends for the super alignment. Note that the super alignment can have more horizontal and vertical geometry than is actually used.

Start Horizontal mode choice box default
 segment
 point

specifies how the start of the usable horizontal geometry is defined.
 If **default**, the beginning of the first non invisible horizontal part is the start of the usable horizontal geometry.
 If **segment**, a user selected segment of the horizontal geometry is the start of the usable horizontal geometry.
 If **point**, a user selected position is dropped perpendicularly onto the super alignment to define the start of the usable horizontal geometry.

Start Control X/Y coordinate select x, y box

used in the **segment** and **point** cases of the **Start Horizontal mode**.

Start Vertical mode choice box default
 relative
 chainage

specifies how the start of the usable vertical geometry is defined.
 If **default**, the beginning of the first non invisible vertical part is the start of the usable vertical geometry.
 If **relative**, the chainage of the start of the usable horizontal geometry is used as the start of the usable vertical geometry. If the beginning of the defined vertical geometry is **after** this chainage, then the first segment is extrapolated back to the required chainage.
 If **chainage**, a user given chainage defines the start of the usable vertical geometry.

Start Chainage input

used in the **chainage** case of the **Start Vertical mode**.

End Horizontal mode choice box default
 segment

point

specifies how the end of the usable horizontal geometry is defined.

If **default**, the end of the last non invisible horizontal part is the end of the usable horizontal geometry.

If **segment**, a user selected segment of the horizontal geometry is the end of the usable horizontal geometry.

If **point**, a user selected position is dropped perpendicularly onto the super alignment to define the end of the usable horizontal geometry.

End Control X/Y coordinate select x, y box

used in the **segment** and **point** cases of the **End Horizontal mode**.

End Vertical mode choice box

default
relative
chainage

specifies how the end of the usable vertical geometry is defined.

If **default**, the end of the last non invisible vertical part is the end of the usable vertical geometry.

If **relative**, the chainage of the end of the usable horizontal geometry is used as the end of the usable vertical geometry. If the end of the defined vertical geometry is **before** this chainage, then the last segment is extrapolated to the required chainage.

If **chainage**, a user given chainage defines the end of the usable vertical geometry.

Start Chainage input

used in the **chainage** case of the **End Vertical mode**.

Chainage tab

defines the chainage for the string

Horizontal Chainage input

0

the user given chainage value. Where it is applied depends on the **Horizontal mode**

Horizontal Model choice box

start point
end point
control point
start part
end part

if **start point**, the **Chainage** value is applied to the start of the usable horizontal geometry,

If **end point**, the **Chainage** value is applied to the end of the usable horizontal geometry,

If **control point**, a user given control point is dropped perpendicularly onto the horizontal geometry and that position is given the **Chainage** value.

If **start part**, the **Chainage** value is applied to the start of the first part of horizontal geometry, even if it is invisible.

If **end part**, the **Chainage** value is applied to the end of the last part of horizontal geometry, even if it is invisible.

Horizontal Control X/Y coordinate select x, y box

used in the **control point** cases of the **Horizontal mode**

Horizontal Chainage interval input

10

horizontal chainage interval for the string

Horizontal Chord to arc tol input

0.1

horizontal chord to arc tolerance to use for any arcs

Vertical Chainage interval input

10

vertical chainage interval for the string

Vertical Chord to arc tol input

0.1

vertical chord to arc tolerance to use for any parabolas

Note: the horizontal and vertical intervals and chord to arc tolerances are used when the super alignment is approximated by straights in three dimensions.

Label Major Chainage interval	input	10
<i>major chainage interval to use for labelling</i>		
Label Minor Chainage interval	input	
<i>minor chainage interval to use for labelling</i>		
Label Reference chainage interval	input	0
<i>reference value for the chainage labelling intervals</i>		
Label Special chainage file	file box	*.spc file
<i>file of special chainages for labelling</i>		

*Note: the labelling of the super alignment is given by the **Label style** on the **General** tab.*

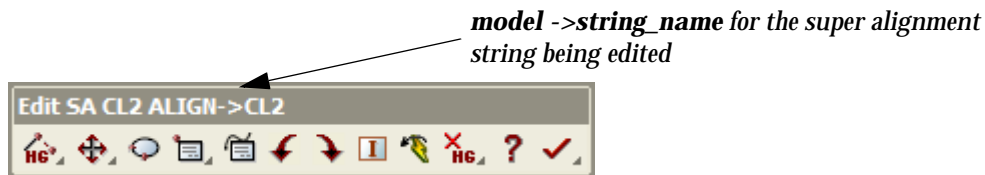

Buttons at Bottom

Create button
*After the **Create** button is chosen, the super alignment toolbar is created. The **Super Alignment Edit** toolbar is displayed*

Same as button
*After the **Same as** button is chosen, another string is selected and information about it is used for the fields in this panel*

Super Alignment Edit

After selecting the **Create** button the **Super Alignment** toolbar is created and placed on the screen.

The Super Alignment Edit menu is still under development and for more information on creating and editing the super alignment, please play the 12d Training DVD's.

For definitions of the horizontal and vertical elements, go to "Placing Elements for Super Alignments"

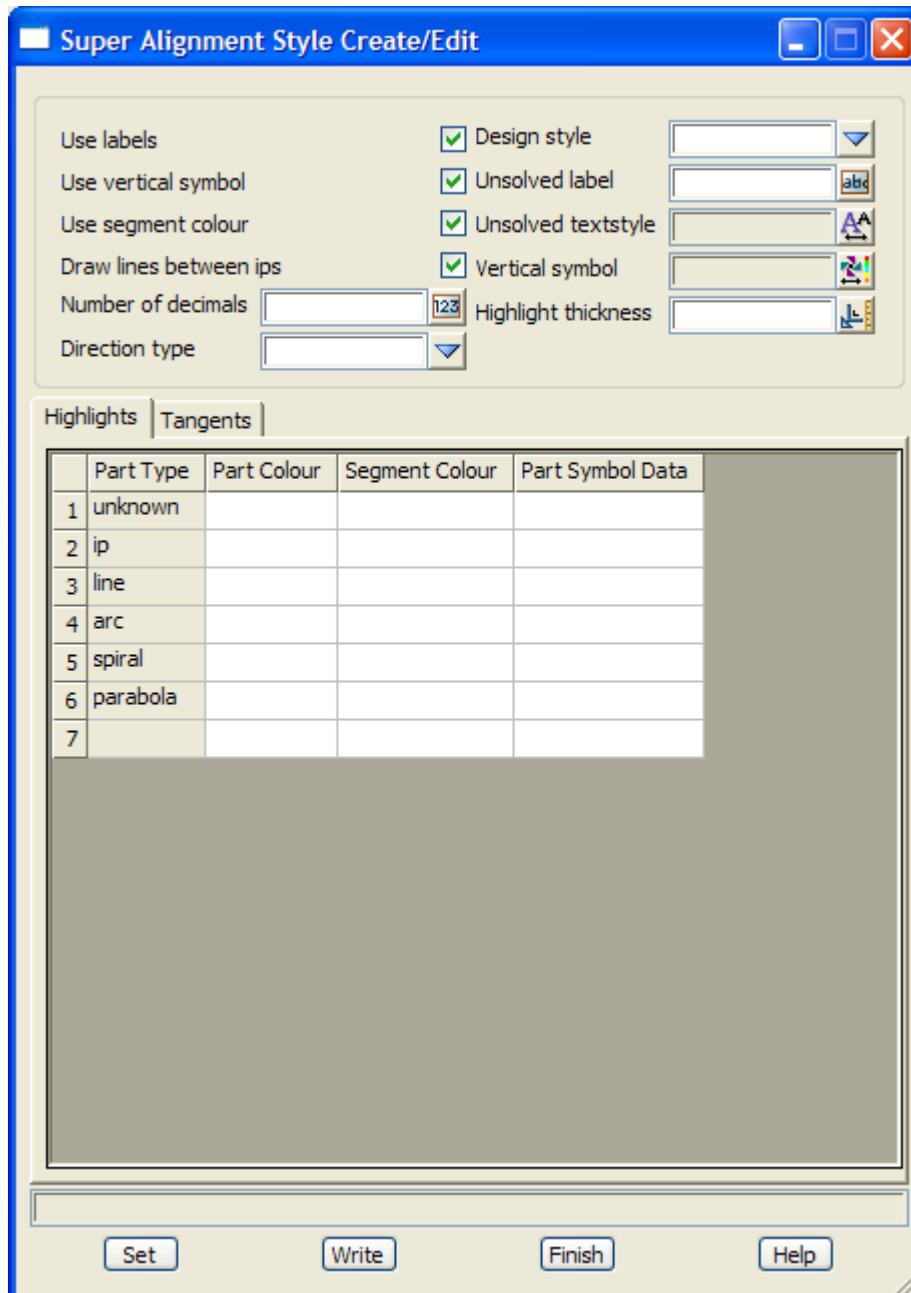

Super Alignment Style

[super_alignment_style_create_edit](#)

Position of option on menu: Strings =>Create =>Super alignment =>Super alignment style

The super alignment styles control the way that the super alignment draws and highlights on the screen.

Selecting Super alignment style displays the **Super Alignment Style Create/Edit** panel.

Highlights tab

the definition of how to highlight horizontal and vertical parts of the super alignment

Tangents tab

the definition of what text, symbols and decimal places should be used in labelling tangent points, crest and sag points, major and minor intervals, segment radii and lengths, and special chainages.

Buttons at Bottom

Set button

*clicking the **Set** button means that for this session, all the definitions in the panel will be used for the design style given in the **Design style** field. Unless the **Write** button is used to write the values out to the **astyles.4d** file, the values will be lost when the project is exited.*

Write button

*clicking the **Set** button writes out all the values in this panel to the **astyles.4d** file as the design style given in the **Design style** field*

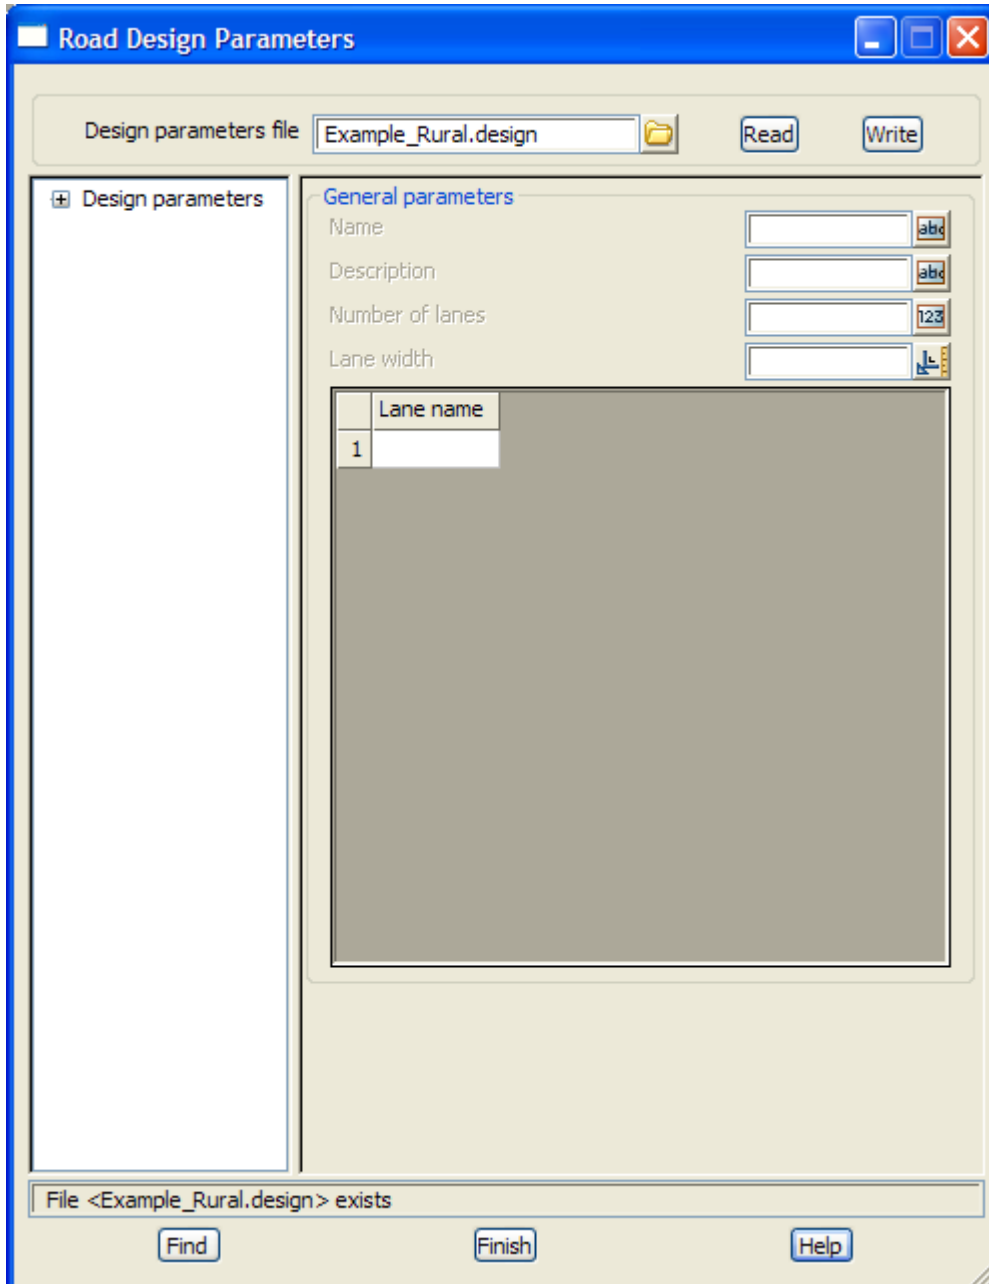

Define Design Parameters

road_design_parameters

Position of option on menu: Strings =>Create =>Super alignment =>Design parameters

The **design parameters table** defines the use arcs, transition curves, parabolas, super elevation and road widening for given design speeds. The table is used to use by a super alignment in conjunction with user supplied information given in the **Design** tab of the super alignment.

Selecting Design parameters displays the **Road Design Parameters** panel.

Resolve a Super Alignment

`resolve_super_alignment`

Position of option on menu: Strings =>Create =>Super alignment =>Resolve

When a super alignment is created using *computators*, the super alignment is defined with **references** to other strings. If the referenced strings are modified, then the super alignment will not automatically reflect the changes in the referenced strings.

Resolve forces the string to be resolved using the current position and properties of any referenced strings.

Selecting Resolve displays the **Resolve Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select a super string to resolve.</i>	string select		
Resolve <i>after the Resolve button is clicked, the super alignment is resolved using the new position and properties of any referenced strings.</i>	button		

Dereference a Super Alignment

dereference_super_alignment

Position of option on menu: Strings =>Create =>Super alignment =>Deref

When a super alignment is created using *computators*, the super alignment is defined with *references* to other strings.

Deref copies any referenced strings and inserts the copies into the super alignment in place of the referenced string. So after running Deref that there is no longer any references to other strings in the super alignment.

Selecting Deref displays the **Dereference Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Super alignment	string select		
------------------------	---------------	--	--

select a super string to dereference.

Deref	button		
--------------	--------	--	--

*after the **Deref** button is clicked, any referenced strings are copied and inserted into the super alignment in place of the referenced strings.*

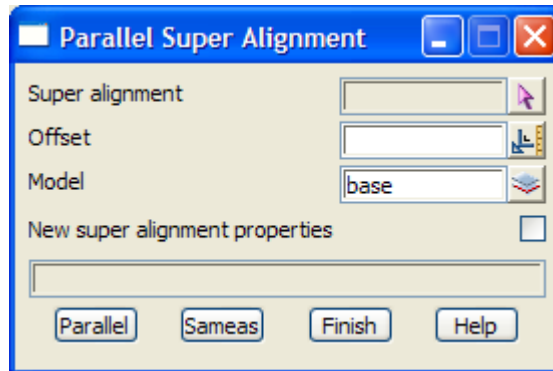

Parallel a Super Alignment

parallel_super_alignment

Position of option on menu: Strings =>Create =>Super alignment =>Parallel

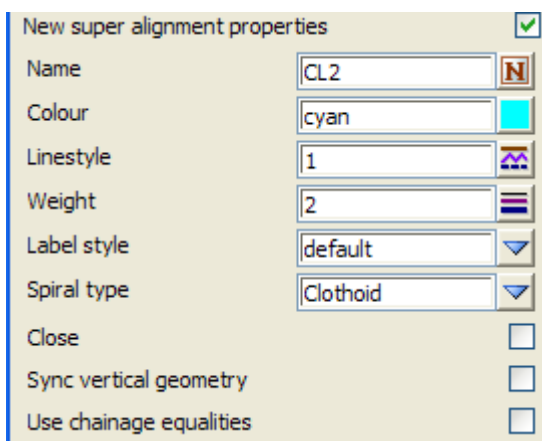

Parallel parallels the horizontal geometry of a super alignment by a user given offset.

Selecting Parallel displays the **Parallel Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select a super alignment to parallel</i>	string select		
Offset <i>distance to offset the selected super alignment</i>	input		
Model <i>model for the paralleled string</i>	model box		available models
New super alignment properties <i>if tick, the panel is expanded to show all the properties that can be set for the new paralleled string.</i>	tick box		

Extra panel fields when **New super alignment properties** is ticked on

Parallel button

after the **Parallel** button is clicked, a dereferenced copy of the horizontal geometry of the super alignment is paralleled. The vertical geometry is deleted.

Same as button

*after clicking **Same as** and then select a string. All the picked string properties will be loaded into the panel fields.*

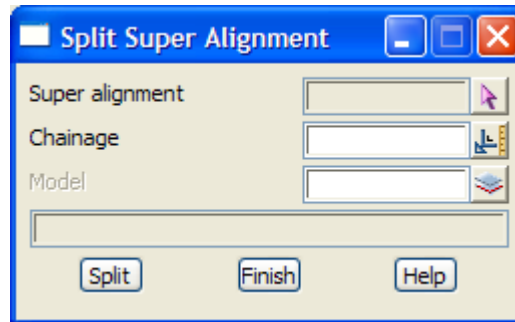

Split a Super Alignment

`split_super_alignment`

Position of option on menu: Strings =>Create =>Super alignment =>Split

Split splits super alignment at a given chainage.

Selecting Split displays the **Split Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select a super alignment to split</i>	string select		
Chainage <i>chainage to split the super alignment at</i>	input		
Model <i>model for the split string</i>	model box		available models
Split <i>after the Split button is clicked, the super alignment is split at the given chainage.</i>	button		

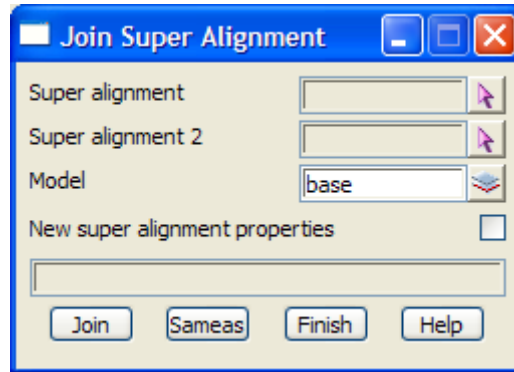

Joining Two Super Alignments

join_super_alignment

Position of option on menu: Strings =>Create =>Super alignment =>Join

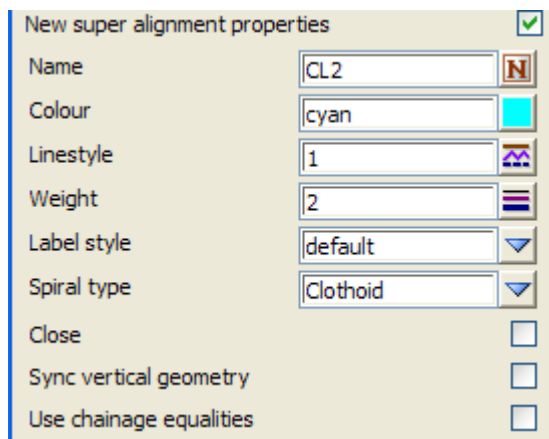

Join joins two super alignments at their ends.

Selecting Join displays the **Join Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select a super alignment to join</i>	string select		
Super alignment 2 <i>select a super alignment to join to the first selected super alignment</i>	string select		
Model <i>model for the joined string</i>	model box		available models
New super alignment properties <i>if tick, the panel is expanded to show all the properties that can be set for the new joined string.</i>	tick box		

Extra panel fields when **New super alignment properties** is ticked on

Join button
after the **Join** button is clicked, a new super alignments is created by joining the two super alignments

Same as button
after clicking **Same as** and then select a string. All the picked string properties will be loaded into the panel fields.

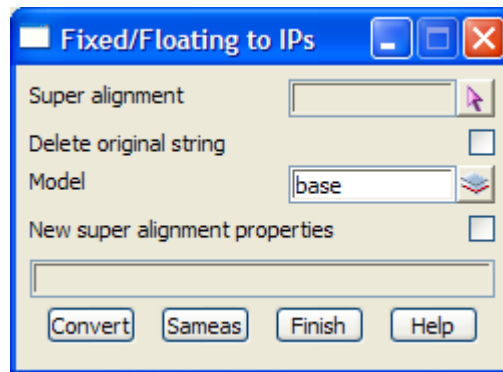

Convert Fixed/Floating Elements to IP's

[fixed_floating_to_ips](#)

Position of option on menu: Strings =>Create =>Super alignment =>Fixed/floating to IPs

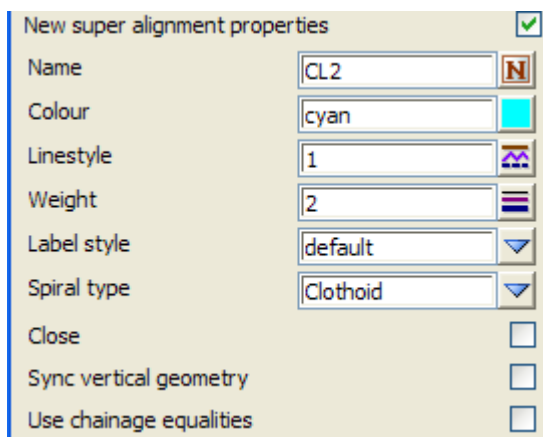

Fixed/floating to IP's converts the fixed and floating elements of the horizontal and vertical geometry to horizontal and vertical intersection points joins with arcs and transitions and parabolas or vertical arcs respectively.

Selecting Fixed/floating to IPs displays the **Fixed/floating to IPs** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select a super alignment to convert</i>	string select		
Delete original string <i>if tick, the original super alignment is deleted after the conversion is successful</i>	tick box		
Model <i>model for the converted string</i>	model box		available models
New super alignment properties <i>if tick, the panel is expanded to show all the properties that can be set for the new converted string.</i>	tick box		

Extra panel fields when
New super alignment properties
is ticked on

Convert button

*after the **Convert** button is clicked, a new super alignments is created by converting all the elements to IPs*

Same as button

*after clicking **Same as** and then select a string. All the picked string properties will be loaded into the panel fields.*

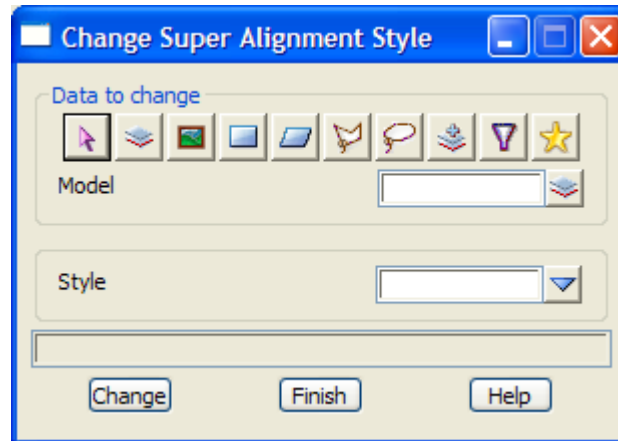

Change the Styles for Selected Super Alignments

`change_super_alignment_style`

Position of option on menu: Strings =>Create =>Super alignment =>Change style

Change style changes the super alignment style for all the selected super alignments.

Selecting Change style displays the **Change Super Alignment Style** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Style	SA style box		available SA styles
<i>super alignment style to apply to all the selected super alignments</i>			
Change	button		
<i>after the Change button is clicked, all the selected super alignments are given the super alignment style</i>			

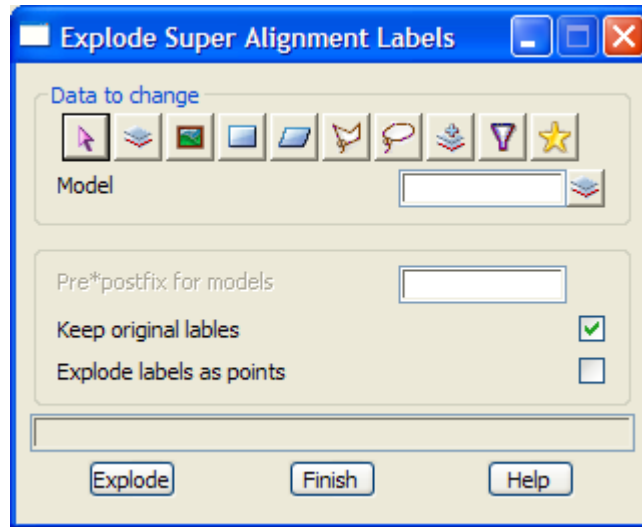

Explode the Super Alignments Labelling

explode_super_alignment_labels

Position of option on menu: Strings =>Create =>Super alignment =>Explode labels

Explode labels creates text and lines from the automatic labelling of the selected super alignments.

Selecting Explode labels displays the **Explode Super Alignment Labels** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

Keep original lables	tick box		
-----------------------------	----------	--	--

Explode labels as points	tick box		
---------------------------------	----------	--	--

Explode	button		
----------------	--------	--	--

create text strings for all the text in the automatic labels of the selected super alignments

Constrain the Movement of Super Alignment Points

move_super_alignment_point_settings

Position of option on menu: Strings =>Create =>Super alignment =>Move settings

Explode labels creates The move settings constrains the movement of horizontal and vertical intersection points for any super alignment being edited.

Selecting Move settings displays the **Move Super Alignment Point Settings** panel.

The buttons are radio buttons - that is, only one can be selected:

Default

allows any movement in the selected HIP or VIP point

X-axis

constrains an HIPs to only move along the x-axis. That is, the y coordinate is fixed.

Constrains a VIPs to only move along the chainage-axis. That is, the height coordinate is fixed.

Y-axis

constrains an HIPs to only move along the y-axis. That is, the x coordinate is fixed.

Constrains a VIPs to only move along the height-axis. That is, the chainage coordinate is fixed.

Fwd Tgt

constrains an HIPs to only move along the incoming straight to the HIP.

Constrains a VIPs to only move along the incoming straight to the VIP.

Bwd Tgt

constrains an HIPs to only move along the outgoing straight from the HIP.

Constrains a VIPs to only move along the outgoing straight from the VIP.

Create Arcs

create_arcs

Position of menu: Strings =>Create =>Arcs

The create arcs option is used to create 12d Model arcs.

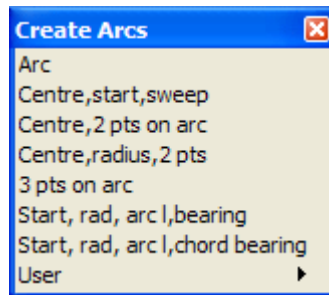

A 12d Model arc consists of a radius, a centre point, and a start and end point on the arc.

The radius can be positive or negative. If the radius is positive, the arc is drawn from the start-point to the end-point in a clockwise direction. If the radius is negative, the arc is drawn from the start-point to the end-point in counter-clockwise direction.

The height at the start point and at the end point can be different. In that case, the arc is still a plan arc but the z- value varies linearly from the start point to the end point as one moves around the arc. Hence the 12d Model arc string is actually a **helix** with its centre-line perpendicular to the xy-plane.

For convenient 12d Model includes a variety of methods for creating arcs.

On selecting the arcs option, the create arcs menu is displayed giving all the different methods for creating arcs.

Each option in the create arcs menu fires up its own special panel to collect the necessary information for defining the arc.

The mouse is used to select the special points required for the arc and circle definitions. For example, in the arc - 3 points on arc option, the three points are selected using the mouse.

Unlike the other strings created under **strings=>create**, the arc can be created immediately without needing any options from the arc editors.

Consequently, after an arc is defined, the create panel is not removed and is left on the screen to create another arc. Any information that needs modifying is changed in the **arc** panel and is used for the new create.

New arcs are created until either the panel is removed by selecting the **finish** or **[X]** button, or the create terminated by selecting **cancel** from the **pick ops** menu in which case the panel will be left on the screen. In the last case, the **arc** button is then used to begin a new create sequence.

Each of the methods for creating arcs will now be described.

Create - Arc

create_arc_string

Position of option on menu: Strings =>Create =>Arcs =>Create Arcs

Arcs and circles are normally created using the **strings=>create=> arcs** or **strings=>create=> circles** menu. Please see the documentation on that option for creating arcs and circles.

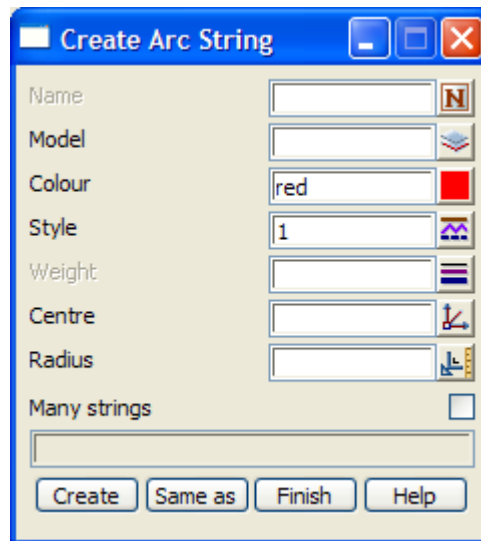

This option is a special arc creator so that a menu exists if the **strings=>create=>same** as option is used on an arc. It creates an arc with an initial sweep angle of 360 degrees.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If

many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create Arc String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Arc String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style, breakline type and height field of the **Create Arc String** panel.

After selecting the option, the **create arc string** panel is displayed.

The new fields and buttons used in the **create arc string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
Centre <i>co-ordinates of the centre of the arc.</i>	input		xyz ops menu
Radius <i>the radius for the arc.</i>	input		
Many strings <i>if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick		
Create <i>After the create button is chosen, the arc edit menu and arc edit info panel are displayed.</i>	button		

Same as button

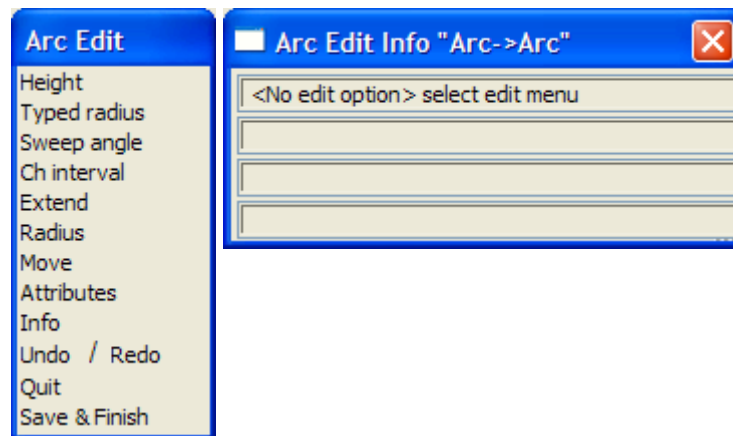

*After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.*

Note - the centre co-ordinates can either be typed into the centre panel field, or if LB is clicked on [+] for the centre panel field, the xyz ops menu comes up and the pick xyz option used to select a point as the arc centre.

Arc Edit

Unlike the other string creates, on selecting the **Create** button the arc string is immediately created with a sweep angle of 360 degrees. The arc edit menu and **arc edit info** panel are also placed on the screen at the same time

The arc edit menu and **arc edit info** panel for an arc string are

For full information in the Arc Editor, go to the section “Arc Edit”

Create Arc - Centre Point, Start Point and Sweep

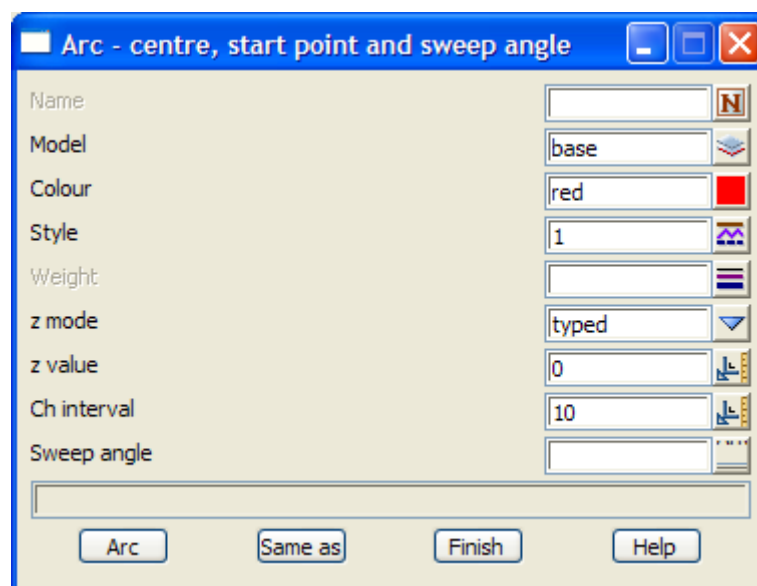

[arc__centre__start_point_and_sweep_angle](#)

Position of option on menu: Strings =>Create =>Arcs =>Centre,Start,Sweep

This option defines an arc by selecting a centre point, the start point of the arc and the sweep angle of the arc. The sweep angle is measured in the **clockwise** direction.

The radius is calculated by the option and is simply the distance between the centre and start points. The arc end point is also automatically calculated using the known points, radius and sweep angle.

After selecting the option, the **arc - centre, start point and sweep angle** panel is displayed.

To **create** an arc, the name, colour, model, chainage interval and sweep angle are entered into the

appropriate fields and then the centre point and start point of the arc are selected with the cursor. The arc is then created using the information provided in the panel.

The new fields and buttons used in the **arc - centre, start point and sweep angle** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
z mode <i>the method of specifying the z-value for the end points of the arc. It can be typed in or taken from the z-value of the selected end points.</i>	input	typed	snap, typed
z value <i>if the z mode method is typed, then the height (z-value) of the end points is the value in the field.</i>	input	0	
Ch interval <i>the chainage interval used when a chord approximation is needed for the arc.</i>	input	10	
Sweep angle <i>sweep angle for the arc - Note: clockwise is positive for sweep angles</i>	input		
Arc <i>The arc button is used to begin a new create if the previous one was cancelled.</i>	button		
Same as <i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button

Create Arc - Centre Point, Start and End Points

arc__centre_start_and_end_points

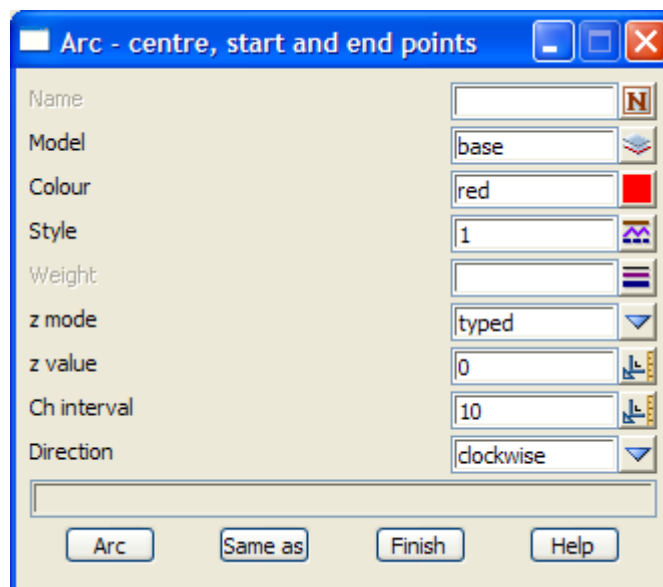

Position of option on menu: Strings =>Create =>Arcs =>Centre, 2 pts on arc

This option defines an arc by selecting a centre point, a start and end points for the arc and the direction (clockwise, anti-clockwise) that the arc travels in. The radius is calculated by the option and is simply the distance between the centre and start points.

It is difficult to choose the end point correctly so that it lies exactly on the arc since it only occurs when the distance between the centre and selected end point is exactly the radius of the arc.

Hence, the selected end point and arc direction is used to determine the sweep angle from the start point to the "end point to centre point" line. This is enough information to define the arc. The real end point is then calculated so that it **lies** on the arc.

After selecting the option, the **arc - centre, start and end points** panel is displayed.

To **create** an arc, the name, colour, model, chainage interval and direction are entered into the appropriate fields and then the centre point, start and end points of the arc selected with the cursor. The arc is then created using the information provided in the panel.

The fields and buttons used in the **arc - centre, start and end points** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	

Create Arc - Centre, Radius, Start and End Points

arc__radius__centre__start_and_end_points

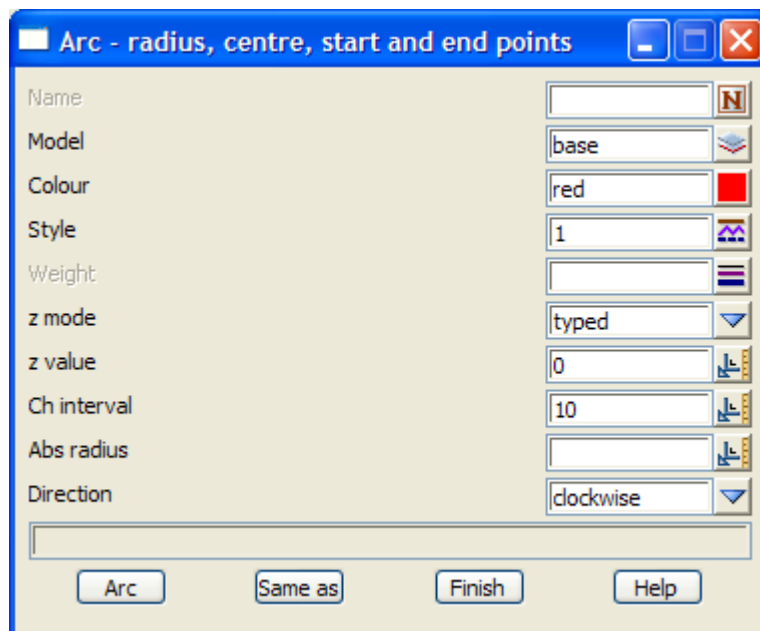

Position of option on menu: Strings =>Create =>Arcs =>Centre, radius, 2pts

This option defines an arc by the user setting a radius and direction of arc and then selecting the centre, start and end points for the arc.

Since the radius is given exactly, it is difficult to choose the start and end points so that they lie exactly on the arc. This only occurs when the distance between the centre and selected start and end points is exactly the radius of the arc.

Hence, the selected start point is dropped perpendicularly onto the arc to give the real start point. Similarly, for the real end point.

After selecting the option, the **arc - radius, centre, start and end points** panel is displayed.

To **create** an arc, the name, colour, model, chainage interval, radius and direction are entered into the appropriate fields and then the centre point, start and end points of the arc selected with the cursor. The arc is then created using the information provided in the panel.

The fields and buttons used in the **arc - radius, centre, start and end points** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	

z mode	input	typed	snap, typed
	<i>the method of specifying the z-value for the end points of the arc. It can be typed in or taken from the z-value of the selected end points.</i>		
z value	input	0	
	<i>if the z mode method is typed, then the height (z-value) of the end points is the value in the field.</i>		
Ch interval	input	10	
	<i>the chainage interval used when a chord approximation is needed for the arc.</i>		
Abs radius	input		
	<i>the absolute radius of the arc.</i>		
Direction	input	clockwise	clockwise, anti-clockwise
	<i>the direction for the arc</i>		
Arc	button		
	<i>The arc button is used to begin a new create if the previous one was cancelled.</i>		
Same as	button		
	<i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>

Create Arc - Three Points on Arc

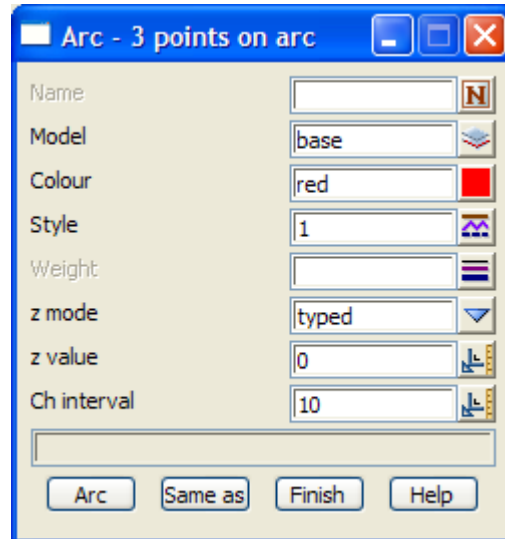

arc__3_points_on_arc

Position of option on menu: Strings =>Create =>Arcs =>3 pts on arc

This option defines an arc by selecting three points that lie on the arc.

The selected arc points are the start point, a point between the start and end point, and the end point. The three points must be selected in that order.

After selecting the option, the **arc - 3 points on arc** panel is displayed.

To **create** an arc, the name, colour, model and chainage interval are entered into the appropriate fields and then three points - start point, point between the start and end point, and the end point- which lie on the arc are selected with the cursor.

After the three points are picked, the arc is created using the information provided in the panel.

After a arc is defined, the option does not terminate. Another arc can be created by simply modifying any of the information that needs changing in the **arc - 3 points on arc** panel and then selecting three points on a new arc.

The fields and buttons used in the **arc - 3 points on arc** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new arc.</i>	input		
Model <i>name of the model that the new arc is in.</i>	input		available models
Colour <i>the colour of the new arc.</i>	input	default colour	available colours
Style <i>line style of the arc.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
z mode <i>the method of specifying the z-value for the arc. It can be typed in or taken from the z-value of the selected end points.</i>	input	typed	snap, typed
z value <i>if the z mode method is typed, then the height (z-value) of the end points is the value in the field.</i>	input	0	
Ch interval <i>the chainage interval used when a chord approximation is needed for the arc.</i>	input	10

Create Arc - Start Point, Radius, Arc Length and Start Bearing

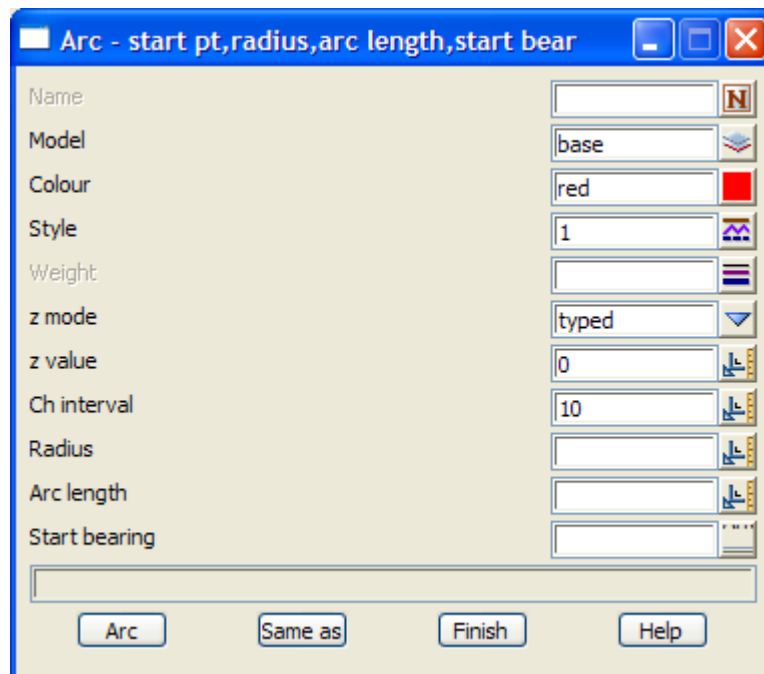

arc__start_pt_radius_arc_length_start_bear

Position of option on menu: Strings =>Create =>Arcs =>Start, rad, arc, bear

This option defines an arc by giving the radius, the arc length and start bearing and then selecting a start point for the arc.

This is enough information for the option to calculate the centre and end points and the direction of the arc, and hence, fully define the arc.

After selecting the option, the **arc - start pt, radius, arc length, start bear** panel is displayed.

To **create** an arc, the name, colour, model, chainage interval, radius, arc length and start bearing are entered into the appropriate fields and then the start point of the arc selected with the cursor. The arc is then created using the information provided in the panel.

The new fields and buttons used in the **arc - start pt, radius, arc length, start bear** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
z mode <i>the method of specifying the z-value for the end points of the arc. It can be typed in or taken from the z-</i>	input	typed	snap, typed

value of the selected end points.

z value input 0

if the z mode method is typed, then the height (z-value) of the end points is the value in the field.

Ch interval input 10

the chainage interval used when a chord approximation is needed for the arc.

Radius input

radius of the arc.

Arc length input

length of the arc from the start to the end point.

Start bearing input

bearing of the tangent to the arc at the start point.

Arc button

*The **arc** button is used to begin a new create if the previous one was cancelled.*

Create Arc - Start Point, Radius, Arc Length and Chord Bearing

arc__start_pt_radius_arc_length_chord_bear

Position of option on menu: Strings =>Create =>Arcs =>Start, rad, arc, ch bear

This option defines an arc by giving the radius, the arc length and chord bearing and then selecting a start point for the arc. This is enough information for the option to calculate the centre and end points and the direction of the arc, and hence, fully define the arc.

After selecting the option, the **arc - start pt, radius, arc length, chord bear** panel is displayed.

To **create** an arc, the name, colour, model, chainage interval, radius, arc length and chord bearing are entered into the appropriate fields and then the start point of the arc selected with the cursor. The arc is then created using the information provided in the panel.

The new fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Name	<i>the name of the new string.</i>	input		
Model	<i>name of the model that the new string is in.</i>	input		available models
Colour	<i>the colour of the new string.</i>	input	default colour	available colours
Style	<i>line style of the string.</i>	input	1	available line styles
Weight	<i>thickness of the string.</i>	input	0	
z mode	<i>the method of specifying the z-value for the end points of the arc. It can be typed in or taken from the z-value of the selected end points.</i>	input	typed	snap, typed

z value input 0
if the z mode method is typed, then the height (z-value) of the end points is the value in the field.

Ch interval input 10
the chainage interval used when a chord approximation is needed for the arc.

Radius input
radius of the arc.

Arc length input
length of the arc from the start to the end point.

Chord bearing input
bearing of the chord to the arc at the start point.

Arc button
The arc button is used to begin a new create if the previous one was cancelled.

Create - Circles

create_circles

Position of menu: Strings =>Create =>Circles

The create circles option is used to create **12d** Model circles.

A **12d** Model **circle** has no start and end points but is defined by a centre point and a radius. The circle has a constant height (z-value).

For convenient **12d** Model includes a variety of methods for creating circles. On walking-right on the circles option, the create circles menu is displayed giving all the different methods for creating circles.

Each option in the create circles menu fires up its own special panel to collect the necessary information for defining the circle.

The mouse is used to select the special points required for the circle definitions. For example, the circle - centre, radius option required the value of the radius to be entered into the **circle - centre point, radius** panel and the centre point is selected using the cursor.

Unlike the other strings created under **strings=>create**, the circles can be created immediately without needing any options from the circle editor. Consequently, after a circle is defined, the create panel is not removed and is left on the screen to create another circle. Any information that needs modifying is changed in the **circle** panel and is used for the new create.

New circles are created until either the panel is removed by selecting the **finish** or **[X]** button, or the create terminated by selecting **cancel** from the **pick ops** menu in which case the panel will be left on the screen. In the last case, the **circle** button is then used to begin a new create sequence.

Each of the methods for creating circles and arcs will now be described.

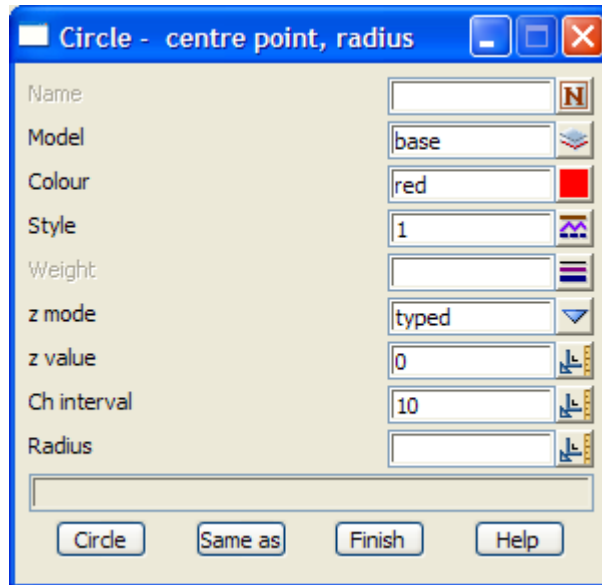

Create Circle - Centre Point, Radius

circle__centre_point__radius

Position of option on menu: Strings =>Create =>Circles =>Centre, radius

This option defines a circle by supplying a typed radius and selecting a centre point with the mouse

After selecting the option, the **circle - centre point, radius** panel is displayed.

To **create** a circle, the name, colour, model, chainage interval and radius are entered into the appropriate fields and the centre point selected with the cursor. The circle is then created using the information provided in the panel.

The new fields and buttons used in the **circle - centre point, radius** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
z mode <i>the method of specifying the z-value for the circle. It can be typed in or taken from the z-value of the selected centre point.</i>	input	typed	snap, typed
z value <i>if the z mode method is typed, then the height (z-value) of the circle is the value in the field.</i>	input	0	

Ch interval input 10

the chainage interval used when a chord approximation is needed for the circle.

Radius input 10

the radius for the circle.

Circle button

*The **circle** button is used to begin a new create if the previous one was cancelled.*

Create - Feature

create_feature_string

Position of option on menu: Strings =>Create =>Feature

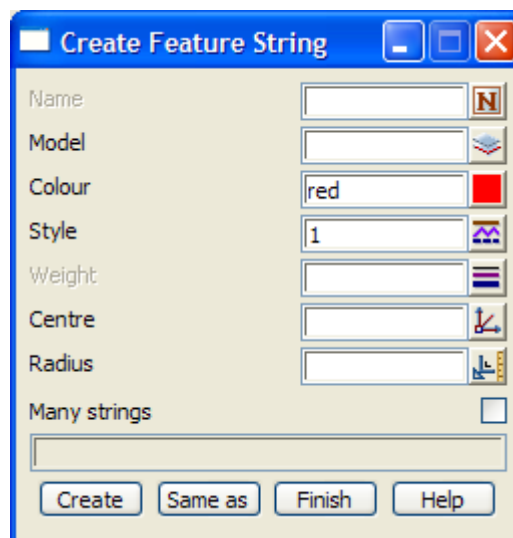

A feature string consists of a centre point (x,y,z) and a user given radius.

The difference between a circle and a feature string is that for a feature string the **centre point** is considered to be a valid (x,y,z) point but all the points on the circumference of the feature string are null values. Feature strings can be used to represent objects such as trees.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Feature String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Feature String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style, breakline type and height field of the **Create Feature String** panel.

After selecting the option, the **create feature string** panel is displayed.

The new fields and buttons used in the **create feature string** panel have the following functions.

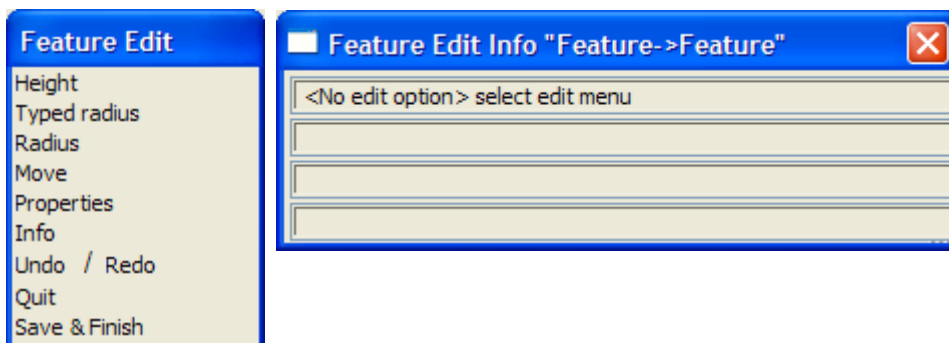

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
Centre <i>co-ordinates of the centre of the feature.</i>	input		xyz ops menu
Radius <i>the radius for the feature.</i>	input		
Many strings <i>if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick		
Create <i>After the create button is chosen, the feature edit menu and feature edit info panel are displayed.</i>	button		
Same as <i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		

Note - the centre co-ordinates can either be typed into the centre panel field, or if LB is clicked on [+]
for the centre panel field, the xyz ops menu comes up and the pick xyz option can be used from it to select a point as the arc centre.

Feature Edit

Like the arc creates, on selecting the **Create** button the feature string is immediately created. The feature edit menu and **feature edit info** panel are also placed on the screen at the same time

The feature edit menu and panel for a feature string are

For full information in the Feature Editor, go to the section “Feature Edit”

Create - Pipe

create_pipe_string

Position of option on menu: Strings =>Create =>Pipe

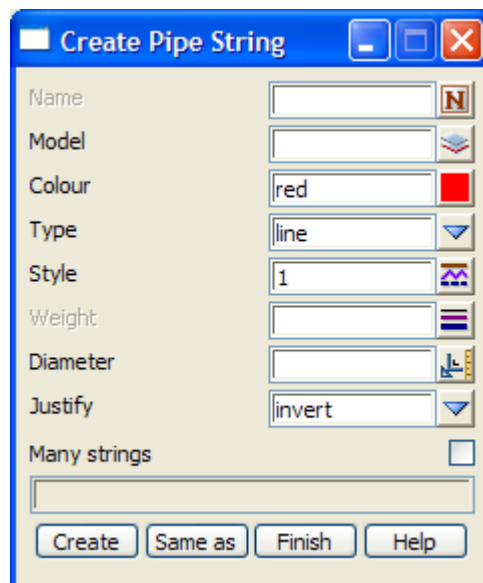

A pipe string is the same as a 3d string except that the pipe string also has a diameter hence the options for creating and editing a pipe string are almost the same as for a 3d string.

The main difference is that there are no options to open and close a pipe string and there is an additional option for modifying the pipe diameter.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create Pipe String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Pipe String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Pipe String** panel.

On selecting the Pipe string option, the **Create Pipe String** panel is displayed.

To **create** a new pipe string, the name, colour, model, point-line type and diameter of the new string are entered into the appropriate fields and the **create** button selected.

The new fields and buttons used in the **create pipe string** panel have the following functions.

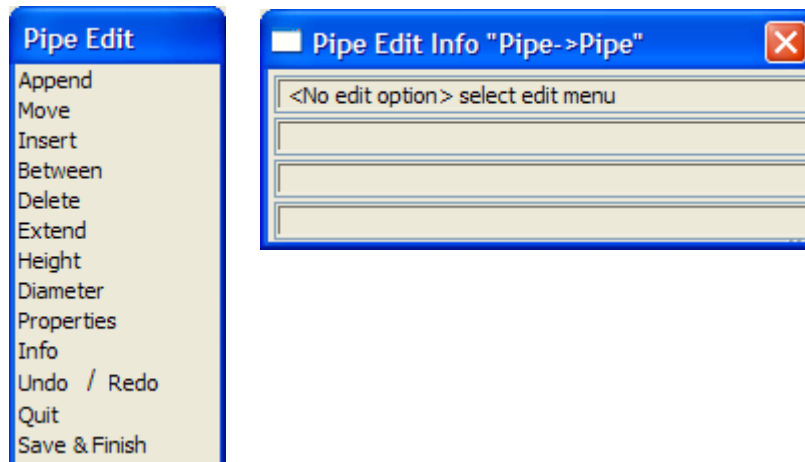

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles

Weight	input	0	
	<i>thickness of the string.</i>

	<i>After the create button is chosen, the pipe edit menu and pipe edit info panel are displayed.</i>		
Same as	button		
	<i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>		

Pipe Edit

On selecting the **Create** button in the **Create Pipe String** panel the **Pipe Edit** menu and **Pipe Edit info** panel are placed on the screen.

The **Pipe Edit** menu and panel for a pipe string are

To create a new pipe string, select the **Append** option from the **Pipe Edit** menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all pipe strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Pipe Edit** menu are usable.

The options in the **Pipe Edit** menu are not only used for placing the initial vertices of the string,

but for editing the string once it is created. Since the **Append** and other options in the **Pipe Edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the **string Editor** section.

For full information in the **Pipe Editor**, go to the section “**Pipe Edit**”

Create - Polyline

create_polyline_string

Position of option on menu: Strings =>Create =>Polyline

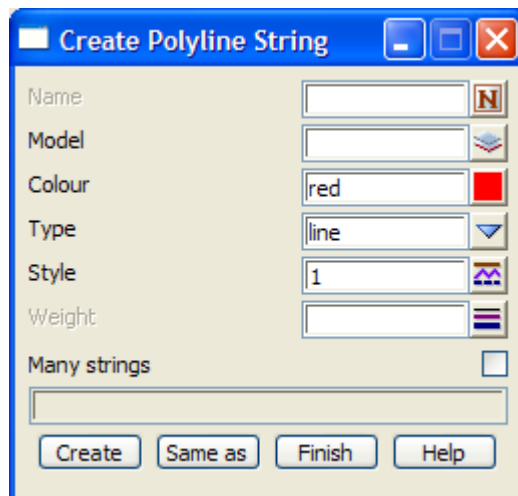

A polyline string is similar to a 3d string except that it can have either straight lines or arcs joining the (x,y,z) points of the string. The arcs are plan arcs with possibly a different z at either end and the z values are linearly interpolated between the end points. Hence in a long section, the end points are joined by a straight lines for both line and arc segments of the polyline.

Creating and editing a polyline string is very similar to a 3d string. The only major difference is that a radius is required at each string segment (a radius of 0 means no arc, just a straight line).

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create Polyline String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Polyline String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Polyline String** panel.

On selecting the polyline string option, the **create polyline string** panel is displayed.

To **create** a new polyline string, the name, colour, model, point-line type and linestyle of the new string are entered into the appropriate fields and the **create** button selected.

The new fields and buttons used in the **create pipe string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles

Weight input 0

thickness of the string.

Many strings tick

if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

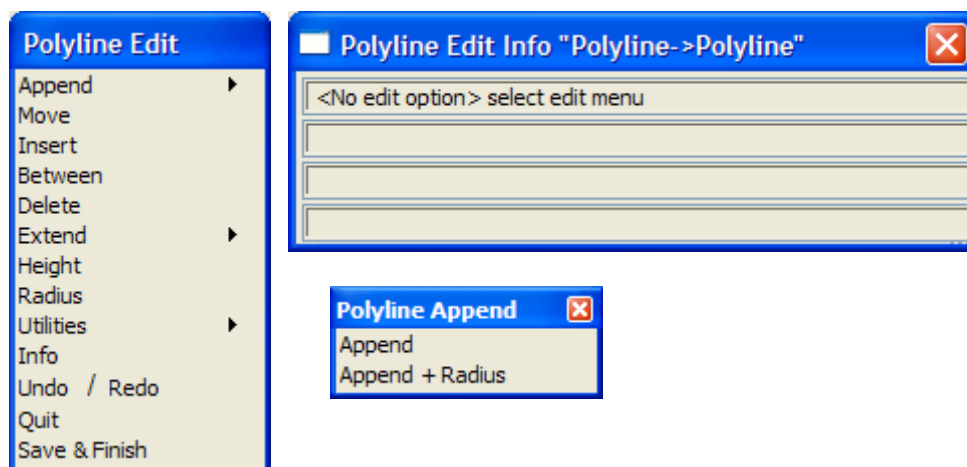

*After the **create** button is chosen, the **polyline edit menu** and **polyline edit info** panel are displayed.*

Same as button

*After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.*

Polyline Edit

Selecting the **create** button in the **create polyline string** panel the **polyline edit menu** and **polyline edit info** panels are placed on the screen.

To create a new polyline string, the user must select one of the two append options (**Append** or **Append + radius**) on the **Append** walk-right of the **Polyline Edit** menu. The which **Append** option to simply creates points which are joined by a straight segment whereas the **Append + radius** create points with a radius for the segment.

The **Append** options are used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all polyline strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

If **Append + radius** was selected, the user will then be prompted for the radius of the segment being placed.

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Polyline Edit** menu are usable.

The options in the **Polyline Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the

Polyline Edit menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the Polyline Editor, go to the section “Polyline Edit”

Create - Super

`create_super_string`

Position of option on menu: Strings =>Create =>Super

A super string is a combination and generalisation of a 4d string, a pipe string and a polyline string.

A super strings consists of a series of (x,y) vertices, plus it can have either straight lines or arcs joining the vertices of the string.

At each vertex, the super string has:

- height
- text
- visibility
- tinability (contourability)
- point number
- symbol
- user defined attributes

For each segment, the super string has:

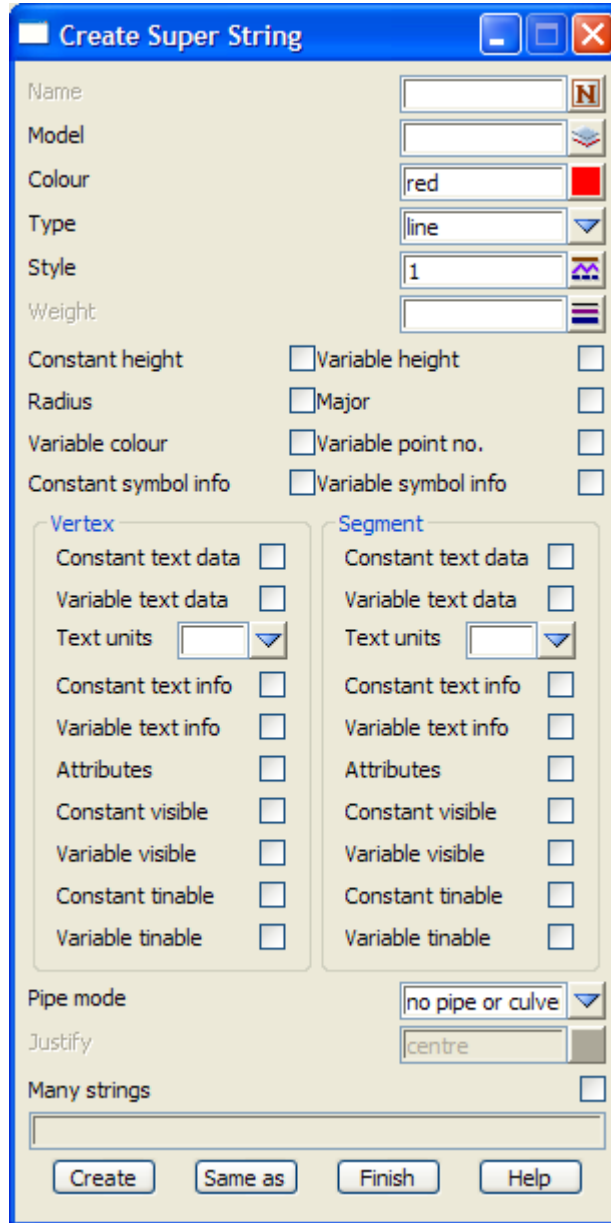

- plan radius
- colour
- text
- tinability (breakline)
- pipe diameter or box dimensions
- visibility
- user defined attributes

Creating and editing a super string is very similar to a polyline string in that a radius is required at each string segment (a radius of 0 means no arc, just a straight line). However there are many more choices about what is defined for each vertex and segment of the super string.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create Super String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Super String** panel.

On selecting the super string option, the **Create Super String** panel is displayed.

To **create** a new super string, the name, colour, model, point-line type and linestyle of the new string are entered into the appropriate fields, plus settings any required settings in the tick boxes, and the **create** button selected.

The new fields and buttons used in the **create pipe string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles

Weight input 0

thickness of the string.

Many strings tick

if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

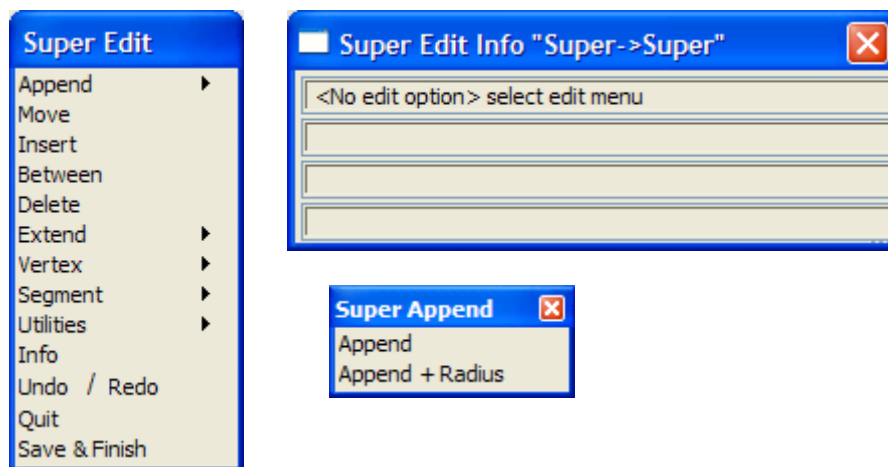

*After the **create** button is chosen, the **super edit menu** and **super edit info panel** are displayed.*

Same as button

*After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.*

Super Edit

On selecting the **Create** button in the **Create Super String** panel the Super Edit menu and Super Edit Info panels are placed on the screen.

To create a new super string, the user must select one of the two append options (**Append** or **Append + radius**) on the **Append** walk-right of the Super Edit menu. The **Append** option simply creates points which are joined by a straight segment whereas the **Append + radius** create points with a radius for the segment.

For all super strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

If **Append + radius** was selected, the user will then be prompted for the radius of the segment being placed.

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's Super Edit menu are usable.

The options in the Super Edit menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the Super Edit menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the Super Editor, go to the section “Super Edit”

Create - Text

create_text_string

Position of option on menu: Strings =>Create =>Text

A text string consists of

- (a) the text
- (b) an (x,y) position for the text
- (c) a text style
- (d) a justification
- (e) the height of the text in pixels or world units
- (f) the x factor and slant of the text
- (g) the colour of the text
- (h) the angle to write the text at

The default text style uses a non-proportional font but user defined fonts can be proportional or non-proportional.

The justification of the text with respect to text string's (x,y) position is user specified.

The text angle is measured in a counter- clockwise direction with respect to the horizontal axis.

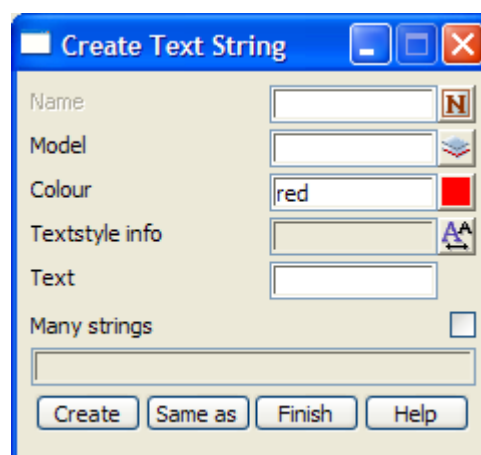

Note - deleting text

Text is deleted as a normal string with the picking point at the text string's definition point. The relationship of the definition point and the text depends on the text offset and justification

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create Text String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Text String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Text String** panel.

On selecting the text string option, the **create text string** panel is displayed.

To **create** a new text string, the name, colour, model, size, offset, justification, angle and actual text of the new string are entered into the appropriate fields and the **create** button selected.

The new fields and buttons used in the **create text string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Textstyle info <i>textstyle information.</i>	input		
Text <i>the actual text.</i>	input		
Many strings <i>if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick		
Create <i>After the create button is chosen, the text edit menu and text edit info panel are displayed.</i>	button		
Same as <i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		

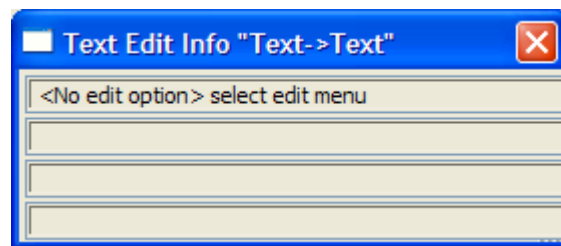

Text Edit

On selecting the **create** button in the **create text string** panel the text edit menu and text edit info panel are placed on the screen.

The text edit menu for a text string is and the **text edit** panel is

(x,y) position of text
define the actual text
text height
text angle
bring up attribute panel
toggle edit info panel
undo/redo
quit the create
finish the text edit

To creating a new text string, the user must first select the Position option from the Text edit menu. Then after selecting a position, the text is created and displayed (if the model is on the view).

For full information in the Text Editor, go to the section "Text Edit"

Create - Control Stations

Position of option on menu: Strings =>Create =>Create Control Stations

This option is documented in Survey =>Extras =>Create Control stations in the section "Create Control Stations" in the Chapter "Survey"

Old

string_create_old

Position of option on menu: Strings =>Create =>Old

These old options are the string creation options that were available before *12d Model 8* was released.

The Create option is used to produce **new** strings. If a string already exists, the Editor option is used to modify it.

The Create walk-right menu contains options to create 2d, 3d, 4d, alignment, super alignment, circles, arcs, feature, pipe, polyline, super and text strings.

Each string type has its own special information so by choosing the appropriate type to be created, only information needed for that type of string is asked for.

Once a string has been created, it can be converted to most of the other string types using the string Convert option.

To create a new string of the same type and with similar header information as an existing string, the same as option is selected from the String Create menu.

Notes

1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertex (point type) or with straight lines joining the vertices (line type).

Linestyles can be defined that drawn lines between the points even though the breakline type is **point**.

2. The string vertices are also called intersection points (IP's).

The String Create Old walk-right menu is

The string creation process is similar for each string type and for editing strings as well.

For	2d	"Create - 2d (pre V8)"
	3d	"Create - 3d (pre V8)"
	4d	"Create - 4d (Pre V8)"

Create - 2d (pre V8)

create_2d_string

Position of option on menu: Strings =>Create =>Old =>2d

A 2d string consists of a series of (x,y) vertices all with the same z-value (height). 2d strings are often referred to as "contour strings" because contours are the most common example of a string with a constant height.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create 2d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 2d**

String panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

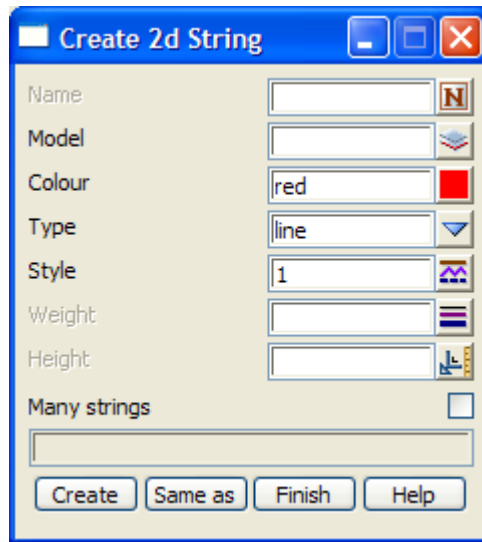

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style, breakline type and height field of the **Create 2d String** panel.

From **12d Model 8** onwards, the default is to create **2d super strings** rather than the **2d strings** used up to **12d Model 7**. A **2d super string** is a **super string** with **Constant height**. That is, there is only one z-value for the entire string. The advantage of using a **2d super string** is that all the CAD options will work for it and it can be given point id's for setout.

The older 2d string create options are still available under

Strings =>Create =>Old

On selecting the 2d string option, the **create 2d string** panel is displayed.

The default values for the panel fields are taken from the **CAD Controlbar** (see “**CAD, Symbol and Text Controlbars**”)

To **create a new** 2d string, the name, colour, model, point-line type and height of the new string are entered into the appropriate fields and the **Create** button selected.

The new fields and buttons used in the **create 2d string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Type <i>breakline type (point-line type) of the string.</i>	input	line	line, point
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	

Height input

height (z-value) of the entire string.

Many strings tick

if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

*After the **create** button is chosen, the 2d edit menu and 2d edit info panel are displayed.*

Same as button

*After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.*

Finish button

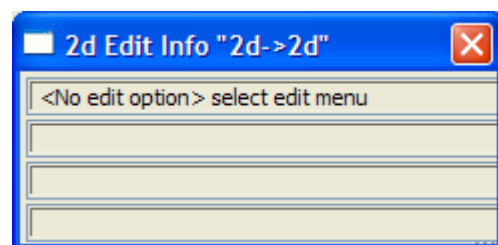

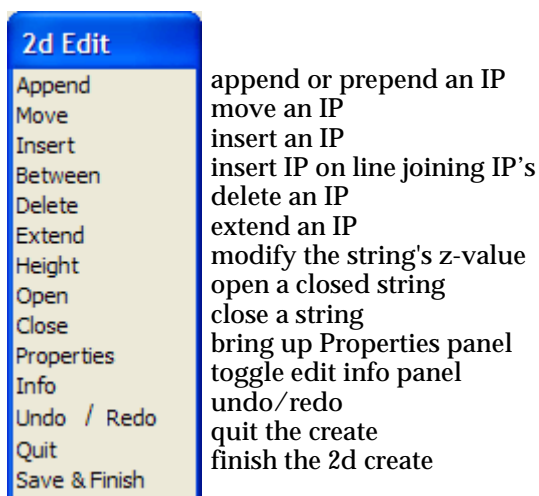

*end the option, **don't** proceed to the edit stage.*

2d Edit

On selecting the **Create** button in the **Create 2d String** panel the 2d edit menu and **2d Edit Info** panel are placed on the screen.

The 2d edit menu for a 2d string is

and the **2d edit info** panel is

To create a new 2d string, select the **Append** option from the 2d Edit menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all 2d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the 2nd vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's 2d Edit menu are usable.

The options in the 2d Edit menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the 2d Edit menu are identical to the options used when editing an existing string, they will be discussed in detail

in the string Editor section.

For full information in the 2d Editor, go to the section “2d Edit”

Create - 3d (pre V8)

create_3d_string

Position of option on menu: Strings =>Create =>Old =>3d

A 3d string consists of a series of (x,y,z) points.

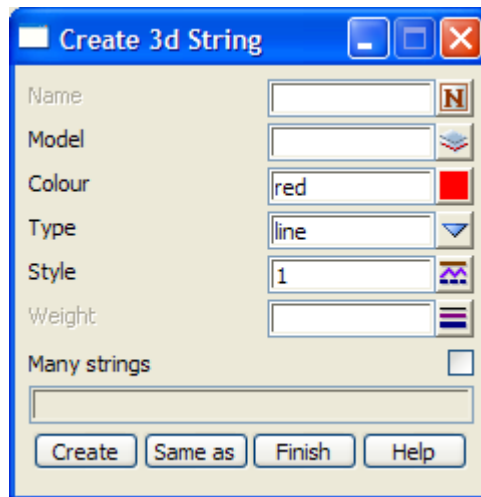

The difference between a 2d and a 3d string is that for a 3d string, the z-value (height) can vary at each string point, whereas a 2d string has a constant height for the entire string. Hence a 2d string is simply a special case of a 3d string where the heights at all the points are the same.

Creating and editing a 3d string is very similar to a 2d string. The only major difference is that a height is required at each string point.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create 3d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 3d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create 3d String** panel.

On selecting the 3d string option, the **create 3d string** panel is displayed.

To **create** a new 3d string, the name, colour, model and point-line type of the new string are entered into the appropriate fields and the **create** button selected.

To **create** a new 2d string, the name, colour, model, point-line type and height of the new string are entered into the appropriate fields and the **Create** button selected.

The new fields and buttons used in the **create 3d string** panel have the following functions.

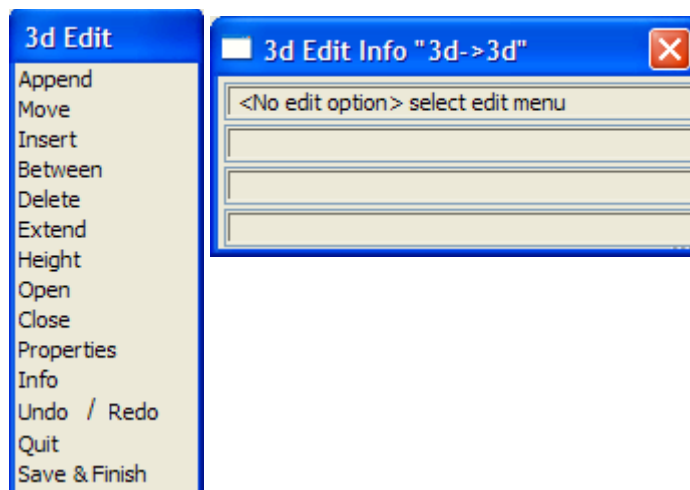

Field Description	Type	Defaults	Pop-Up
Name	input		
			<i>the name of the new string.</i>

Model	input		available models
	<i>name of the model that the new string is in.</i>		
Colour	input	default colour	available colours
	<i>the colour of the new string.</i>		
Type	input	line	line, point
	<i>breakline type (point-line type) of the string.</i>

	<i>line style of the string.</i>		
Weight	input	0	
	<i>thickness of the string.</i>		
Many strings	tick		
	<i>if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>		
Create	button		
	<i>After the create button is chosen, the 3d edit menu and 3d edit info panel are displayed.</i>		
Same as	button		
	<i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>		

3d Edit

Selecting the **create** button in the **create 3d string** panel the 3d edit menu and **3d edit info** panel are placed on the screen.

The 3d edit menu and panel for a 3d string are

To create the new 3d string, select the **Append** option from the 3d Edit menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all 3d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's 3d Edit menu are usable.

The options in the 3d Edit menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the 3d edit menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the 3d Editor, go to the section "3d Edit"

Create - 4d (Pre V8)

create_4d_string

Position of option on menu: Strings =>Create =>4d

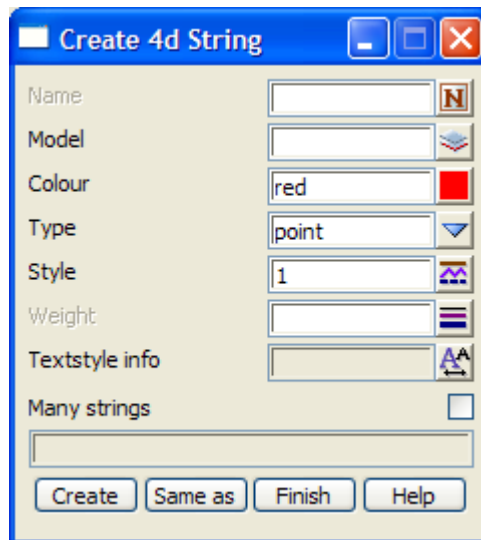

A 4d string consists of a series of (x,y,z) points and a text label at each point.

Creating and editing a 4d string is very similar to a 3d string.- the major difference is that a height **and** a text label is required at each string point.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is Finished or Quit, a new **Create 4d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 4d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create 4d String** panel.

On selecting the 4d string option, the **create 4d string** panel is displayed.

To **create** a new 4d string, the name, colour, model, point-line type, text size and units, offset, justification and angle for the new string are entered into the appropriate fields and the **create** button selected.

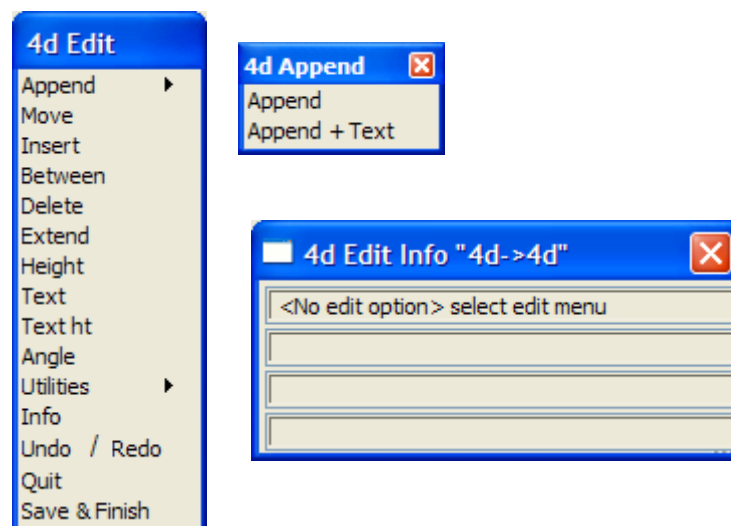

The new fields and buttons used in the **create 4d string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Type <i>breakline type (point-line type) of the string.</i>	input	line	line, point
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
Textstyle info <i>textstyle information.</i>	input		
Many strings <i>if tick then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick		
Create <i>After the create button is chosen, the 4d edit menu and 4d edit info panel are displayed.</i>	button		
Same as <i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		

4d Edit

Selecting the **create** button in the **create 4d string** panel the 4d edit menu and 4d edit info panel are placed on the screen.

The 4d edit menu and panel for a 4d string are

To create a new 4d string, the user must select one of the two Append options on the Append

walk-right of the 4d Edit menu which has options to simply create points or to create points and text at the points.

The **Append** and **Append + text** options are used to add points and text (in a plan view) to either end of an existing string, or in the case of a new string, places the 1st point and text and then begins appending points and text to the 1st point.

For all 4d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

If **Append + text** was selected, the user will then be prompted for the text to be placed at that points.

The string and text is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's 4d Edit menu are usable.

The options in the 4d Edit menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the 4d edit menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the 4d Editor, go to the section "4d Edit"

Create - Same As

`create_same_as`

Position of option on menu: Strings =>Create =>Same as

The same as option is used to create a new string of the same type and with similar header information as an existing string.

On selecting the same as create option, the **create same as** panel is displayed.

After selecting the option, the option is already running and waiting for a string to be selected.

Once a string is selected from a view, a new **create nd string** panel of the same type as the selected string and with all the header information from the selected string, is displayed on the screen.

The user then proceeds as a normal create string option.

If the pick is terminated by clicking RB to get up the pick ops menu and selecting cancel from it, the option can be started again by selecting the **pick & create** button.

Editor

edit_string

Position of option on menu: Strings =>Editor

The string editor is used for modifying any of the 12d Model strings.

After selecting the editor option, the **edit string** panel is placed on the screen to record any error messages.

The option is already in pick mode (the **pick & edit** button only needs to be selected if the pick was cancelled) and the user simply picks and accepts the string to be edited. From the picked string's type, the editor is able to determine the appropriate editor and placed on the screen.

Each string type has its own edit operations which will now be discussed in detail.

Note - if the edit menu is deleted from the screen using the menu delete option, it can be raised again by clicking RB in any view.

Please continue to the next section "Editor - Common Information" .

For the option Edit 2d, please go to the section "2d Edit" .

Editor - Common Information

nd edit menu

After selecting the string to be edited, the menu containing the list of available edit options (the string's nd edit menu) and an information panel, (the string's **nd edit info** panel) are placed on the screen.

For example, the string edit menu and **string edit info** panel for a 2d string are

Most of the options chosen from the **nd edit** menus repeat until cancelled by the user. That is, the option remains in force and can be applied repeatedly until terminated by the user.

For example, if the delete option is selected, any number of points can be deleted from the chosen string without re-selecting the delete option.

To select a new **nd edit** option, simply select the option from the **nd edit** menu. The current option is automatically terminated and the new option begun.

An option is also terminated when the entire string editing option is ended by selecting either the **Quit** or **Finish** button in the **nd edit** menu.

Info

Toggles the **nd edit info** panel on/off for the string.

Undo/Redo

An **undo** and **redo** list is defined for each editor on the screen. That is, each editor has its own undo/redo lists. If an option is **undone**, it is added to the **redo** list so that it can be **redone**.

When the editor is exited by either **Quit** or **Finish**, the undo and redo lists are deleted and are no longer usable.

Undo

Undoes the last editor operation for this string and adds it to the top of the redo list.

Redo

Redo the last editor operation that was undone for this string. Add the undone operation to the top of the undo list.

Quit

Even after points are created for the new string, the create process can be **aborted** by selecting the **Quit** option from the **nd Edit** menu. The option then terminates and **no** string is created.

The **Quit** option is used to terminate the **nd string edit session** **without** storing any of the edits. That is, the string is left as it was *before* the edit was begun.

After selecting the **Quit** option, a **Yes-No-Cancel** panel is displayed to confirm that the edit is to be ended. If **yes** is selected, the edits will be ignored and the unedited string kept.

Note that if it was a new string being created, the option is terminated by **Quit** and **no** string is created.

Finish

The edit process is completed and the modified string stored in the given model when the **Finish** option is chosen from the **nd Edit** menu.

After selecting the **Finish** option, a **Yes-No-Cancel** panel is displayed to confirm that the edit is to be ended. If **Yes** is selected, the edits will be stored.

Notes

1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its point (point type) or with straight lines joining the points (line type).

Linestyles can be defined that drawn lines between the points even though the breakline type is **point**.

2. The string points are called intersection points (IP's).
3. The string **nd Edit Info** panel will not automatically appear if **Display edit info** is set to **off** in the System Settings tab of the **Utilities =>Defaults** panel.

Typed input

Typed input can be used wherever a select is required to obtain a co-ordinate. For example an (x,y), (x, y, z) or (chainage, height).

To start typed input, simply press <F7> and a special typed-input box appears on the screen

If the focus is on a Plan or Perspective view, then an **Enter X Y Z** box comes up. If the focus is on a Section view, then a **Enter Ch Ht** box appears. These are also called the *XYZ typed input* box and the *Chainage Height typed input* box respectively.

An <enter> terminates the typed input and the entered values taken as the position of the required point. The typed-input box then disappears.

If the user wishes to **abort** the typed input and return to mouse input, simply select the **[X]** button on the typed input box or type <enter> with no values in the typed input box.

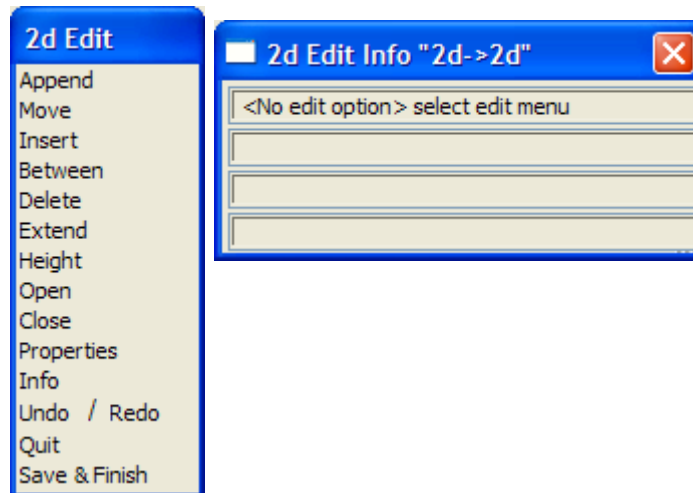

Please continue to the next section "2d Edit" .

2d Edit

2d_edit

Position of option on menu: Strings =>Editor

On **2d_edit_info** picking a 2d string, the 2d edit menu and the 2d edit info panel are placed on the screen.

See the earlier section “Editor - Common Information” for general information about editing strings.

Each option in the 2d edit menu will now be described.

Append

The **append** option is used to create the 1st point in a new string, to append a new intersect point to the end of the string or to prepend a new intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

Existing 2d Strings

Appending a point is a two step process.

Step (a) - selecting the end to append the point to.

After the **append** option has been selected, the end of the string to append the point to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

message area 1	<Append Points>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for an IP
message area 4	select final position- after pick
Screen message area	
	<Select string end to append to> [picks][][menu]
	<Select string end to append to> [picks][accepts][menu]

Step (b) - selecting the position for the new appended point.

A cross indicates where the cursor currently is. The position of the new appended point is set to the current cursor position by picking (LB) and accepting (MB).

message area 1	<Append Points>
message area 2	IP point number, x, y, z co-ords of IP

message area 3	bearing-in, bearing out, bearing difference for closest IP
message area 4	select final position- before pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Once a point has been appended to the string, the appended point is considered to be the selected string end and a new append cycle begins. That is, stage (a) is already set up. The current cursor position indicates the new position for the next appended point.

Hence a **series** of string points is easily entered by first selecting the string end that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point and selecting them in turn.

Typed input can be used in either step.

The append option is terminated by either bringing up the pick ops menu and selecting **cancel** or by selecting a new option from the 2d edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the append option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the append option still current.

New 2d String

For creating a new string, the cursor is used to select the 1st point of the string. The option then continues as if appending to an existing 2d string where the end point has already been selected.

Move

The move option is for moving individual points (intersection points - IP's) of the string.

The move cycle consists of two steps:

- (a) selecting the point to be moved
- (b) selecting the new position for the point.

Step (a)

First the point to be moved is selected. The selected point will then move around the view and the string redrawn to show the change as the cursor is moved.

message area 1	<Move Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for the closest IP
message area 4	select final position- after pick
Screen message area	
	<Select point to move> [picks][][menu]
	<Select point to move> [picks][accepts][menu]

Step (b)

The current cursor position is selected as the new position for the point by selecting (LB) and accepting (MB). The point being moved is then anchored at the cursor position for the IP, and the string redrawn.

message area 1	<Move Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for the moved IP
message area 4	select final position- before pick, edit finished- after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Typed input can be used in either step.

Once the move cycle is completed and the point moved, the move option is still current and can be repeated for other points without having to re-select the move option.

The move option is terminated by selecting cancel from the pick ops menu or by selecting a new 2d edit option.

Insert

The insert option is designed to place a new intersection point in a string between two adjacent intersection points (note that the inserted point **does not** have to be on the line joining the two intersection points).

Inserting a point, like moving a point, is a two step process.

Step (a) - selecting the IP's to be on either side of the new intersection point

The two adjacent intersection points are chosen by selecting the **line** connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

message area 1	<Insert Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for closest IP
message area 4	select final position- after pick
Screen message area	
	<Select line to insert on> [picks][][menu]
	<Select line to insert on> [picks][accepts][menu]

Step (b) - selecting the position for the new intersection point

The position of the new intersection point is selecting

message area 1	<Insert Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Once the insert cycle is completed and the point inserted, the insert option is still current and can be repeated for other insertions without having to re-select the insert option.

The insert option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the 2d edit menu.

Typed input can be used in either step.

Between

The between option is similar to the insert option except that the inserted point **does** have to be on the line joining the two intersection points. To accomplish this, the cursor position is projected onto the IP-IP line to give the new IP point position.

The between option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the 2d edit.

Delete

The delete option is used to delete selected intersection points from the string.

The point to be deleted is picked (LB) and accepted (MB). When the point is accepted, it is **deleted**. The string, minus the deleted point, is then redrawn.

Once a point has been deleted, another point in the string can then be selected and deleted. Hence any number of points from the string can be deleted one after another.

```

message area 1 <Delete Points>
message area 2          IP point number, x, y, z co-ords of IP
message area 3          bearing-in, bearing out, bearing difference for closest IP
message area 5
Screen message area
    <Select point to delete> [picks][][menu]
    <Select point to delete> [picks][accepts][menu]

```

The delete option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the 2d edit menu.

Typed input can be used to select a point for deletion.

Extend

The extend option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

That is, the bearing of the IP-IP line is kept constant and the intersection point is moved along that line either **towards** or **away** from its neighbouring intersection point on the IP-IP line.

Extending, like moving a point, is a two step process.

Step (a) - selecting the IP-IP line and the IP to be moved along that line

The IP-IP line and the intersection point to be moved are chosen in the one operation by picking (LB) and accepting (MB) a co-ordinate point near the IP-IP line and close to the intersection point to be moved along that line.

Once the line and intersection point (IP) are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line.

As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

```

message area 1          <Extend Point>
message area 2          IP point number, x, y, z co-ords of IP
message area 3          bearing-in, bearing out, bearing difference for closest IP
message area 4          select final position- after pick
Screen message area
    <Select line to extend> [picks][][menu]
    <Select line to extend> [picks][accepts][menu]

```

Step (b) - selecting the final position for the intersection point

The final position for the intersection point is set to the projection of the selected cursor position onto the IP-IP line.

```

message area 1          <Extend Points>
message area 2          IP point number, x, y, z co-ords of IP
message area 3          bearing-in, bearing out, bearing difference for closest IP
message area 4          select final position - before pick, edit finished - after pick
Screen message area
    <Select final position of point> [picks][][menu]
    <Select final position of point> [picks][accepts][menu]

```

Once the extend is completed, the extend option is still current and can be repeated without re-

selecting the extend option.

The extend option is terminated by selecting **cancel** from the pick ops menu or by selecting a new option from the 2d edit menu.

Typed input can be used in either step.

Note - Extend can be used on the end points of the string

Height

The height option is used to modify the height (z value) of the 2d string.

After the height option is chosen, an **enter value** typed-input box is displayed on the screen with the string's current height (z value).

The enter value typed-input box looks like:

The height is entered into the typed-input box, terminated by <enter>. The entered value is taken as the height of the 2dstring and the string redrawn with the new height. The typed-input box then disappears.

The height option automatically terminates and a new option is selected from the 2d edit.

Note - all the points in a 2d string have the same height.

Open

If the string is closed (that is, the end points have the same x and y values), selecting the open option removes the last point of the string.

If the string is not closed, the open option does nothing.

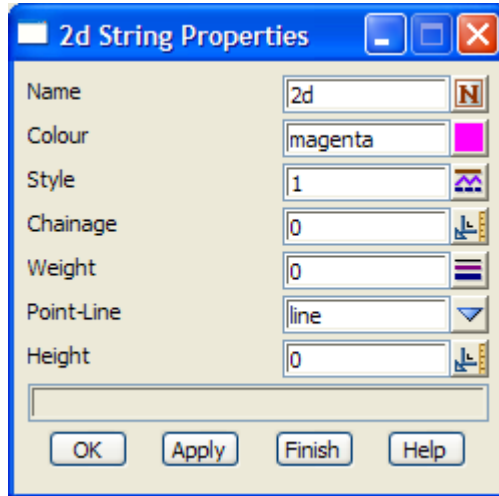

Close

Selecting the close option adds a point to the end of the string with the same co-ordinate values as the 1st point in the string.

Properties

[2d_string_properties](#)

Selecting **Properties** brings up the **2d String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **Create 2d String** panel and the 2d string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
Set	button		

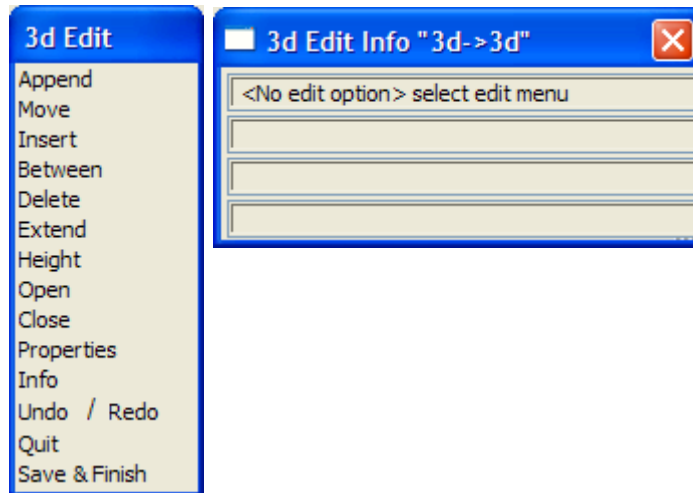

*for the 2d string being edited, set all the items in the **2d String Properties** panel to the values given in the panel.*

3d Edit

3d_edit

Position of option on menu: Strings =>Editor

On **3d_edit_info** picking a 3d string, the 3d edit menu and **3d edit info** panel are placed on the screen.

The difference between a 2d and a 3d string is that all points in a 2d string have the same z-value, whereas for a 3d string, each point can have a different z-value.

Hence most of the options in the 3d edit menu are similar to the 2d edit options of the same name, and only the differences for each option will be discussed. The *2d Edit* options are given in the section “2d Edit”

See the earlier section “Editor - Common Information” for general information about editing strings.

Append

The **append** operation for a 3d string is similar to that for a 2d string except that a height (z-value) is required for each new point.

Since in most cases, it would be tiresome to ask for a height every time a point is added, the entry of a new height is controlled by the height toggle in the **snaps** menu. If **height** is toggled to on, then every time a point is placed or moved an **enter height** typed-input box is displayed on the screen.

The enter height typed-input box looks like:

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the 3d string point and the string redrawn with the new height at the point. The typed-input box then disappears.

When the enter height box is placed on the screen, it will already have a value in it depending on the circumstances preceding the operation.

For example, if a point or line was snapped to, the height at that point or line will be displayed in the box.

Height

The height option is used to modify the height (z value) of any point in the string.

After the height option is chosen, the user must select which point is going to have its height modified.

After the point has been selected, a **New height** typed-input box is displayed on the screen with the point's current height (z value).

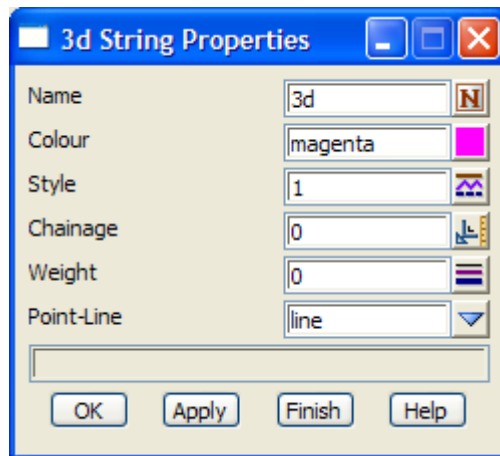

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the point in the 3d string and the string redrawn with the new height at that point. The typed-input box then disappears.

The height option is terminated on selecting cancel from the pick ops menu or by selecting a new option from the 3d edit menu.

Properties

3d_string_properties

Selecting **Properties** brings up the **3d String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **create 3d string** panel and the 3dd string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

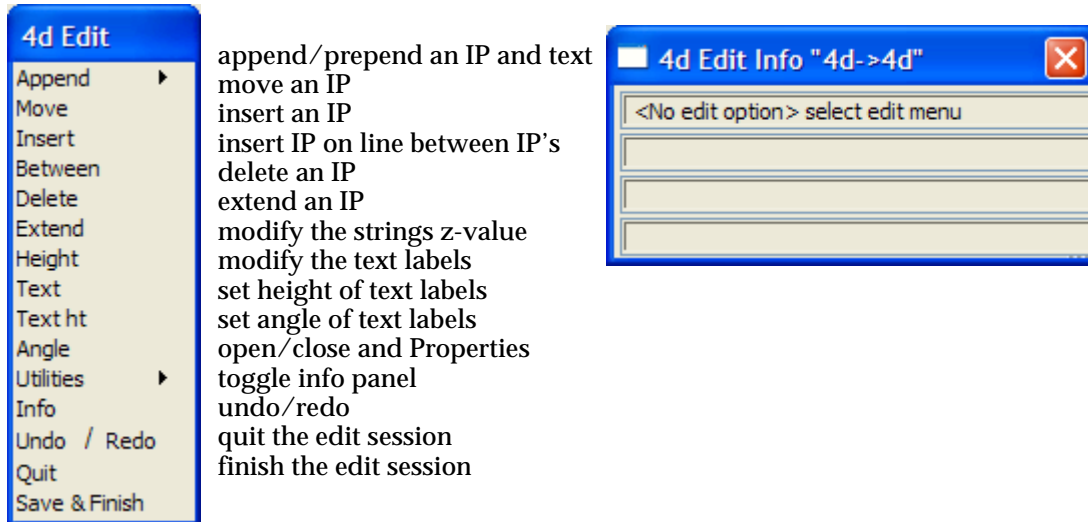

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the 3d string with the values in the panel fields and leaves the panel on the screen.*

4d Edit

4d_edit

Position of option on menu: Strings =>Editor

On picking `4d_edit_info` a 4d string, the 4d edit menu and 4d edit info panel are placed on the screen.

append/prepend an IP and text
 move an IP
 insert an IP
 insert IP on line between IP's
 delete an IP
 extend an IP
 modify the strings z-value
 modify the text labels
 set height of text labels
 set angle of text labels
 open/close and Properties
 toggle info panel
 undo/redo
 quit the edit session
 finish the edit session

Only the options append, text, size and angle will be described in detail since all the other options are similar to the equivalent 3d string option (see the section "3d Edit").

See the earlier section "Editor - Common Information" for general information about editing strings.

Append

4d_append

The append operation for a 4d string is similar to the 3d string case except that a height and an optional text label is required for each new point.

Since in many cases a text label is not required at every point of a 4d string, there is an append option that asks for text at every point and another that does not ask.

The 4d append walk-right is

The **height** question for each point is toggled on or off in the snaps menu just as it was for a 3d string.

The append option is terminated on selecting cancel from the pick ops menu or by selecting a new option from the 4d edit menu.

Text

The text option is used to modify the text label of any point in the 4d string.

After the text option is chosen, the user must select which point is going to have its text label modified. Once the point has been selected, an **enter text** typed-input box is displayed on the screen with the point's current text label placed in it.

The new text label is entered into the typed-input box, terminated with <enter>. The entered value is taken as the text label of the point in the 4d string and the string redrawn with the new text at that point. The typed-input box then disappears.

The text option is terminated on selecting **cancel** from the pick ops menu or by selecting a new option from the 4d edit menu.

Text ht

All the text labels in the 4d string have the same height (given in pixel or world units). The text ht option is used to modify this text label height.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current text label height placed in it.

The new text label height is entered into the typed-input box, terminated with <enter>.

The entered value is taken as the text label height for all the points in the 4d string and the string redrawn using the new height. The typed-input box then disappears.

The text ht option automatically terminates after use.

Angle

All the text labels in the 4d string are drawn rotated about their defining string point with the same rotation angle. The angle, in degrees, is measured in a counter-clockwise direction about the horizontal axis.

The angle option is used to modify the text rotation angle.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current text rotation angle placed in it.

The new text rotation angle is entered into the typed-input box, terminated with <enter>.

The entered value is taken as the text rotation angle for all the points in the 4d string and the string redrawn using the new angle. The typed-input box then disappears.

The angle option automatically terminates after use.

Utilities

Position of option on menu: Strings =>Editor

4d_utilities

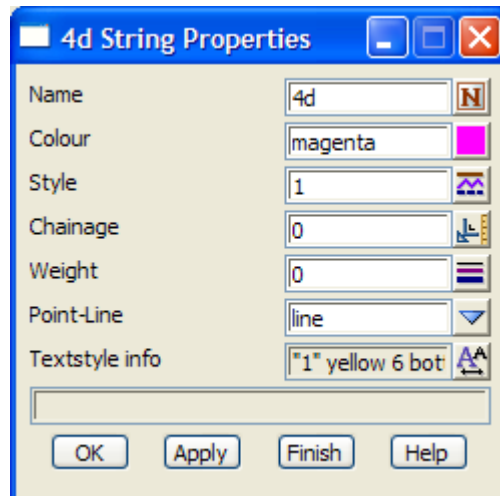

The 4d utilities walk-right is

Properties

4d_string_properties

Selecting **Properties** brings up the **4d String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **create 4d string** panel and the 4d string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

OK/Apply	button		
-----------------	--------	--	--

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel.*

***Apply** sets the string with the values in the panel fields and leaves the panel on the screen.*

Alignment Edit

alignment_edit

Alignment_edit_info

Position of option on menu: Strings =>Editor

An alignment string is defined by specifying the horizontal and vertical geometry as separate operations.

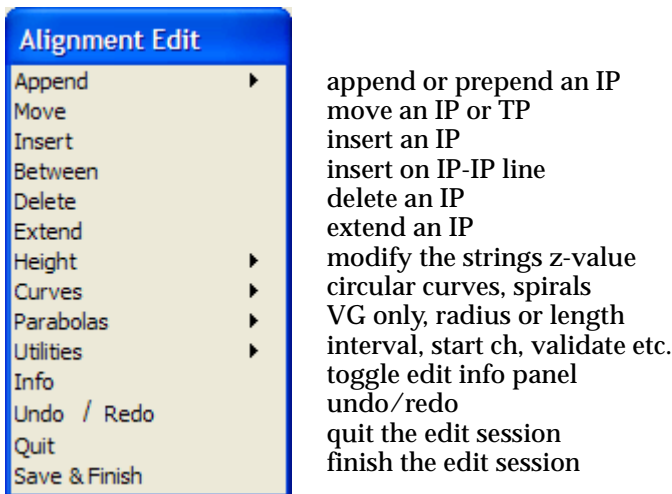

The **horizontal geometry** consists of a series of (x,y) points (called horizontal intersection points, **HIP**'s) and circular curves and spirals applied to the intersection points.

Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points called vertical intersection points (**VIP**'s) and parabolic or circular curves applied to the vertical intersection points.

The horizontal geometry is defined in a plan view and the vertical geometry in a section view. Hence the alignment string editor can edit information for the string on both plan and section views.

Since a section view is only defined in relation to a specific string (called the primary string for the section view), the vertical geometry of the picked string can only be edited in a section view if the string is the primary string for that section view. That is, the string can only be edited on a section view if the string being edited is profiled on that section view.

On selecting an alignment string, the alignment edit menu and the **alignment edit info** are placed on the screen.

Most of the options are applicable to either horizontal or vertical geometry. The meaning of the option depends on whether the string is being edited in a plan or a section view. Hence the description of the option will often need to be split into its separate action on horizontal or vertical geometry.

See the earlier section “Editor - Common Information” for general information about editing strings.

Each option will now be discussed in detail.

append

Append

The **append** operation for an alignment string is similar to the 3d string case except that there are separate append options for the horizontal and vertical geometry of the string.

The **append walk-right** is

Append HIPs - Horizontal Geometry

The **append=>HIPs** option in a plan view is used to create the 1st horizontal point in a new alignment string, to append a new horizontal intersect point to the end of the string or to prepend a new horizontal intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

Existing Alignment String

Appending a point is a two step process.

Step (a) - selecting the end to append the point to.

After picking **append=>HIPs**, the end of the string to append the point to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

message area 1	<Append Points>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for an IP
message area 4	select final position - after pick
Screen message area	

<Select string end to append to> [picks][][menu]
 <Select string end to append to> [picks][accepts][menu]

Step (b) - selecting the position for the new appended point.

A cross indicates where the cursor currently is. The position of the new appended point is set to the current cursor position by picking (LB) and accepting (MB).

message area 1	<Append Points>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for closest IP
message area 4	select final position - before pick
Screen message area	

<Select final position of point> [picks][][menu]
 <Select final position of point> [picks][accepts][menu]

Once an intersection point has been appended to the string, the appended intersection point is considered to be the selected string end and a new append cycle begins. That is, stage (a) is already set up. The current cursor position indicates the new position of the next appended intersection point.

Hence a **series** of string points is easily entered by first selecting the string end that the new

points are to be appended to (step (a)) and then moving the cursor to the position of each new point in turn and selecting them in turn.

Typed input can be used in either step.

The **append** option is terminated by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the alignment edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the append option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the append option still current.

New Alignment String

When the **append=>HIPs** option is selected, a cross will appear on any plan views that have the alignment string's model on them.

The first horizontal intersection point is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing alignment string where the end point has already been accepted.

Append VIPs - Vertical Geometry

The `append=>VIPs` option is used to create and edit the vertical geometry of the picked string if the string is a **primary** string on any section view. This can be achieved by using either the `VG edit` or the `profile` option from the section view `view=>utilities` menu.

Vertical geometry can only be defined for a string with **existing** horizontal geometry.

On a section view, `Append=>VIPs` is used to create the first vertical intersection point in an existing string, to append a new vertical intersect point to the end of the string or to prepend a new vertical intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

Existing Vertical Geometry

Appending a vertical point is the same as for a horizontal intersection point except that the coordinate system is (chainage,height) rather than (x,y) values and the information messages displayed in the **alignment edit info** panel show chainage, height and percentage grade rather than x,y,z and bearings.

For example -

message area 1	<Append Points>
message area 2	VIP point number, chainage,height of VIP
message area 3	curve length, %grade-in, %grade-out, grade difference for an VIP
message area 4	edit finished - before pick select final position - after pick

New Vertical Geometry

Creating the **1st vertical intersection point** (VIP) in a string is similar to the 1st horizontal IP.

When the `append=>VIPs` option is selected, a cross will appear on any section views that have the alignment string profiled on them.

The 1st vertical intersection point is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing vertical geometry where the end point has already been accepted.

Typed input can be used at any stage of the append.

Move

The move option allows the user to move

- individual horizontal intersection points (HIPs)
- individual tangent points (HTPs) if their is no spiral on the HIP.
- individual vertical intersection points or tangent points (VIPs or VTPs).

move acts on the horizontal geometry if the point to move is selected in a plan view, or the vertical geometry if the point to move is selected in a section view.

Move - Horizontal Geometry

The move option in a plan view is for moving individual horizontal intersection points (HIP's) or horizontal tangent points (HTPs) of the string.

The move cycle consists of two steps:

- selecting the point to be moved
- selecting the new position for the point.

Step (a)

First the horizontal intersection or tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a **horizontal intersection point** is selected, the string will be redrawn with the intersection point moved to the cursor position and the circular curve radius and spiral lengths left constant.

A **horizontal tangent point** only occurs on a line connecting two adjacent horizontal intersection points (the HIP-HIP line). Hence, a horizontal tangent point can only move along its HIP-HIP line. Moving a horizontal tangent point actually means that the **radius** of the circular curve at the tangent point is **modified** so that the new position of the point is still a tangent point on the HIP-HIP line for the new circular curve.

To guarantee that the new position for the tangent point is on the HIP-HIP line, the cursor position is automatically projected perpendicularly onto the HIP-HIP line to give the new tangent point.

message area 1	<Move Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - after pick
Screen message area	
	<Select point to move> [picks][][menu]
	<Select point to move> [picks][accepts][menu]

Step (b)

The current cursor position (or its projection for a HTP) is selected as the new position for the point by picking (LB) and accepting (MB). The point being moved is then anchored at the cursor position for the HIP (or at the projected point for a HTP), and the string redrawn.

message area 1	<Move Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Typed input can be used in either step

Once the move cycle is completed and the point moved, the move option is still current and can be repeated for other points without having to re-select the move option.

move is terminated by selecting cancel from the pick ops menu or by selecting a new alignment edit option.

Move - Vertical Geometry

The move option is used in a section view to move individual vertical intersection points (VIP's) or vertical tangent points (VTP's).

The move cycle consists of two steps:

- (a) selecting the point to be moved
- (b) selecting the new position for the point.

Step (a)

First the vertical intersection or tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a **vertical intersection point** (VIP) is selected, the string will be redrawn with the vertical intersection point moved to the cursor position and the parabolic curve length or the circular curve radius left constant.

A **vertical tangent point** (VTP) only occurs on a line connecting two adjacent vertical

intersection points (the VIP-VIP line). Hence, a vertical tangent point can only move along its VIP-VIP line. Moving a vertical tangent point actually means that the **length** of the parabolic curve at the vertical tangent point is **modified** so that the new position of the point is still a vertical tangent point on the VIP-VIP line for the new parabolic curve.

To guarantee that the new position for the vertical tangent point is on the VIP-VIP line, the cursor position is automatically projected perpendicularly onto the VIP-VIP line to give the new vertical tangent point.

message area 1	<Move Point>
message area 2	VIP point number, ch, ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	select final position - after pick
Screen message area	
	<Select point to move> [picks][][menu]
	<Select point to move> [picks][accepts][menu]

Step (b)

The current cursor position (or its projection for a VTP) is selected as the new position for the point by selecting (LB) and accepting (MB). The point being moved is then anchored at the cursor position for an VIP (or at the projected point for a VTP), and the string redrawn.

message area 1	<Move Point>
message area 2	VIP point number, ch, ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Typed input can be used in either step.

Once the move cycle is completed and the point moved, the move option is still current and can be repeated for other points without having to re-select the move option.

The move option is terminated by selecting cancel from the pick ops menu or by selecting a new alignment edit option.

Insert

The insert option is designed to place a new intersection point in a string between two adjacent intersection points. The inserted point does not have to be on the line joining the two intersection points - the between option is used to guarantee that the IP is on the IP-IP line.

Inserting a point, like moving a point, is a two step process.

Step (a) - selecting the IP's to be on either side of the new intersection point

The two adjacent intersection points are chosen by selecting the **line** connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

Like the move option, the insert works on the horizontal or the vertical geometry depending on whether a plan or section view is used to select the connecting line.

For horizontal inserts

message area 1	<Insert Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - after pick
Screen message area	

<Select line to insert on> [picks][][menu]
 <Select line to insert on> [picks][accepts][menu]

For vertical inserts

message area 1	<Insert Point>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	select final position - after pick
Screen message area	
	<Select line to insert on> [picks][][menu]
	<Select line to insert on> [picks][accepts][menu]

Step (b) - selecting the position for the new intersection point

The position of the new intersection point is set to the current cursor position by picking (LB) and accepting (MB).

horizontal

message area 1	<Insert Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

vertical

message area 1	<Insert Point>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Once the insert cycle is completed and the point inserted, the insert option is still current and can be repeated for other insertions without having to re-select the insert option.

The insert option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the alignment edit menu.

Typed input can be used in either step.

Between

The **between** option is similar to the **insert** option except the inserted point **does** have to be on the line joining the two intersection points. To accomplish this, the cursor position is automatically projected onto the IP-IP line to give the new IP point position.

The **between** option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the alignment edit menu.

Delete

The delete option is used to delete intersection points from the string.

After picking the delete option, any selected intersection point in the string is deleted. The string, minus the deleted point, is redrawn after each deletion.

Once an intersection point has been deleted, another intersection point in the selected string can be selected for deletion. Hence any number of the string points can be deleted one after another.

A horizontal intersection point is deleted if the point is chosen from a plan view and a vertical intersection point deleted if the point is selected from a vertical view.

For horizontal deletes

message area 1	<Delete Points>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
Screen message area	
	<Select point to delete> [picks][][menu]
	<Select point to delete> [picks][accepts][menu]

For vertical deletes

message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
Screen message area	
	<Select point to delete> [picks][][menu]
	<Select point to delete> [picks][accepts][menu]

The delete option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the alignment edit menu.

Typed input can be used to select a point for deletion.

Extend

The extend option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

That is, in a plan view, the bearing of the HIP-HIP line is kept constant and the intersection point is moved along that line either **towards** or **away** from its neighbouring intersection point on the HIP-HIP line.

In a section view, the grade of the VIP-VIP line is kept constant and the vertical intersection point is moved along that line either **towards** or **away** from its neighbouring intersection point on the VIP-VIP line.

Extending, like moving a point, is a two step process.

Step (a) - selecting the IP-IP line and the IP to be moved along that line

The IP-IP line and the intersection point to be moved are chosen in the one operation by selecting a co-ordinate point near the IP-IP line and close to the intersection point to be moved along that line.

Once the line and IP are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line. As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

For horizontal extends

message area 1	<Extend Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - after pick
Screen message area	
	<Select line to extend> [picks][][menu]
	<Select line to extend> [picks][accepts][menu]

For vertical extends

message area 1	<Extend Point>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP

message area 4 select final position - after pick
 Screen message area
 <Select line to extend> [picks][][menu]
 <Select line to extend> [picks][accepts][menu]

Step (b) - selecting the final position for the intersection point

The final position for the intersection point is set to the projection of the current cursor position onto the IP-IP line.

horizontal -

message area 1 <Extend Points>
 message area 2 IP point number, x, y co-ords of IP, radius, start spiral, end spiral
 message area 3 bearing-in, bearing out, bearing difference for the inserted IP
 message area 4 select final position - before pick, edit finished- after pick
 Screen message area
 <Select final position of point> [picks][][menu]
 <Select final position of point> [picks][accepts][menu]

vertical

message area 1 <Extend Points>
 message area 2 VIP point number, Ch, Ht co-ords of VIP
 message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
 message area 4 select final position - before pick, edit finished- after pick
 Screen message area
 <Select final position of point> [picks][][menu]
 <Select final position of point> [picks][accepts][menu]

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The extend option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the alignment edit menu.

Typed input can be used in either step.

Note - Extend can be used on the end points of the string

height

Height

The height option is used to insert and/or modify the height of a vertical intersection point in a plan view, or to modify the height of a vertical intersection point in a section view.

Hence the height option is unique - it only affects the vertical geometry of the string but can be used in a plan or section view.

The height walk-right is

By Plan - Height in a Plan View

In a plan view, the height=>by plan option is used to create a **vertical intersection point** of a given height, or modify the height of an existing vertical point, at a selected plan position on the string.

After the height option is chosen, the user selects a position on the string in a plan view. The use

of point and line snap will important for selecting the correct position.

If a vertical intersection point already exists at the chainage of the selected position, it will be selected for modification. Otherwise a new vertical intersection point will be inserted into the vertical geometry at the chainage of the selected position.

A new height typed-input box is then displayed on the screen with the vertical intersection point's current height (z value).

The new height typed-input box looks like:

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new height of the vertical intersection point in the alignment.

The typed-input box then disappears.

By Section - Height in a Section View

In a section view, the height=>by section option can only be used to modify the height of an **existing** vertical intersection point.

After the height option is chosen, the user selects the vertical intersection point that will have its height modified from a section view. After selecting the VIP, a new height typed-input box is displayed on the screen with the point's current height (z value).

The new height typed-input box looks like:

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new height of the vertical intersection point in the alignment string and the string redrawn with the new height at that point.

The typed-input box then disappears.

For either height=>by plan or height=>by section, the height option is terminated on selecting cancel from the pick ops menu or by selecting a new option from the alignment edit menu.

curves

Curves

The curves option allows the user to

- add a circular curve of a specified radius or curve length to a horizontal intersection point
- add start and end transition spirals to an intersection point with an existing circular curve
- add a circular curve of a specified radius or curve length to a vertical intersection point

The Curves walk-right menu is

The radius option is used to create or modify the radius of a circular curve at a horizontal or vertical intersection point. radius acts on the horizontal geometry if the point is selected in a plan

view, or the vertical geometry if the point is selected in a section view.

Similarly the **length** option is used to set a circular curve by giving its total curve length rather than the radius. **length** acts on the horizontal geometry if the point is selected in a plan view, or the vertical geometry if the point is selected in a section view.

The **spiral** option is for adding transition spirals to a **horizontal intersection point with a curve already on it**.

Radius

In a plan view, the radius option is used to **add** a circular curve to an intersection point with no curve or to **modify** the radius of the circular curve if one already exists.

In a section view, the radius option is used to **add** a circular curve to an intersection point with no curve or to **modify** the radius of a circular curve if one already exists.

Radius is a two step process.

Step (a) - selecting the intersection point

First the intersection point whose curve is to be modified is selected.

For horizontal radius

message area 1	<Radius>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP

For vertical radius

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	radius, % grade-in, % grade-out, grade diff for the moved VIP
message area 4	enter value- after pick

Screen message area

<Select point to change radius> [picks][][menu]
<Select point to change radius> [picks][accepts][menu]

Step (b) - entering the new radius

after an intersection point is chosen, a **new radius typed-input box** is displayed on the screen with either the intersection point's current curve radius or, if no curve exists, zero.

The new radius typed-input box looks like:

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the curve at that intersection point and the string redrawn with the new curve. The typed-input box then disappears.

If an existing curve is to be **removed** from an intersection point, enter the value zero into the new radius typed-input box.

horizontal

message area 1	<Radius>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing diff for the inserted IP
message area 4	enter value - before value entered edit finished- after value entered

vertical

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP

message area 3	radius, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	enter value - before value entered edit finished- after value entered

Like most of the other alignment edit options, after a radius has been modified the option is still current and another intersection point can be chosen to have its curve radius modified.

The radius option is terminated by selecting a different alignment edit option.

Length

Although the circular curve on an intersection point is stored as a radius, it is possible to define the radius indirectly by giving the total curve length by using the length option.

The option works in plan or section views.

To use length, first select the intersection point to add a new circular curve to, or to modify the existing curve.

A new length **typed-input box** is then displayed on the screen with either the current curve length, or if no curve exists, zero.

The new length typed-input box looks like:

The total curve length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new curve length. The typed-input box then disappears.

If an existing circular curve is to be **removed**, zero is entered into the new length typed-input box.

Like most of the other alignment edit options, after the length has been modified the option is still current and another IP can be chosen to have its curve modified.

The length option is terminated by selecting a different alignment edit option.

WARNING - when length is used, the equivalent radius is computed and stored with the curve. If the IP is moved, the **radius** is kept **constant** and the total curve **length** is **modified**.

Spiral

In a plan view, the spiral option is used to **add** a start or end transition spiral (transition curve) to a curve on an intersection point, or to **modify** an existing spiral. Spiral does not work on a section view.

After picking spiral, select the end of the curve to add a new spiral to, or the existing spiral to be modified. A new length **typed-input box** is displayed on the screen with either the current spiral length, or if no spiral exists, zero.

The new length typed-input box looks like:

The spiral length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new spiral length. The typed-input box then disappears.

If an existing spiral is to be **removed**, zero is entered into the new length typed-input box.

Like most of the other alignment edit options, after the spiral has been modified the option is still current and another curve can be chosen to have its spirals modified.

The spiral option is terminated by selecting a different alignment edit option.

[reverse_ip](#)

Reverse

12d Model normally creates a curve on the side of the IP that has the smallest angle. The sign of the radius (positive or negative) is automatically determined by 12d Model.

The Reverse option creates a circular curve that is the part left over from the standard curve.

On selecting Reverse, the **Reverse IP** panel is displayed.

The HIP is chosen by either typing in the HIP number in the IP number field, or by clicking on the 123 button and then selecting the HIP.

To change the curve from reversed/not reversed, simply tick on/off the Reversed tick box and then click on **Set**.

parabolas

Parabolas

The **parabolas** option is for adding, removing or modifying parabolic curves to the **vertical geometry**. It allows the user to

- (a) add a parabolic curve of a given curve length to a vertical intersection point
- (b) add a parabolic curve of a given effective radius to a vertical intersection point

The parabolas walk-right menu is

The **radius** option is used to set a parabolic curve of given effective radius to a vertical intersection point.

The **length** option is used to set a parabolic curve of a given curve length to a vertical intersection point.

Note - the option only works on the vertical geometry if the VIP is selected in a section view. Points cannot be selected in any other view.

Radius

In a section view, the radius option is used to **add** a parabolic curve to an intersection point with no curve or to **modify** the radius of the parabolic curve if one already exists.

Radius is a two step process.

Step (a) - selecting the intersection point

First the intersection point whose parabola is to be modified is selected.

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	enter value- after pick
Screen message area	
	<Select point to change radius> [picks][][menu]
	<Select point to change radius> [picks][accepts][menu]

Step (b) - entering the new radius

After an intersection point is chosen, a **new radius typed-input box** is displayed on the screen with either the intersection point's current parabolic radius or, if no parabola exists, the last value entered into the radius typed-input box.

The new radius typed-input box looks like:

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the parabola at that intersection point and the string redrawn with the new parabola. The typed-input box then disappears.

If an existing parabola is to be **removed** from an intersection point, enter the value zero into the radius typed-input box.

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	enter value - before value entered edit finished- after value entered

Like most of the other alignment edit options, after the radius has been modified the option is still current and another intersection point can be chosen to have its parabolic radius modified. The radius option is terminated by selecting a different alignment edit option.

WARNING - when radius is used, the equivalent parabolic length is computed and stored with the curve. If the VIP is moved, the **parabolic length** is kept **constant** and the **effective radius** is **modified**.

Length

The length option is used to **add** a parabolic curve to a vertical intersection point with no curve or to **modify** the length of the parabolic curve if one already exists.

Adding or modifying curve length is a two step process.

Step (a) - selecting the vertical intersection point

First the vertical intersection point whose parabola is to be modified is selected.

message area 1	<Length>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	edit finished - before pick enter value - after pick
Screen message area	
	<Select point to change length> [picks][][menu]
	<Select point to change length> [picks][accepts][menu]

Step (b) - entering the new curve length

After a VIP is selected, a **new length typed-input box** is displayed on the screen with the point's current parabolic curve length.

The new length typed-input box looks like

The curve length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the length of the parabolic curve at that vertical intersection point and the string redrawn with the new curve. The typed-input box then disappears.

If an existing parabola is to be **removed** from a vertical intersection point, enter the value zero into the curve length typed-input box.

message area 1	<Length>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	enter value- before value entered edit finished- after value entered

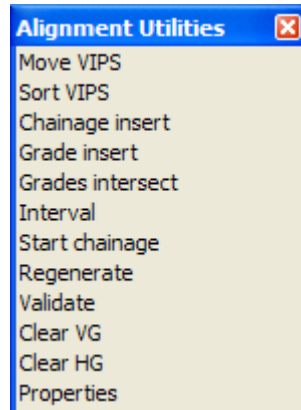

Like most of the other alignment edit options, after the parabolic curve length has been modified the option is still current and another vertical intersection point can be chosen to have its parabola modified.

The length option is terminated by selecting a different alignment edit option.

alignment_utilities

Utilities

The **utilities** walk-right menu contains a number of useful miscellaneous option for the alignment string. The menu is

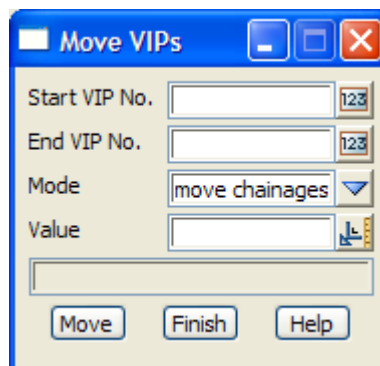

Each of the options will now be discussed.

Move VIPs

`move_vips`

The move VIPs option is for moving a range of vertical intersection points (VIP's) by a chainage or an elevation increment.

After selecting the option, the **move VIPs** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Start VIP No.	input		
----------------------	-------	--	--

the VIP number of the 1st VIP in the range to be moved. If blank, then 1.

End VIP No.	input		
--------------------	-------	--	--

the VIP number of the last VIP in the range to be moved. If blank, then the last VIP.

Mode	input	move chainage	move chainage move hts
-------------	-------	---------------	---------------------------

*if **move chainage**, the chainage of all the points in the specified range are incremented by the given value. If **move hts**, the heights (elevations) of all the points in the specified range are incremented by the given value.*

Value	input	0	
--------------	-------	---	--

value to increment either the chainage or the height for all the VIPs in the specified range.

Move	button		
-------------	--------	--	--

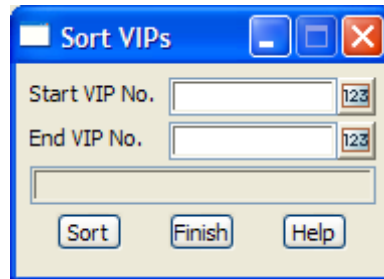

move the VIPs in the range given by the start and end ip field by the chainage or height given in the value field.

Sort VIPs

sort_vips

The sort VIPs option is for sorting VIP's into increasing chainage order.

After selecting the option, the **sort VIPs** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start VIP No.	input		
<i>if non-blank, the VIP number of the 1st VIP in the range to be sorted. If blank, then 1.</i>			
End VIP No.	input		
<i>the VIP number of the last VIP in the range to be sorted. If blank, then the last VIP.</i>			
Sort	button		
<i>sort the VIPs in the range given by the start and end ip field into chainage order.</i>			

Chainage Insert

chainage_insert_vip

The chainage insert option inserts a vertical intersection point (VIP) at a given chainage and height.

After selecting the option, the **chainage insert VIP** panel is displayed.

The fields and buttons used in the panel have the following functions.

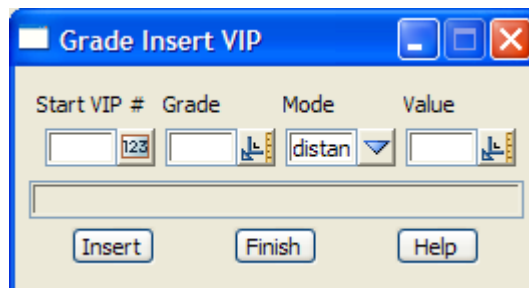

Field Description	Type	Defaults	Pop-Up
Ch ht	input		
<i>the chainage and height of the VIP to insert - separate values by spaces.</i>			
Insert	button		
<i>insert the VIP point given in the Ch ht field into the alignment string.</i>			

Grade Insert

grade_insert_vip

The **grade insert** option inserts a VIP at a given grade from an existing VIP. The new VIP position is given by either a distance from the picked VIP or at given chainage.

After selecting the option, the **grade insert VIP** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Start VIP #	input		
<i>the VIP number whose position is used to start the grade insert from.</i>			

Grade	input		
<i>percent grade to be used.</i>			

Note **positive is up** when going in the direction of **increasing chainage** and **negative is up** when going in the direction of **decreasing chainage**.

Mode	choice	distance	distance, chainage
<i>if distance, the new VIP is inserted at the given grade and distance (given in the value field) from the start VIP.</i>			
<i>if chainage, the new VIP is inserted at the chainage (given in the value field but having the given grade from the start VIP.</i>			

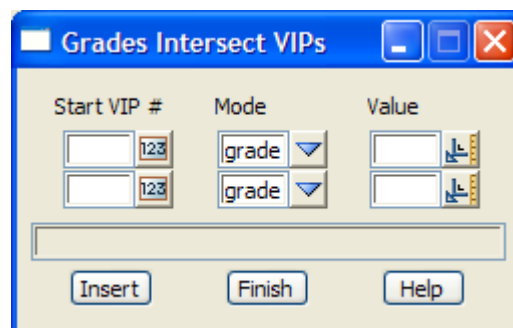

Insert	button		
<i>insert the new VIP into the alignment string.</i>			

Grades Intersect

grade_intersect_vips

The **grades intersect** option inserts a VIP which is given by intersecting lines of given grades from two existing VIPs. The grades are either typed in or calculated by giving another VIP that the line goes through.

After selecting the option, the **grades intersect VIPs** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start VIP # <i>the VIP number which is used in defining a line.</i>	input		
Mode <i>if grade, the field value is a percent grade and a line is defined as going through the start VIP and with the given grade.</i> <i>if VIP #, the field value is the number of a VIP and a line is defined as going through the start VIP and this VIP.</i> <i>Note for grades positive is up when going in the direction of increasing chainage and negative is up when going in the direction of decreasing chainage.</i>	choice	grade	grade, VIP #
Value <i>if mode is grade, value is a percent grade.</i> <i>if mode is VIP #, value is the number of a VIP.</i>	input		
Insert <i>calculate the point which is the intersection of the two lines and insert it as a new VIP into the alignment string.</i>	button		

Interval

Each alignment string has a chainage interval that is used to define regular points along the string. The chainage interval is used for approximation the alignment in operations such as triangulating and applying templates to an alignment string.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current chainage interval placed in it.

The new chainage interval is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The interval option terminates after use.

Start Chainage

Each alignment string has a start chainage which can be positive, negative or zero.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current start chainage in it.

The new start chainage is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

When a new start chainage is entered, the vertical intersection points are automatically moved so that they retain their same relative chainage with respect to the start point on the alignment.

The start chainage option terminates after use.

Regenerate

If the horizontal geometry of an alignment string is modified, then the profile through any triangulations would also change. Hence, if the alignment string being edited was profiled on any section views, then the profile would be need to be recalculated after any horizontal geometry changes.

On selecting the regenerate option, **any** section view that has the alignment string being edited as its primary string (that is, as the string defining the chainage for the section view) is automatically re-profiled.

Hence the regenerate option is equivalent to running the regenerate option for each section view with the edited alignment string as its primary string.

Validate

When constructing horizontal and vertical geometry, it is possible to end of with invalid constructs such as overlapping tangent points.

On selecting the validate option, the alignment string will be checked for

horizontal geometry checks

- ▲ at least two horizontal intersection points
- ▲ no co-incident horizontal intersection points
- ▲ no overlapping horizontal tangent points

vertical geometry checks

- ▲ at least two vertical intersection points
- ▲ no co-incident vertical intersection points
- ▲ no overlapping vertical tangent point
- ▲ vertical intersection points chainages are in ascending order

errors

If any errors occur, an errors menu is placed on the screen.

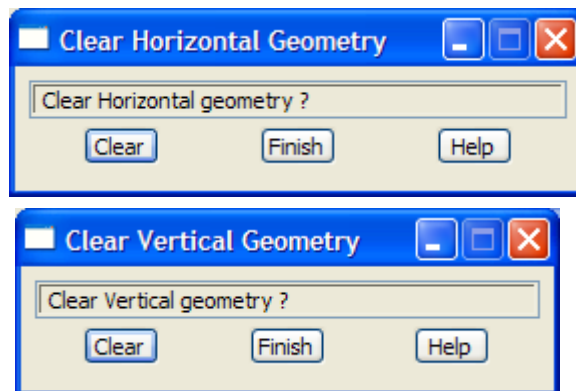

The errors menu remains on the screen and only disappears when either the [X] is picked or one of the error messages is picked with LB.

Note - the validate option is automatically run when the edit is finished.

Clear VG and Clear HG

`clear_horizontal_geometry`
`clear_vertical_geometry`

The Clear VG and Clear HG options are used to delete all the horizontal and/or vertical intersection points in the string.

The Clear VG option removes all the vertical geometry from the string.

The horizontal geometry still exists plus all the other string properties (model, name, colour and type).

The Clear HG option removes all the horizontal and vertical geometry from the string.

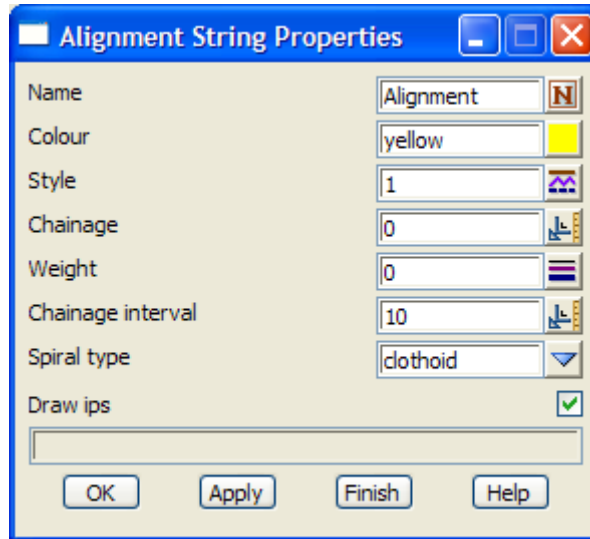

The string still exists and keeps its other properties such as model, name, colour and type.

After a Clear, the horizontal or vertical geometry can be re- entered using the edit options.

Properties

alignment_string_properties

Selecting **Properties** brings up the **Alignment String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **Create Alignment String** panel and the alignment string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
Draw ips	tick	tick	

*if tick, the horizontal and vertical intersection points are draw on plan and section views.
If no tick, the ips are not draw on the plan and section views.*

OK/Apply button

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel.
Apply sets the string with the values in the panel fields and leaves the panel on the screen.*

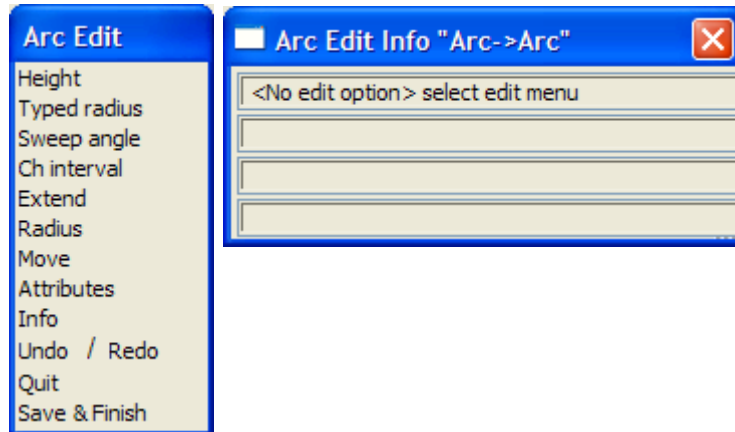

Finish

The finish option is used to terminate the alignment string edits. After selecting the finish option, the string is checked for overlapping horizontal or vertical tangent points and any errors reported.

Arc Edit

`arc_edit arc_edit_info`

On picking an arc string, the arc edit menu and **arc edit info** panel are placed on the screen.

Each option in the arc edit menu will now be described.

See the earlier section “Editor - Common Information” for general information about editing strings.

Height

The height option is used to define the z-value at the start or end point of the arc.

The z-value at any point on the arc is an interpolation on arc length of the values at the end points. Hence, the arc is an arc in plan only - in three dimensions, it is a **helix**.

Height is a two step process.

Step (a) - selecting the start or end point of the arc

After picking height, the end point of the arc whose height is to be modified is selected.

```
message area 1      <Height of arc>
Screen message area
    <Select point to change height> [picks][][menu]
    <Select point to change height> [picks][accepts][menu]
```

Step (b) - entering the new height

After the start or end point of the arc is selected, an **enter value** typed-input box is placed on the screen with the points current height displayed in it.

The enter value typed-input box looks like:

The new height for the point is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The height option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the arc edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the height option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the height option still current.

Typed Radius

The typed radius option is used to modify the radius of the selected arc.

After the typed radius option is chosen, an **enter value** typed-input box is placed on the screen with the arcs current radius displayed in it.

The **enter value** typed-input box looks like:

The arc radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc and the arc is redrawn with its new radius.

The typed-input box then disappears.

The typed radius option is automatically terminated and a new option needs to be selected from the arc edit menu.

Sweep Angle

The sweep angle option is used to modify the sweep angle of the selected arc.

After the sweep angle option is chosen, an **enter value** typed-input box is placed on the screen with the arcs current sweep angle displayed in it.

The **enter value** typed-input box looks like:

The arc sweep angle is entered into the typed-input box, terminated with <enter>. The entered value is taken as the sweep angle of the arc and the arc is redrawn with its new sweep angle.

The typed-input box then disappears.

The sweep angle option is automatically terminated and a new option needs to be selected from the arc edit menu.

Chainage interval

The **ch** interval option is used to modify the chainage interval of the selected arc.

After the **ch** interval option is chosen, an **enter value** typed-input box is placed on the screen with the arcs current chainage interval displayed in it.

The **enter value** typed-input box looks like:

The new chainage interval is entered into the typed-input box, terminated with <enter>. The entered value is taken as the chainage interval of the arc and the arc is redrawn with its new chainage interval.

The typed-input box then disappears.

The **ch** interval option is automatically terminated and a new option needs to be selected from the arc edit menu.

Move End

The move end option is used to re-position either the start or the end point of the arc.

Move end is a two step process.

Step (a) - selecting the start or end point of the arc

After selecting the move end option, the end point to be move is selected.

```
message area 1      <Move End>
Screen message area
    <Select point to move> [picks][][menu]
    <Select point to move> [picks][accepts][menu]
```

Step (b) - selecting the new position for the end point

After selecting the end point to move, the new position for the end point is selected.

```
message area 1      <Move End>
Screen message area
    <Select final position of point> [picks][][menu]
    <Select final position of point> [picks][accepts][menu]
```

The move end option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the arc edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the move end option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the move end option still current.

Radius

The radius option is used to change the radius of the arc by leaving the centre point alone and re-positioning a point on the arc. The new position for the point will define a new radius for the arc.

Radius is a two step process.

Step (a) - selecting the point on the arc to move

After selecting the radius option, the point on the arc to be moved is selected.

```
message area 1      <Radius>
Screen message area
    <Select point to move> [picks][][menu]
    <Select point to move> [picks][accepts][menu]
```

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

```
message area 1      <Radius>
Screen message area
    <Select final position of point> [picks][][menu]
    <Select final position of point> [picks][accepts][menu]
```

The radius option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the arc edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the radius option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the radius option still current.

Move

The move option is used to change the position of the entire arc by selecting and moving the arc centre or any point on the arc.

Move is a two step process.

Step (a) - selecting the point on the arc to move

After selecting the move option, the point on the arc to move is selected.

```
message area 1      <Move>
Screen message area
    <Select point to move> [picks][ ][menu]
    <Select point to move> [picks][accepts][menu]
```

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

```
message area 1      <Move>
Screen message area
    <Select final position of point> [picks][ ][menu]
    <Select final position of point> [picks][accepts][menu]
```

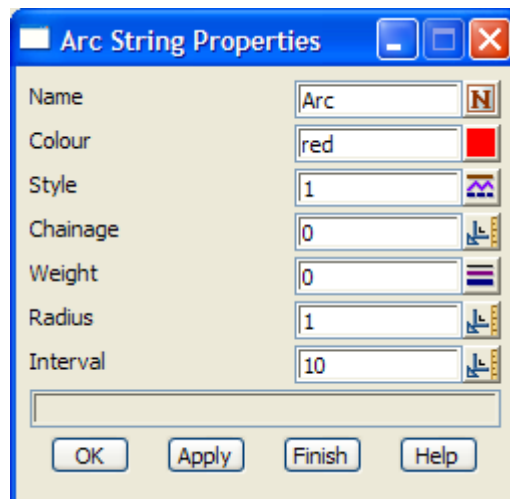

The move option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the arc edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the move option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the move option still current.

Properties

arc_string_properties

Selecting **Properties** brings up the **Arc String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **create arc string** panel and the arc editor options. The only new field is

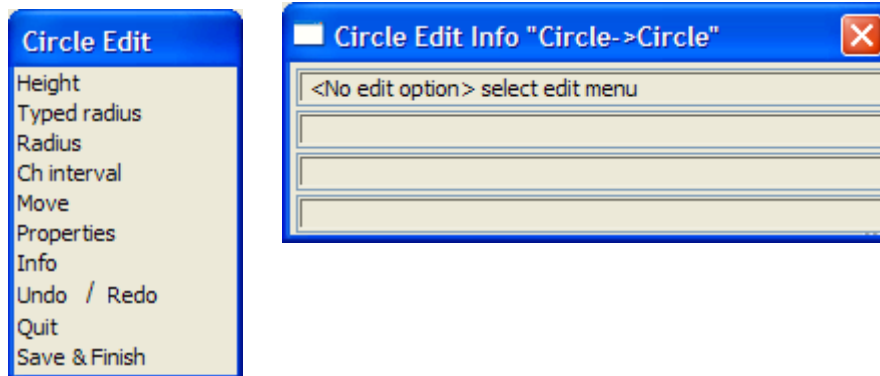

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

for the string being edited, OK sets the string with the values in the panel fields and removes the panel. Apply sets the string with the values in the panel fields and leaves the panel on the screen.

Circle Edit

[circle_edit](#) [circle_edit_info](#)

On picking a circle string, the **circle edit** menu and **circle edit info** panel are placed on the screen.

Each option in the circle edit menu will now be described.

See the earlier section “Editor - Common Information” for general information about editing strings.

Height

The **height** option is used to define the z-value for the entire circle.

After selecting the **height** option, an enter value typed-input box is placed on the screen with the circles current height displayed in it.

The enter value typed-input box looks like:

The new height for the circle is entered into the typed-input box, terminated with <enter>.

The typed-input box then disappears.

The **height** option is automatically terminated and a new option needs to be selected from the circle edit menu.

Typed Radius

The **typed radius** option is used to modify the radius of the selected circle.

After the **typed radius** option is chosen, an enter value typed-input box is placed on the screen with the circles current radius displayed in it.

The enter value typed-input box looks like:

The circle radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the circle and the circle redrawn with its new radius.

The typed-input box then disappears.

The **typed radius** option is automatically terminated and a new option needs to be selected from

the circle edit menu.

Radius

The radius option is used to change the radius of the circle by leaving the centre point alone and re-positioning a point on the circle. The new position for the point will define a new radius for the circle.

Radius is a two step process.

Step (a) - selecting the point on the circle to move

After selecting the radius option, the point on the circle to be moved is selected.

```
message area 1 <Radius>
Screen message area
    <Select point to move> [picks][][menu]
    <Select point to move> [picks][accepts][menu]
```

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

```
message area 1 <Radius>
Screen message area
    <Select final position of point> [picks][][menu]
    <Select final position of point> [picks][accepts][menu]
```

The radius option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the circle edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the radius option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the radius option still current.

Chainage Interval

The ch interval option is used to modify the chainage interval of the selected circle.

After the ch interval option is chosen, an **enter value** typed-input box is placed on the screen with the circles current chainage interval displayed in it.

The enter value typed-input box looks like:

The new chainage interval is entered into the typed-input box, terminated with <enter>. The entered value is taken as the chainage interval of the circle.

The typed-input box then disappears.

The ch interval option is automatically terminated and a new option needs to be selected from the circle edit menu.

Move

The move option is used to change the position of the entire circle by selecting and moving the circle centre or any point on the circle.

Move is a two step process.

Step (a) - selecting the point on the circle to move

After selecting the move option, the point on the circle to move is selected.

```
message area <Move>
Screen message area
    <Select point to move> [picks][ ][menu]
    <Select point to move> [picks][accepts][menu]
```

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

```
message area 1 <Move>
Screen message area
    <Select final position of point> [picks][ ][menu]
    <Select final position of point> [picks][accepts][menu]
```

The move option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the circle edit menu.

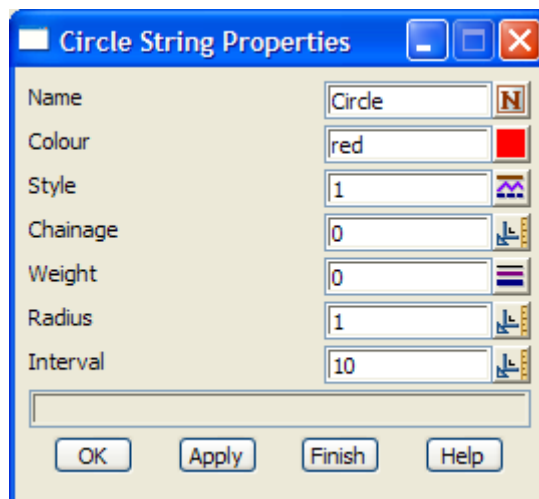

If, after bringing up the pick ops menu, it is decided to continue with the move option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the move option still current.

Note - the centre point of the circle can be selected and moved with the move option.

Properties

circle_string_properties

Selecting **Properties** brings up the **Circle String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **create circle string** panel and the circle editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
Set	button		

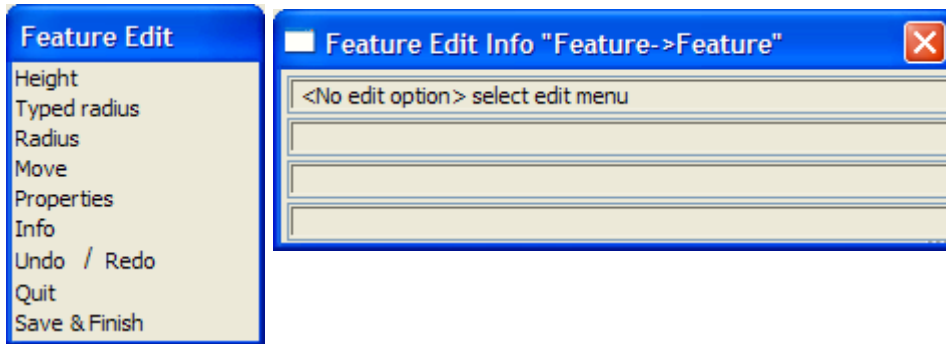

*for the circle being edited, set all the items in the **circle string Properties** panel to the values given in*

the panel.

Feature Edit

[feature_edit](#) [feature_edit_info](#)

On picking a feature string, the **feature edit** menu and panel are placed on the screen.

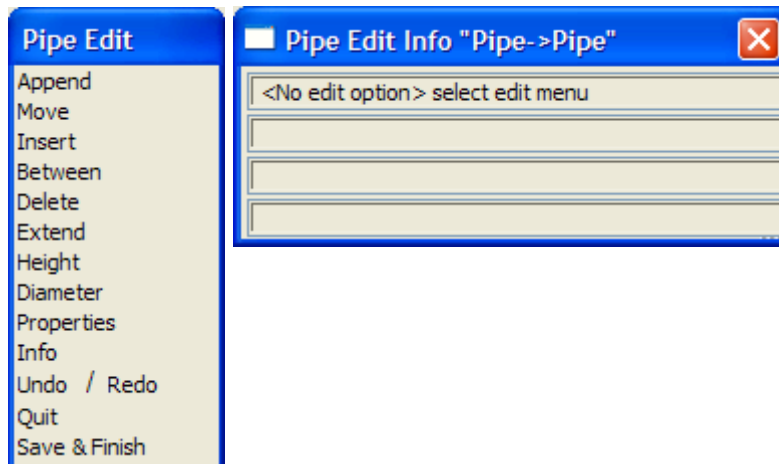

Each option in the feature edit menu is identical to those from the circle edit menu and will not be described again. See the section "Circle Edit"

See the earlier section "Editor - Common Information" for general information about editing strings.

Pipe Edit

[pipe_edit](#) [pipe_edit_info](#) [pipe_pipe_](#)

On picking a pipe string, the **pipe edit** menu and panel are placed on the screen.

The only difference between a 3d and a pipe string is that the pipe string has a diameter.

Hence most of the options in the pipe edit menu are similar to the 3d edit options of the same name, and only the diameter and Properties options need to be discussed. See the section "3d Edit" for information on the 3d string editor.

See the earlier section "Editor - Common Information" for general information about editing strings.

Diameter

The diameter option is used to modify the diameter of the pipe string.

After the diameter option is chosen, an enter value typed-input box is displayed on the screen with the string's current diameter.

The enter value typed-input box looks like:

The diameter is entered into the typed-input box, terminated with <enter>. The entered value is taken as the diameter of the pipe string. The typed-input box then disappears.

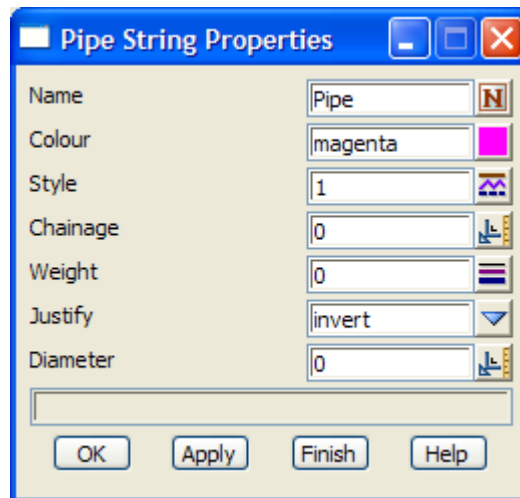

The diameter option automatically terminates and a new option is selected from the pipe edit menu.

Note - the pipe string has only one diameter for the entire string.

Properties

pipe_string_properties

Selecting **Properties** brings up the **Pipe String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **create pipe string** panel and the 3d string editor options. The only new field is

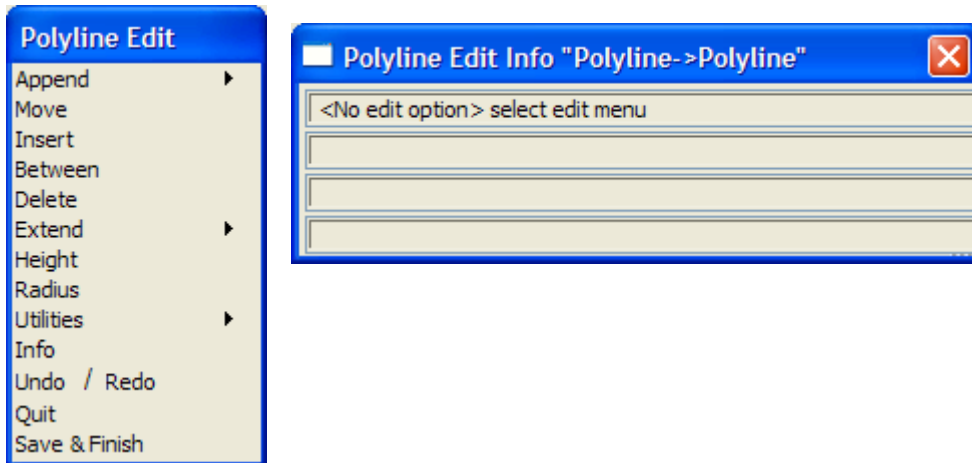

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.*

Polyline Edit

polyline_edit polyline_edit_info

On picking a polyline string, the **polyline edit** menu and **polyline edit info** panel are placed on the screen.

The major difference between a polyline and a 3d string is that a polyline string can have an arc instead of a line joining adjacent string points. Hence most of the options in the **polyline edit** menu are similar to the 3d edit options of the same name, and only the differences for each option will be discussed. See the section “3d Edit” for information on the 3d string editor.

See the earlier section “Editor - Common Information” for general information about editing strings.

Append

polyline_append The **append** operation for a polyline string is similar to the 3d string case except that an arc radius can be given for each new line segment.

Since in many cases an arc radius is not required at every segment of a polyline string, there is an **append** option that asks for the radius at every point and another that does not ask.

The **append walk-right** is

If the **append + radius** option selected, then before each point is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next polyline string point and the arc will be drawn correctly as the cursor is moved to the next point.

A **radius** value of **0** is taken to mean no arc.

The height question for each point is toggled on/off in the snaps menu just as it was for a 3d string.

The **append** option is terminated on selecting **cancel** from the pick ops menu or by selecting a new option from the polyline edit menu

Extend

polyline_extend

There are two extend options for a polyline string - **extend=>extend** that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, **extend=>extend ht** where the z-value of the point being extended is linearly interpolated by the extension distance.

The **extend** walk-right is

Extend

extend=>extend that is identical to the 3d string case where the z-value of the point being extended is kept constant.

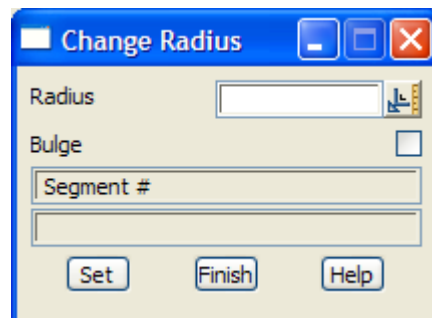

Extend by ht

extend=>extend ht not only moves the point but also linearly interpolates the z-value of the point being extended.

Radius

change_radius

Selecting **radius** brings up the **change radius** panel which is used to modify the radius of any arc/line joining adjacent polyline points.

After selecting the radius option, the user selects the arc/straight to be modified and the current arc radius and bulge setting will be displayed in the **change radius** panel.

New values can then be entered and the arc modified by selecting the **set** button.

If the radius is positive, the arc is drawn from the start point to the next point on the polyline in a clockwise direction. If the radius is negative, the arc is drawn from the start point to the next point on the polyline in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned on, the larger arc is used. The default is bulge turned off.

Utilities

polyline_utilities

The **utilities** walk-right menu contains a number of useful miscellaneous options for the polyline string. The menu is

Each of the new options will now be discussed.

Ins 3 Pt Curve

The **Ins 3 Pt Curve** option is used to insert a curve through three adjacent polyline points.

After selecting the option, the middle IP of the three adjacent polyline points is selected.

When the IP is accepted, the radius required to fit a curve through the IP and the two adjacent IP's is calculated, and this radius is then applied to the segments joining the adjacent IP's.

Del 3 Pt Curve

The **del 3 pt curve** option is used to delete the curves on either side of a polyline point.

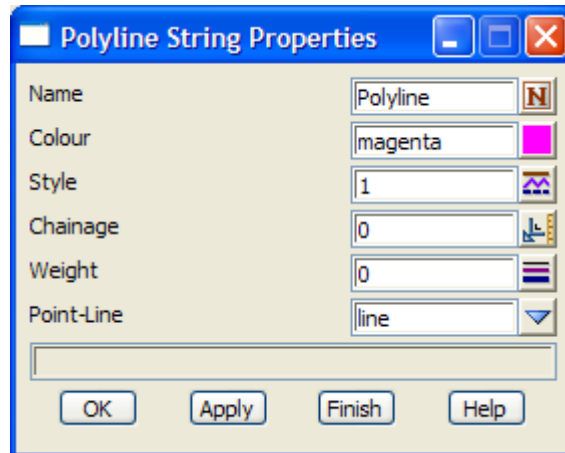

After selecting the option, an IP is selected and when the IP is accepted, the radii of the segments on either side are set to zero.

Hence the curves on either side of the IP are effectively removed.

Properties

polyline_string_properties

Selecting **Properties** brings up the **Polyline String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **create polyline string** panel and the polyline string editor options. The only new field is

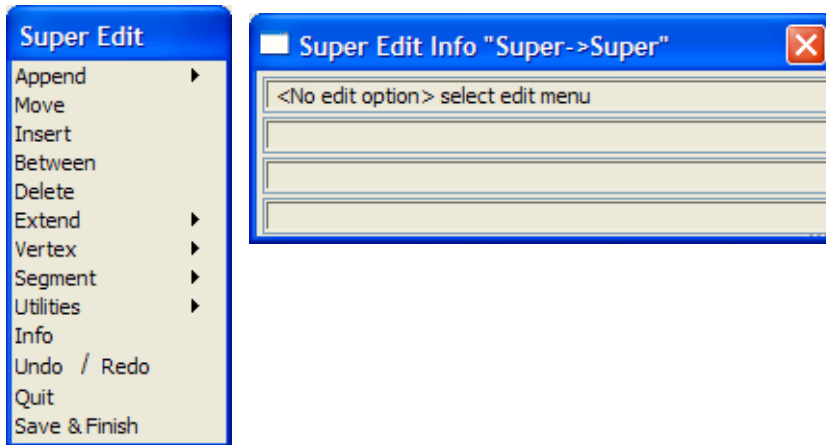

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.*

Super Edit

super_edit super_edit_info

On picking a super string, the **Super Edit** menu and **Super Edit Info** panel are placed on the screen.

The super string is similar to a polyline string in that it can have an arc instead of a line joining adjacent string points. Hence most of the options in the super edit menu are similar to the polyline edit options of the same name, and only the differences for each option will be discussed.

See the earlier section “Editor - Common Information” for general information about editing strings.

super_append

Append

The Append operation for a super is the same as the polyline case and an arc radius can be given for each new line segment.

Since in many cases an arc radius is not required at every segment of a super string, there is an append option that asks for the radius at every point and another that does not ask.

The append walk-right is

If the **Append + Radius** option selected, then before each vertex is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next super string vertex and the arc will be drawn correctly as the cursor is moved to the next vertex.

A **radius** value of **0** is taken to mean **no arc**.

The height question for each vertex is toggled on/off in the snaps menu just as it was for a polyline string.

The Append option is terminated on selecting Cancel from the Pick Ops menu or by selecting a new option from the Super Edit menu

[polyline_extend](#)

Extend

There are two extend options for a polyline string - Extend=>Extend that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, Extend=>Extend Ht where the z-value of the point being extended is linearly interpolated by the extension distance.

The Extend walk-right is

Extend

Extend=>Extend that is identical to the 3d string case where the z-value of the point being extended is kept constant.

Extend by Ht

Extend=>Extend Ht not only moves the point but also linearly interpolates the z-value of the point being extended.

Please continue to the next section "Vertex" .

[super_vertex](#)

Vertex

The Vertex menu contains options to modify information at any vertex of the super string.

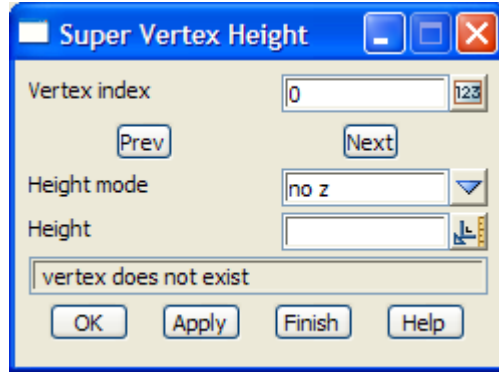

The Vertex walk-right is

Height

[super_vertex_height](#)

Selecting Vertex=>Height brings up the **Super Vertex Height** panel which is used to set the height value for vertices.

As soon as Height is chosen, a *<Select vertex> [Picks][Menu]* message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number*, *height mode* and *height* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

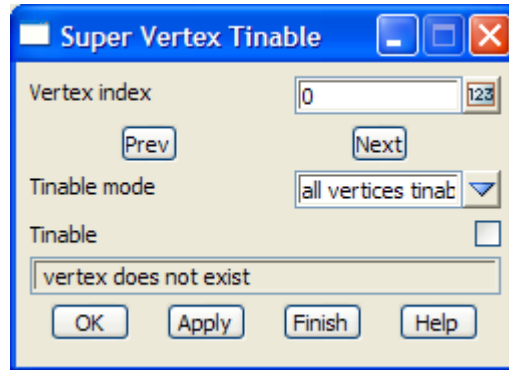

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Height mode vertex	input		no z, entire string, each
<i>if no z, there is no z value for the vertex.</i>			
<i>if entire string, then the string has the same z value for each vertex.</i>			
<i>if each vertex, then each vertex has a separate z value.</i>			
Height	input	height of vertex/string	
<i>the height used for the vertex or for the entire string.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Tinable

super_vertex_tinable

Selecting Vertex=>Tinable brings up the **Super Vertex Tinable** panel which is used to set the tinable flag for vertices.

As soon as Tenable is chosen, a `<Select vertex> [Picks][][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and *tinable flag* are displayed in the panel. The tinable flag can be changed and either **OK** or **Apply** selected to change the tinable flag of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

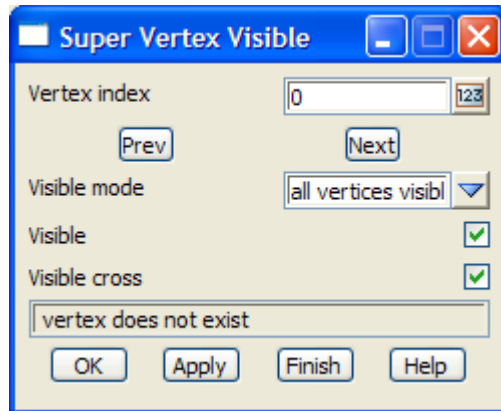

The fields and buttons used in the **Super Vertex Tenable** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Tenable	tick		
<i>if tick, the vertex is included in tins. if not tick, then the vertex is ignored when triangulating.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Visible

`super_vertex_visible`

Selecting Vertex=>Visible brings up the **Super Vertex Visible** panel which is used to set the visibility flag for vertices.

As soon as Visible is chosen, a `<Select vertex> [Picks][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and *visibility flag* are displayed in the panel. The visibility flag can be changed and either **OK** or **Apply** selected to change the visibility flag of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

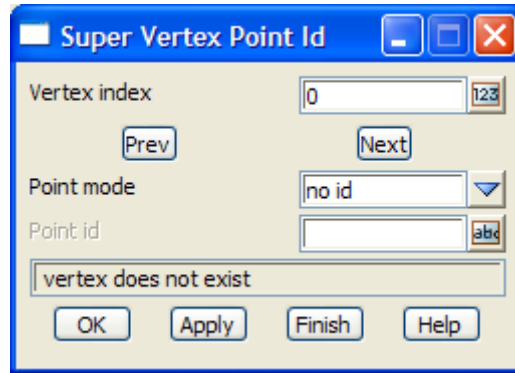

The fields and buttons used in the **Super Vertex Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Visible	tick		
<i>if tick, the vertex is visible.</i>			
<i>if not tick, then the vertex is invisible.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Point no

`super_vertex_point_id`

Selecting Vertex=>Point no brings up the **Super Vertex Point Number** panel which is used to set the point numbers for vertices.

As soon as Point no is chosen, a `<Select vertex> [Picks][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and *point number* are displayed in the panel. The point number can be changed and either **OK** or **Apply** selected to change the point number of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

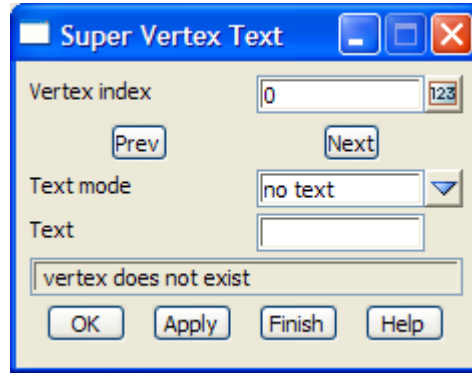

The fields and buttons used in the **Super Vertex Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Point no.	input	point no of vertex	
<i>the point number used for the vertex.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Text

super_vertex_text

Selecting Vertex=>Text brings up the **Super Vertex Text** panel which is used to set the text for vertices.

As soon as Text is chosen, a `<Select vertex> [Picks][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number*, *text mode* and *text* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

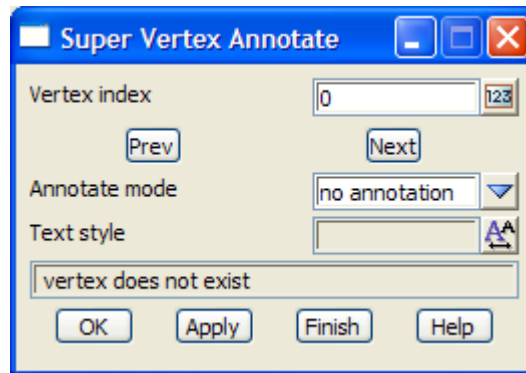

The fields and buttons used in the **Super Vertex Text** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Text mode	input		no text, entire string, each vertex
<i>if no text, there is no text for the vertex.</i>			
<i>if entire string, then the string has the same text for each vertex.</i>			
<i>if each vertex, then each vertex has a separate text value.</i>			
Text	input	text of vertex/string	
<i>the text used for the vertex or for the entire string.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Text Info

super_vertex_annotate

Selecting Vertex=>Text info brings up the **Super Vertex Annotate** panel which is used to set the annotation styles for the text at vertices.

As soon as Text info is chosen, a `<Select vertex> [Picks][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number*, *annotate mode* and *annotation information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Annotate** panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Vertex no.		input	selected vertex	
	<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev		button		
	<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next		button		
	<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Annotate mode		input		no annotation, entire string, each vertex
	<i>if no annotation, then the text at the vertex is not displayed.</i>			
	<i>if entire string, then the same annotation settings are used for each vertex.</i>			
	<i>if each vertex, then each vertex has separate annotations settings.</i>			
Text style		input	1	available text styles
	<i>text style for the text at the vertex.</i>			
Text units		input	pixels	pixels, world
	<i>units for the height of the text.</i>			
Height (u)		input		
	<i>height of the text (in text units).</i>			
X factor		input	1	
	<i>x factor of the text.</i>			
Offset (u)		input	0	
	<i>distance (in text units) to offset the text from its (x,y) placement position.</i>			
Raise (u)		input	0	
	<i>distance (in text units) to raise the text above the line for its (x,y) placement position.</i>			

Justify input bottom-left bot-left/cent/right, mid-left/cent/right top-left/cent/right

text justification (about the offset position).

Angle input

angle of the text.

Slant input 0

slant, in degrees, of the text.

Colour input available colours

colour of the text.

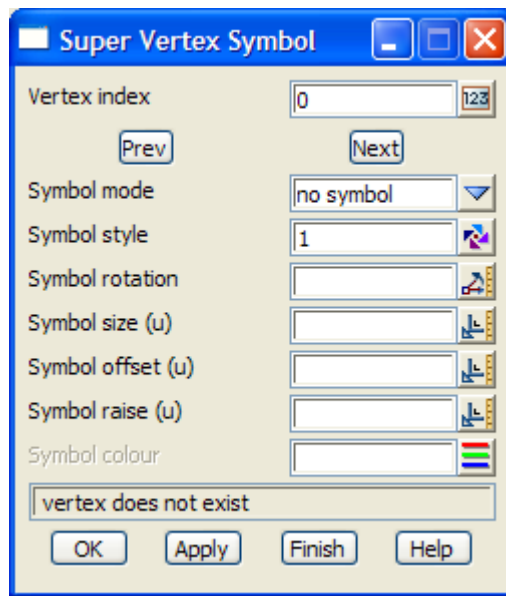

OK/Apply button

for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.

Symbol Info

super_vertex_symbol

Selecting Vertex=>Symbol info brings up the **Super Vertex Symbol** panel which is used to set symbols and their display parameters at vertices.

As soon as Symbol info is chosen, a <Select vertex> [Picks][][Menu] message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number*, *symbol mode* and *symbol information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values for the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Symbol** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	

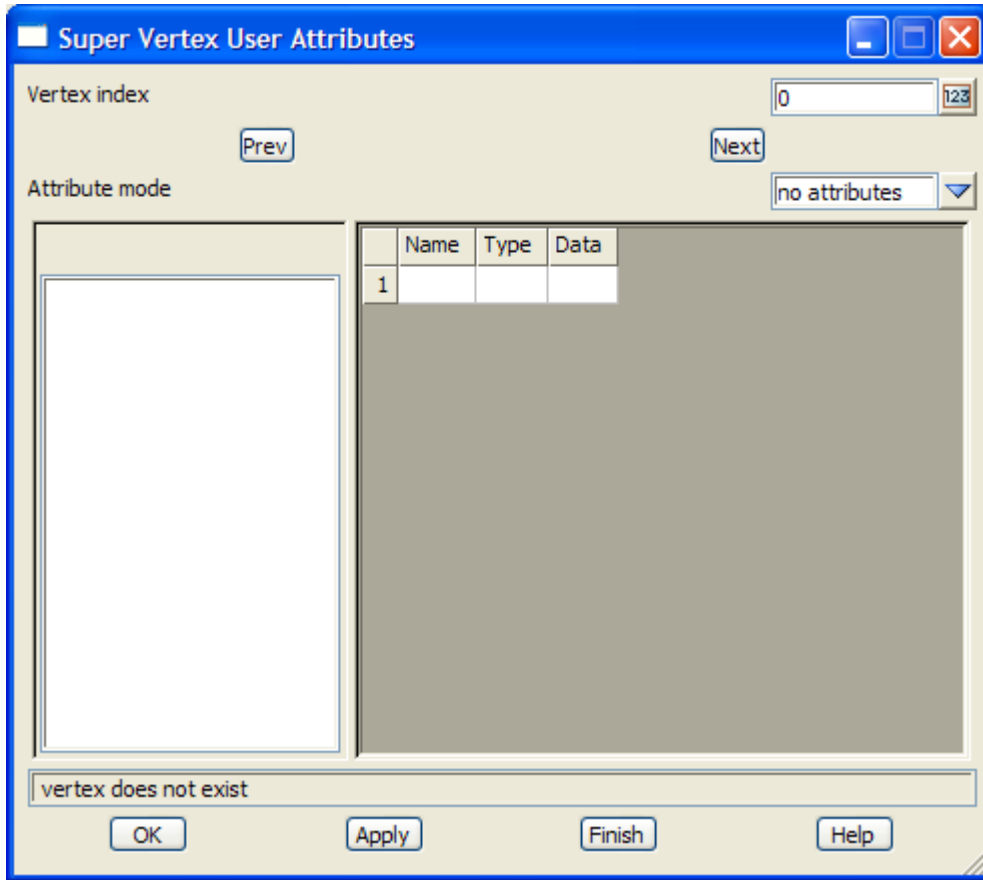

*if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if **OK** or **Apply** is selected.*

Prev	button		
	<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>		
Next	button		
	<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>		
Symbol mode	input		no symbol, entire string, each vertex
	<i>if no symbol, then there is no symbol at the vertex.</i>		
	<i>if entire string, then the same symbol and settings are used for each vertex.</i>		
	<i>if each vertex, then each vertex has separate symbols and settings.</i>		
Symbol style	input	1	available line styles
	<i>line style for the symbol at the vertex.</i>		
Symbol rotation	input		
	<i>rotation angle of the symbol.</i>		
Symbol size (u)	input		
	<i>size of the symbol (in xxx units).</i>		
Symbol offset (u)	input	0	
	<i>distance (in xxx units) to offset the symbol from its (x,y) placement position.</i>		
Symbol raise (u)	input	0	
	<i>distance (in xxx units) to raise the symbol above the line for its (x,y) placement position.</i>		
Symbol colour	input		available colours
	<i>colour of the symbol if none is defined in the symbol definition</i>		
OK/Apply	button		
	<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>		

Attributes

[super_vertex_user_attributes](#)

Selecting Vertex=>Attributes brings up the **Super Vertex User Attributes** panel which is used to display and edit user defined attributes at vertices of the super string.

The **Prev** and **Next** buttons are used to cycle through and display the attributes for each vertex in the super string in the *Name/Type/Data* grid.

The data in the *Name/Type/Data* grid can be deleted, modified or added to and then updated for the vertex using the **OK** or **Apply** button.

The fields and buttons used in the **Super Vertex User Attributes** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	

*when the option starts, the user attributes for the first vertex is displayed. The **Next** and **Prev** buttons will move onto other vertices. Also a number can be typed into the field and any information in the panel will then be applied to that vertex if **OK** or **Apply** is selected. Typing <Enter> after entering a number will go to that vertex number and display the attributes.*

Prev button

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Attribute mode choice box no attributes, each vertex

*if **no attributes**, then no vertices have user attributes.
if **each vertex**, then each vertex can have user attributes.*

Name/Type/Data Grid

Name	input	
	<i>name for the user attribute. This must be unique for all attributes at this vertex.</i>	
Type	choice box	integer, real, text
	<i>type of the attribute.</i>	
Data	input	
	<i>value for the attribute.</i>	

OK/Apply button

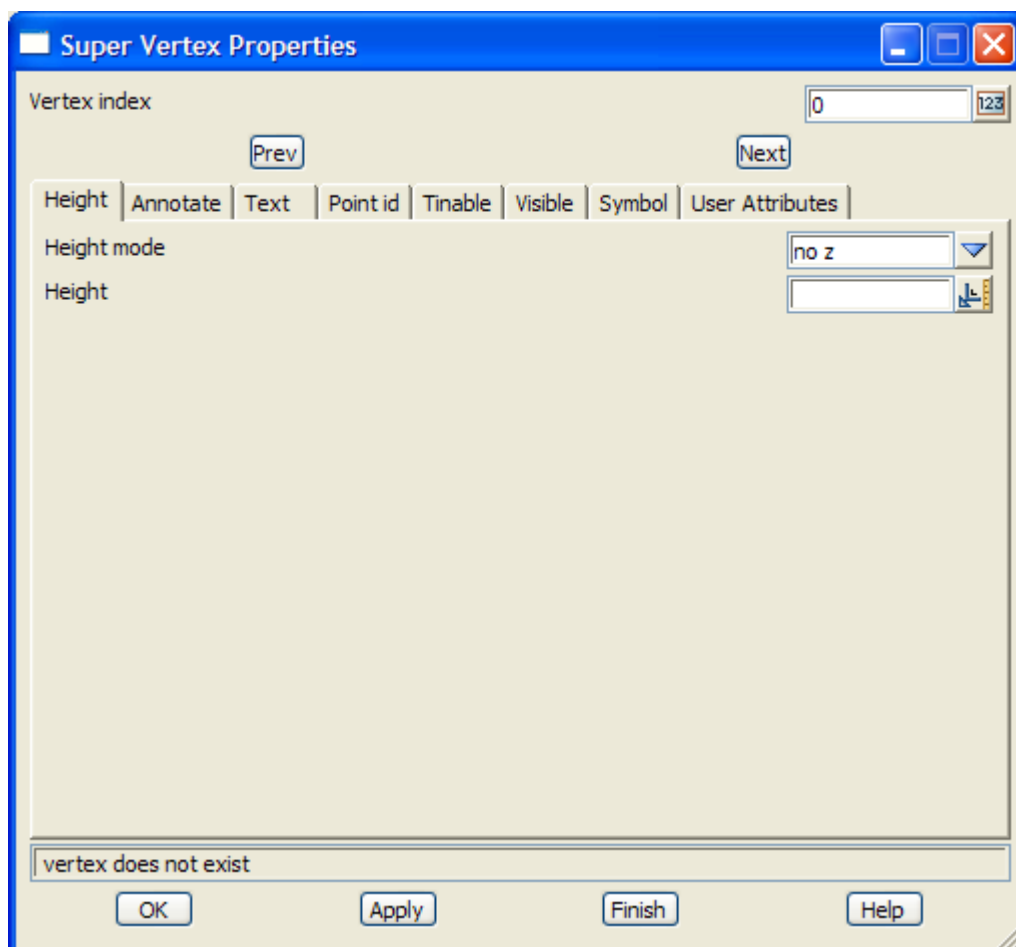

for the vertex being edited, **OK** sets the vertex with the values in the panel fields and removes the panel. **Apply** sets the vertex with the values in the panel fields and leaves the panel on the screen.

Vertex - All above**super_vertex_properties**

Selecting Vertex=>All above brings up the **Super Vertex Properties** panel which is used to display all the properties for a vertex.

This option is also available from the *Strings* menu

Position of option on menu: Strings =>Properties =>Vertex (all)

As soon as All above is chosen, a `<Select vertex> [Picks][Menu]` message is written to the **Status**

Bar and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and all other *information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values for the vertex.

The fields in the **Super Vertex Properties** panel have already been described in the other Vertex options and so will not be described again.

Please continue to the next section “Segment” .

Segment

super_segment

The **Segment** menu contains options to modify information at any segment of the super string.

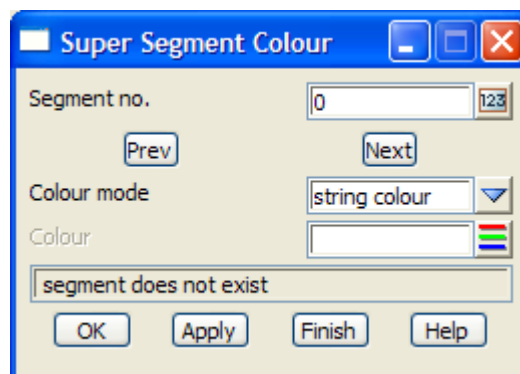

The **Segment** walk-right is

Colour

super_segment_colour

Selecting **Segment=>Colour** brings up the **Super Segment Colour** panel which is used to set the colour of the string segments.

As soon as **Colour** is chosen, a *<Select segment> [Picks][Menu]* message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number*, *colour mode* and *colour* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments. The appropriate segment highlights when the **Prev** and **Next** buttons are used.

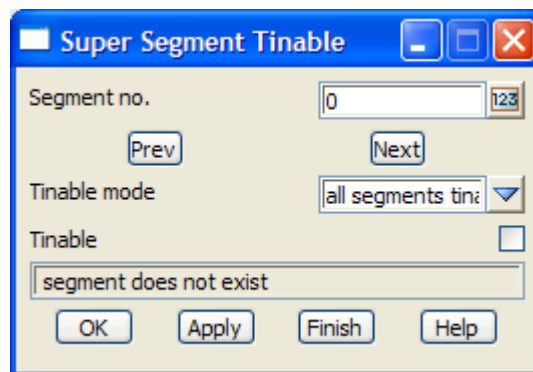

The fields and buttons used in the **Super Segment Colour** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no. <i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>	input	selected vertex	
Prev <i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>	button		
Next <i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>	button		
Colour mode <i>if no z, there is no z value for the vertex. if string colour, then all the segments in the string have the same colour. if each segment, then each segment has a separate colour.</i>	input		string colour, each segment
Colour <i>the colour used for the segment or for the entire string.</i>	input	colour of segment/string	available colours
OK/Apply <i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>	button		

Tinable

super_segment_tinable

Selecting Segment=>Tinable brings up the **Super Segment Tinable** panel which is used to set the tinable flag for segments.

As soon as Tinable is chosen, a `<Select segment> [Picks][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the segment to modify is selected, its *segment number* and *tinable flag* are displayed in the panel. The tinable flag can be changed and either **OK** or **Apply** selected to change the tinable flag of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

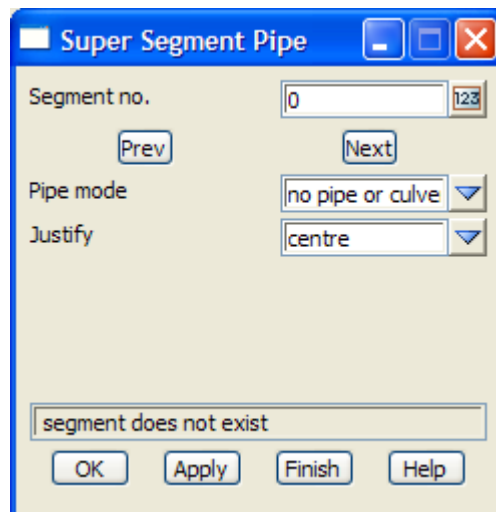

The fields and buttons used in the **Super Segment Tinable** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no. <i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>	input	selected segment	
Prev <i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>	button		
Next <i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>	button		
Tinable <i>if tick, the triangulation process tries to preserve the segment as a side of a triangle in the tin.</i>	tick		
OK/Apply <i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>	button		

Diameter

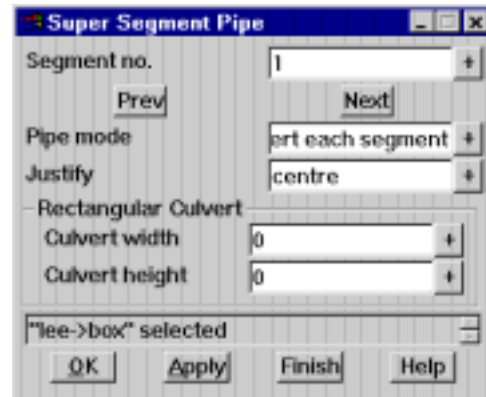

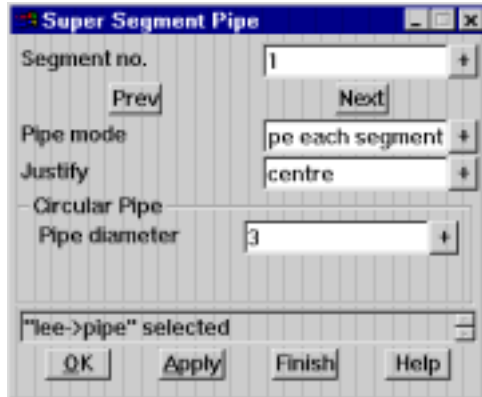

super_segment_pipe

The segments of a super string can have either a pipe or box cross section, or none. Selecting Segment=>Diameter brings up the **Super Segment Pipe** panel which is used to set the pipe mode and size for the string segments.

As soon as Diameter is chosen, a *<Select segment> [Picks][Menu]* message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number*, *pipe mode* and *information* are written to the appropriate panel fields and the **Super Segment Pipe** panel will change depending on whether it was a pip or box cross-section for the string.

After any panel fields are modified, selecting either **OK** or **Apply** will change the pipe information for the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments. The appropriate segment highlights when the **Prev** and **Next** buttons are used.

The fields and buttons used in the **Super Segment Pipe** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	
<i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>			
Pipe mode	input		no pipe or box pipe entire string pipe each segment box entire string box each segment
<i>if no pipe or box, there is no z value for the vertex. if string colour, then all the segments in the string have the same colour. if each segment, then each segment has a separate colour.</i>			
Justify	input		invert, centre, overt
<i>justification of the pipe/box with respect to the co-ordinates given for the vertices of the super string. rotation angle of the symbol.</i>			
Pipe diameter	input		
<i>diameter of the pipe in world units.</i>			
Box width	input		
<i>width of the box section in world units.</i>			
Box height	input		
<i>height of the box section in world units.</i>			
OK/Apply	button		
<i>for the segment being edited, OK sets the segment/string with the values in the panel fields and</i>			

removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.

Radius

super_segment_radius

When viewed in plan, the segments of a super string can be joined by string lines or arcs. If the radius is positive, the arc is drawn from the start vertex to the end vertex of the segment in a clockwise direction. If the radius is negative, the arc is drawn from the start vertex to the end vertex on the segment in a counter-clockwise direction.

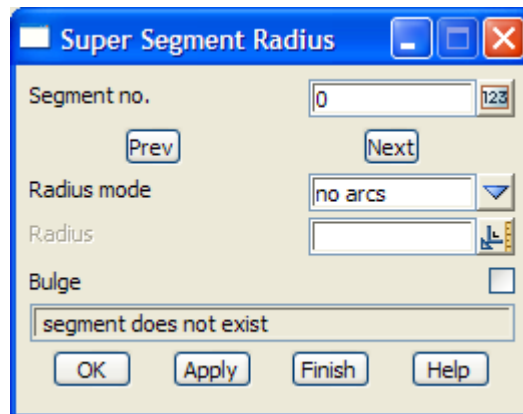

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned *on*, the larger arc is used. The default is bulge turned off.

A zero radius is interpreted to be a just a straight line segment with no arc.

Selecting Segment=>Radius brings up the **Super Segment Radius** panel which is used to set the plan radius of the segment.

As soon as Radius is chosen, a *<Select segment> [Picks][Menu]* message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number*, *radius* and *bulge* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments. The appropriate segment highlights when the **Prev** and **Next** buttons are used.

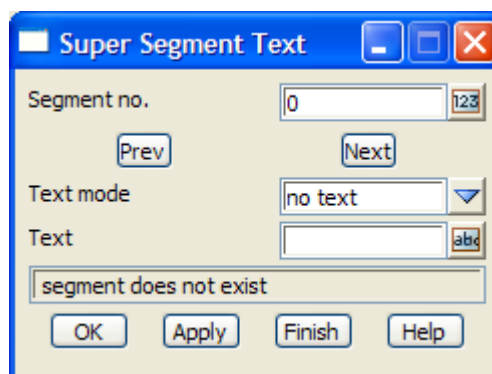

The fields and buttons used in the **Super Segment Radius** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no. <i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>	input	selected vertex	
Prev <i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>	button		
Next <i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>	button		
Colour mode <i>if no z, there is no z value for the vertex. if string colour, then all the segments in the string have the same colour. if each segment, then each segment has a separate colour.</i>	input		string colour, each segment
Radius <i>if tick, the larger arc is used. if not-tick, the smaller arc is used.</i>	tick		
Bulge <i>radius of the segment arc. A radius of 0 mean no arc.</i>	input	0	
OK/Apply <i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>	button		

Text

super_segment_text

Selecting Segment=>Text brings up the **Super Segment Text** panel which is used to set the text for segments.

As soon as Text is chosen, a `<Select segment> [Picks][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the segment to modify is selected, its *segment number*, *text mode* and *text* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

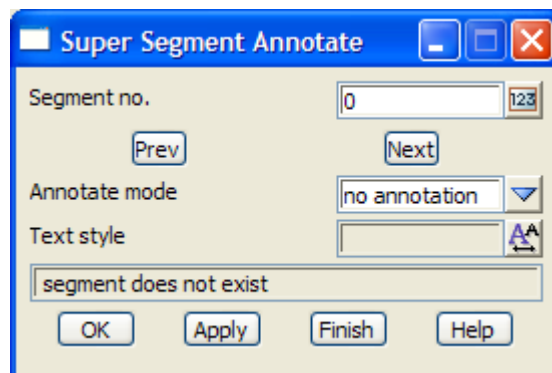

The fields and buttons used in the **Super Segment Text** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no. <i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>	input	selected vertex	
Prev <i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>	button		
Next <i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>	button		
Text mode <i>if no text, there is no text for the segment. if entire string, then the string has the same text for each segment. if each vertex, then each segment has a separate text value.</i>	input		no text, entire string, each segment
Text <i>the text used for the segment or for the entire string.</i>	input	text of segment/string	
OK/Apply <i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>	button		

Text Info

super_segment_annotate

Selecting Segment=>Text info brings up the **Super Segment Annotate** panel which is used to set the annotation styles for the text at segments.

As soon as Text info is chosen, a <Select segment> [Picks][Menu] message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number*, *annotate mode* and *annotation information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

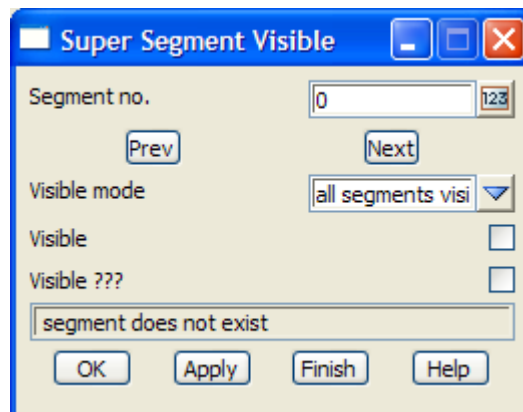

The fields and buttons used in the **Super Segment Annotate** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no. <i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>	input	selected vertex	
Prev <i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>	button		
Next <i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>	button		
Annotate mode <i>if no annotation, then the text at the segment is not displayed. if entire string, then the same annotation settings are used for each segment. if each vertex, then each segment has separate annotations settings.</i>	input		no annotation, entire string, each segment
Textstyle info <i>textstyle information.</i>	input		
OK/Apply <i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>	button		

Visible

super_segment_visible

Selecting Segment=>Visible brings up the **Super Segment Visible** panel which is used to set the visibility flag for segments.

As soon as Visible is chosen, a <Select segment> [Picks][Menu] message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number* and *visibility flag* are displayed in the panel. The visibility flag can be changed and either **OK** or **Apply** selected to change the visibility flag of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

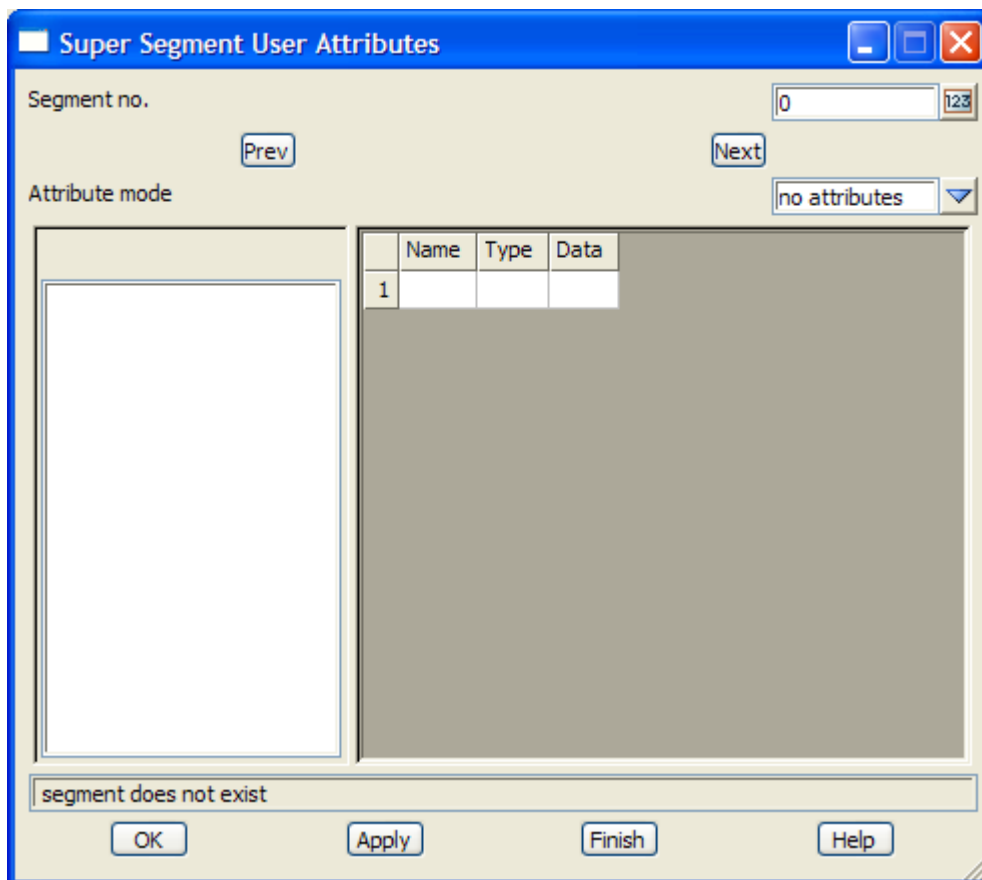

The fields and buttons used in the **Super Segment Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no. <i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>	input	selected vertex	
Prev <i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>	button		
Next <i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>	button		
Visible <i>if tick, the segment is visible. if not tick, then the segment is invisible.</i>	tick		
OK/Apply <i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>	button		

Attributes

super_segment_user_attributes

Selecting Segment=>Attributes brings up the **Super Segment User Attributes** panel which is used to display and edit user defined attributes at segments of the super string.

The **Prev** and **Next** buttons are used to cycle through and display the attributes for each segment

in the super string in the *Name/Type/Data* grid.

The data in the *Name/Type/Data* grid can be deleted, modified or added to and then updated for the segment using the **OK** or **Apply** button.

The fields and buttons used in the **Super Segment User Attributes** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Segment no.

*when the option starts, the user attributes for the first segment is displayed. The **Next** and **Prev** buttons will move onto other segments. Also a number can be typed into the field and any information in the panel will then be applied to that segment if **OK** or **Apply** is selected. Typing <Enter> after entering a number will go to that segment number and display the attributes.*

Prev button

move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Attribute mode choice box no attributes, each segment

*if **no attributes**, then no segments have user attributes.
if **each segment**, then each segment can have user attributes.*

Name/Type/Data Grid

Name input

name for the user attribute. This must be unique for all attributes at this segment.

Type choice box integer, real, text

type of the attribute.

Data input

value for the attribute.

OK/Apply button

*for the segment being edited, **OK** sets the segment with the values in the panel fields and removes the panel. **Apply** sets the segment with the values in the panel fields and leaves the panel on the screen.*

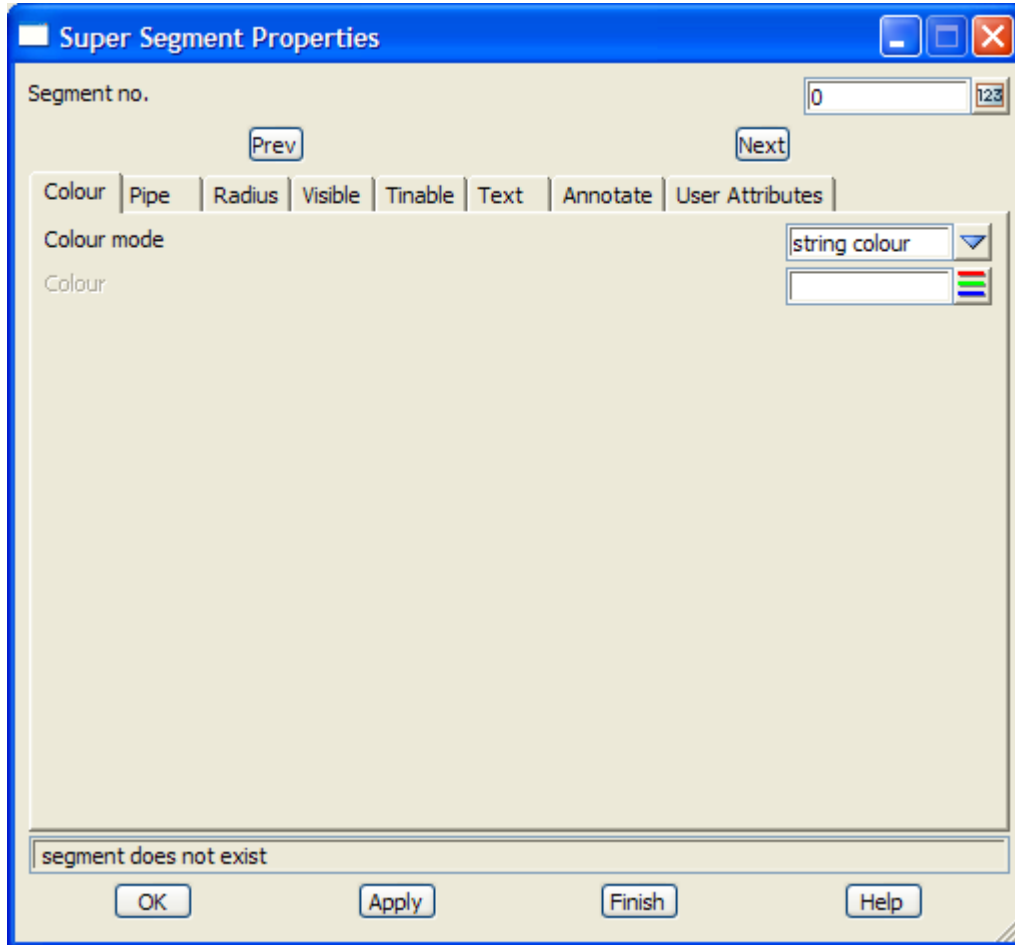

Segment - All above

[super_segment_properties](#)

Selecting Segment=>All above brings up the **Super Segment Properties** panel which is used to display all the properties of a segment.

This option is also available from the *Strings* menu

Position of option on menu: Strings =>Properties =>Segment (all)

As soon as **All above** is chosen, a `<Select segment> [Picks][Menu]` message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number* and all other *information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values for the segment.

The fields in the **Super Segment Properties** panel have already been described in the other Segment options and so will not be described again.

Please continue to the next section “Utilities” for information on Utilities, Open, Close and Properties.

Utilities

super_utilities

The **Utilities** walk-right menu contains a number of useful miscellaneous option for the super string. The menu is

Each of the new options will now be discussed.

Ins 3 Pt Curve

The **Ins 3 Pt Curve** option is used to insert a curve through three adjacent super string vertices.

After selecting the option, the middle vertex of the three adjacent super string vertices is selected.

When the vertex is accepted, the radius required to fit a curve through the vertex and the two adjacent vertices is calculated, and this radius is then applied to the segments joining the adjacent vertices.

Del 3 Pt Curve

The **del 3 pt curve** option is used to delete the curves on either side of a super string vertex.

After selecting the option, a vertex is selected and when the vertex is accepted, the radii of the segments on either side are set to zero.

Hence the curves on either side of the vertex are effectively removed.

Open

If the string is closed, selecting the **open** option removes the segment between the 1st and last vertex of the super string.

If the string is not closed, the **open** option does nothing.

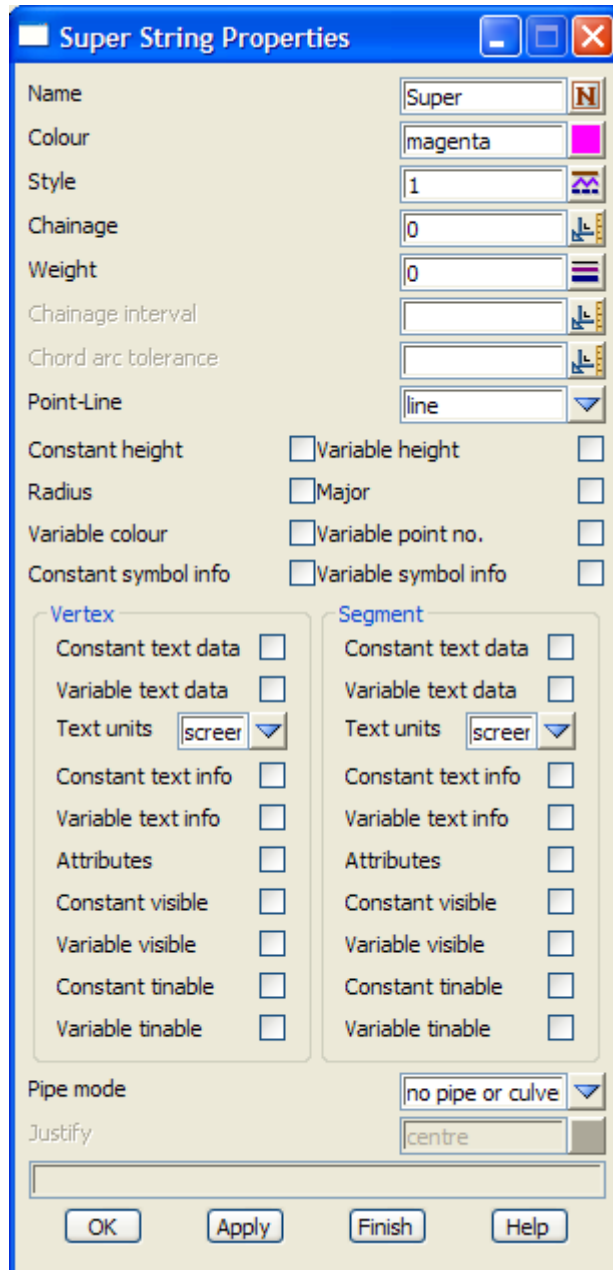

Close

Selecting the **close** option adds a segment between the 1st and the last vertices of the super string. Note that unlike other strings, no extra vertices are added.

Properties

super_string_properties

Selecting **Properties** brings up the **Super String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **Create Super String** panel and the Super String Editor options. The only new field is

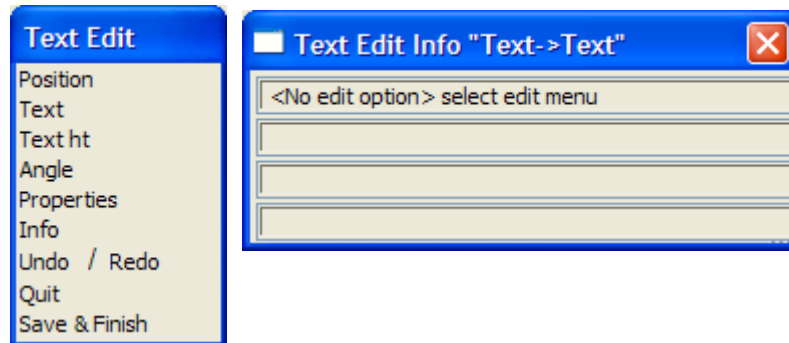

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.*

Text Edit

[text_edit](#) [text_edit_info](#)

On picking a text string, the **text edit** menu and the panel are placed on the screen.

Each option in the text edit menu will now be described.

See the earlier section “Editor - Common Information” for general information about editing strings.

Position

The **position** option is used to place the text string for the first time and to re-position (move) an existing text string.

Position is a one step process.

After selecting the **position** option, the new position for the text is selected. The text is then redrawn at the new position.

```
message area 1 <Position>
Screen message area
    <Select point position> [picks][ ][menu]
    <Select point position> [picks][accepts][menu]
```

The **position** option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the text edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the position option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the position option still current.

Typed input can be used at any stage

Text

The **text** option is used to modify the text of the text string.

After the **text** option is chosen, an enter text typed-input box is placed on the screen with the string's current text displayed in it.

The enter text typed-input box looks like:

The text is entered into the typed-input box, terminated with <enter>. The entered value is taken as the text of the text string and the string redrawn with the new text. The typed-input box then disappears.

The text option automatically terminates and a new option needs to be selected from the text edit menu.

Text ht

The text ht option is used to modify the height of the text in the text string.

After the text ht option is chosen, an **enter value** typed-input box is placed on the screen with the string's current text height displayed in it.

The enter value typed-input box looks like:

The text height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the text in the text string and the string redrawn with the new height.

The typed-input box then disappears.

The height option is automatically terminated and a new option needs to be selected from the text edit menu.

Angle

The angle option is used to modify the angle that the text in the text string is drawn at.

The text angle is measured in a counter-clockwise direction with respect to the horizontal axis.

After the angle option is chosen, an **enter angle** typed-input box is placed on the screen with the string's current text angle displayed in it.

The enter angle typed-input box looks like:

The text angle is entered into the typed-input box, terminated with <enter>. The entered value is taken as the angle of the text in the text string and the string redrawn with the new angle.

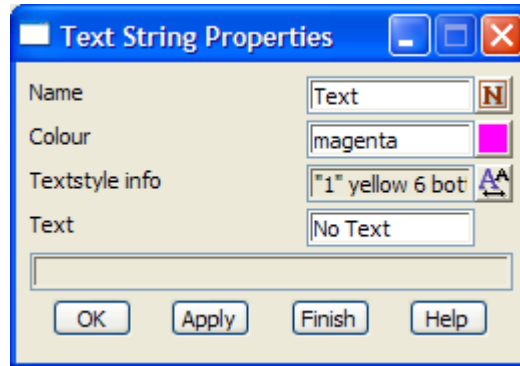

The typed-input box then disappears.

The angle option is automatically terminated and a new option needs to be selected from the text edit menu.

Properties

text_string_properties

Selecting **Properties** brings up the **Text String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **create text string** panel and the text string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.*

Points Edit

points_edit

Position of menu: Strings =>Points Edit

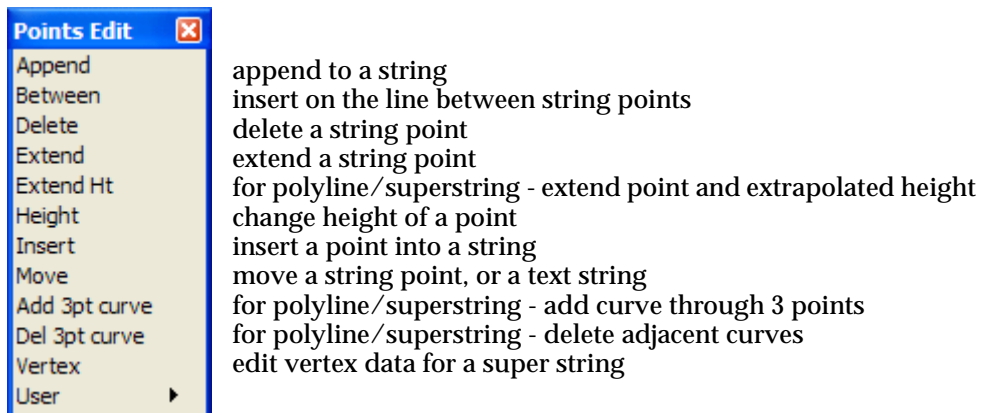

The points operations available in the points edit menu are similar to the create/edit options.

However, in the points edit options, the user does not begin by picking the particular string to be edited. Instead, the required option is selected followed by the point to be modified from any string.

The option can then be applied to another point on that or any other string, or another point operation chosen, and applied to any point.

If the user wants to make a large number of point edits to the one string, the editor option discussed in the last section is the easiest option to use. However, if a number of strings are going to be edited with the same operation or a selection of operations, then the points edit option is more suitable.

After selecting the points edit option, the points edit menu is displayed.

Each of the options performs the same work as the option of the same name in the Edit string option.

The individual options in the Points Edit menu will now be discussed in detail.

For the option *Append*, go to the section "Append Point"

<i>Between</i>	"Between Point"
<i>Delete</i>	"Delete Point"
<i>Extend</i>	"Extend Point"
<i>Extend Ht</i>	"Extend Height"
<i>Height</i>	"Height"
<i>Insert</i>	"Insert Point"
<i>Move</i>	"Move Point"
<i>Add 3pt curve</i>	"Add 3 Point Curve"
<i>Del 3pt curve</i>	"Delete 3 Point Curve"
<i>Vertex</i>	"Edit Vertex"

Append Point

append_point

Position of option on menu: Strings =>Points Edit => Append

The append option adds additional points to the end of a string. On selecting the append option, an **append point** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the **append** option, the particular end of the string to append points to is selected using the standard LB and MB pick and accept sequence.

The points to be appended are then selected. The option keeps adding points to the selected string until the pick ops menu is brought up using RB and **cancel** is selected.

After the *append* has been completed, the option repeats. That is, the user is asked to select another string to append to. This continues until **finish** or **[X]** is selected from the **append point** panel.

Between Point

between_point

Position of option on menu: Strings =>Points Edit => Between

On selecting the between option, a **between point** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the **between** option, the particular segment to insert a point on is selected using the standard LB and MB pick and accept sequence. The position of the point to insert is then selected and accepted.

After the *between* has been completed, the option repeats. That is, the user is asked to select another segment to insert a point on. This continues until **finish** or **[X]** is selected from the **between point** panel.

Delete Point

delete_point

Position of option on menu: Strings =>Points Edit => Delete

On selecting the delete option, a **delete point** message panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the delete option, the particular point to delete is selected using the standard LB and MB pick and accept sequence. When the point is accepted, it is deleted.

After the *delete* has been completed, the option repeats. That is, the user is asked to select another point to delete (the point can be on any string). This continues until **finish** or **[X]** is selected from the **delete point** panel.

Extend Point

extend_point

Position of option on menu: Strings =>Points Edit => Extend

On selecting the extend option, a **extend point** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the *extend* option, the particular point on a segment to extend is selected by picking the segment near to the point using the standard LB and MB pick and accept sequence. The position of the point is then moved along the segment until the final position is selected and accepted.

After the *extend* has been completed, the option repeats. That is, the user is asked to select another segment to extend a point on. This continues until **finish** or **[X]** is selected from the **extend point** panel.

Extend Height

extend_point_by_ht

Position of option on menu: Strings =>Points Edit => Extend Ht

The *extend point by height* option is similar to the *extend* option except that the z-value of the moved point is modified by linearly interpolating the z-value from the original points at the end of the selected segment. On selecting the *extend by ht* option, an **extend point by ht** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the *extend point by ht* option, the particular point on a segment to extend is selected by picking the segment near to the point using the standard LB and MB pick and accept sequence. The position of the point is then moved along the segment until the final position is selected and accepted. The z-value of the moved point is the linear interpolation of the selected segment.

After the *extend point by ht* has been completed, the option repeats. That is, the user is asked to select another segment to extend a point on. This continues until **finish** or **[X]** is selected from the **extend point by ht** panel.

Height

point_height

Position of option on menu: Strings =>Points Edit => Height

On selecting the height option, a **point height** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the *height* option, the particular point to modify the height for is selected using the standard LB and MB pick and accept sequence. When the point is accepted, the height existing height is displayed in a **height** box which can be modified and accepted by typing <enter>.

After the *height* has been completed, the option repeats. That is, the user is asked to select another point to modify the height for (the point can be on any string). This continues until **finish** or **[X]** is selected from the **point height** panel.

Insert Point

insert_point

Position of option on menu: Strings =>Points Edit => Insert

On selecting the insert option, an **insert point** message panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the *insert* option, the particular segment to identify the two points to insert the point is selected using the standard LB and MB pick and accept sequence. The position of the point to insert is then selected and accepted.

After the *insert* has been completed, the option repeats. That is, the user is asked to select another segment to insert a point on. This continues until **finish** or **[X]** is selected from the **insert point** panel.

Move Point

move_point

Position of option on menu: Strings =>Points Edit => Move

On selecting the move option, a **move point** panel is displayed.

The message area of this panel informs the user of any error messages. There are similar panels

for each of the other points edit options.

Once in the move option, the particular point to move is selected using the standard LB and MB pick and accept sequence. The position that the point is to be moved to is then selected and accepted.

After the move has been completed, the option repeats. That is, the user is asked to select another point to move (the point can be on any string). This continues until **finish** or **[X]** is selected from the **move point** panel.

Add 3 Point Curve

insert_3pt_curve

Position of option on menu: Strings =>Points Edit => Add 3pt Curve

On selecting the add 3pt curve option, a **insert 3pt curve** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the add 3pt curve option, the middle point of the three points of the super string to fit a curve for, is selected using the standard LB and MB pick and accept sequence. When the point is accepted, the curve is fitted between it and the left and right adjacent points of the super string.

After the *add 3pt curve* has been completed, the option repeats. That is, the user is asked to select another point to add a curve to (the point can be on any super string). This continues until **finish** or **[X]** is selected from the **insert 3pt curve** panel.

Delete 3 Point Curve

delete_3pt_curve

Position of option on menu: Strings =>Points Edit => Del 3pt Curve

On selecting the del 3pt curve option, a **delete 3pt curve** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the delete 3pt curve option, a vertex from a super string is selected using the standard LB and MB pick and accept sequence and if there is curves on both sides of the vertex, the radii are removed and the vertices are joined by straight line segments.

After the *delete 3pt curve* has been completed, the option repeats. That is, the user is asked to select another point on a super string to remove the curves on either side (the point can be on any super string). This continues until **finish** or **[X]** is selected from the **delete 3pt curve** panel.

Edit Vertex

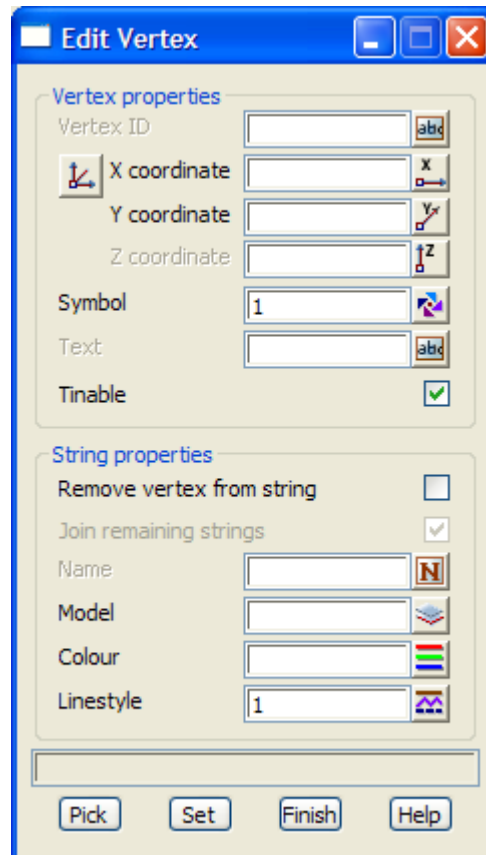

edit_vertex

Position of option on menu: Strings =>Points Edit => Vertex

The Edit Vertex option allows the quick editing of the co-ordinates, vertex id, symbol, vertex text and tinability of a selected string vertex.

The name, model, colour and linestyle, which are string properties, can also be modified however the user has the choice of modifying the string properties for the entire string, or have the option remove the selected vertex from the string and only give the string properties to the newly created one vertex string. If a vertex is removed from the string, the adjacent vertices of the removed vertex can be joined.

On selecting the Vertex option, a **Edit Vertex** panel is displayed.

The Edit Vertex option is already running and a super string vertex is selected.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex properties			
Vertex id	input		
<i>the vertex id (point number) for the selected vertex. Change this to the required value.</i>			
X coordinate			Measure X panel
<i>the x coordinate (easting) of the selected vertex. Change this to the required value.</i>			
Y coordinate			Measure Y panel
<i>the y coordinate (northing) of the selected vertex. Change this to the required value.</i>			
Z coordinate			Measure Z panel
<i>the y coordinate (elevation) of the selected vertex. Change this to the required value.</i>			

Symbol symbol box available symbols
the symbol on the selected vertex. Change this to the required symbol.

Text input
the text on the selected vertex. Change this to the required text.

Tinable tick box
ticked if the selected vertex is tinable. Change if required.

String/New vertex properties

Remove vertex from string tick box
tick if the selected vertex is to be removed from its current string.

Join remaining points tick box
*only settable if **Remove vertex from string** is ticked.
If tick then the vertices on either side of the removed vertex are joined.
If not ticked then the original string will be broken into two strings when the vertex is removed.*

Name input
the name of the string containing the selected vertex. Change this to the required name.

Model model box available models
the model of the string containing the selected vertex. Change this to the required model.

Colour colour box available colours
the colour of the string containing the selected vertex. Change this to the required colour.

Linestyle linestyle box
the linestyle of the string containing the selected vertex. Change this to the required linestyle.

Pick button
chose Pick and then select the vertex to be edited.

Set button
apply the values in the panel to the selected vertex. Pick is still active so that another vertex can be selected.

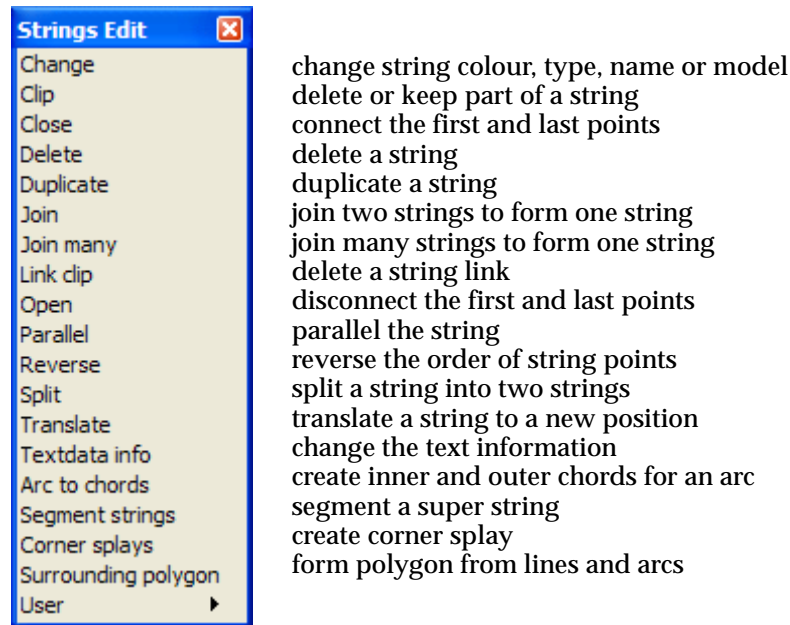

Strings Edit

strings_edit

Position of menu: Strings =>Strings Edit

The strings edit option contains operations to be applied, not to individual points of a string, but to entire strings.

After selecting the strings edit option, the strings edit menu is displayed.

The individual options in the strings edit menu will now be discussed in detail.

For the option *Change*, go to the section “Change”

<i>Clip</i>	“Clip”
<i>Close</i>	“Close”
<i>Delete</i>	“Delete”
<i>Duplicate</i>	“Duplicate”
<i>Join</i>	“Join”
<i>Join many</i>	“Join Many”
<i>Link clip</i>	“Link Clip”
<i>Open</i>	“Open”
<i>Parallel</i>	“Parallel”
<i>Reverse</i>	“Reverse”
<i>Split</i>	“Split”
<i>Translate</i>	“Translate”
<i>Textdata info</i>	“Textdata Info”
<i>Arc to chords</i>	“Arc to Chords”
<i>Segment strings</i>	“Segment Strings”
<i>Corner splays</i>	“Corner Splays”
<i>Surrounding polygon</i>	“Surrounding Polygon”

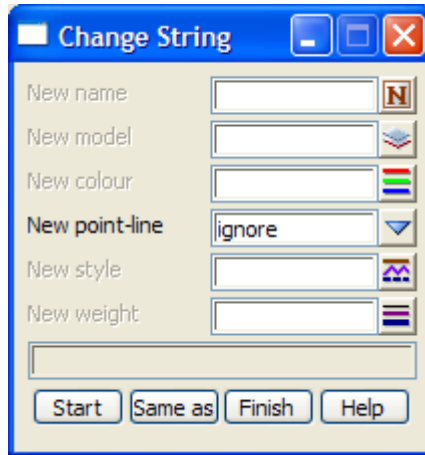

Change

change_string

Position of option on menu: Strings =>Strings Edit =>Change

The change option can be used to change the mode, colour, style, name and point-line type of a string.

On selecting the change option, the **change string** panel is displayed.

The change option is already in progress and if a string is selected, the model, colour, style, name and point-line type are changed according to the fields in the **change string** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name <i>if non-blank, the name of the selected string will be changed to the name given in the new name field.</i>	input		
New model <i>if non-blank, the selected string will be moved to the model given in the new model field.</i>	input		available models
New colour <i>if non-blank, the colour of the selected string will be changed to the colour given in the new colour field.</i>	input		available colours
New point-line <i>if non-blank, the breakline type of the selected string will be changed to the type given in the new point-line field (point or line type).</i>	input		point, line
New style <i>if non-blank, the style of the selected string will be changed to the name given in the new style field.</i>	input		

Please continue to the next section "Clip" .

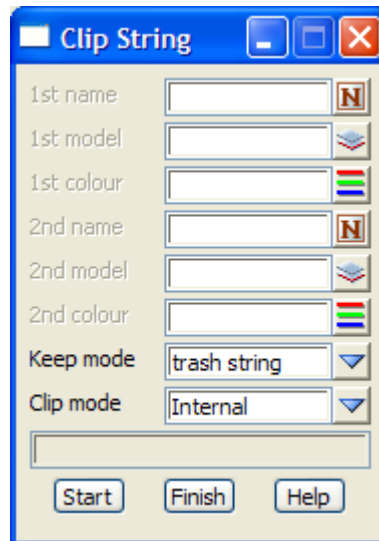

Clip

clip_string

Position of option on menu: Strings =>Strings Edit =>Clip

The clip option can be used to delete or keep part of a string.

On selecting the clip option, the **clip string** panel is displayed.

After selecting the clip option, the user is asked to select the string to be clipped. The user is then asked to select two points on the string to define the section to be clipped.

Depending on the clip mode, either

- a new string is created from the section of the string between the two points
- two new strings are created by deleting the section of the string between the two points
- one new string is created by deleting the section of the string between the two points and then joining the two selected points.

If the 1st name, 1st model and/or 1st colour panel fields are non-blank, the values are used for the 1st half of the clipped string. Otherwise the values of the original string are used for the 1st half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the clipped string. Otherwise the values of the original string are used for the second half of the string.

If the keep mode is set to
 keep string, the original string is kept
 trash string, the original string is moved to the trash model
 delete string, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
1st name <i>if blank, the first half of the clipped string is given the name of the original string. If non-blank, the first half of the clipped string is given the name in the 1st name field.</i>	input		
1st model <i>if blank, the first half of the clipped string is placed in the same model as the original selected string. If non-blank, the first half of the clipped string is placed in the model given in the 1st model field.</i>	input		available models
1st colour <i>if blank, the first half of the clipped string is given the colour of the original string. If non-blank, the first half of the clipped string is given the colour specified in the 1st colour field.</i>	input		available colours
2nd name <i>if blank, the second half of the clipped string is given the name of the original string. If non-blank, the second half of the clipped string is given the name in the 2nd name field.</i>	input		

2nd model	input		available models
	<i>if blank, the second half of the clipped string is placed in the same model as the original selected string. If non-blank, the second half of the clipped string is placed in the model given in the 2nd model field.</i>		
2nd colour	input		available colours
	<i>if blank, the second half of the clipped string is given the colour of the original string. If non-blank, the second half of the clipped string is given the colour specified in the 2nd colour field.</i>		
Keep mode	input	keep string	delete, keep, trash string
	<i>if delete string, the string selected to be clipped is deleted. keep string, the selected string is not deleted. trash string, the string selected to be clipped is moved to the trash model.</i>		
Clip mode	input	internal	internal, external, join external
	<i>if internal, a new string is created from the section of string between the two selected points. external, two new strings are created by deleting the section of the string between the two points. join external, one new string is created by deleting the section of the string between the two points and then joining the two selected points.</i>		

How to Use the Panel and Panel Messages

- (a) Enter the new model, colour and name for the first and second parts of the clipped string.
- (b) The string to be clipped is selected.
- (c) The points to be used as the clipped point are then selected.
- (d) The section of the string is then clipped between the selected points and depending on the clip mode, the selected string is then clipped or the clipped section kept.

Please continue to the next section “Close” .

Close

close_string

Position of option on menu: Strings =>Strings Edit =>Close

A closed string is simply a string whose 1st and last points are the same.

The close string option adds to the end of the string, a point that is identical to the 1st string point. This then forms a closed string.

On selecting the close option, the **close string** panel is displayed.

The close option is already in progress and if a string is selected, it is closed.

Please continue to the next section “Delete” .

Delete

delete_string

Position of option on menu: Strings =>Strings Edit =>Delete

Entire strings can be deleted from the model using the delete option.

On selecting the delete string option, the **delete string** panel is displayed.

The delete option is already in progress and if a string is selected (LB) and accepted (MB), it is deleted

If the trash mode in the **trash defaults** panel is set to trash string, the original string is not deleted but moved to the trash model.

Please continue to the next section “Duplicate” .

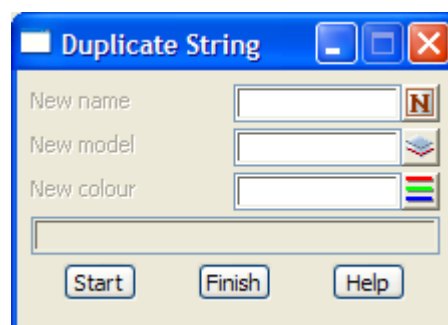

Duplicate

duplicate_string

Position of option on menu: Strings =>Strings Edit =>Duplicate

The duplicate option is used to make a copy of the string with the option of giving the duplicate string a new model, colour and/or name.

On selecting the duplicate option, the **duplicate string** panel is displayed.

The duplicate option is already in progress and if a string is selected, then a copy of the string will be created and possibly given a new model, colour or name depending on the fields in the **duplicate string** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		
New model	input		available models

if the new name field is blank, the duplicate string has the same name as the original string. If the new name field is non-blank, then the duplicate string is given the name in the new name field.

New model input available models

if new model is blank, the duplicate string is placed in the same model as the original string. If the new

model field is non-blank, then the duplicate string is placed in the model given in the new model field.

New colour input available colours

if the new colour field is blank, the duplicate string has the same colour as the original string. If the new colour field is non-blank, then the duplicate string is given the colour specified in the new colour field.

Please continue to the next section “Join” .

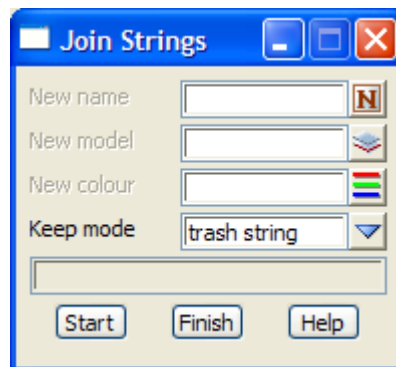

Join

join_strings

Position of option on menu: Strings =>Strings Edit =>Join

The join option is used to create a new string by joining two existing strings together.

On selecting the join option, the **join strings** panel is displayed.

After selecting the join option, the user is asked to select in turn the two strings that make up the joined string.

First, the string that will become the first half of the new joined string is selected with the direction that the string will have as the first half of the new string.

Next, the string that will become the second half of the new joined string is selected with the direction that the string will have as the second half of the new string.

The end of the first selected directed string and the beginning of the second selected directed string are joined to form the new joined string.

If the model, colour and/or name panel fields are non-blank, their values are used for the new joined string. Otherwise the values from the first selected string are used for the joined string.

If the keep mode is set to
 keep string, the original strings are kept
 trash string, the original strings are moved to the trash model
 delete string, the original strings are deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name <i>if the new name field is blank, the joined string is given the name of the first selected string. If the new name field is non-blank, the joined string is given the name in the new name field.</i>	input		
New model <i>if new model is blank, the joined string is placed in the same model as the first selected string. If the new model field is non-blank, the joined string is placed in the model given in the new model field.</i>	input		available models
New colour <i>if the new colour field is blank, the joined string is given the colour of the first selected string. If the new colour field is non-blank, then the joined string is given the colour specified in the new colour field.</i>	input		available colours
Keep mode <i>if delete string, the selected strings selected are deleted. keep string, the selected strings are not deleted. trash string, the strings selected to be joined are moved to the trash model.</i>	input	keep strings	delete string, keep strings

How to Use the Panel

- (a) Enter the new model, colour and name for the joined string.

- (b) The 1st string is selected by picking it with the required direction.
- (c) The string to be joined to the 1st selected string is selected by picking it with the required direction.
- (d) The last point of the 1st directed string and the 1st point of the second directed string are joined to create a new string with model, colour, name as specified in the **join strings** panel.

Please continue to the next section “Join Many” .

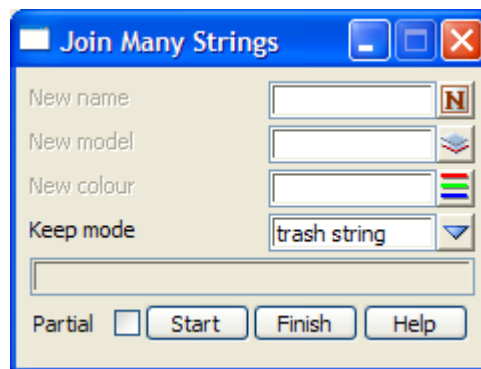

Join Many

join_many_strings

Position of option on menu: Strings =>Strings Edit =>Join many

The join many option is used to create a new string by joining two or more existing strings, or parts or strings, together.

On selecting the join many option, the **join many strings** panel is displayed.

After selecting the join many option, the user is asked to select in turn the strings that will make up the joined string. Using the partial mode, parts of strings can be joined.

First, the string that will become the first part of the new joined string is selected with the direction that the string will have as the first part of the new string.

If partial is **set (tick)**, two points are then picked on the string and only the part of the string between the picked points is used in the join.

Next, the strings that will become the subsequent parts of the new joined string are selected in order with the direction that the strings will have in the new joined string.

Again, whenever partial is **set (tick)**, two points are picked on the selected string and only the part of the string between the picked points is used in the join.

The end of each selected directed string (or partial string) is joined to the beginning of the subsequent selected directed string (or partial string) when forming the joined string.

If the name, model and/or colour panel fields are non-blank, their values are used for the new joined string. Otherwise the values from the first selected string are used for the joined string.

If the keep mode is set to
 keep string, the original strings are kept
 trash string, the original strings are moved to the trash model
 delete string, the original strings are deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		

if blank, the joined string is given the name of the first selected string.

If non-blank, the joined string is given the name in the new name field.

New model input available models

if blank, the joined string is placed in the same model as the first selected string.

If non-blank, the joined string is placed in the model given in the new model field.

New colour input available colours

if blank, the joined string is given the colour of the first selected string.

If non-blank, the joined string is given the colour specified in the new colour field.

Keep mode input keep strings delete strings, keep strings

if **delete string**, the selected strings are deleted.

if **keep string**, the selected strings are not deleted.

if **trash string**, the strings selected to be joined are moved to the trash model.

Partial tick

if **tick**, two points are then picked on the string and only the part of the string between the picked points is used in the join.

if **no tick**, no extra points are required and the entire string is used.

How to Use the Panel and Panel Messages

- Enter the new model, colour and name for the joined string.
- The first string to be joined is then selected by picking the required string with the required direction, plus two points to restrict the string if partial is set on.
- The second and subsequent strings to be joined are then selected (or partial string if partial is set on) in order and with the required direction.
- The last point of each directed string is connected to the first point of the subsequent directed string to create a new joined string. The model, colour and name as specified in the **join many strings** panel are used for the new string.

Please continue to the next section "Link Clip" .

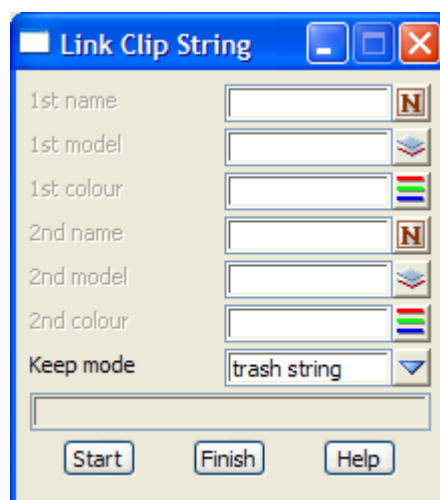

Link Clip

link_clip_string

Position of option on menu: Strings =>Strings Edit =>Link clip

The link clip option can be used to **delete** the link joining two adjacent vertices of a string.

On selecting the link clip option, the **link clip string** panel is displayed.

After selecting the link clip option, the user selects the link of the string to be clipped. On

acceptance, the selected link is deleted from the string, thus creating two new strings.

If the 1st name, 1st model and/or 1st colour panel fields are non-blank, the values are used for the first half of the link clipped string. Otherwise the values of the original string are used for the first half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the link clipped string. Otherwise the values of the original string are used for the second half of the string.

If the keep mode is set to
 keep string, the original string is kept
 trash string, the original string is moved to the trash model
 delete string, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
1st name	input		
<i>if blank, the first half of the clipped string is given the name of the original string.</i>			
<i>If non-blank, the first half of the clipped string is given the name in the 1st name field.</i>			
1st model	input		available models
<i>if blank, the first half of the clipped string is placed in the same model as the original selected string.</i>			
<i>If non-blank, the first half of the clipped string is placed in the model given in the 1st model field.</i>			
1st colour	input		available colours
<i>if blank, the first half of the clipped string is given the colour of the original string.</i>			
<i>If non-blank, the first half of the clipped string is given the colour specified in the 1st colour field.</i>			
2nd name	input		
<i>if blank, the second half of the clipped string is given the name of the original string.</i>			
<i>If non-blank, the second half of the clipped string is given the name in the 2nd name field.</i>			
2nd model	input		available models
<i>if blank, the second half of the clipped string is placed in the same model as the original selected string.</i>			
<i>If non-blank, the second half of the clipped string is placed in the model given in the 2nd model field.</i>			
2nd colour		input	available colours
<i>if blank, the second half of the clipped string is given the colour of the original string.</i>			
<i>If non-blank, the second half of the clipped string is given the colour specified in the 2nd colour field.</i>			
Keep mode	input	keep string	delete, keep, trash string
<i>if delete string, the string selected to be clipped is deleted.</i>			
<i>keep string, the selected string is not deleted.</i>			
<i>trash string, the string selected to be clipped is moved to the trash model.</i>			

Please continue to the next section “Open” .

Open

open_string

Position of option on menu: Strings =>Strings Edit =>Open

A closed string is opened by removing the last point of the string.

On selecting the **open** option, the **open string** panel is displayed.

The open option is already in progress and if a closed string is selected, it is opened.
Please continue to the next section “Parallel” .

Parallel

parallel_string

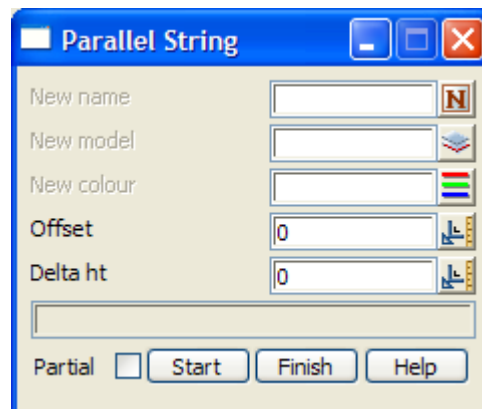

Position of option on menu: Strings =>Strings Edit =>Parallel

Strings, or parts of strings, can be translated perpendicularly to either the left or right using the parallel option. The z-values of the string can also be adjusted by a constant value.

The difference between a translate and a parallel is that for a straight translate, the translation vector is the same for the whole string. In a parallel, the translation is at right angles to each link of the string and hence the translation direction varies along the string.

For example, the edge of a road is a parallel of the centre-line, not a copy of the centre-line.

On selecting the parallel option, the **Parallel String** panel is displayed.

The user is then asked to select the string to parallel.

If partial is **not set**, the string is copied parallel through the distance given in the offset field.

If partial is **set (tick)**, two points are then picked on the string and only the part of the string between the picked points is copied parallel through the distance given in the offset field.

The value in the delta ht field is then added to the z-values of the string.

The direction imposed upon the string when selecting it is used to determine what is the left and right side of the string in the parallel operation.

A positive offset parallels the string to the right with respect to the direction of picking. A negative offset parallels to the left with respect to the direction of picking.

Hence, the fields and buttons used in the **parallel string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		

if blank, the paralleled string is given the name of the original string.

If non-blank, the parallel string is given the name in the new name field.

New model	input	available models
<i>if blank, the paralleled string is placed in the same model as the original selected string. If non-blank, the paralleled string is placed in the model given in the new model field.</i>		
New colour	input	available colours
<i>if blank, the paralleled string is given the colour of the original string. If non-blank, the paralleled string is given the colour specified in the new colour field.</i>		
Offset	input	
<i>distance (in world units) that the string will be copied parallel through. A positive distance denotes that the string will be paralleled to the right of the original string.</i>		
Delta ht	input	
<i>value to add to the z-values of the string.</i>		
Partial	tick	
<i>if tick, two points are then picked on the string and only the part of the string between the picked points is used in the parallel. if no tick, no extra points are required and the entire string is used.</i>		

How to Use the Panel

- Enter the new model, colour and name for the paralleled string.
- Enter the offset distance for the parallel - left and right is determined by picking direction.
- Enter the height to add to the string's z-values in the delta ht field.
- The selected string (or partial string if partial is set on) is then copied parallel as required.

Please continue to the next section "Reverse" .

Reverse

reverse_string

Position of option on menu: Strings =>Strings Edit =>Reverse

The reverse string option simply reverses the order of the points in a string.

On selecting the reverse option, the **reverse string** panel is displayed.

After selecting the reverse option, the user simply picks (LB) the string that is to have its point order reversed and on acceptance (MB) of the string, the reversing takes place.

Please continue to the next section "Split" .

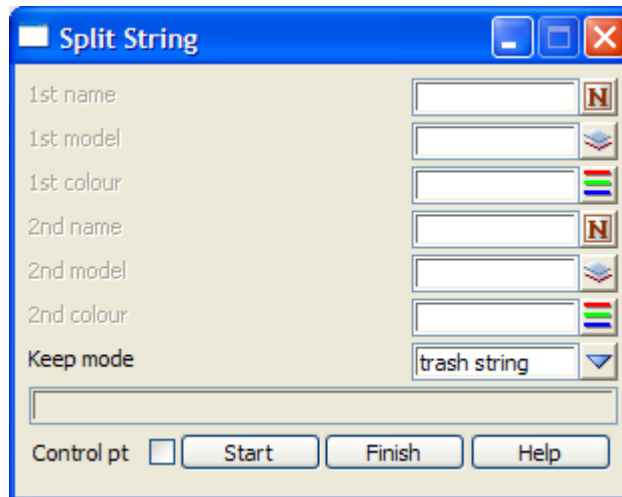

Split

split_string

Position of option on menu: Strings =>Strings Edit =>Split

The split option is used to create two new strings by splitting an existing string about a selected point on the string.

On selecting the split option, the **split string** panel is displayed.

If **control point** is set **off**, after selecting the split option, the user is asked to select the string and the selection point is **also** used as a split point. Hence the one point is used to select the string and as the split point.

If **control point** is set **on**, the user is asked to select the string to split and then pick the point that is dropped perpendicularly onto the selected string as the point on the string to be used as a split point. Hence the **string select** and the **split point** are selected separately.

Two strings are then created by splitting the chosen string about the split point.

If the 1st name, 1st model and/or 1st colour panel fields are non-blank, the values are used for the first half of the split string. Otherwise the values of the original string are used for the first half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the split string. Otherwise the values of the original string are used for the second half of the string.

If the keep mode is set to
 keep string, the original string is kept
 trash string, the original string is moved to the trash model
 delete string, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
1st name	input		
<i>if blank, the first half of the split string is given the name of the original string.</i>			
<i>If non-blank, the first half of the split string is given the name in the 1st name field.</i>			
1st model	input		available models
<i>if blank, the first half of the split string is placed in the same model as the original selected string.</i>			
<i>If non-blank, the first half of the split string is placed in the model given in the 1st model field.</i>			
1st colour	input		available colours
<i>if blank, the first half of the split string is given the colour of the original string.</i>			

If non-blank, then the first half of the split string is given the colour specified in the 1st colour field.

2nd name input

if blank, the second half of the split string is given the name of the original string.

If non-blank, the second half of the split string is given the name in the 2nd name field.

2nd model input available models

if blank, the second half of the split string is placed in the same model as the original selected string.

If non-blank, the second half of the split string is placed in the model given in the 2nd model field.

2nd colour input available colours

if blank, the second half of the split string is given the colour of the original string.

If non-blank, then the second half of the split string is given the colour specified in the 2nd colour field.

Keep mode input keep string delete, keep, trash string

*if **delete string**, the string selected to be split is deleted.*

***keep string**, the selected string is not deleted.*

***trash string**, the string selected to be split is moved to the trash model.*

Control pt tick

*If **tick**, the user is asked to select the string to split and then pick the point that is dropped perpendicularly onto the selected string as the point on the string to be used as a split point.*

*If **not tick**, the user is asked to select the string and the selection point is **also** used as a split point.*

How to Use the Panel and Panel Messages

- (a) Enter the new model, colour and name for the first and second parts of the split string.
- (b) If control is on, the string is selected and then the split point is selected.
If control is off, the string is selected and the same point is to be used as the split point.
- (c) The chosen string is then split about the split point and the two halves given models, colours and names as defined by the split string panel.

Please continue to the next section "Translate" .

Translate

translate_string

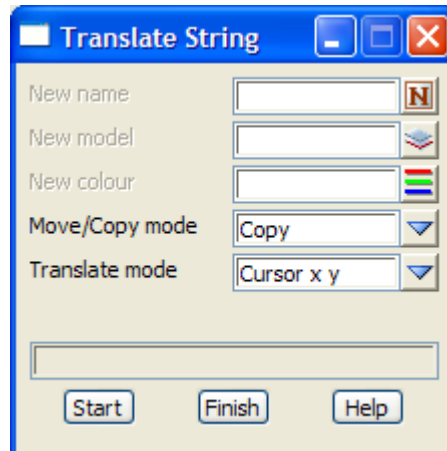

Position of option on menu: Strings =>Strings Edit =>Translate

Entire strings can be translated in the x,y and z directions using the translate option.

The translated string can either be moved or copied to its new translated position.

The difference between a copy or a move is simply that if a string is copied, a copy of the string is translated and the original string left untouched, whereas for a move, the actual string is moved from its original position to the new translated position.

On selecting the Translate option, the **Translate string** panel is displayed.

The selected string is translated by using the cursor to select a position on the string (the before point) and then selecting the position (not necessarily on a string) that the point will be translated to (after point).

Hence the translate operation requires two positions - a before and an after point - for the translation to be defined.

The first position (the before point) is selected using the normal select procedures. The second position (the after point) depends entirely on the translate mode.

If the translate mode is set to

cursor x y z or cursor x y

the cursor is used to not only select the string point but also to indicate where it is to be moved/copied to.

typed x y z

the second point has the absolute coordinates given in the x y z field.

typed dx dy dz

the second point is defined relative to the first point by the adding the dx dy dz given in the dx dy dz field.

Selected strings will be translated until the option is finished.

The fields and buttons used in the **translate** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name <i>if blank, the string is given the name of the original string.</i> <i>If non-blank, the string is given the name in the new name field.</i>	input		
New model <i>if blank, the string is placed in the same model as the original selected string.</i> <i>If non-blank, the string is placed in the model given in the New model field.</i>	input		available models
New colour <i>if blank, the string is given the colour of the original string.</i> <i>If non-blank, then the string is given the colour specified in the new colour field.</i>	input		available colours
Translate mode	input	cursor xy	cursor xy, cursor xyz,

typed xyz, typed dxdydz

see comments about translate mode in the general description of move/copy

x y z input

*if Translate mode is **Typed x y z** then this field appears and the position on the string where the string was selected is translated to this co-ordinate.*

dx dy dz input

*if Translate **mode** is **Typed dx dy dz** then this field appears and the selected string is translated by the given dx dy dz.*

Move/copy mode input move copy, move

*if the mode is set to **move**, the string is translated as defined in the panel fields and the original string is deleted. If the mode is **copy**, the original string is left alone.*

How to Use the Panel and Panel Messages

- (a) Enter the new model, colour and name for the translated string.
- (b) The string to be translated and its “before” point is chosen.
- (c) The “after” point is chosen according to the translate mode.
- (d) The selected string is then translated (moved or copied) as required.

Please continue to the next section “Textdata Info” .

Textdata Info

change_textstyle_info

Position of option on menu: Strings =>Strings Edit =>Textdata info

The Textdata info option is used to change the information about the text for a text string, super strings and text for 4d strings.

Selecting the option, the **Change Textstyle Info** panel:

The parameters for the textstyle information are set and then any selected string is given the new textstyle parameters. If any of the parameters are left blank, then that parameter is not modified for the selected string.

To define the Textstyle info parameters, click on the text button and then the **edit** button.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

New textstyle info	textstyle data		
---------------------------	----------------	--	--

textstyle information to use for the selected strings.

Change	button		
---------------	--------	--	--

selected strings will have their text modified by the parameters in the new textstyle info field.

Arc to Chords

arc_to_chords

Position of option on menu: Strings =>Strings Edit =>Arc to chords

The *Arc to Chord* option works on a super string and creates inside or outside chords for any arc segments in the super string.

The number of chords created can be defined by giving the number of chords required, a chord length to use for each chord, or an arc to chord tolerance.

On selecting the **Arc to chords** option, the **Arc to Chords** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick <i>select the super string to edit.</i>	button		
Previous <i>move to the previous segment of the super string.</i>	button		
Next <i>move to the next segment of the super string.</i>	button		
Convert mode <i>create the chords on the inside or the outside of the arc.</i>	choice box	inside	inside outside
Method <i>method for creating the chord.</i>	choice box	no. of chords	no. of chords chord length arc to chord tolerance
No. of Chords, Chord length, Arc to chord tolerance <i>value to use with the Method.</i>			
Process <i>create chords for the selected segment of the super string.</i>	button		

Segment Strings

segment_string

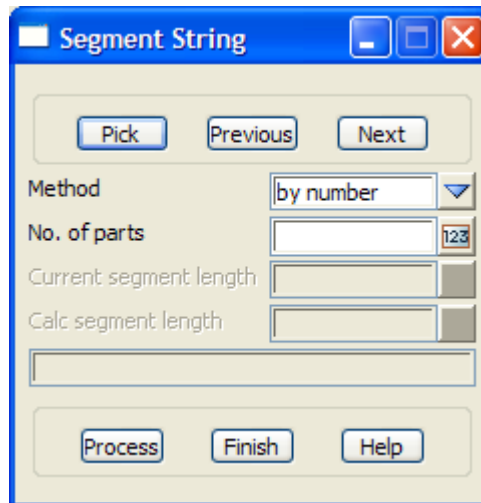

Position of option on menu: Strings =>Strings Edit =>Segment string

The *Segment string* option works on a super string and inserts extra points on an arc or line segment of the super string to break it into smaller arc or line segments.

The number of arcs/lines created can be controlled by specifying either

- the number of sub-segments required
- a single sub-segment length to break the start of the segment into that length
- a sub-segment length to break the segment into as many sub-segments of that length as possible.

On selecting the Segment strings option, the **Segment String** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		
<i>select the super string to edit.</i>			
Previous	button		
<i>move to the previous segment of the super string.</i>			
Next	button		
<i>move to the next segment of the super string.</i>			
Method	choice box	by number	by number one distance by distance
<i>method for creating the sub-segments.</i>			
<i>by number - the segment is broken into No of parts equal segments</i>			
<i>one distance - the segment is broken into two parts with the first part having the length Distance (which end will depend on the direction that the segment was selected).</i>			
<i>by distance - the segment is broken into as many sub-segments of length Distance as possible (which end the division starts at depends on the direction that the segment was selected).</i>			

No of parts, Distance

value to use with the Method.

Current segment length output only

length of the currently selected segment of the super string.

Calc segment length output only

calculated length of the segment that will be created.

Process button

create sub-segments for the selected segment of the super string.

Corner Splays

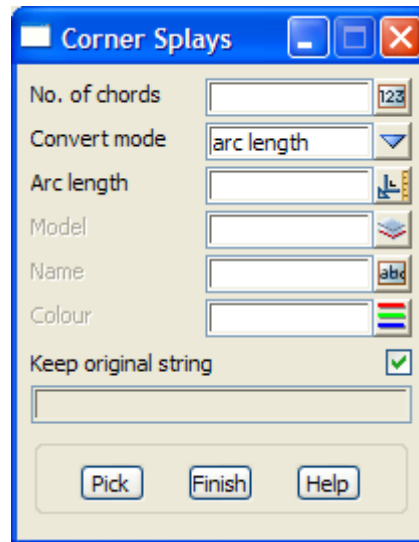

corner_splays

Position of option on menu: Strings =>Strings Edit =>Corner splays

The *Corner splays* option works on a super string and creates splays between two adjacent straight segments.

The number of chords created can be defined by giving the number of sub-segments required, one sub-segment length to beak of the segment or a sub-segment length to beak the segment into as many sub-segments as possible.

On selecting the Corner splays option, the **Corner splays** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
No of chords <i>value to use with the Method.</i>			
Convert mode <i>method for creating the corner splays.</i>	choice box	arc length	arc length arc radius chord length total chords length tangent length
Arc length <i>Arc length, Arc radius, Chord length, Total chords length, tangent length value to use with the Convert mode.</i>			
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Keep original string <i>if tick, the original string is not modified and a new string is created with the corner splays. If not tick, the original string is modified.</i>	tick box	tick	
Pick <i>select a super string and the splays will be created.</i>	button		

Surrounding Polygon

`create_polygon__pick_point_inside`

Position of option on menu: Strings =>Strings Edit =>Surrounding polygon

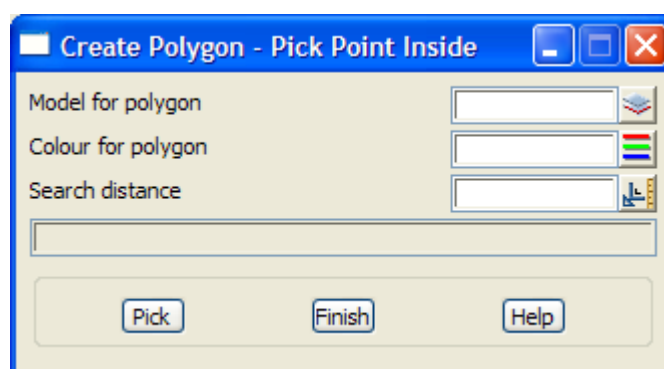

The *Surrounding polygon* option works on all the super strings on the view surrounding a selected position (point) and, if possible, creates a closed polygon from parts of the strings surrounding the selected point.

A straight line must be able to be drawn from the selected point to the lines/arcs that could be used in the surrounding strings.

This option creates a lot/polygon by a picking inside a collection of strings and the lot/polygon is created from the closest strings to the picked position. The picked position must be selected so that all sides of the lot/polygon can be "seen" from the picked position. That is, a straight line can be drawn from the picked position to the lot/polygon side without cutting any other segment.

On selecting the Surrounding polygon option, the Create Polygon - Pick Point Inside panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new created polygon.</i>	input		

Model	input		available models
	<i>model for the created polygon.</i>		
Colour	input	default colour	available colours
	<i>colour for the created polygon.</i>		
Pick	button		
	<i>pick a position on a view and the surrounding polygon will be created from all the super strings on the view.</i>		

Cogo

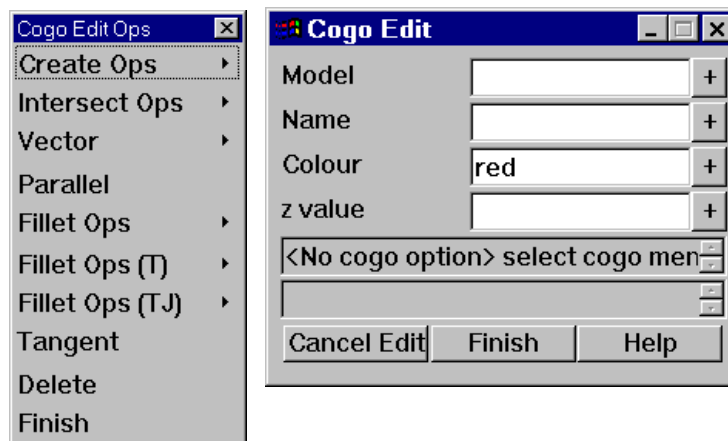

cogo_edit_ops

cogo_edit

Position of menu: Strings =>Cogo

The **cogo** (co-ordinate geometry) options provide methods of constructing points, lines and arcs from a variety of operations such as picking, filleting, intersecting and finding tangents.

Selecting the **cogo** option creates the **cogo edit ops** menu and the **cogo edit** panel.

The options in the **cogo edit ops** menu all create either a point, string or arc and the **cogo edit** panel remains on the screen for each of the menu options and provides the string properties for any created objects.

All of the options chosen from the **cogo edits ops** menu and its sub-menus repeat until cancelled by the user. That is, the option remains in force and can be applied repeatedly until terminated by the user.

The name of the current selected option is displayed in the first message area of the **cogo edit** panel.

To select a new **cogo edits ops** option, simply select the new option from the **cogo edit ops** menu or sub-menus. The current option is automatically terminated and the new option begun.

An option is also terminated when either the **cancel** or **finish** button is selected in the **cogo edit** panel, or **finish** is elected from the **cogo edit ops** menu.

Each of the options in the **cogo edit ops** menu will now be discussed.

For the option *Create ops*, please continue to the section “Create Ops” .

Intersect ops, please continue to the section “Intersect Ops” .

Vector, please continue to the section “Vector” .

Parallel, please continue to the section “Parallel” .

Fillet ops, please continue to the section “Fillet Ops” .

Fillet ops (T), please continue to the section “Fillet Ops (T)” .

Fillet ops (TJ), please continue to the section “Fillet Ops (TJ)” .

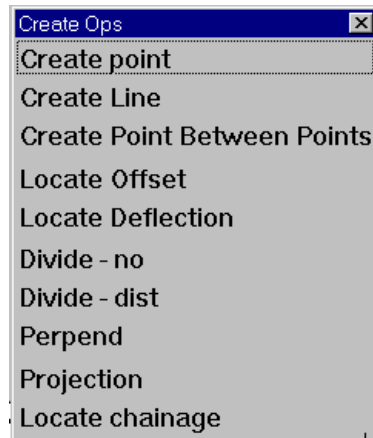

Tangent, please continue to the section “Tangent” .

Please continue to the next section “Create Ops” .

Create Ops

create_ops

The create ops walk-right menu is

Each of the options in the Create Ops menu will now be discussed.

For the option *Create point*, please go to the section “Create Point” .

<i>Create line</i>	“Create Line” .
<i>Create point between points</i>	“Create Point Between Points” .
<i>Locate offset</i>	“Locate Offset” .
<i>Locate deflection</i>	“Locate Deflection” .
<i>Divide - no</i>	“Divide - Number” .
<i>Divide - dist</i>	“Divide - Distance” .
<i>Perpedn</i>	“Perpendicular” .
<i>Projection</i>	“Projection” .
<i>Locate chainage</i>	“Locate Chainage” .

Create Point

After selecting the create point option, the user simply selects a point using the normal picking sequence.

The point will be created with name, colour and model from the **cogo edit** panel.

If no z-value is given in the **cogo edit** panel, then a null z-value is used.

If **height snap** is on and the point is created by snapping to an existing point or line, the z-value for the point is taken from the snapped point or if tin snap is on, from the underlying triangulation. The snapped z-value will be displayed in an enter height typed input box.

If required, this value can be modified by typing into the enter height box. If the box is empty, the z-value is taken from the **cogo edit** panel. If no value exists in the **cogo edit**, an error message **please specify z value** is displayed in the **cogo edit** message area.

The z-value in the enter height box is accepted by entering a <enter> in the box. The enter height box then disappears.

Screen message area

```
<<Create Point> Select position for point> [picks][][menu]
```

Create Line

After selecting the create line option, the user simply selects two points to be the end points of the line using the normal picking sequence.

The line will be created with name, colour and model from the **cogo edit** panel.

If either end point is created by snapping to an existing point or line, the z-value for the point is taken from the snapped point or if tin snap is on, from the underlying triangulation. If no z-value exists, the z-value is taken from the **cogo edit** panel.

If height snap is on, the snapped z-value will be displayed in an enter height typed input box.

If required, this value can be modified by typing into the enter height box. If the box is empty, the z-value is taken from the **cogo edit** panel. If no value exists in the **cogo edit**, an error message **please specify z value** is displayed in the **cogo edit** message area.

The z-value in the enter height box is accepted by entering a <enter> in the box. The enter height box then disappears.

Screen message area

```
<<Create Line> Select 1st point on line> [picks][][][menu]
<<Create Line> Select 2nd point on line> [picks][][][menu]
```

Create Point Between Points

The create point between points option allows the user to select two point to act as the end points of a line and then create a new point a user supplied given distance along that line.

After selecting the create point between points option, the user simply selects two points to act as the end points of the line using the normal picking sequence.

An enter distance from 1st point box is then displayed on the screen and the user simply enters the appropriate distance into the box, terminated with a <enter>. The box then disappears.

The point is then created with name, colour and model and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Screen message area

```
<<Between> Select 1st point> [picks][][][menu]
<<Between> Select 2nd point> [picks][][][menu]
<Between> Enter distance from 1st point [caret][][][menu] select a button
```

Locate Offset

The locate offset option is used to create a point at a given perpendicular offset distance from a user defined point on a selected item.

The point on the item to offset from is determined by picking a control point on the item and projecting along the item by a given distance.

Hence the locate offset option needs

- (a) a selected item
- (b) a control point
- (c) a projection distance
- (d) an offset distance

After selecting the locate offset option, the user picks the item to project along using the normal picking sequence. The direction imparted when picking the item determines the sense for direction along the item and offset left and right.

Next a control point on the item is picked.

A distance along item box is then displayed on the screen and the user enters the appropriate distance into the box, terminated with a <enter>. The box then disappears. A positive distance is in the picking direction of the item.

Finally an offset distance box is displayed on the screen. The user enters the appropriate offset

distance into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

The appropriate point is then created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Screen message area

```
<<Locate Offset> Select item to project along> [picks][ ][menu]
<<Locate Offset> Select control point> [picks][ ][menu]
<Locate Offset> distance along item [caret][ ][menu] select a button
<Locate Offset> offset distance [caret][ ][menu] select a button
```

Locate Deflection

The locate deflection option is used to create a point at a given deflection angle and distance from a user defined point on a selected item.

The locate deflection option is very similar to the locate offset option except instead of going out perpendicular to the item, the user provides a deflection angle. Hence the locate offset is a special case of the locate deflection option when the deflection angle is ninety degrees.

The point on the item to offset from is determined by picking a control point on the item and projecting along the item by a given distance.

Hence the locate deflection option needs

- (a) a selected item
- (b) a control point
- (c) a projection distance
- (d) a deflection angle
- (e) a deflection distance

After selecting the locate offset option, the user picks the item to project along using the normal picking sequence. The direction imparted when picking the item determines the sense for direction along the item and offset left and right.

Next a control point on the item is picked.

Boxes for the distance along item, deflection angle and deflection distance are then (sequentially) displayed on the screen and the user enters the appropriate values into each box, terminated with a <enter>. The box then disappears.

A positive distance is in the picking direction of the item and a positive angle is an angle to the right of the item when moving in the picking direction of the item.

The appropriate point is then created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Screen message area

```
<<Locate Deflection> Select item to project along> [picks][ ][menu]
<<Locate Deflection> Select control point> [picks][ ][menu]
<Locate Deflection> distance along item [caret][ ][menu] select a button
<Locate Deflection> deflection distance [caret][ ][menu] select a button
<Locate Deflection> deflection angle [caret][ ][menu] select a button
```

Divide - Number

The `divide - nos` option is used to place points at positions which would divide an arc or a line into an equal number of pieces.

For example, if the option was used to show how and an arc could be divided into seven pieces, points would be placed at the six division marks. No point is placed at the start or end of the arc. Hence, the start and end points plus the division points divide the arc into the required number of divisions.

Since the option will only divide an arc or a line, when an item is selected only the picked line or arc sub-element of the item will be divided.

On selecting the `divide - nos` option, the user picks the item to divide using the normal picking sequence.

A no of divisions box is then displayed on the screen and the user enters the required number of divisions into the box, terminated with a `<enter>`. The box then disappears.

A point string is then created containing points at each of the required division positions. The string has the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

```
<<Divide by #> Select item to divide> [picks][][menu]
<Divide by #> no division [caret][][menu] select a button
```

Divide - Distance

The `divide - dist` option is used to place points at positions which would divide an arc or a line into pieces of a given distance.

Note - unless the arc or line is exactly divisible by the distance, the last division will be smaller than the required distance.

Since the option will only divide an arc or a line, when an item is selected only the picked line or arc sub-element of the item will be divided.

On selecting the `divide - dist` option, the user picks the item to divide using the normal picking sequence.

A distance box is then displayed on the screen and the user enters the required distance for each division into the box, terminated with a `<enter>`. The box then disappears.

A point string is then created containing points at each of the required division positions. The string has the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

```
<<Divide by distance> Select item to divide> [picks][][menu]
<Divide by #> distance [caret][][menu] select a button
```

Perpendicular

The `perpend` option is used to create the point which is the perpendicular projection of a selected point onto a selected line or arc.

Since the option can only drop a point onto an arc or a line, when the item is selected to project onto, only the picked line or arc sub-element of the item is used.

On selecting the `perpend` option, the user picks the point to drop perpendicularly.

The item to drop perpendicularly onto is then selected.

The point representing the perpendicular projection of the chosen point onto the selected item is then created. The created point has the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

```
<<Perpend> Select point to drop> [picks][][menu]  
<<Perpend> Select item to drop onto> [picks][][menu]
```

Projection

The projection option is used to create a point which is given distance along a line or arc.

Since the option can only project a point along an arc or a line, when the item is selected to project along, only the picked line or arc sub-element of the item is used.

On selecting the projection option, the user picks the item to project along.

A distance box is then displayed on the screen and the user enters the appropriate projection distance into the box, terminated with a <enter>. The box then disappears. A positive distance is in the picking direction of the item.

The point representing the projected point along the selected item is then created using the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

```
<<Projection> Select item to project along> [picks][][menu]  
<Projection> distance [caret][][menu] select a button
```

Locate Chainage

The locate chainage option is used to create a point at a given chainage on a selected string.

On selecting the locate chainage option, the user picks the item to locate the chainage on.

A locate chainage box is then displayed on the screen and the user enters the appropriate chainage into the box, terminated with a <enter>. The box then disappears.

A point at the given chainage on the selected item is then created using the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

```
<<Locate chainage> Select item to locate on> [picks][][menu]  
<Locate chainage> chainage [caret][][menu] select a button
```

Please continue to the next section “Intersect Ops” .

Intersect Ops

intersect_ops

The intersection options are for finding various intersections of lines and arcs.

Most of intersect cases can have more than one solution. For example, the intersection of a line with an arc.

To easily distinguish between the cases, 12d Model uses the sense of direction implied when picking items to determine which case was required by the user.

The intersect ops walk-right menu is

Each of the options in the Intersect Ops menu will now be discussed.

For the option *Intersect*, please continue to the section "Intersect" .

<i>Create line</i>	"Create Line" .
<i>intersect offset</i>	"Intersect Offset"
<i>Bearings intersect</i>	"Bearings Intersect" .
<i>2 pts 2 dists</i>	"Two Points, Two Distances" .

Intersect

The intersect option creates a point at the intersection of lines and arcs.

That is, it will find the intersection of

- (a) a line with a line
 - (b) a line with an arc
- or
- (c) an arc with an arc

After selecting the intersect option, the user simply selects the two items to intersect using the normal picking sequence.

If an intersect exists, a point is created at the intersection with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

When there is more than one possible solution, the order of picking and the directions imparted when picking the items are used to determine which solution is required.

Since the option will only intersect arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the intersect.

Screen message area

```
<<Intersect> Select 1st item to intersect> [picks][][][menu]
<<Intersect> Select 2st item to intersect> [picks][][][menu]
```

Intersect Offset

Like the intersect option, intersect offset is for creating points at the intersection of lines and arcs.

However, before the line or arc is used, it is offset by a user supplied distance.

Hence the intersection is between displaced lines and arcs.

A practical example of intersect offset is for finding the position of a manhole in a subdivision which is three metres from one property line and two metres from the culdesac arc.

After selecting the intersect option, the user selects the first item to intersect using the normal picking sequence.

A 1st offset box is then displayed on the screen and the user enters the appropriate offset for the first line into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

The second item to intersect is then selected and a 2nd offset box is displayed on the screen for the user to enter the offset for the second line.

If an intersect exists for the two offset items, a point is created at the intersection with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

As in the intersect option, when more than one solutions is possible, the order of picking and the directions imparted when picking the items are used to determine which solution is required.

Since the option will only intersect arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the intersect.

Screen message area

```
<<Intersect Offset> Select 1st item to intersect> [picks][ ][menu]
<Intersect Offset> 1st offset [caret][ ][menu] select a button
<<Intersect Offset> Select 2st item to intersect> [picks][ ][menu]
<Intersect Offset> 2nd offset [caret][ ][menu] select a button
```

Bearings Intersect

The bearings intersect option finds the intersect of the lines going through two user selected points at user supplied bearings.

Hence the option will calculate the point that is at given bearings from two selected points

After selecting the bearings intersect option, the user selects the first point using the normal picking sequence.

A bearing 1 box is then displayed on the screen and the user enters the bearing for the line through the point into the box, terminated with a <enter>. The box then disappears. The bearing is entered in degrees, minutes and seconds.

The second point is then selected and a bearing 2 box is displayed on the screen for the user to enter the bearing for the line through the second point.

The intersection of the two lines is then calculated and if it exists, a point is created at the intersection with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Note

The selected points do not have to be actual points in a point string. Any snap or cursor position is a valid **point** for the option

Screen message area

```
<<Bearings Intersect> Select 1st point> [picks][ ][menu]
<Bearings Intersect> bearing 1 [caret][ ][menu] select a button
<<Bearings Intersect> Select 2nd point> [picks][ ][menu]
<Bearings Intersect> bearing 2 [caret][ ][menu] select a button
```

Two Points, Two Distances

The 2 pts 2 dists option find the point that given distances from two user selected points.

This problem is equivalent to finding the intersection of two circles centred on the points and with radii the same as the distances.

When there is more than one solution, the solution to the right of the line joining the two points

is used. (the direction of the line is from the first point to the second point). To obtain the other solution, simply select the points in the opposite order.

After selecting the 2 pts 2 dists option, the user selects the first point using the normal picking sequence.

A 1st distance box is then displayed on the screen and the user enters the distance that the new point is from the selected point into the box, terminated with a <enter>. The box then disappears.

The second point is then selected and a 2nd distance box is displayed on the screen for the user to enter the distance to the second point.

The point that is the required distances from the two points is created with name, colour, model and z-value from the **cogo edit** panel. If no z-value exists in the panel, no point is created.

Note

The selected points do not have to be actual points in a point string. Any snap or cursor position is a valid **point** for the option

Screen message area

```
<<Locate 2 pts 2 dists> Select 1st point> [picks][][menu]
<Locate 2 pts 2 dists> 1st distance [caret][][menu] select a button
<<Locate 2 pts 2 dists> Select 2nd point> [picks][][menu]
<Locate 2 pts 2 dists> 2nd distance [caret][][menu] select a button
```

Please continue to the next section “Vector” .

Vector

vector_ops

The vector options are for creating points which are a given as at a given vector from another point.

The default definition of the vector is as (bearing, distance) but other combinations such as (angle, distance), relative (x,y) and absolute (x,y) are possible using normal typed input.

The methods for creating the new points are

- (a) locate - create a new point using a vector
- (b) radiation - the points created are all a vector from the initial point selected
- (c) traverse - the last point created becomes the next point to work from

The vector walk-right menu is

Each of the options in the Vector Ops menu will now be discussed.

For the option *Traverse*, please go to the section “Traverse” .

Radiation

“Radiation” .

Intersect offset

“Intersect Offset”

Locate

“Locate” .

Locate

In the locate option, a point is selected and a vector supplied to produce a new point which is the vector away from the initial point.

The sequence is then repeated by selecting another point and giving another vector.

After selecting the locate option, the user simply selects the point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>. The box then disappears.

A new point is then created which is the given bearing and distance from the selected point. The new point is given the name, colour, model and z-value from the **cogo edit** panel. If no z-value exists in the panel, the given z-value could be nonsense.

The sequence of picking a point and giving a vector is then repeated.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

```
<<Locate> Select point> [picks][][menu]  
<Locate> bearing distance [caret][][menu] select a button
```

Radiation

In the radiation option, a point is selected and a vector supplied to produce a new point which is the vector away from the initial point.

After selecting the radiation option, the user simply selects the point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>.

A new point is then created which is the given bearing and distance from the selected point. The new point is given the name, colour, model and z-value from the **cogo edit** panel. If no z-value exists in the panel, the given z-value could be nonsense.

The bearing distance box remains on the screen.

If another value is entered into the box (or the previous one left) terminated by a <enter>, a new point is created which is the new given bearing and distance from the original selected point.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

```
<<Radiation> Select point> [picks][][menu]  
<Radiation> bearing distance [caret][][menu] select a button
```

Traverse

In the traverse option, an initial point is chosen and a vector supplied to produce a new point which is the vector away from the initial point.

The created point is then taken to be the start point for the next sequence of creating a new point by a vector.

After selecting the traverse option, the user simply selects the first point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>.

A new point is then created which is the given bearing and distance from the selected point.

The new point is given the name, colour, model and z-value from the **cogo edit** panel. If no z-value exists in the panel, the given z-value could be nonsense.

The bearing distance box remains on the screen.

If another value is entered into the box (or the previous one left) terminated by a <enter>, a new point is created which is the given bearing and distance from the last created point.

Hence, the last created point takes the place of the original selected point.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

```
<<Traverse> Select point> [picks][][menu]
<Traverse> bearing distance [caret][][menu] select a button
```

Please continue to the next section “Parallel” .

Parallel

Items can be translated perpendicularly to either the left or right using the parallel option (also known as a copy parallel operation).

After selecting the parallel option, the user simply selects the item to paralleled using the normal picking sequence.

A offset box is then displayed on the screen and the user enters the required offset distance into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

A new item is then created which is a copy parallel of the selected item by the given offset distance. The new item has the name, colour and model from the **cogo edit** panel.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

```
<<Parallel> Select item to parallel> [picks][][menu]
<Parallel> offset> [caret][][menu] select a button
```

Please continue to the next section “Fillet Ops” .

Fillet Ops

fillet_ops

The fillet options are for creating an arc between lines and arcs.

That is, it will try and fit an arc between

- (a) two lines
 - (b) a line and an arc
- or
- (c) two arcs

The created arc is determined by tangents from the items it is a fillet for and another piece of information such as a radius or a start point.

Since the option can only fillet between arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the fillet.

Most fillet cases can have more than one solution. For example, the fillet of a given radius between two lines can have up to four solutions.

To easily distinguish between the cases, 12d Model uses the order of picking and the sense of direction implied when picking the items to determine which case was required by the user.

The direction is used as follows -

the arc comes off the first item in the direction that the first item is picked and lands on the second in the direction that the second item is picked.

The fillet ops walk-right menu is

Each of the options in the Fillet Ops menu will now be discussed.

For the option *Item Item Radius*, please go to the section "Fillet Item Item Radius" .

<i>Item Item Point</i>	"Fillet Item Item Point" .
<i>Intersect offset</i>	"Intersect Offset"
<i>3 points</i>	"Fillet Three Points" .

Fillet Item Item Radius

This fillet option creates an arc of a user given radius between two user selected items.

After selecting the fillet item item radius option, the user selects the first item to be used in the fillet using the normal picking sequence.

Next the second item to be used in the fillet is selected.

An enter radius box is then displayed on the screen and the user types the appropriate radius for the fillet into the box, terminated with a <enter>. The box then disappears.

A positive radius implies that the arc travels in a clockwise direction and a negative radius for an arc travelling in an anti-clockwise direction.

If a fillet exists for the two items and the radius, an fillet arc is created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no arc is created.

Screen message area

```
<<Fillet by radius> Select 1st item> [picks][][menu]
<<Fillet by radius> Select 2nd item> [picks][][menu]
<Fillet by radius> Enter radius [caret][][menu] select a button
```

Fillet Item Item Point

This fillet option creates an arc between two user selected items starting at a user defined control point.

After selecting the fillet item item pt option, the user selects the first item to be used in the fillet using the normal picking sequence.

Next the second item to be used in the fillet is selected.

Finally, a point is selected to act as the starting point for the fillet. This point, called the control point, must lie on the first item selected. If the selected point doesn't lie on the first item, the selected point is projected perpendicularly onto the item and the projected point used as the control point.

If a fillet exists for the two items and the control point, a fillet arc is created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, a null z-value is used.

Screen message area

```
<<Fillet by start point> Select 1st item> [picks][][menu]
<<Fillet by start point> Select 2nd item> [picks][][menu]
<<Fillet by start point> Select start point> [picks][][menu]
```

Fillet Three Points

This option creates an arc between three user selected points.

After selecting the fillet 3 pts option, the user selects the three points one after another using the normal picking sequence.

The three arc points must be selected in the order

- (a) the start point
- (b) a point between the start and end point
- (c) the end point

If an arc does exist containing the three points, it will be unique including its direction. The arc will be created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, a null z-value is used.

Screen message area

```
<<Fillet 3 points> Select 1st item> [picks][][menu]
<<Fillet 3 points> Select 2nd item> [picks][][menu]
<<Fillet 3 points> Select start point> [picks][][menu]
```

Please continue to the next section "Fillet Ops (T)" .

Fillet Ops (T)

fillet_ops_t_

The fillet (T) options are the almost identical to the fillet options.

The only difference is that after the fillet arc is created, the original items are trimmed back to the start and end of the arc.

The trimmed items are not joined to the fillet arc.

The original strings obey the trash defaults from the utilities=>defaults=>trash defaults option.

That is, if the trash mode is set to *keep string*, the original strings are untouched.

<i>delete string</i> ,	deleted.
<i>trash string</i> ,	moved to the trash model.

For information on the fillet options, see the section “Fillet Ops”

For the option *Item Item Radius*, please go to the section “Fillet Item Item Radius” .

Item Item Point

“Fillet Item Item Point” .

Please continue to the next section “Fillet Ops (TJ)” .

Fillet Ops (TJ)

fillet_ops_tj_

The fillet (TJ) options are the almost identical to the fillet and fillet (T) options.

The only difference is that after the fillet arc is created, the original items are trimmed back to the start and end of the arc and the three items joined to form a new item.

That is, the trimmed items are joined to the fillet arc.

The original strings obey the trash defaults from the Utilities=>Defaults=>Trash defaults option.

That is, if the trash mode is set to *keep string*, the original strings are untouched.

delete string,

deleted.

trash string,

moved to the trash model.

For information on the fillet options, see the section “Fillet Ops”

For the option *Item Item Radius*, please continue to the section “Fillet Item Item Radius” .

Item Item Point

“Fillet Item Item Point” .

Please continue to the next section “Tangent” .

Tangent

The tangent option creates tangent lines between point and arcs.

That is, tangents can be defined between

(a) a point and an arc

(b) two arcs

or

(c) two points - simply a line between the two points

Since the option can only fillet between points and arcs, when an item is selected, only the picked sub-arc of the item is used as an arc.

Most tangent cases can have more than one solution. For example, two tangents from a point to an arc.

To easily distinguish between the cases, 12d Model uses the order of picking the items and the sense of direction implied when picking an arc to determine which case was required by the user.

After selecting the tangent option, the user selects the first item to be used in the tangent calculations using the normal picking sequence.

Next the second item to be used is selected.

If a tangent line exists between the two items selected, a line string is created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, a null z-value is used for the line.

Screen message area

<<Tangent> Select 1st item> [picks][][menu]

<<Tangent> Select 2nd item> [picks][][menu]

Convert

convert_string

Position of option on menu: Strings =>Convert

The Convert option is used to create a new string of possibly a different string type from a chosen string.

Since not all string conversion are possible, or even make sense (for example, converting a 3d string to a text string), the list of defined conversion depends on the type of the string chosen for conversion.

After selecting the string to convert, a menu containing the possible conversions is raised and the required conversion selected from it.

After the type of conversion is selected, a string Properties panel containing the attribute information for the new string is displayed and can be used to modify any properties of the new string.

After selecting the **Convert option**, the **Convert String** panel is placed on the screen.

If a new name, model or colour is required for the converted string, the new data is entered into the **Convert String** panel. If a change isn't required, leave the appropriate panel field blank.

The Convert option is already in progress and if a string is selected and accepted, a menu containing all the available conversions for that particular string type is displayed.

convert_2d_string_to

convert_3d_string_to

convert_4d_string_to

convert_Alignment_string_to

convert_arc_string_to

convert_drainage_string_to

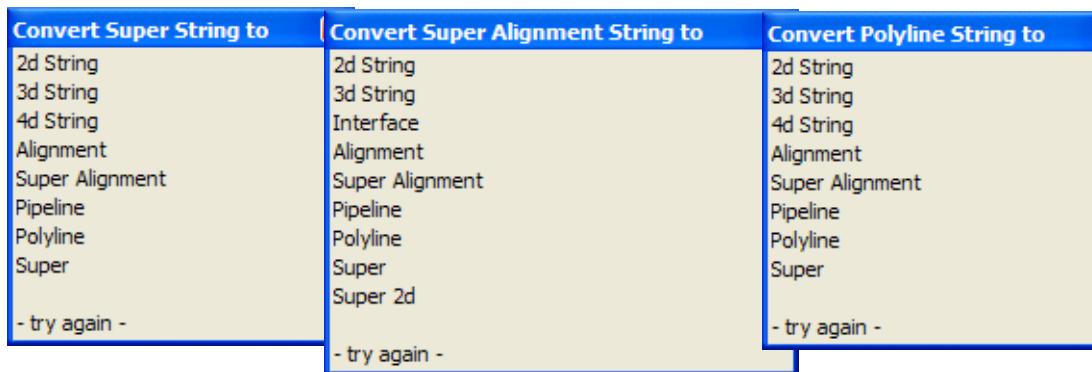

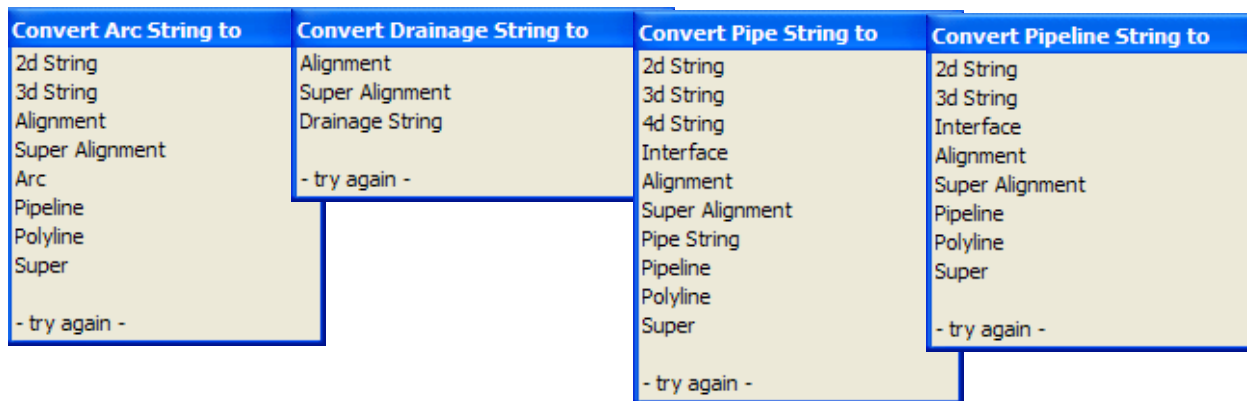

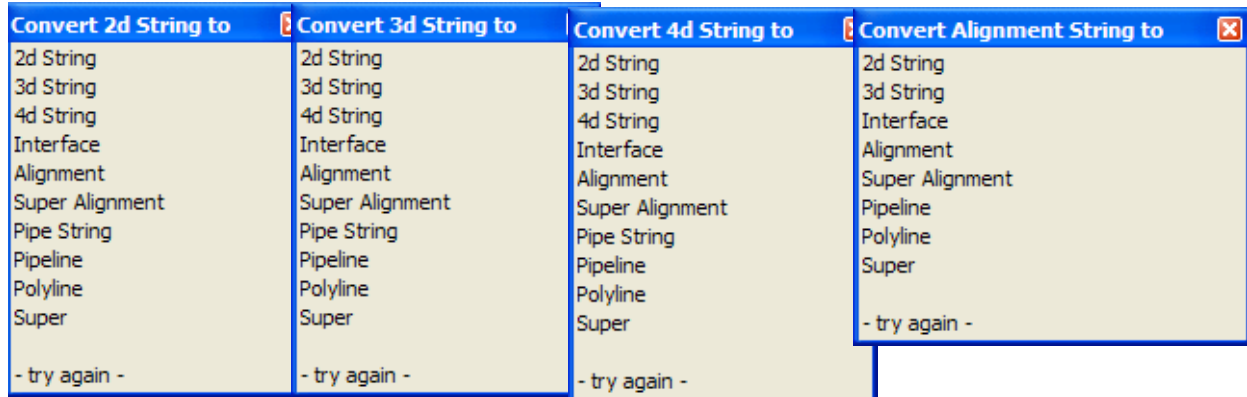

convert_pipe_string_to

convert_pipeline_string_to

convert_super_string_to

convert_super_alignment_string_to

For example, for each string type the choices are:

After selecting the conversion to be made, a new string of the selected type is created and given the model, colour and name according to the fields in the **Convert String** panel.

The **Properties** panel for the new string is also displayed and hence any of the strings properties can be modified for the new string.

The fields and buttons used in the **Convert String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		
<i>If blank, the converted string is given the same name as the original string.</i>			
<i>If non-blank, then the converted string is given the name in the new name field.</i>			
New model	input		available models
<i>if blank, the converted string is placed in the same model as the original string.</i>			
<i>If non-blank, then the converted string will be placed in the model given in the new model field.</i>			

New colour input available colours
if blank, the converted string is given the same colour as the original string.
If non-blank, then the converted string is given the colour in the new colour field.

Mode input keep string keep, delete, trash string
if delete string, the string selected to be converted is deleted.
keep string, the selected string is not deleted.
trash string, the string selected to be converted is moved to the trash model.

Inquire

string_inquire

Position of option on menu: Strings =>Inquire

The inquire option is used to obtain information about a string displayed on the screen. The amount and type of information varies between string types.

On selecting the Inquire option, the **String Inquire** panel is displayed.

The panel is used for any special messages and to end the option.

After selecting the inquire option, the strings are selected using the normal **12d** Model selecting mechanism (LB to pick a string, MB to accept a string, RB for the pick ops menu). Whenever a string is picked, the information about the picked string is displayed on the screen in the Information menu.

An example of the Information menu for an Alignment string is

For more details on the Information menu, go to the section “String Information”

Any number of string inquiries can be made with the option by repeated use of the mouse buttons LB and MB to pick and accept strings.

The inquire option is terminated by either selecting the Cancel option from the Pick Ops menu (raised by clicking RB) or selecting **Finish** or **[X]** from the **String Inquire** panel.

String Information

information

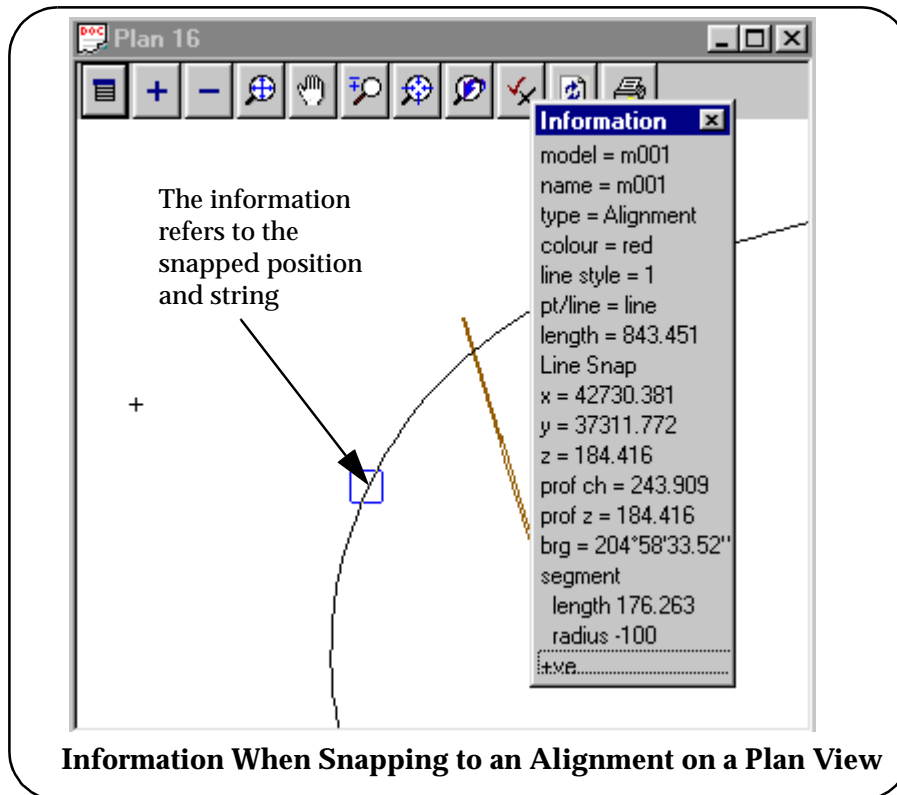

Whenever a string is picked, the information about the picked string is displayed on the screen in the Information menu

The Information menu displays different information depending on whether the string was picked in a Plan or Perspective view or in a Section view.

For a Plan or Perspective View

The details on the Information menu can include:

- model = - gives the model of the selected string
- name = - " name " " "
- type = - " type " " "
- colour = - " colour " " "
- line style = - " line style " " "
- pt/line = - " " breakline type " " "
- # pts = - " " number of points " " "
- area = - " " area if it is a closed string
- length = - " " length of the string
- Snap type - e.g. Line Snap, Point Snap
- x = - " " x co-ordinate of the selected position
- y = - " " y co-ordinate of the selected position
- prof ch = - " " chainage of the selected position on the string
- prof z = - " " z-value of the selected position on the string
- brg = - " instantaneous bearing of the selected position on the string
- segment length - " length of the string segment containing the selected position
- +ve or -ve - if the direction of the pick was the same as the direction of the string, then +ve is displayed otherwise the direction of the pick is opposite to the string direction and a -ve is displayed.

For a Section View

For a section view, the x-axis of the view is defined by the chainage along the string that is being profiled on the section view (the **profiled** string). The profiled string is displayed on the section view.

For any tins in models added to the section view, the sections through the tins along the

profiled string are also displayed in the section view.

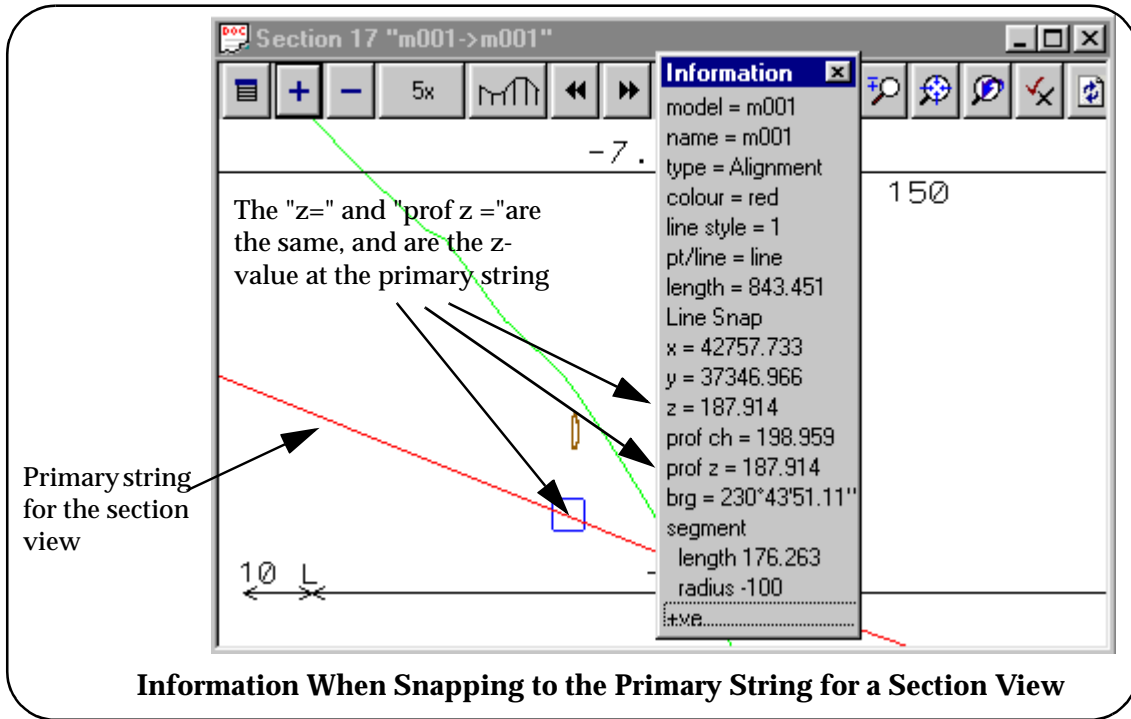

Finally, any parts of any strings in models added to the section view that are in the corridor defined for the section view are projected onto the section view and displayed.

The details on the Information menu can include:

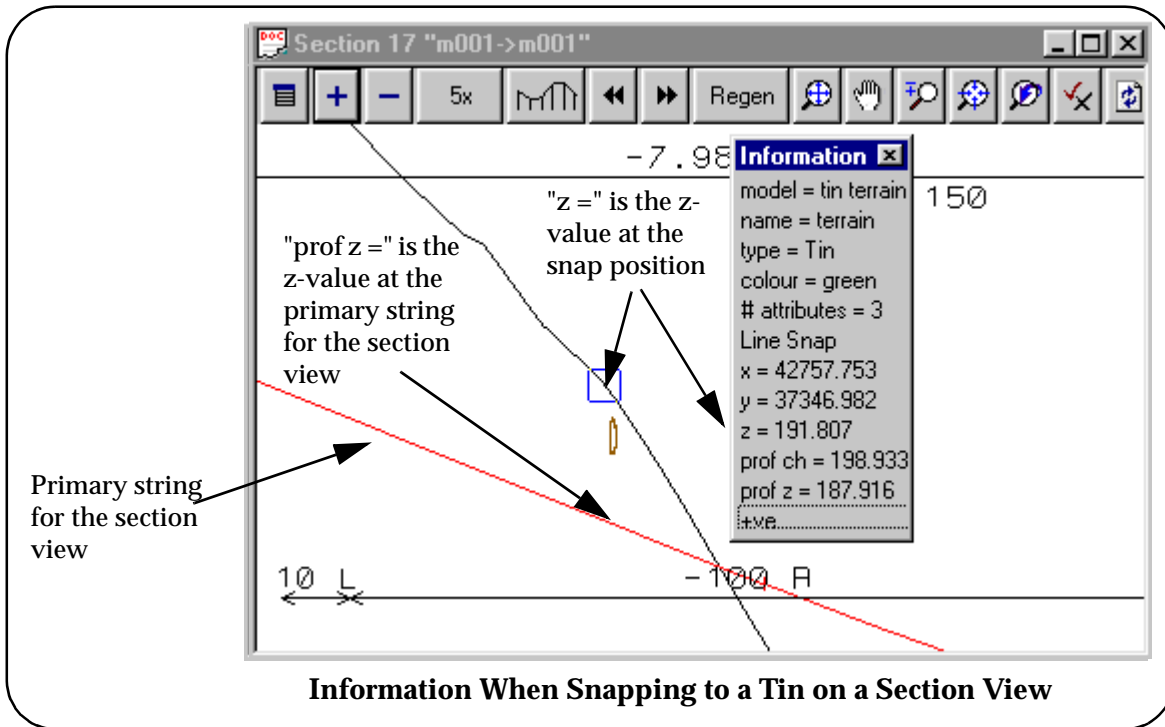

model =	- gives the model of the selected string
name =	- " name " " "
type =	- " type " " "
colour =	- " colour " " "
line style =	- " line style " " "
pt/line =	- " breakline type " " "
# pts =	- " number of points " " "
area =	- " area if it is a closed string
length =	- " length of the string
Snap type	- e.g. Line Snap, Point Snap
x =	- " x co-ordinate of the selected position
y =	- " y co-ordinate of the selected position
z =	- " z co-ordinate of the selected position
prof ch =	- " chainage of the <i>profiled</i> string at the selected position Note that this is not the chainage of the selected string unless the selected string is the profiled string
prof z =	- " " z-value of the <i>profiled</i> string at the profile chainage of the selected position Note that this is not the z of the selected position unless the selected string is the profiled string
brg =	- " instantaneous bearing of the selected position on the string
segment length	- " length of the string segment containing the selected position
+ve or -ve	- if the direction of the pick was the same as the direction of the string, then +ve is displayed otherwise the direction of the pick is opposite to the string direction and a -ve is displayed.

IMPORTANT NOTES

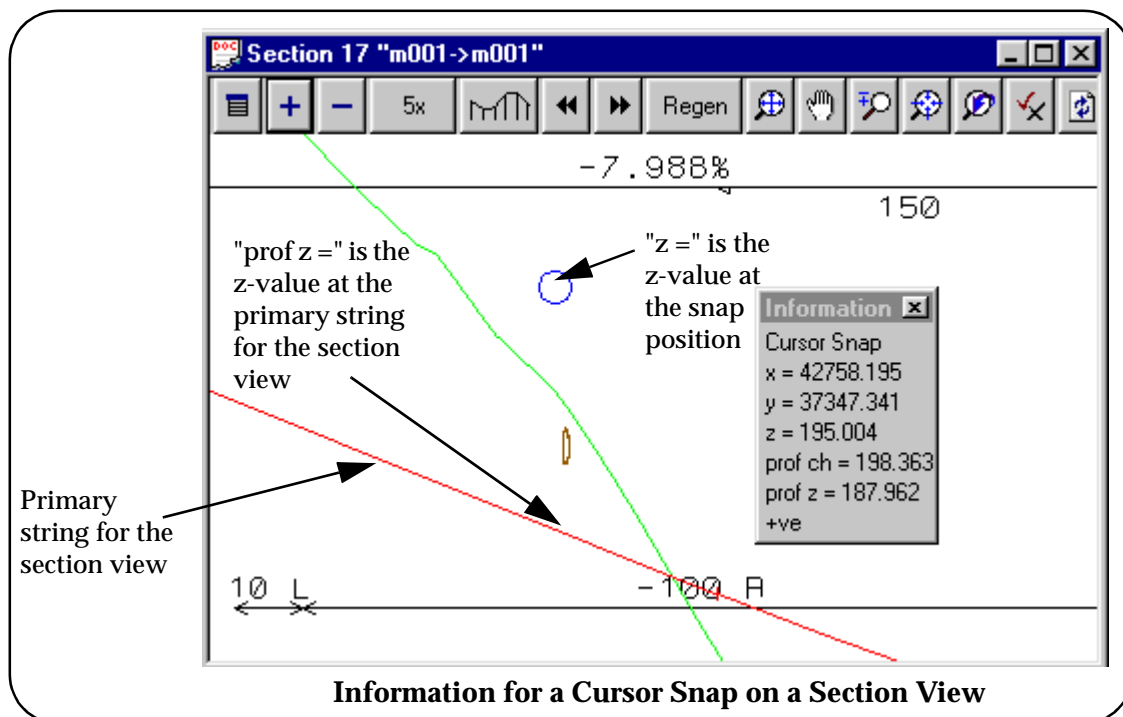

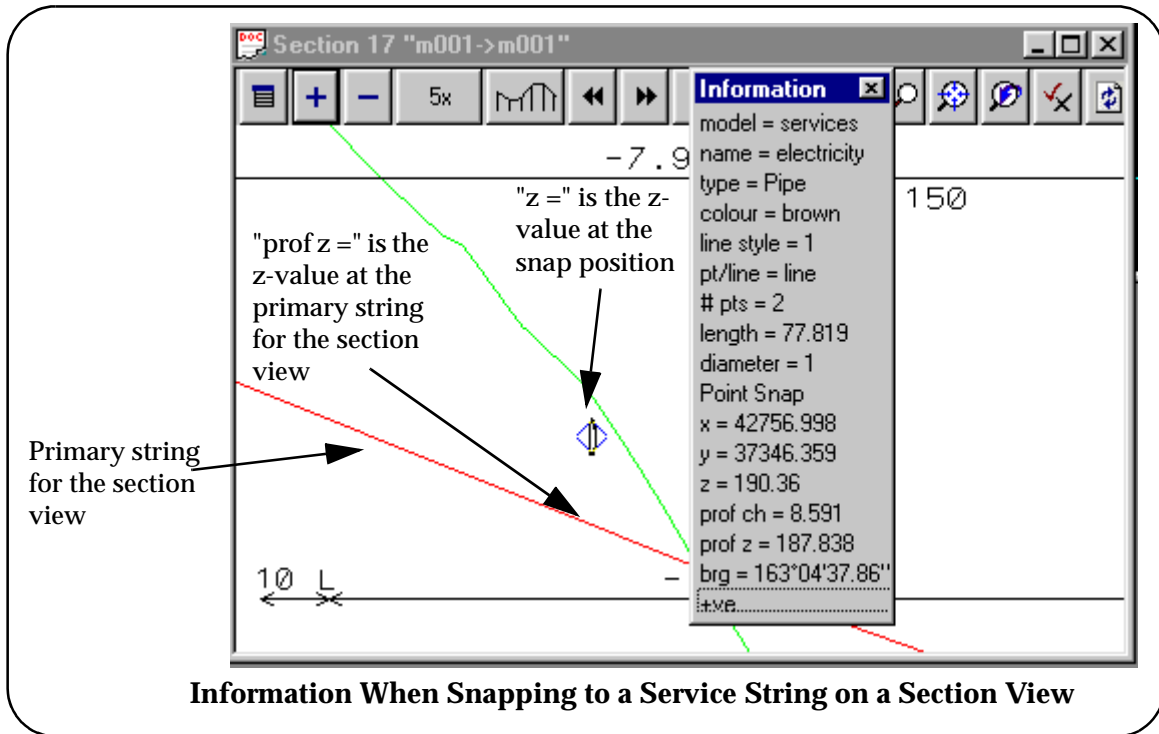

1. for a string selected on a section view, the " z = " value is the z co-ordinate of the selected position. The "**prof z** = " value is the z co-ordinate of the string profiled on the section view.
2. The "**prof ch** = " value is the chainage of the string profiled on the section view, not the chainage of the selected string.

Information When Snapping to the Primary String for a Section View

Information When Snapping to a Tin on a Section View

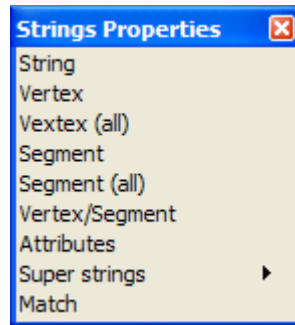

Properties

strings_properties

Position of menu: Strings =>Properties

The Properties walk-right menu contains options to obtain and/or modify the properties of any string displayed on the screen, or obtain and/or modify the vertices and segments of a super string.

The Properties walk-right menu is

For the option *String*, go to the section “String”

<i>Vertex</i>	“Vertex”
<i>Vertex (all)</i>	“Vertex - All above”
<i>Segment</i>	“Segment”
<i>Segment (all)</i>	“Segment - All above”
<i>Vertex/Segment</i>	“Vertex/Segment”
<i>Attributes</i>	“Attributes”
<i>Super strings</i>	“Super Strings”
<i>Match</i>	“Match”

String

string_properties

Position of option on menu: Strings =>Properties =>String

The String option obtains and/or modify property information about any string displayed on the screen.

For example, the string’s name, colour and style are string properties. Each string type has its own particular set of properties.

On selecting the String option, the **String Properties** panel is displayed.

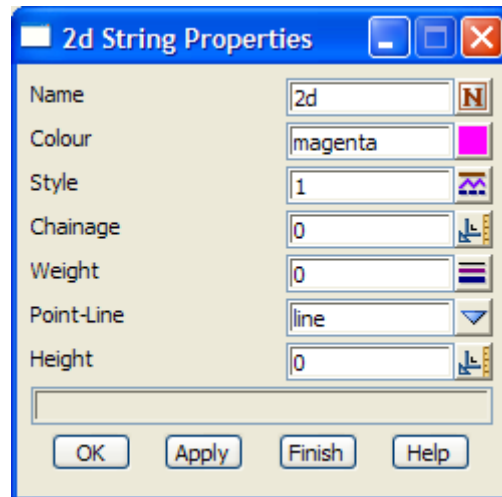

The panel is only used for any special messages and to end the option.

The String Properties option is automatically in a pick mode and the user selects strings using the normal 12d Model picking mechanism (LB to select a string, MB to accept a string, RB for the pick ops menu). Whenever a string is selected, the appropriate **Properties** panel for the string

type is displayed on the screen with all the picked string's properties shown.

For example, for a 2d string, the **Properties** panel is

To modify any of the properties for the selected string, simply change the information in the appropriate panel field and select the **OK** or **Apply** button.

The **Properties** panel is also brought up by the **Properties** option on each string editor and the **Properties** panel have been shown for each string in the Editor section of the manual.

Please continue to the next section "Vertex" .

Vertex

[string_vertex_properties](#)

[vertex_properties](#)

Position of option on menu: Strings =>Properties =>Vertex

The Vertex option obtains and/or modify property information about the vertex of any super string displayed on the screen.

For example, the height, symbol, annotation, point no are all properties of a super string vertex.

On selecting the Vertex option, the **String Vertex Properties** panel is displayed.

The panel is only used for any special messages and to end the option.

The String Vertex Properties option is automatically in a pick mode and the user selects the *vertex* of a super string using the normal **12d** Model picking mechanism. Whenever a *vertex* is selected, a Vertex menu showing the properties of the vertex is displayed on the screen.

To modify any of the properties for the selected vertex, simply click on the appropriate item on the Vertex menu and the appropriate panel will come up to modify the vertex property.

Please continue to the next section “Segment” .

Segment

[string_segment_properties](#)

[segment_properties](#)

Position of option on menu: Strings =>Properties =>Segment

The Segment option obtains and/or modify property information about the segment of any super string displayed on the screen.

For example, the visibility, radius, colour, text are all properties of a super string segment.

On selecting the Segment option, the **String Segment Properties** panel is displayed.

The panel is only used for any special messages and to end the option.

The String Segment Properties option is automatically in a pick mode and the user selects the *segment* of a super string using the normal 12d Model picking mechanism. Whenever a *segment* is selected, a Segment menu showing the properties of the segment is displayed on the screen.

To modify any of the properties for the selected segment, simply click on the appropriate item on the Segment menu and the appropriate panel will come up to modify the segment property.

Please continue to the next section “Vertex/Segment” .

Vertex/Segment

[string_vertex_segment_properties](#)

[vertex_properties](#) [segment_properties](#)

Position of option on menu: Strings =>Properties =>Vertex/Segment

This option is a combination of the Vertex and Segment options already documented.

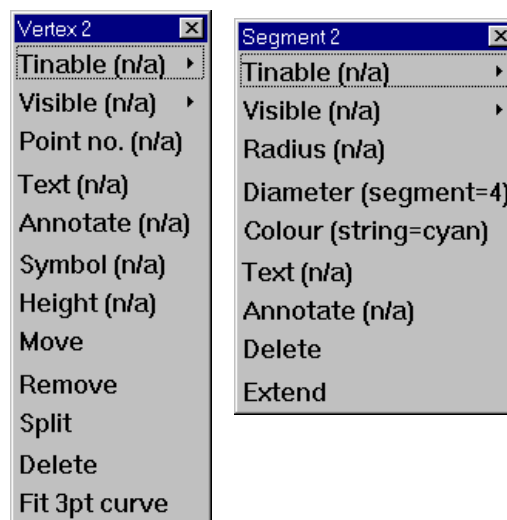

The Vertex/ Segment option obtains and/or modify property information about the vertex or segment of any super string displayed on the screen.

On selecting the Vertex/Segment option, the **String Vertex/Segment Properties** panel is displayed.

The panel is only used for any special messages and to end the option.

The String Vertex/Segment Properties option is automatically in a pick mode and the user selects either the *vertex* or the *segment* of a super string using the normal 12d Model picking mechanism. Whenever a *vertex* or *segment* is selected, the Vertex or Segment menu showing the properties of the selected vertex or segment is displayed on the screen.

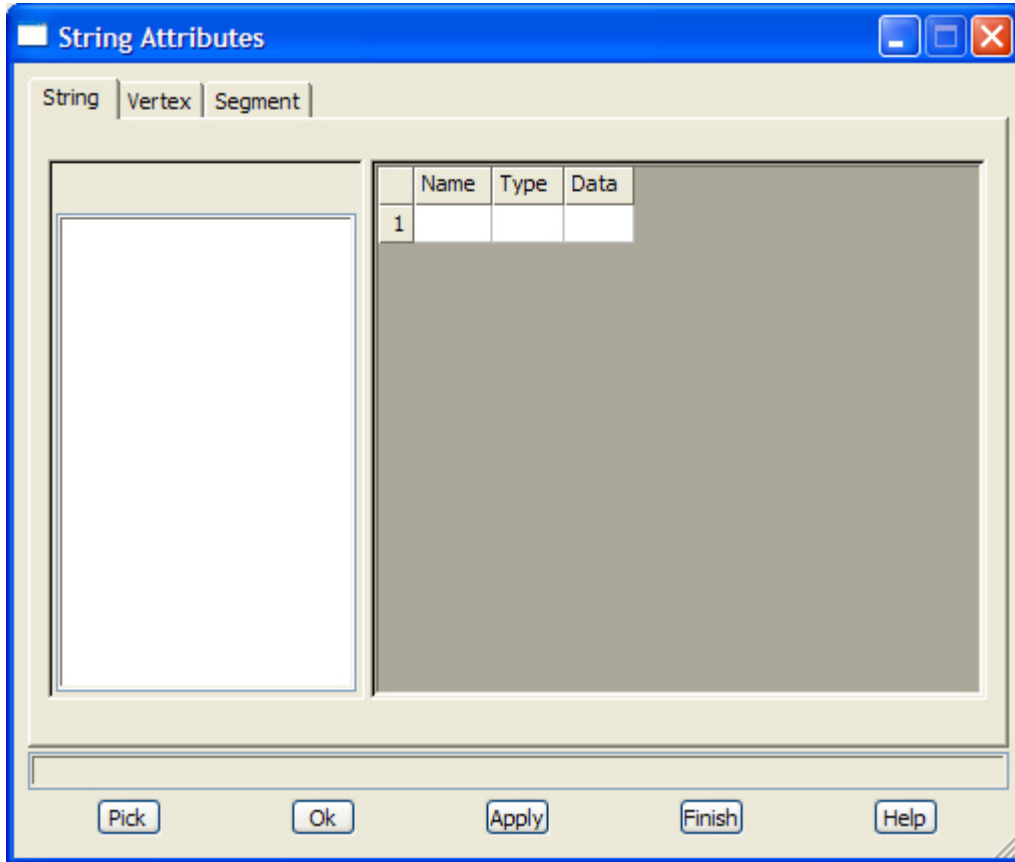

Attributes

[string_attributes](#)

Position of option on menu: String =>Properties =>Attributes

The Attributes options displays, creates and edits attributes for any strings in the project.

On selecting Attributes, the **String Attributes** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

String tab

this tab displays/edits the attributes that apply for the entire string. All string types have these.

Name

name of the string attribute

Type

integer, real, text

type of attribute - integer, real or text

<i>Attribute</i>	“Attribute”
<i>Vertex id</i>	“Vertex Id”
<i>Pipe/culvert/extrude</i>	“Pipe/Culvert”
<i>Radius</i>	“Radius”
<i>Segment geometry</i>	“Segment Geometry”
<i>Text</i>	“Text”

Chainage Interval

change_super_string_chainage_interval

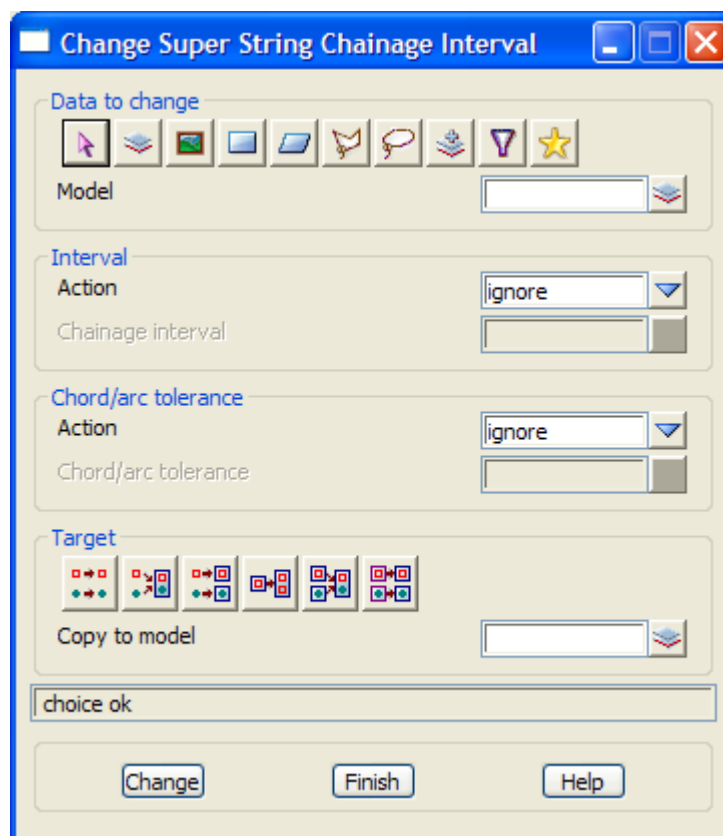

Position of option on menu: Strings =>Properties =>Super strings =>Chainage interval

A super string has one *chainage interval* value for the entire string. If the value is non-zero, then any line segments of the string are subdivided by the chainage interval when the super string is used in triangulations.

A super string also has one *arc-chord tolerance* value for the entire string. If the value is non-zero, then any curved segments are subdivided by the arc-chord tolerance when used in triangulations.

The Chainage interval option can set the *chainage interval* value and/or the *chord-to-arc tolerance* value for selected super strings.

On selecting the Chainage interval option, the **Change Super String Chainage Interval** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

Interval tab

Action	choice box	ignore	set, clear, ignore
---------------	------------	--------	--------------------

if set, set the chainage intervals of the selected super strings to the value in Chainage interval.

If clear, set all the selected super strings to not use a chainage interval.

If ignore, don't modify the chainage interval of the selected super strings.

Chainage interval input

the chainage interval to use for a super string.

Chord/arc tolerance tab

Action choice box ignore set, clear, ignore

*if **set**, set the chord/arc tolerance of the selected super strings to the value in Chord/arc tolerance.*

*If **clear**, set all the selected super strings to not use a chord/arc tolerance.*

*If **ignore**, don't modify the chord/arc tolerance of the selected super strings.*

Chord/arc tolerance input

the chord/arc tolerance to use for a super string.

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Change button

process the selected strings

Visible

change_super_string_visibility

Position of option on menu: Strings =>Properties =>Super strings =>Visible

For selected super strings, the Visible option can set the flags that determine how visibility is defined for a super string.

Segment visibility can

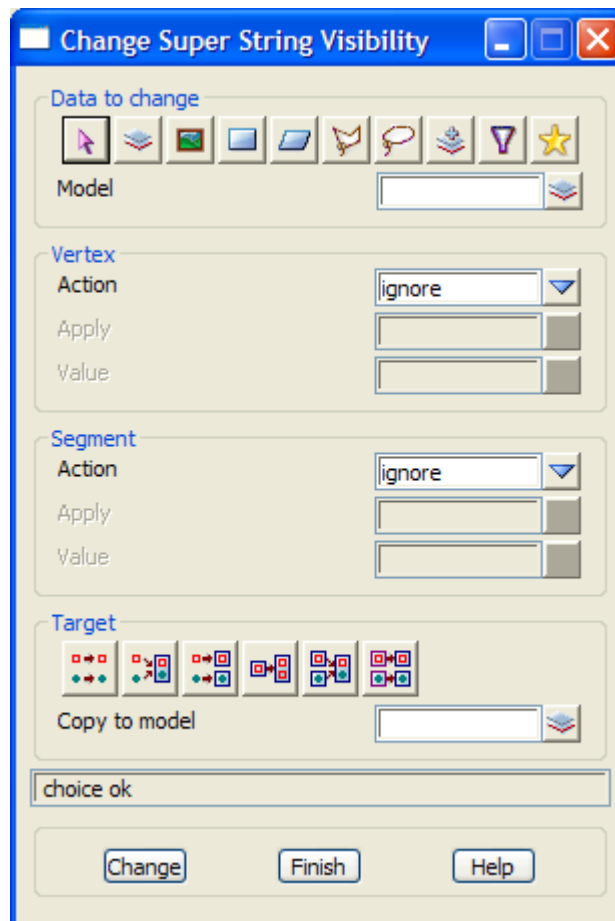

- (a) be not setable at all for the string - it is always visible
- (b) have one setting for the entire string - visible only
- (c) have separate settings for each segment (and all set to visible)

Similarly, vertex visibility can

- (a) be not setable at all for the string - it is always visible
- (b) have one setting for the entire string - visible only
- (c) have separate settings for each segment (and all set to visible).

The Visible option allows any of the above cases to be set up for the selected super strings.

On selecting the Visible option, the **Change Super String Visibility** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

Vertex tab

Action choice box ignore set, clear, ignore

*if **set**, the vertex visibility can be allowed to be a constant for all vertices in the string, or to be different for each vertex in the string.*

*If **clear**, the vertex visibility flags are removed for the string and the string vertices are always visible.*

*If **ignore**, don't modify the visibility flags for the vertices of the string.*

Apply choice box

*if **Action** is **set**, then the **Apply** field is used.*

*If **Apply** is **constant**, the string has only one visibility flag and it applies to all vertices in the string. It is set to visible.*

*If **Apply** is **variable**, each vertex in the string has its own visibility flag and each flag is set to visible.*

Segment tab

Action choice box ignore set, clear, ignore

*if **set**, the segment visibility can be allowed to be a constant for all segments in the string, or to be different for each segment in the string.*

*If **clear**, the segment visibility are removed for the string and the string segments are always visible.*

*If **ignore**, don't modify the visibility flags for segments of the string.*

Apply choice box

*if **Action** is **set**, then the **Apply** field is used.*

*If **Apply** is **constant**, the string has only one visibility flag and it applies to all segments in the string It is set to visible*

*If **Apply** is **variable**, each segment in the string has its own visibility flag and each flag is set to visible.*

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Change button

process the selected strings.

Compress

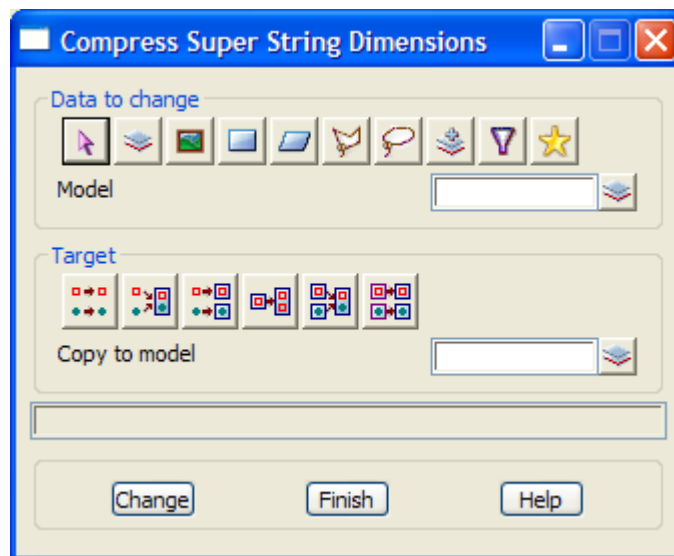

`compress_super_string_dimensions`

Position of option on menu: Strings =>Properties =>Super strings =>Compress

The compress option removes any super string dimensions that are not needed. For example, dimensions such radius, variable z etc. that are not being used in the string are removed.

This reduces the storage required for the super string.

On selecting the Compress option, the **Change Super String Visibility** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info	input		
--------------------	-------	--	--

extra information required for the target.

Change	button		
---------------	--------	--	--

process the selected strings

Tinable

change_super_string_tinability

Position of option on menu: Strings =>Properties =>Super strings =>Tinable

For selected super strings, the Tinable option can set the flags that determine how tinability is defined for a super string and can also set whether segments or vertices are tinable or not.

Segment tinability can

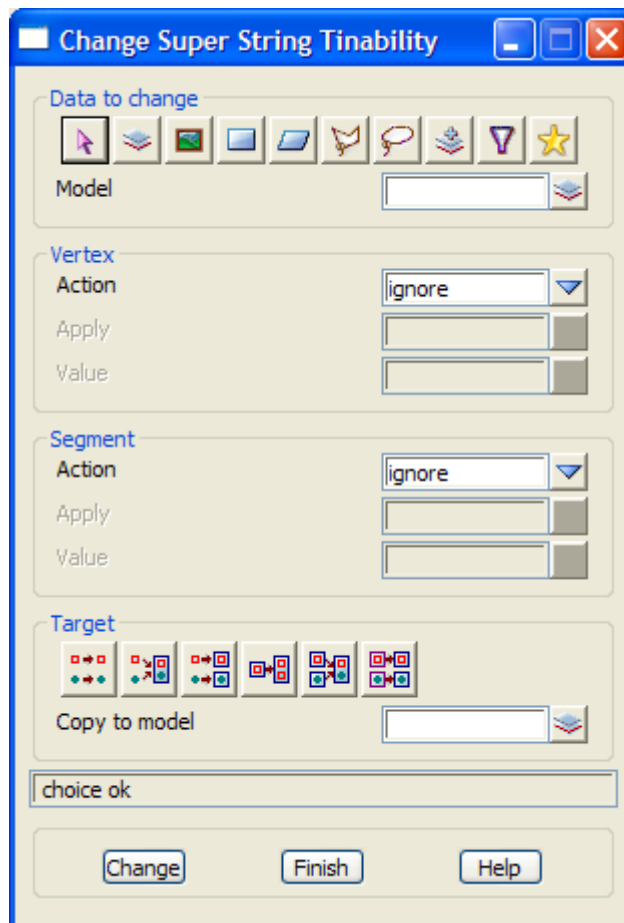

- (a) be not settable at all for the string - it is always tinable
- (b) have one setting for the entire string
- (c) have separate settings for each segment.

Similarly, vertex tinability can

- (a) be not settable at all for the string - it is always tinable
- (b) have one setting for the entire string
- (c) have separate settings for each segment.

The Tinable option allows any of the above cases to be set up for the selected super strings.

On selecting the Tinable option, the **Change Super String Tinability** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source input
source of data is to be processed.

Vertex tab

Action choice box ignore set, clear, ignore
if **set**, the vertex tinability can be allowed to be a constant for all vertices in the string, or to be different for each vertex in the string.
If **clear**, the vertex tinability can not be modified for the string and the string vertices are always tinable.
If **ignore**, don't modify the tinability flags for the vertices of the string.

Apply choice box

if **Action** is **set**, then the **Apply** field is used.
If **Apply** is **constant**, the string has only one tinability flag and it applies to all vertices in the string. The tinability flag it is set to the value in the **Value** field.
If **Apply** is **variable**, each vertex in the string has its own tinability flag. The tinability flag it is set to the value in the **Value** field.

Value choice box

if **Value** is **on**, then the tinable flag is set to **tinable**.
If **Value** is **off**, then the tinable flag is set to **not tinable**.

Segment tab

Action choice box ignore set, clear, ignore
if **set**, the segment tinability can be allowed to be a constant for all segments in the string, or to be different for each segment in the string.
If **clear**, the segment tinability can not be modified for the string and the string segments are always tinable.
If **ignore**, don't modify the tinability flags for segments of the string.

Apply choice box

if **Action** is **set**, then the **Apply** field is used.
If **Apply** is **constant**, the string has only one tinability flag and it applies to all segments in the string. The tinability flag it is set to the value in the **Value** field.
If **Apply** is **variable**, each segment in the string has its own tinability flag. The tinability flag it is set to the value in the **Value** field.

Value choice box

if **Value** is **on**, then the tinable flag is set to **tinable**.
If **Value** is **off**, then the tinable flag is set to **not tinable**.

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Change button

process the selected strings

Fills

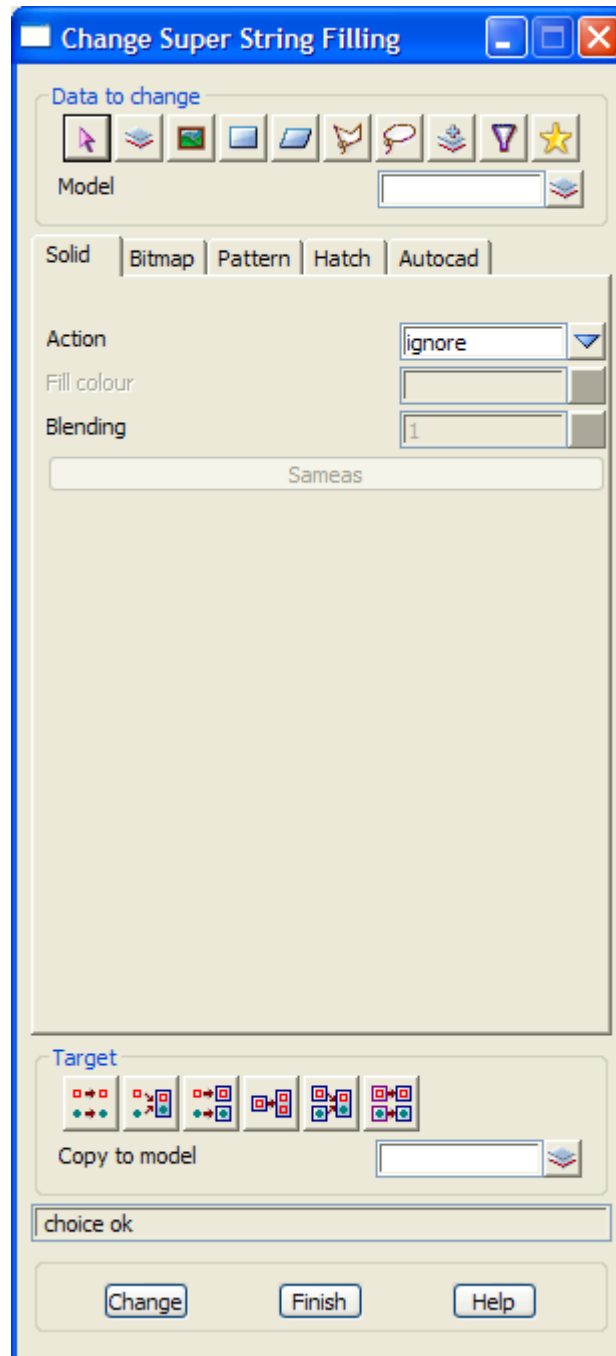

change_super_string_filling

Position of option on menu: Strings =>Properties =>Super strings =>Fills

For selected super strings, the Fills option can set the flags that determine how filling is defined for a super string. If the string is not closed, the first and last vertices are joined to define the region to fill.

A string can have zero, one or more types of fills from the types solid, bitmap, pattern, hatch and Autocad.

On selecting the Fill option, the **Change Super String Filling** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			

Data source	input		
<i>source of data is to be processed.</i>			

Solid, Bitmap, Pattern, Hatch and Autocad Tabs

each tab defines how that type of fill is applied to the string. Zero, one or more fill types can be applied to a string.

Action	choice box	ignore	set, clear, ignore
<i>if set, this type of fill is set for the string.</i>			
<i>If clear, this type of fill is turned off for the string.</i>			
<i>If ignore, don't modify this type of fill for the string.</i>			

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info	input		
<i>extra information required for the target.</i>			

Change	button		
<i>process the selected strings</i>			

Symbol

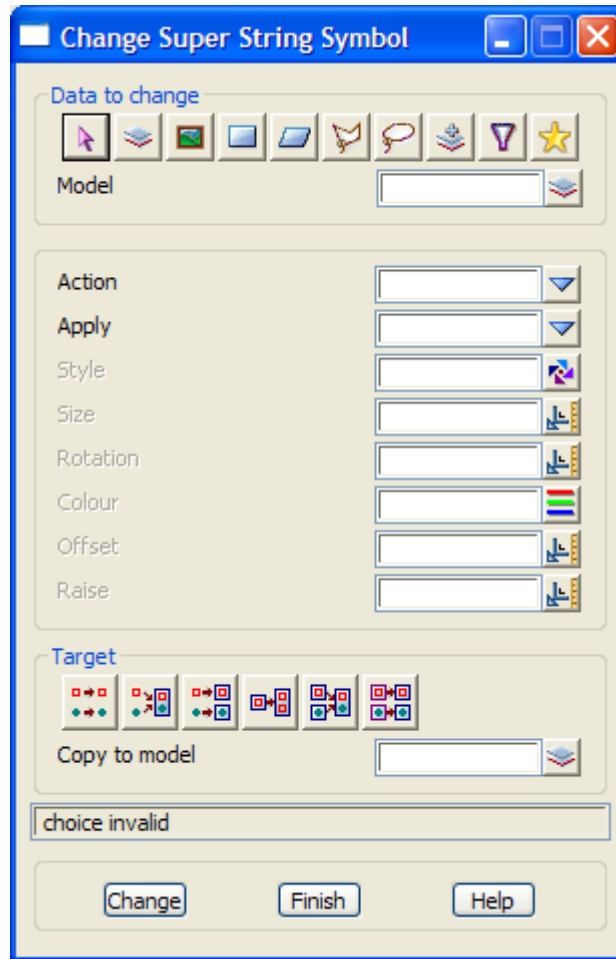

change_super_string_symbol

Position of option on menu: Strings =>Properties =>Super strings =>Symbol

For selected super strings, the symbols option can set the flags that determine how symbols are defined for a super string.

A super string can have no symbols, a constant symbol definition for the entire string or different symbol definitions at each vertex.

On selecting the symbol option, the **Change Super String Symbols** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Action	choice box	ignore	set, clear, ignore
<i>if set, a symbol can be constant for all vertices in the string, or can be different for each vertex in the string.</i>			
<i>If clear, there are no symbols for the string.</i>			
<i>If ignore, don't modify the symbol flags for the vertices of the string.</i>			
Apply	choice box		constant, variable
<i>if Action is set, then the Apply field is used.</i>			

If Apply is **constant**, the string has only one symbol and it used for each vertices in the string. It is set to visible.

If Apply is **variable**, each vertex in the string has its own symbol.

Symbol symbol box

symbol to be used.

Size

size of the symbol.

Rotation angle box

angle to rotation the symbol - positive is counter-clockwise.

Colour colour box

colour for the symbol (if the symbol has no imbedded colours).

Offset

distance the centre of the symbol is from the vertex.

Raise

distance the centre of the symbol is raised off the line through the vertex with the given angle.

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Change button

process the selected strings

Segment Colour

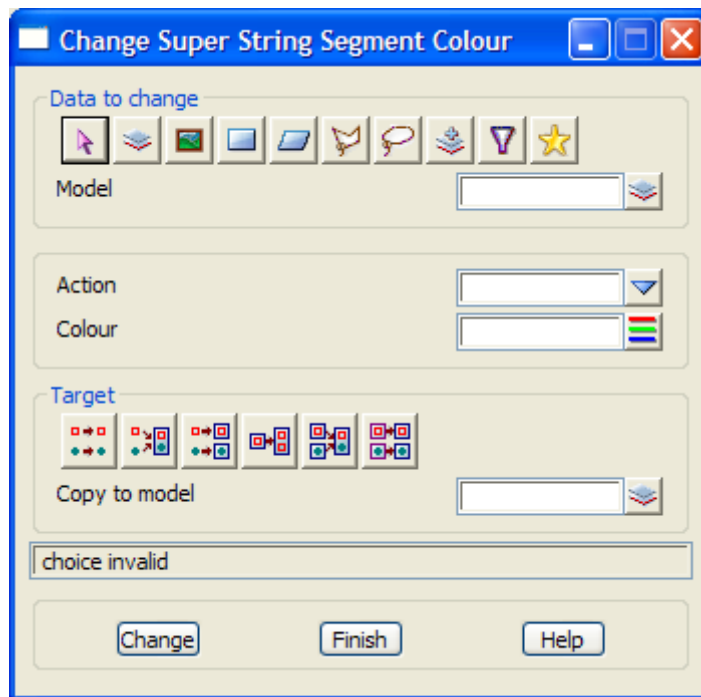

`change_super_string_segment_colour`

Position of option on menu: Strings =>Properties =>Super strings =>Segment colour

A super string has a default colour used for the entire string and segment colours setable for each segment which override the string colour for that segment.

The segment colour option can set a segment colour for every segment in the super string or clear all the set segment colours so that the default string colour is used.

On selecting the segment colour option, the **Change Super String Segment Colour** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Action	choice box		set, clear
<i>if set, each segment colour is set to the colour in the Colour box.</i>			
<i>If clear, any segment colours are removed and each segment set to having no segment colour.</i>			
Colour	colour box		
<i>if Action is set, then every segment is set to this colour.</i>

Change	button		
<i>process the selected strings</i>			

Height

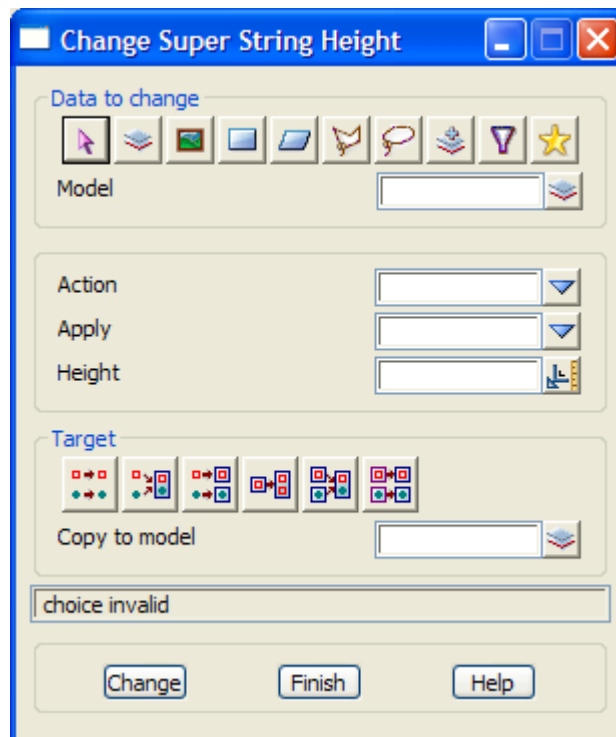

change_super_string_height

Position of option on menu: Strings =>Properties =>Super strings =>Height

A super string can have the one height that is used for every vertex in the super string (constant height) or it can have a different height at each vertex.

The Height option can set the super string to either having a constant height or to allow each vertex to have independent heights.

On selecting the Height option, the **Change Super String Height** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
Data source		input		
Action		choice box	ignore	set, clear
Apply		choice box		constant, variable
Height				

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source

input

source of data is to be processed.

Action

choice box

ignore

set, clear

if set, the string height can be a constant for the entire string, or to be different for each vertex in the string.

If clear, the entire string and each vertex has no height.

Apply

choice box

constant, variable

if Action is set, then the Apply field is used.

If Apply is constant, the string has only one height and no vertex has its own height. The height for the string is set to the height in the Height field.

If Apply is variable, each vertex in the string is set to have its own height and it is set to the value in the Height field.

Height

if Action is set, then either the entire string or every vertex is set to this height.

Vertex Id

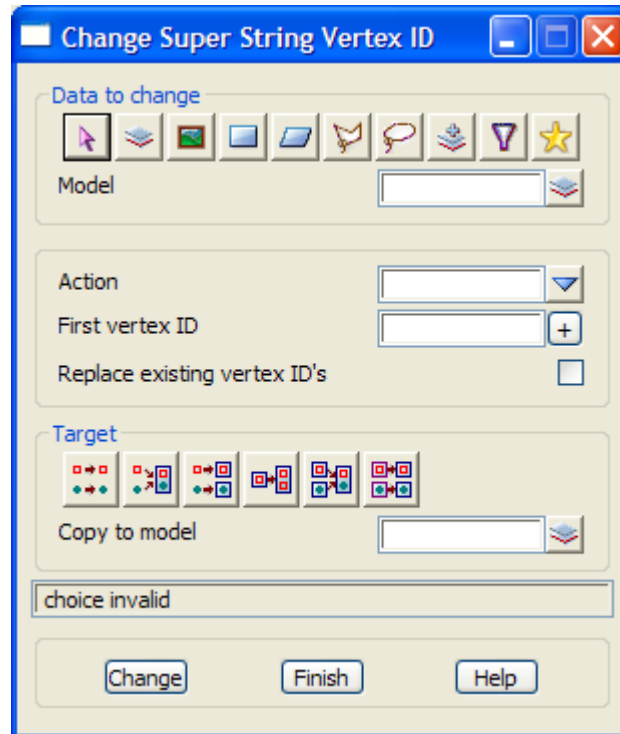

change_super_string_vertex_id

Position of option on menu: Strings =>Properties =>Super strings =>Vertex id

A super string has a *Vertex id* for each vertex.

The Vertex id option can set the Vertex ids to sequential numbers (optionally ignoring existing Vertex ids) or clear all the existing vertex ids for the super string.

On selecting the Vertex id option, the **Change Super String Vertex Id** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source

input

source of data is to be processed.

Action

choice box

set, clear

if clear, the vertex ids are cleared at each vertex.

If set, the vertex id's are given sequential numbers starting with the number given in First vertex id field.

First vertex id

if Action is set, the vertex id's start with this value.

Replace existing vertex id's

tick box

if tick, any vertex with an existing vertex is not given a new vertex id.

If not tick, all vertices are given new vertex ids.

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info

input

extra information required for the target.

Change button
process the selected strings.

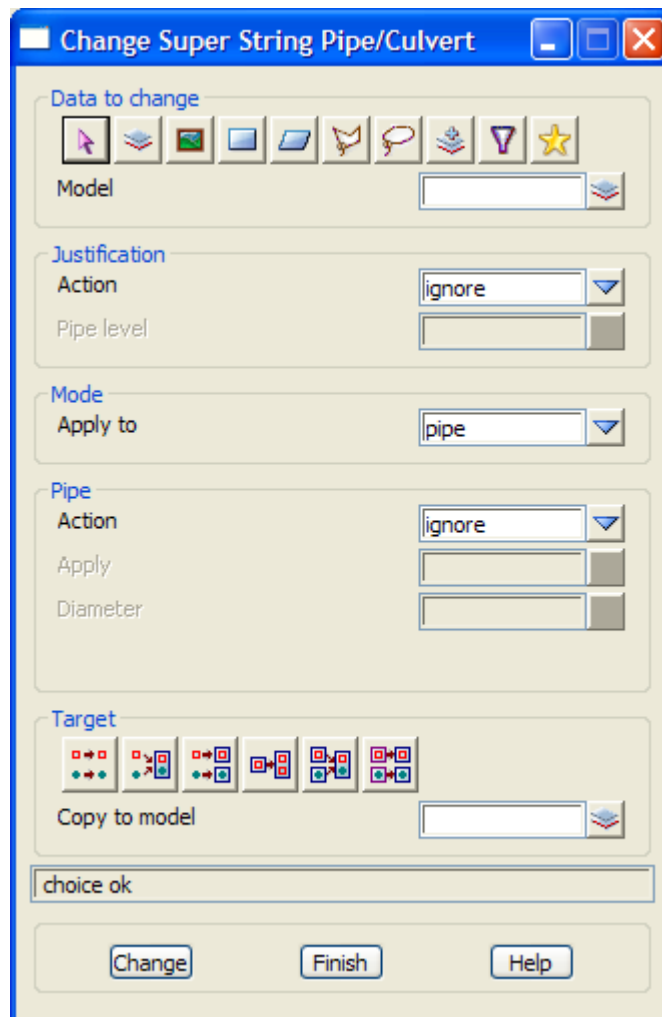

Pipe/Culvert

change_super_string_pipe_culvert

Position of option on menu: Strings =>Properties =>Super strings =>Pipe/culvert/extrude

Each segment of a super string can have a diameter or a rectangular cross-section (box culvert).

On selecting the Pipe/culvert option, the **Change Super String Pipe/Culvert** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

Justification

Action	choice box	set, clear, ignore
---------------	------------	--------------------

if set, the string justification is set to the type given in the Pipe level field.

If clear, the string justification information is cleared.

If ignore, nothing is done to the string justification.

Justification

if Action is set, the string justification is set to this value.

Mode

Apply to choice box pipe, culvert

*if **pipe**, the next section of the panel has fields for setting pipe information.*

*if **culvert**, the next section of the panel has fields for setting culvert information.*

Pipe

Action choice box set, clear, ignore

*if **set**, then the Pipe Apply field specifies how the pipe information is modified.*

*If **clear**, the pipe information is cleared at each segment.*

*If **ignore**, nothing is done to the pipe information.*

Apply choice box constant, variable

*if **Pipe Action** is set, then the Apply field is used.*

*If Apply is **constant**, the string has only one diameter and no segment has its own diameter. The diameter for the string is set to the value in the Diameter field.*

*If Apply is **variable**, each segment in the string is set to have has its own diameter and it is set to the value in the Diameter field.*

Diameter

diameter for each pipe segment.

Culvert

Action choice box set, clear, ignore

*if **set**, then the Culvert Apply field specifies how the culvert information is modified.*

*If **clear**, the culvert information is cleared at each segment.*

*If **ignore**, nothing is done to the culvert information.*

Apply choice box constant, variable

*if **Culvert Action** is set, then the Apply field is used.*

*If Apply is **constant**, the string has only one width and height and no segment has its own width and height. The width and height for the string is set to the values in the Width and Height fields.*

*If Apply is **variable**, each segment in the string is set to have has its own width and height and they are set to the values in the Width and Height fields.*

Width/Height

width/height for each culvert segment.

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Change button

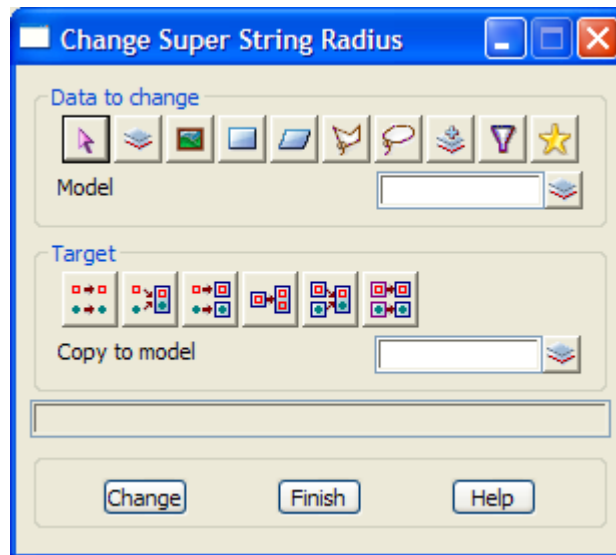

process the selected strings.

Radius

`change_super_string_radius`

Position of option on menu: Strings =>Properties =>Super strings =>Radius

The Radius option clears any segment radii.

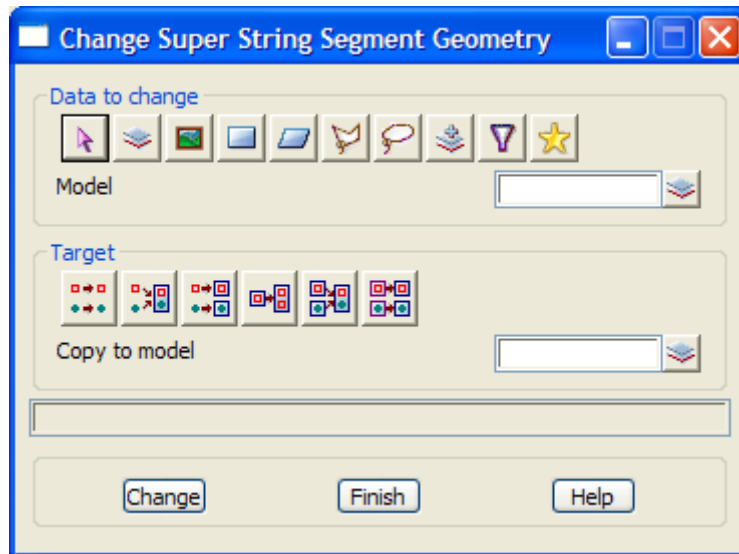

Segment Geometry

[change_super_string_segment_geometry](#)

Position of option on menu: Strings =>Properties =>Super strings =>Segment geometry

The Segment geometry option clears any segment geometry.

Text

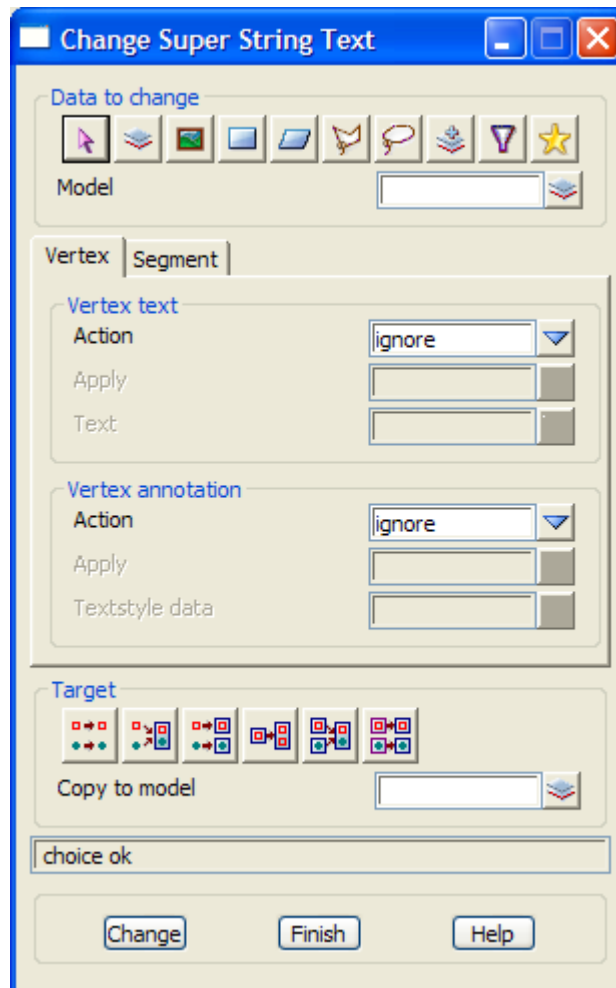

change_super_string_text

Position of option on menu: Strings =>Properties =>Super strings =Text

Each vertex and segment of a super string can have its own text.

The Text option can set, clear the vertex or segment text and/or textstyle data for the super string.

On selecting the Text option, the **Change Super String Text** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

Vertex tab**Vertex text**

Action	choice box	ignore	set, clear, ignore
---------------	------------	--------	--------------------

if set, the vertex text can be a constant for the entire string, or to be different for each vertex in the string.

If clear, the vertex text is cleared.

If ignore, nothing is done to the vertex text.

Apply choice box constant, variable

*if **Action** is set, then the Apply field is used.*

*If Apply is **constant**, the string has only one vertex text value and no vertex has its own vertex text. The vertex text for the string is set to the text in the Text field.*

*If Apply is **variable**, each vertex in the string is set to have has its own text and it is set to the value in the Text field.*

Text

if Action is set, then either the entire string or every vertex text is set to this value.

Vertex annotation

Action choice box ignore set, clear, ignore

if set, the vertex textstyle data can be a constant for the entire string, or to be different for each vertex in the string.

*If **clear**, the vertex textstyle data is cleared.*

*If **ignore**, nothing is done to the vertex textstyle data.*

Apply choice box constant, variable

*if **Action** is set, then the Apply field is used.*

*If Apply is **constant**, the string has only one vertex textstyle data and no vertex has its own vertex textstyle data. The vertex textstyle data for the string is set to the text in the Textstyle data field.*

*If Apply is **variable**, each vertex in the string is set to have has its own textstyle data and it is set to the value in the Textstyle data field.*

Textstyle data

if Action is set, then the vertex textstyle data is set to this value.

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Change button

process the selected strings.

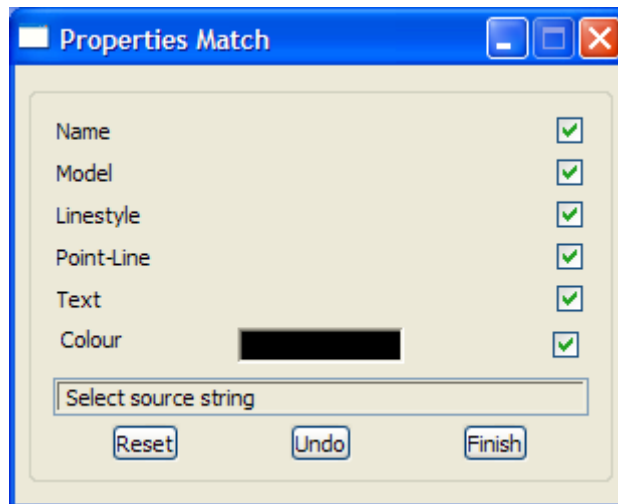

Match

prop_match_panel

Position of option on menu: Strings =>Properties =>Match

The Match option obtains information from a selected string and uses that to set information on another selected string.

On selecting the Match option, the **Properties Match** panel is displayed.

The properties match option is automatically in a pick mode for selecting the string whose properties you wish mimic (source string).

After the source string is selected, the values of the property from the source string are filled in on the panel and tick boxes turned on for each property. The tick boxes can be turned off if that property is not to be modified on the selected strings. The strings to change are then selected one after another.

If a new set of properties is required, selecting the **Reset** button is used to select a new source string.

The fields and buttons in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	tick box	tick	
<i>if tick, set the name of the selected string to the value displayed in the Name field.</i>			
Model	tick box	tick	
<i>if tick, set the model of the selected string to the value displayed in the Model field.</i>			
Linestyle	tick box	tick	
<i>if tick, set the model of the selected string to the value displayed in the Linestyle field.</i>			
Point-Line	tick box	tick	
<i>if tick, set the model of the selected string to the value displayed in the Point-Line field.</i>			
Text	tick box	tick	
<i>if tick, set the textstyle and height of a selected string to the values displayed in the Text field.</i>			
Colour	tick box	tick	
<i>if tick, set the colour of the selected string to the value displayed in the Colour field.</i>			
Reset	button		
<i>Select a new source string to set the values of the properties on the panel.</i>			

Label

string_labelling

Position of menu: Strings =>Properties =>Label

The label menu contains options to label string chainages, create tadpoles for cut and fill, label string vertices with their x, y, z or point numbers and names.

The Label walk-right menu is

For	<i>Chainages</i>	go to	"Label Chainages" .
	<i>Cut/fill</i>		"Label Cut/Fill" .
	<i>Names</i>		"Label Names" .
	<i>Vertices</i>		"Label Vertices" .

Label Chainages

label_chainages_on_string

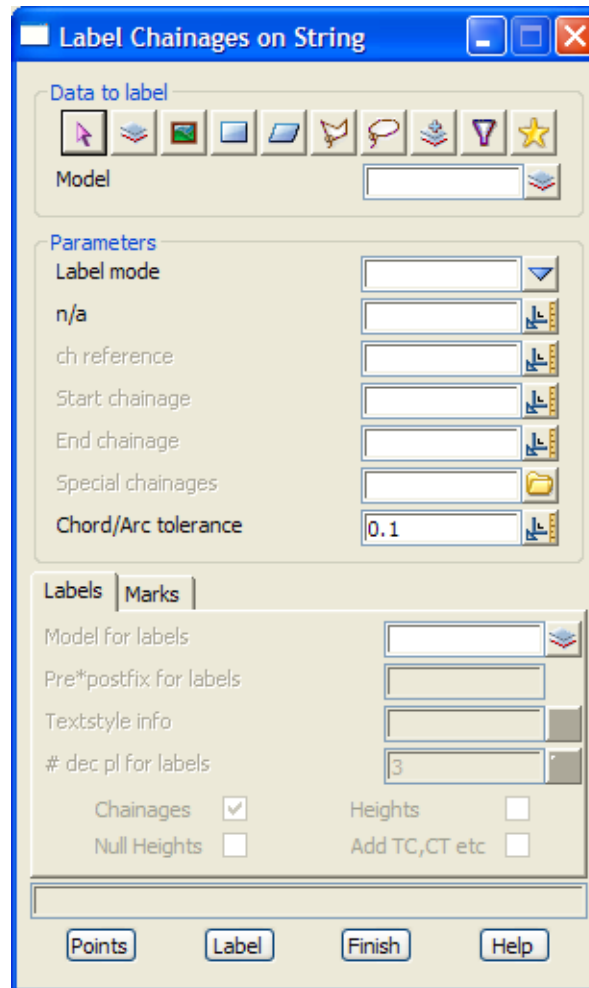

Position of option on menu: Strings =>Label => Chainages

The label chainages option is used to create text at regular chainages and special points on a string such as horizontal and vertical tangent points, crest and sag points and user selected points. It can also create tick marks at selected chainages.

The user has control over the label height, colour, angle, offset and the number of decimal places displayed, plus the size and colour of the tick marks.

As well as being used for labelling centre-lines, this option is used in conjunction with the sewer option to create special labels for sewer long section plots.

On selecting the Label chainages option, the **label chainages on string** panel is displayed.

Individual points can be labelled by selecting them after picking the **Points** button.

The **marks** button brings up the **label chainages on string (marks)** panel which is used to place marks at the chosen chainages.

The fields and buttons used in the **label chainages on string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>			
Data source <i>data source for strings to label.</i>			
Label mode	input		regular interval, regular interval plus end pts end points only horizontal TPs, vertical TPs, horizontal discontinuities vertical discontinuities all discontinuities, crests/sags all horizontal points

type of labelling required.

Ch interval or n/a	input	
	<i>the regular interval to use for labelling points.</i>	
Ch reference	input	0
	<i>the chainages to be labelled are integer multiples of the chainage interval added to the reference chainage. For example, if the reference chainage is 23.2 and the chainage interval 10, the chainages 3.2, 13.2, 23.2, 33.2 etc. will be labelled.</i>	
Start chainage	input	
	<i>if non-blank, the string chainage to start labelling from. If blank, start at the beginning of the string.</i>	
End chainage	input	
	<i>if non-blank, the string chainage to end the labelling at. If blank, go to the end of the selected string.</i>	
Special chainage	input	
	<i>file of special chainages to create labels at.</i>	
Chord/arc tolerance	input	default chord/arc tolerance
	<i>the chord to arc tolerance to use on the strings being labelled for determining how many points are labelled around horizontal curves.</i>	

Labels tab

Model for labels	model box		available models
	<i>if non-blank, labels are generated and placed in this model. If blank, no labels are created (but tick marks may be).</i>		
Pre*postfix for labels	input		
	<i>the beginning and ending of the label to be given at each point. Spaces are significant. This uses the standard 12d method of pre-text*post-text. That is, 'Ch * m' would add 'Ch ' before the value and ' m' after the label.</i>		
Textstyle info	textstyle box	1	available textstyle data
	<i>textstyle data to use when creating the labels.</i>		
# dec pl for labels	input	0	
	<i>number of decimal places used in the labels.</i>		
Chainages	tick	tick	
	<i>if tick, the chainage of each point is appended to the label stem to create the label for the point. If no tick, only the label stem is used as the label.</i>		
Heights	tick		
	<i>if tick, the height of each point is used in the label for the point. If no tick, heights are not used in the label.</i>		
Null heights	tick		
	<i>if tick and the height of a point null, (null) is used in the label for the point. If no tick, null heights are not used in the label.</i>		
Add TC, CT etc.	tick		
	<i>if tick and labelling an alignment string, the critical point types are used in the label for the point. If no tick, critical point types are not used in the label.</i>		

Marks tab

Model for marks	input	available models
	<i>if non-blank, tick marks are generated according to the label mode and placed in this model.</i>	

If *blank*, no tick marks are created.

Points	button
---------------	--------

pick individual positions to label with a label stem and chainage (if the chainages field is set to tick).

Label	button
--------------	--------

label the selected strings as specified by the label mode, mode for marks and other fields in the panel.

Please continue to the next section "Label Cut/Fill" .

Label Cut/Fill

cut_fill_marks

Position of menu: Strings =>Label => Cut/Fill

The cut/fill menu contains options to create cut and fill tick marks between selected strings.

The options can generate standard tadpoles, tick marks or use user specified model as the tick symbol.

For each option, a **reference** string is selected which defines the chainages used for labelling cut/fill. The cut/fill symbols are drawn perpendicular to the reference string.

Two strings, **str1** and **str2** are selected for labelling.

The tick symbols are drawn at right angles to the reference string at a user specified chainage going between the two strings, **str1** and **str2**, from the higher string point to the lower string point (which string is higher or lower may vary along the strings). The tick symbol is repeated at the given chainage interval.

The tick symbol is drawn as a **percentage** of the **distance from the high point to the low point** between the two strings, **str1** and **str2** and this percentage is specified separately for the odd and even numbered ticks.

The cut/fill walk-right menu is

For the option *Tadpoles*, please go to the section "Tadpoles" .

<i>Ticks</i>	"Ticks"
<i>Ticks</i>	"Ticks"
<i>User symbols</i>	"User Symbols"
<i>From file</i>	"From File"

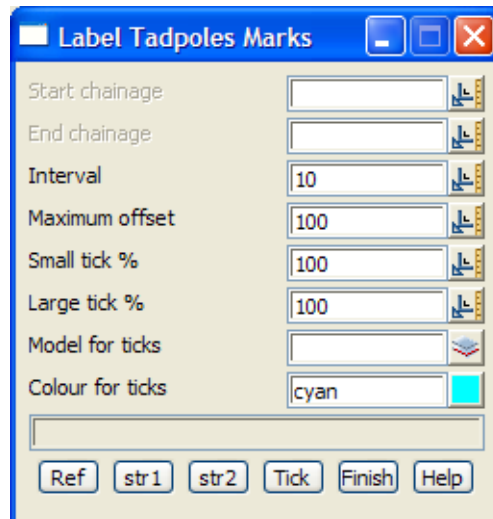

Tadpoles

label_tadpoles_marks

Position of option on menu: Strings =>Label => Cut/Fill => Tadpoles

The tadpoles option is used to generate tadpole symbols between two strings.

On selecting the tadpoles option, the **label tadpoles marks** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Start chainage <i>if non-blank, the reference string chainage to start creating tadpoles from. if blank, the reference string start chainage is used.</i>	input		
End chainage <i>if non-blank, the reference string chainage to end the tadpoles at. if blank, the reference string end chainage is used.</i>	input		
Interval <i>the chainage interval to use for creating tadpoles.</i>	input	10	
Maximum offset <i>the maximum distance to search from the reference string to find strings str1 and str2.</i>	input	100	
Small tick% <i>the percentage of the distance between the two strings, str1 and str2, that is taken up by the odd numbered tadpoles.</i>	input	100	
Large tick% <i>the percentage of the distance between the two strings, str1 and str2, that is taken up by the even numbered tadpole.</i>	input	100	
Model for ticks <i>the models for the tadpoles to placed into.</i>	input		available models
Colour for ticks <i>the colour for the tadpoles.</i>	input	cyan	available colours
Ref/Str1/Str <i>the selected string is used as the reference/str1/str2 string.</i>	button		

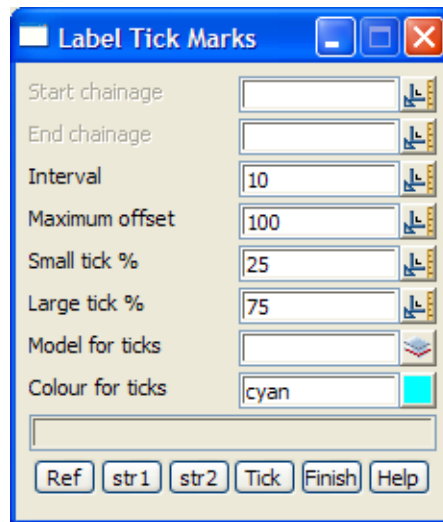

Ticks

label_tick_marks

Position of option on menu: Strings =>Label => Cut/Fill => Ticks

The ticks option is used to generate ticks (straight lines) between two strings.

On selecting the ticks option, the **label tick marks** panel is displayed.

The fields and buttons in this panel are used in exactly the same way as for the **label tadpoles marks** panels. The only difference is that the defaults for the small tick % and large tick % panel fields are 25 and 75 respectively.

User Symbols

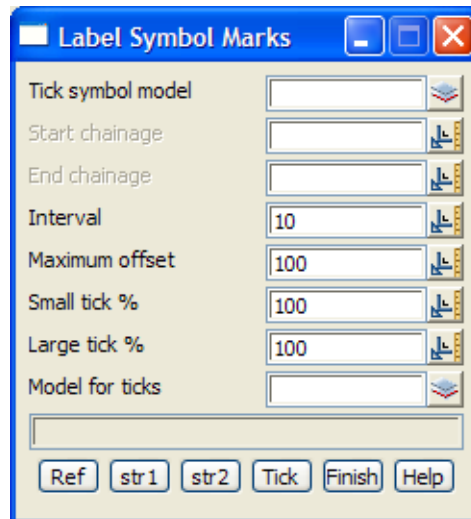

label_symbol_marks

Position of option on menu: Strings =>Label => Cut/Fill => User symbols

The user symbols option uses a given model, the **tick symbol model**, as the symbol to be drawn between the low and high points on the two strings.

The **tick symbol model** is aligned so that the model origin is at the high string point and the model's positive x-axis goes from the high string point to the low string point.

On selecting the ticks option, the **label tick marks** panel is displayed.

The fields and buttons in this panel are used in exactly the same way as for the **label tadpoles marks** panels except that a tick symbol model panel field is used to specify the symbol to be drawn for the cut/fill tick marks.

Field Description	Type	Defaults	Pop-Up
Tick symbol model	input		available models
<i>the model to be used as the tick mark symbols.</i>			

From File

Position of option on menu: Strings =>Label => Cut/Fill => From file

This is the same option as **Drafting =>Create cut/fill symbols**

Please go to the section “Label Cut/Fill” of the Chapter “Drafting” .

Label Names

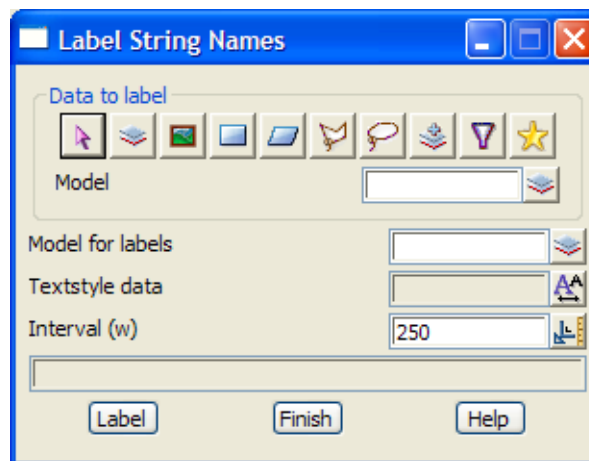

label_string_names

Position of option on menu: Strings => Label => Names

The label names option is used to label individual strings or all the strings in a model, with their string names.

The user has control over the label height, colour, and the distance between the labels.

On selecting the label names option, the **label string names** panel is displayed.

By using the **pick** button, individual strings can be labelled using the values in the panel fields. The model to label field is ignored.

If the **label** button is selected, then all the strings in the model given by the model to label field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the **label names** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>			
Data source <i>data source for strings to label.</i>			
Textstyle data <i>textstyle information.</i>	input		
Interval (w) <i>chainage interval in world units between the labels.</i>	input	250	
Label <i>label all the strings in the model given in the model to label field.</i>	button		

Please continue to the next section “Label Vertices” .

Label Vertices

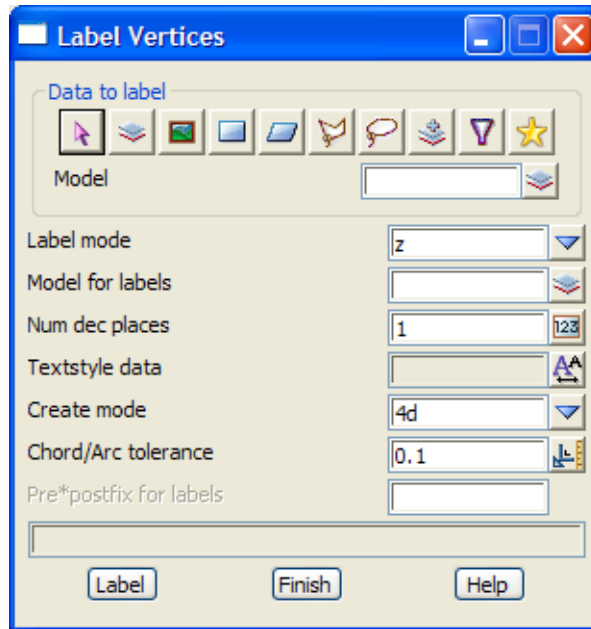

label_vertices

Position of option on menu: Strings =>Label => Vertices

The label vertices option can be used to label the x, y, z, z no nulls, point numbers, id-pt no, name and descriptions of strings selected by the data source.

The user has control over the label height, colour, the number of decimal places, the distance between the labels, the distance the label is from the point position, and the angle to draw the label at.

On selecting the label vertices option, the **label vertices** panel is displayed.

Individual strings can be labelled by using the **pick** button and then selecting the strings, to be labelled using the values in the panel fields. The string model field is ignored.

If the **label** button is selected, then all the strings in the model given by the string model field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the label strings panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>			
Data source <i>data source for strings to label.</i>			
Label mode	input	z	x,y,z, point number, Vertex no x and y id-vertex no z no nulls name <i>type of labelling required - x, y, z, point number, vertex no. for each point in the string.</i>
String model	input		available models <i>name of the model containing the strings to be labelled. Not used with the pick button.</i>

Model for labels	input		available models
<i>name of the model to place the labels in.</i>			
Num dec places	input	0	0,1,2,3,4,5
<i>number of decimal places used in the x,y,z labels.</i>			
Textstyle data	input		
<i>textstyle information.</i>			
Create mode	input	4d	4d, text
<i>if 4d, the vertex labels for the one string are placed in a 4d string.</i>			
<i>text, the vertex labels are created as individual text strings.</i>			
Chord/arc tolerance	input		default chord/arc tolerance
<i>the chord to arc tolerance to use on any alignment string being labelled for determining how many points are labelled around horizontal curves.</i>			
Label	button		
<i>label all the strings in the model given in the string model field.</i>			

Rasters

rasters

Position of menu: Strings =>Rasters

The Rasters menu contains options for working with rasters.

The Rasters walk-right menu is

create a raster
 create a raster from an ECW file
 create a raster from an TAB file
 edit a raster
 convert plan view to a raster
 set a boundary for a raster
 remove the boundary from a raster

For	<i>Create</i>	go to	"Create a Raster"
	<i>Create from ECW's</i>		"Create Rasters from ECW Files"
	<i>Create from TABs'</i>		"Create Rasters from TAB Files"
	<i>Edit</i>		"Edit a Raster"
	<i>Plan to raster</i>		"Create Raster from Plan View" in the chapter "View Menus"
	<i>Set boundary</i>		"Set a Boundary for a Raster"
	<i>Reset boundary</i>		"Reset the Boundary for a Raster"

Create a Raster

create_raster_element

Position of option on menu: Strings =>Rasters =>Create

A raster element consists of a raster image and positioning information for the raster so that it can be mapped into world units.

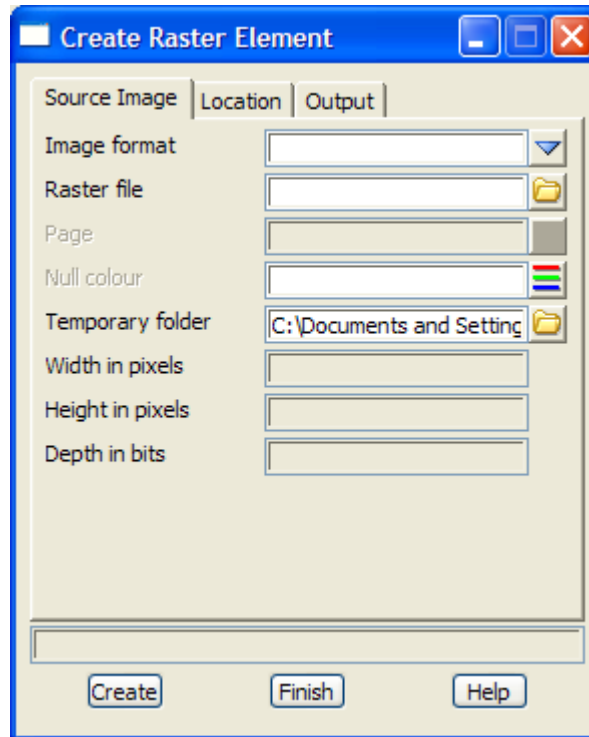

A raster element is added to a model just like any other string but for convenience it is suggested that no other strings are in the same model as a raster.

To help speed up drawing on a view, there is toggle for displaying/not displaying rasters on plan views.

Raster Restrictions

- The Raster file must have read/write permission
- Rasters are only supported on Win 2000 and above.

Selecting Create brings up the **Create Raster Element** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Source Image tab			
Image format	choice box		BMP, DIB, GIF ECW, JPEG, JPEG 2000 PNG, TGA, TIFF
<i>format that the original image is in. Non ECW rasters must be 24 bit colour.</i>			
Raster file	file box		
<i>name of the original raster image. The file must have read/write access and be 24 bit colour.</i>			
Page			
<i>page number of the raster when the format can contain more than one image (e.g. in a TIFF)</i>			
Null colour	colour box		available colours
<i>colour when there is no pixel in the raster</i>			
Temporary folder	file box	c:\temp	select folder
<i>folder to use as a temporary storage area whilst converting the raster to the 12d raster format. The temporary folder needs to have enough free disk space to convert the largest of the rasters to bmp format.</i>			
Width/Height in pixels	output only		
<i>the width/height in pixels of the selected raster</i>			
Depth in bits	output only		
<i>display the colour depth of the source data</i>			
Projection	output only		
<i>display the projection of the source data if available</i>			

Location tab

The location tab supplies the information for positioning the raster in world units in 12d Model. Most

rasters formats, other than ECW or Geotiff, do not include this information so it must be supplied by other means, either in a file or by typing in a world origin, anticlockwise rotation angle and world width and height.

Data format choice box Raw details Raw Details, Autocad scr file
ESRI world, Geo Tiff,
Mapinfo tab

if **Raw details**, the location details are typed into the World Location Details section as rotation, world origin, world width and height.

If **Autocad scr file**, the location details are taken from the scr file given in Location file. An Autocad scr file gives the world co-ordinates of the corners of the raster starting in the bottom left hand corner, bottom right hand corner, top left hand corner and top right hand corner. An example of a scr file is:

```
line
22109.639,148090.695
23109.639,148090.695
22109.639,149090.695
23109.639,149090.695
```

If **ESRI world**, the location details are taken from the ESRI world file given in Location file. An ESRI world file gives the xscale, row rotation, column rotation, yscale, x origin and y origin. For use with 12d, the row and column rotations must be the same and yscale = - xscale.

If **Geo Tiff**, the Location details are taken from the geotiff file given in Location file panel field.

If **Mapinfo Tab**, the location details are taken from the Mapinfo tab file given in Location file.

Location file file box
file with the location details

Anticlockwise rotation angle box
the world rotation of the raster.

X/Y co-ordinate real box
the world x/y co-ordinate of the left hand bottom corner of the raster.

World width/height real box
the width/height in world units of the raster.

Output tab
the parameters for the created 12d raster.

Output size output
an estimate of the amount of disk space the raster will use in 12d Model

Fastest drawing speed input
only if raster is less than 24 bit depth - if selected, the raster is converted to a 24 bit image.

Minimum disk space input
only if raster is less than 24 bit depth - if selected, the raster is not converted to a 24 bit image and hence will take up less disk space. However it is converted at drawing time and so will be slower to display than a 24 bit image.

Name for raster input
the name for the raster

Model for raster input available models
name of the model for the raster element

Show border	tick	tick	
	<i>if tick then the border of the raster element is displayed</i>		
Colour for border	input	default colour	available colours
	<i>the colour of the border for the raster</i>		
Tin	tin box		available tins
	<i>if non blank, this tin is tagged with this raster so the raster is used for draping on the tin when the tin is used in visualisations</i>		
Create	button		
	<i>after the Create button is chosen, the raster element is created.</i>		

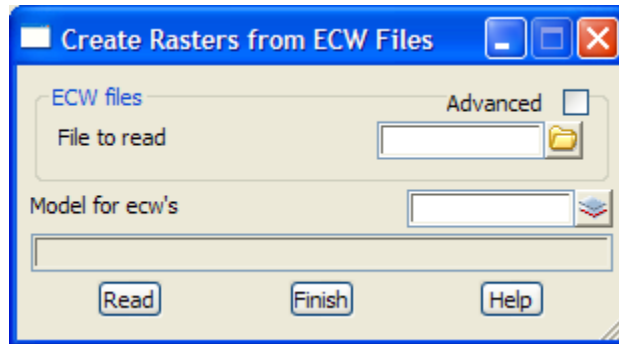

Create Rasters from ECW Files

create_rasters_from_ecw_files

Position of option on menu: Strings =>Rasters =>Create from ECW's

This option attaches one or more ECW files to a model.

Selecting Create from ECW's brings up the **Create Rasters from ECW Files** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for ecw's <i>name of the model for the ECW files</i>	input		available models
Pre*post <i>if non blank, pre*post text to use for the name of the raster from the ECW file (see "Pre*Postfix Panel Fields" for information on using pre*postfix)</i>	text input		
File to read <i>name of the ECW file to attach to the model</i>	file box		*.ecw files
Advanced <i>if tick, a grid to allow multiple ECW files to be read in, is opened. A wild card is used to select all the files to be read in.</i>	tick box		

Folder <i>folder to search for files using the Wild card</i>	folder box
Wildcard <i>wild card to use in search for files in the given folder</i>	input
Use <i>if tick, read in the file</i>	tick box
Files <i>name of the file in the folder</i>	output

Size output
file size

Create button
*after the **Read** button is chosen, the raster elements are created.*

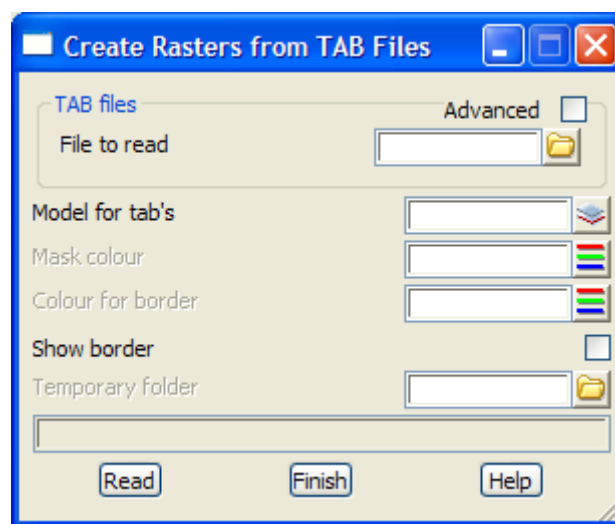

Create Rasters from TAB Files

[create_rasters_from_tab_files](#)

Position of option on menu: Strings =>Rasters =>Create from TAB's

This option reads one or more rasters as define by TAB files and places them in a model.

Selecting Create from TAB's brings up the **Create Rasters from TAB Files** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File to read	file box		*.ecw files

name of the TAB files to read to define rasters to read into the model

Advanced	tick box
-----------------	----------

if tick, a grid to allow multiple TAB files to be read in, is opened. A wild card is used to select all the files to be read in.

Folder	folder box
---------------	------------

folder to search for files using the Wild card

Wildcard	input
-----------------	-------

wild card to use in search for files in the given folder

Use	tick box		
<i>if tick, read in the file</i>			
Files	output		
<i>name of the file in the folder</i>			
Size	output		
<i>file size</i>			
Model for tabs's	input		available models
<i>name of the model for the rasters defined by the TAB files</i>			
Pre*post	text input		
<i>if non blank, pre*post text to use for the raster for the TAB files (see "Pre*Postfix Panel Fields" for information on using pre*postfix)</i>			
Mask colour	colour box		available colours
<i>colour when there is no pixel in the raster</i>			
Colour for border	input	default colour	available colours
<i>the colour of the border for the raster</i>			
Show border	tick	tick	
<i>if tick then the border of the raster element is displayed</i>			
Temporary folder	file box	c:\temp	select folder
<i>folder to use as a temporary storage area whilst converting the raster to the 12d raster format. The temporary folder needs to have enough free disk space to convert the largest of the rasters to bmp format.</i>			
Create	button		
<i>after the Read button is chosen, the raster elements are created.</i>			

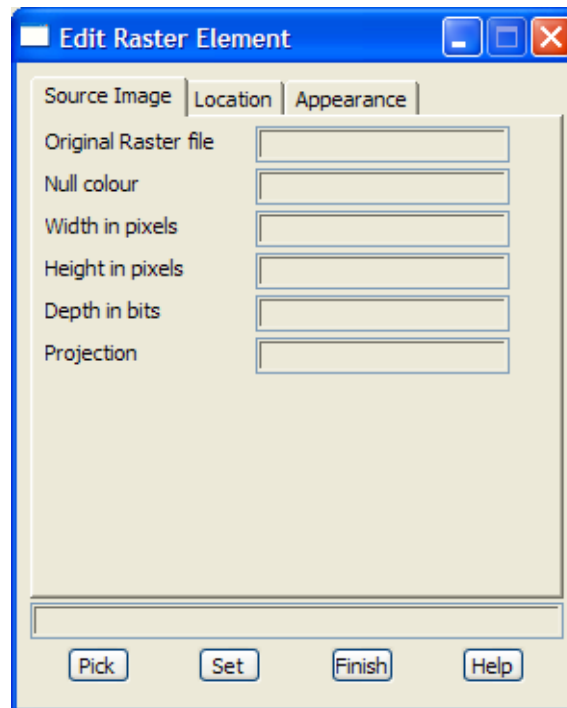

Edit a Raster

edit_raster_element

Position of option on menu: Strings =>Rasters =>Edit

The Edit option modifies the properties of any raster displayed in a *12d Model* view.

Selecting Edit brings up the **Edit Raster Element** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Source Image tab			
Original raster file <i>file that the raster originally came from</i>	output		
Null colour <i>colour when there is no pixel in the raster</i>	colour box		available colours
Width/Height in pixels <i>the width/height in pixels of the selected raster</i>	output only		
Depth in bits <i>display the colour depth of the raster</i>	output only		
Projection <i>display the original projection of the raster (if available)</i>	output only		

Location tab

When the raster is selected, the raw details for the raster (or ECW details) are displayed. The location details can then be modified and hence how the raster is positioned in world units in *12d Model* is modified.

Data format	choice box	Raw details	Raw Details, Autocad scr file ESRI world, Geo Tiff, Mapinfo tab
--------------------	------------	-------------	---

*if **Raw details**, the location details are typed into the World Location Details section as rotation, world origin, world width and height.*

*If **Autocad scr file**, the location details are taken from the scr file given in Location file. An Autocad scr file gives the world co-ordinates of the corners of the raster starting in the bottom left hand corner, bottom right hand corner, top left hand corner and top right hand corner. An example of a scr file is:*

```

line
22109.639,148090.695
23109.639,148090.695
22109.639,149090.695
23109.639,149090.695
    
```

*If **ESRI world**, the location details are taken from the ESRI world file given in Location file. An ESRI world file gives the xscale, row rotation, column rotation, yscale, x origin and y origin. For use with 12d, the row and column rotations must be the same and yscale = - xscale.*

*If **Geo Tiff**, the Location details are taken from the geotiff file given in Location file panel field.*

*If **Mapinfo Tab**, the location details are taken the Mapinfo tab file given in Location file.*

Location file	file box
----------------------	----------

file with the location details

model for the raster element.

Show border	tick	tick
--------------------	------	------

if tick then the border of the raster element is displayed

Colour for border	input	default colour	available colours
--------------------------	-------	----------------	-------------------

the colour of the border for the raster element

Buttons at Bottom

Pick	button
-------------	--------

select the raster element to edit by clicking on the border of the raster. The details for the selected raster are then displayed in the panel.

Set	button
------------	--------

give the raster element the new values from the panels fields

NOTE: A raster is **deleted** by using the string *Delete* option. The raster is selected for deleting by picking on the border of the raster.

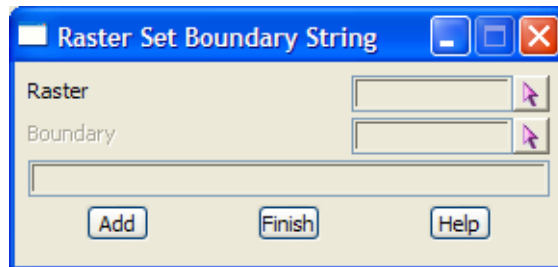

Set a Boundary for a Raster

raster_set_boundary_string

Position of option on menu: Strings =>Rasters =>Set boundary

The Set boundary option defines a boundary polygon for the raster. Only the parts of the raster inside the boundary polygon are displayed. The boundary polygon can have holes.

Selecting Set boundary brings up the **Raster Set Boundary String** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Raster <i>select the raster to have a drawing polygon set for it</i>	raster select box		
Boundary <i>select a polygon</i>	string select box		
Add <i>add the selected polygon as a boundary polygon for the selected raster</i>	button		

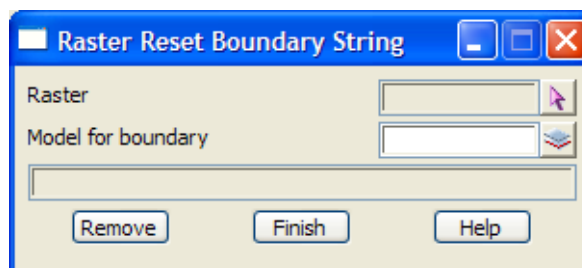

Reset the Boundary for a Raster

raster_reset_boundary_string

Position of option on menu: Strings =>Rasters =>Reset boundary

The Reset boundary option removes the boundary polygon from a raster.

Selecting Remove boundary brings up the **Raster Reset Boundary String** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Raster <i>select the raster to have its drawing polygon removed</i>	raster select box		
Model for boundary <i>model to place the removed boundary polygon in</i>	model box		available models

Remove button
remove the boundary polygon from the selected raster

Utilities

string_utilities

Position of menu: Strings =>Utilities

The utilities menu contains miscellaneous options involving strings.

The Utilities walk-right menu is

set string chainage at a point
 calculate depth string, report offset & xfall
 fit lines and arcs
 remove loops from strings
 create strings from labelled sections
 create section from projecting points onto a line

For	<i>Chainage</i>	go to	"Chainage"
	<i>Depth string</i>		"Depth String"
	<i>Loop removal</i>		"Loop Removal"
	<i>Strings from sections</i>		"Strings from Sections"
	<i>Sections from points</i>		"Sections from Points" in the chapter "Design"
	<i>Developments</i>		"Developments"

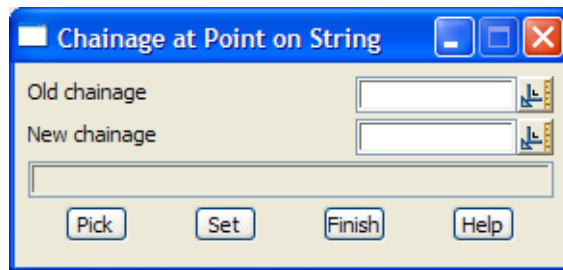

Chainage

chainage_at_point_on_string

Position of option on menu: Strings =>Utilities =>Chainage

The chainage menu option allows the user to specify the start chainage for a string by specifying what the chainage will be at a selected point on the string. The string's start chainage is then adjusted so that the point has the given chainage.

Selecting chainage fires up the **chainage at point on string** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old chainage <i>reports the initial chainage of the dropped point</i>	output		
New chainage <i>the new chainage for the dropped point.</i>	input		

Pick button

two objects to pick - pick the string to modify the chainage at a point and then pick a point which will be dropped onto the selected string to give the point that will have its chainage modified. The existing chainage on the string of the dropped point is then written to the old chainage panel field.

Set button

on selecting set, the start chainage is modified so that the chainage at the picked point is the value in the new chainage field. The old chainage field is then updated with the new chainage.

Please continue to the next section “Depth String” .

Depth String

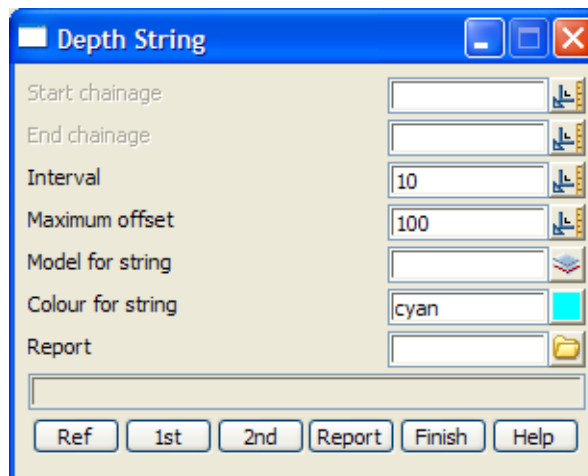

depth_string

Position of option on menu: Strings =>Utilities =>Depth string

The depth string option calculates the horizontal and vertical offsets and the cross-fall between two strings and then creates and/or reports on the string.

A reference string is selected which is used to define chainages. Lines perpendicular to the reference string are taken at regular chainages and intersected (in plan) with the first and second strings. The horizontal and vertical offsets and the cross-fall between the two strings are calculated at the intersection points.

On selecting the **depth string** option, the **depth string** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Start/End chainage	input		
<i>if blank, the start/end chainage of the reference string is used. if non-blank, the given chainage is used as the start/end chainage.</i>			
Interval	input		
<i>chainage interval to calculate values at.</i>			
Maximum offset	input		
<i>if non-blank, the maximum distance to search from the reference string to find the 1st and 2nd strings.</i>			
Model for string	input		available models
<i>if non-blank, a depth string is created and placed in this model.</i>			
Colour for string	input		available colours
<i>the colour for the depth string.</i>			

Report file	input	*.rpt
	<i>if non-blank, the file for the offset and cross-fall report</i>	
Ref/1st/2nd	button	
	<i>select the reference/first/second string.</i>	
Report	button	
	<i>calculate a depth string and produce an offset and cross-fall report on it.</i>	

Please continue to the next section “Loop Removal” .

Loop Removal

loop_removal

Position of option on menu: Strings =>Utilities =>Loop removal

The loop removal option tries to remove loops from strings by deleting points from the parts of the string where loops occur. No new points are introduced.

The user must indicate a good part on the string before any processing can begin.

Selecting loop removal fires up the **loop removal** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for string <i>model for the processed string to go to.</i>	input		available models
Pick string <i>pick the string to try and remove loops from.</i>	button		
Pick point <i>pick a good point on the string.</i>	button		
Process <i>try and remove string points from the loops in the string.</i>	button		

Please continue to the next section “Strings from Sections” .

Strings from Sections

Position of option on menu: Strings =>Utilities =>Strings from sections

The strings from sections option creates strings by joining the common named points on successive 4d strings (usually generated as sections). This option is documented under

Design => X-Sections => Strings from Sections

Please go to the section “Strings from Sections” of the Chapter “Design” .

Developments

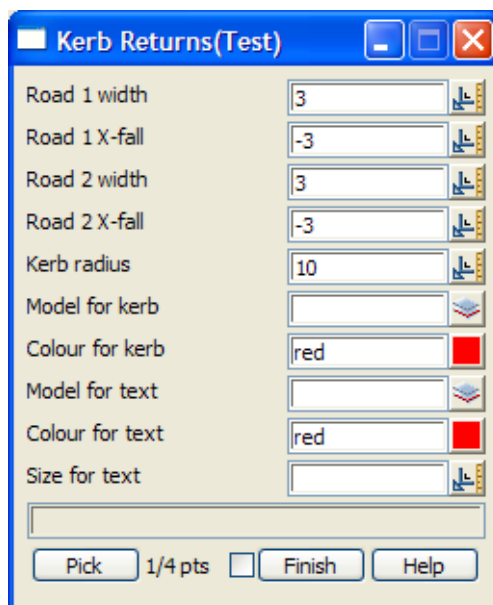

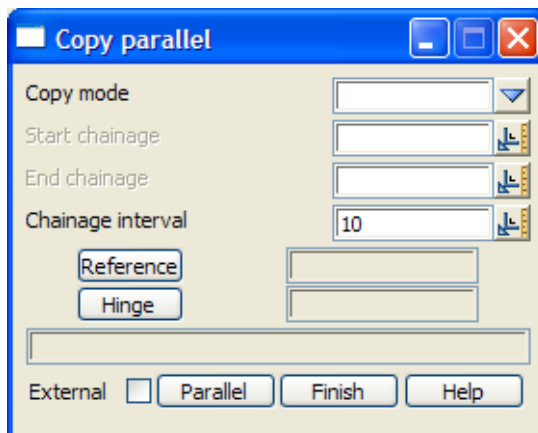

- string_developments
- copy_parallel
- kerb_returns_test_
- kerb_returns
- user_attributes_for_string

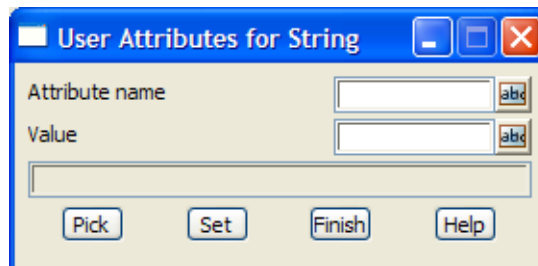

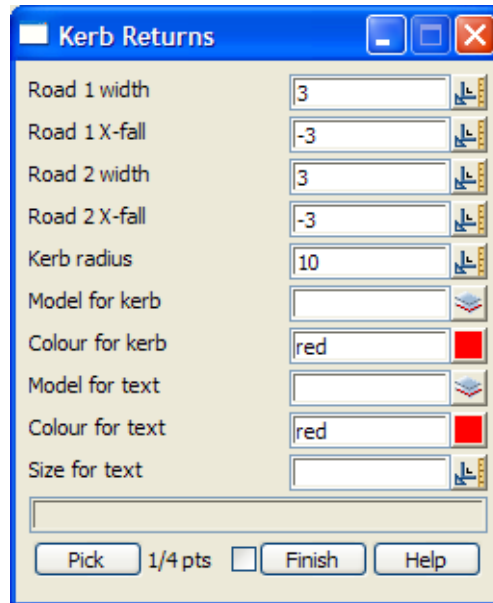

Position of menu: Strings =>Utilities =>Developments

Some of the options under string utilities are still under development, or are being phased out (Cogo(trial)) and won't be documented or released until future versions of 12d Model. The current options on the *Developments* menu are

- VG detailed design option - test
- HG, VG detailed design option - test
- kerb return VG - test
- kerb return VG - test
- user attributes
- Cogo superseded by CAD

cogo

Delete

strings_delete

Position of option on menu: Strings =>Delete

Entire strings can be deleted from **12d** Model using the delete option.

Any number of strings can be deleted by successively selecting the strings.

On selecting the delete string option, the **strings delete** panel is displayed.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick & Delete	button		
--------------------------	--------	--	--

any selected strings are deleted.

The cycle is terminated by clicking RB to raise the pick ops menu and selecting cancel from it.

15 Triangles

triangles

Position of menu: Tins

A **tin** (triangulated irregular network) is an accurate method of representing surfaces, especially those described by strings. **12d** Model uses tins in most operations involving surfaces. For example, contouring, interfacing and volume calculations.

Unlike strings, tins can be in more than one model, or even no model at all. However, to be **displayed** in a view or used for **profiling** on a section view, tins need to be in at least one model. It is suggested that each tin be in its own model called "tin **tin_name**". This makes it easy to know the model a tin is in, and also to see which models contain tins and obtain lists of all tins.

The triangles walk-right menu is

on Main menu

create floating Triangles menu

list of tins
information on project tins
check crossing breaklines
triangulate a model or view, supertin
modify model list etc. for tin
construct tin boundary
colour of tin, colour in polygon
contouring hts, depths, labelling
drape strings onto tin
slope, aspect, viewshed etc.
tin values at cursor position
remove unwanted triangles
various tin options
creating x-sections, mesh, long sec
tin sharing
User menus
delete tins from disk

on **12d** Model menu
and floating menu

Each of these options will now be discussed.

For the option *Tins*, please continue to "Tins"

<i>Tins info</i>	"Tin Info"

“Sections”
“Delete”

Tins

tin_list

Position of menu: Tins =>Tins

The tins walk-right menu provides options to list all the tins in the project (project tins) and all the tins in the project area but not in the project (removed tins).

The tins walk-right menu is

list of tins in project
list of removed tins in project area

Project Tins

Position of option on menu: Tins =>Tins => Project Tins

The project tins walk-right menu provides a list of all the tins in the project and there is a walk-right on each tin name showing what models the tin is in. If a tin name is selected from the list of tins, the **tin information** panel is fired up with the selected tin name already in the tin field.

Removed Tins

Position of option on menu: Tins =>Tins => Removed Tins

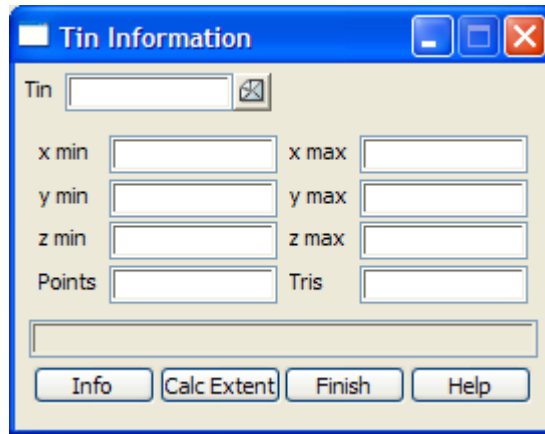

The removed tins walk-right menu provides a list of all the tins in the project area that have been removed from the project (using the removed from project option).

Tin Info

tin_information

Position of option on menu: Tins =>Tin info

Selecting tin info fires up the tin information panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin <i>input the name of the tin to get information on</i>	input		available tins
xmin, xmax	output		
ymin, ymax	output		
zmin, zmax <i>returns the tin x, y, z limits</i>	output		
Points <i>returns the number of points in the tin</i>	output		
Tris <i>returns the number of triangles in the tin</i>	output		
Info <i>get the information for the tin given in the tin field.</i>	button		
Calc Extent <i>recalculate the x, y, z bounding box for the tin given in the model field.</i>	button		

How to Use the Panel

The information for the tin given in the tin field is retrieved and placed in the appropriate panel fields when the tin name is piped into the tin field from the pop-ups, or an <enter> is entered after typing the tin name into the tin field, or on selecting the **info** button.

Check Breaklines

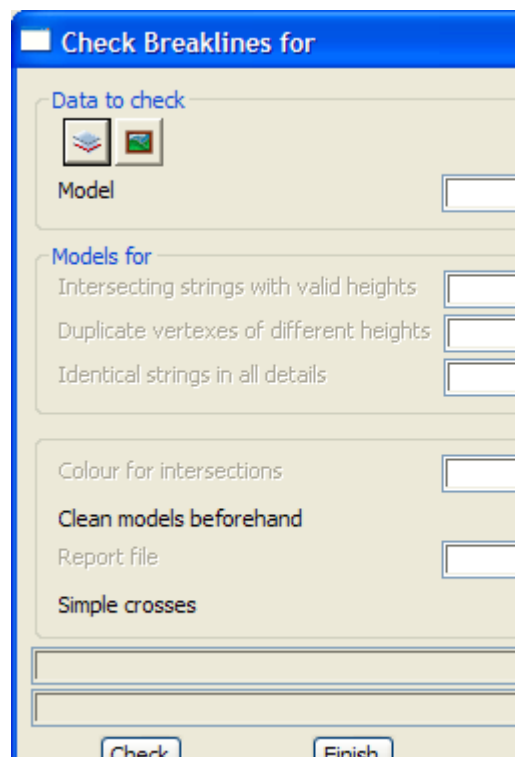

check_breaklines_for

Position of option on menu: Tins =>Check breaklines

The check breakline option is used to test whether any of the line segments from any line strings in a model or view intersect (cross) the line segments from any other string in the model/view. This includes self intersections of strings.

The option also checks for any points with the same x and y co-ordinates (same plan position) but different z-values, and for totally duplicated strings.

On selecting **Check breaklines** option and then the appropriate **Data Source** in the panel, the **Check Breaklines for** panel is displayed.

The fields and buttons in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts" .

Data source	input		
--------------------	-------	--	--

data to be processed.

Model for intersections	input		available models
--------------------------------	-------	--	------------------

if non-blank, check for any crossing line segments and place either a copy of the crossing segments into the model given in this field or a diamond depending on the state of "Simple crosses".

Model for duplicates	input		available models
-----------------------------	-------	--	------------------

*if non-blank, **copies** of any strings that are completely duplicated are placed in the model given in this field and circles are placed in this model at any duplicate points that aren't from an entire string.*

Model for identicals input available models
*if non-blank, the duplicates of any strings are **moved** to model given in this field. That is, if any strings are identical in all ways, then the second and subsequent identical strings are moved to the Model for identicals. This is for the case when a second copy of some data has been supplied.*

Colour for intersections input available colours
colour for the copies of the crossing segments.

Report file input
if non-blank, a report file of this name is created giving details of all the crossing breaklines and duplicate plan points with different z-values.

Duplicate points tick box tick
*if **tick**, check for points with the same (x,y) position.*

Duplicate strings tick box tick
*if **tick**, check for duplicate strings.*

Intersections tick box tick
*if **tick**, check for strings that intersect (in plan).*

Simple crosses tick box tick
*if **tick**, create diamonds at the position where strings cross, otherwise create a string in the shape of a cross with parts of the crossing strings.*

Check button
*after selecting the **check** button, all the strings in the model/view are tested for any crossing line segments or duplicate points. If requested, a report is generated.*

<esc> can be used to abort the checking option.

Create

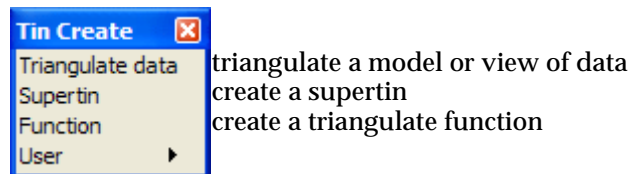

tin_create

Position of menu: Tins =>Create

The input data for a triangulation is either all the data in a selected model or all the data from all the models on a selected view or a list of models. The options for each method of selecting data are on the Create walk-right menu.

A SuperTin™ is a list of Tins and a Tin function creates a re-calc function name for an existing Tin. Each of these options are also on the Create walk-right menu.

The Create walk-right menu is

For the option *Triangulate data*, go to the section "Triangulate Data" .

Supertin

"Create SuperTin™" .

Function

"Function" .

Triangulate Data

triangulate_a_data_source

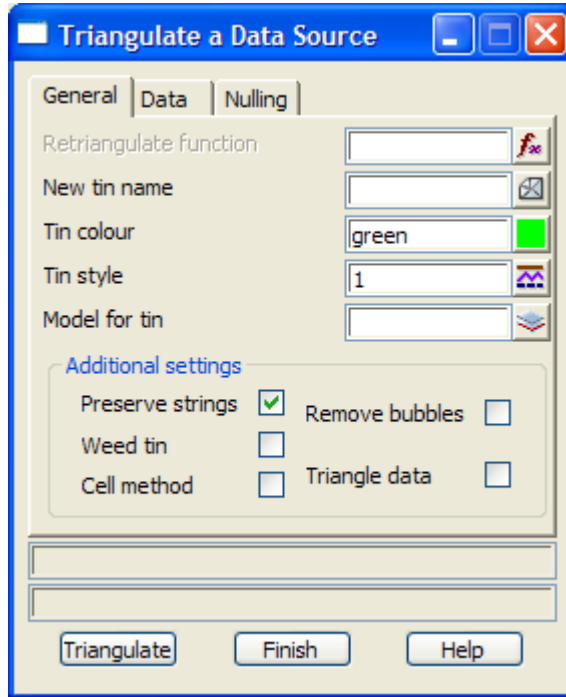

Position of option on menu: Tins =>Create =>Triangulate data

For simple jobs, the data to triangulate is all in the one model. However, it often occurs that the data one needs to triangulate is not in one model but is in the models displayed on a particular view.

The Triangulate data source option allows use to either select the data to triangulate from a single model, a list of models or to it uses the data points from all the models attached to a particular view, rather than the data from a particular model.

In each case, the models used in creating the triangulation are recorded so that the models can be easily retriangulated if any of the data changes.

On selecting the **Triangulate data** option, the **triangulate a Data Source** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts".</i>			
Data source	input		
<i>source of data is to be triangulated - only Model or View allowed for this option.</i>			
New tin name	input		
<i>name of the tin created from the triangulation of the model/view. If <enter> is type after the name, the model for tin field is filled out with the name tin new_tin_name.</i>			
Tin colour	input	default tin colour	available colours
<i>colour to draw the triangles whenever they are displayed in a view.</i>			
Tin style	input	1	available line styles
<i>line style used for drawing sections through the tin on the section view.</i>			
Model for tin	input		available models
<i>if non-blank, the created tin will be added to the model given in this field. if blank, the name tin new_tin_name will be placed in the field when the triangulate button is selected.</i>			
Preserve strings	tick box	tick	
<i>if tick, all strings with breakline type line or segment type tinable will be preserved as sides of triangles. Otherwise, all line strings or segments of type tinable will be treated as point strings for the triangulation.</i>			
Remove bubbles	tick box		
<i>if tick, post-processing occurs to try and stop all the points of a triangle coming from the same string. This helps prevent triangles with all three points coming from the one contour string and hence forming a flat triangle.</i>			

Weed tin tick box

if tick, all duplicate points are removed from the tin database. This helps to reduce the size of the tin files if there was a large amount of duplicate data. This flag is automatically set to tick for triangle data.

Triangle data tick box

if tick, then it is assumed the original data was triangles and 12d will ensure that the triangles produced by the triangulation exactly match (including null regions) the original triangle data. Weed tin is automatically set to tick if face data is set to tick.

Cell method tick box

if tick, try to create the triangles in cells - an alternate method of ordering the data which is often faster when the data comes in lines rather than randomly.

Data polygon string-select

if a string is selected as a data polygon, only string points that are inside the data polygon are used in the triangulation.

If no string is selected, then all the points in all the model/view are used in the triangulation.

Null polygon string-select

if a string is selected as a null polygon, any triangle whose centroid is outside the null polygon is automatically nulled.

Triangulate button

Triangulate the model/view given in the model/view to triangulate field. The created tin will be stored with the name given in the new tin name field. The tin will be the colour given in the tin colour field. If the model/view for tin field is non-blank, the created tin will be added to the model given in that field - if the model does not exist, it will be created.

Panel Messages

Progress messages - sent to the panel message area

no of points in model/view = no. of points

no. points pts no. break lines break lines

no. points pts no. of secs s no. pts/s no. dup

break lines finished. time taken = secs

Completion message - sent to the panel message area

average no of pts per sec = no.

<esc> can be used to abort the triangulation option.

Create SuperTin™

create_super_tin

Position of option on menu: Tins =>Create =>Supertin

The SuperTin™ option is designed to create a super triangulation from other triangulations.

With **SuperTins**, existing triangulations can be combined to form the equivalent of a merged triangulation without having to completely re-build a merged model and retriangulating it.

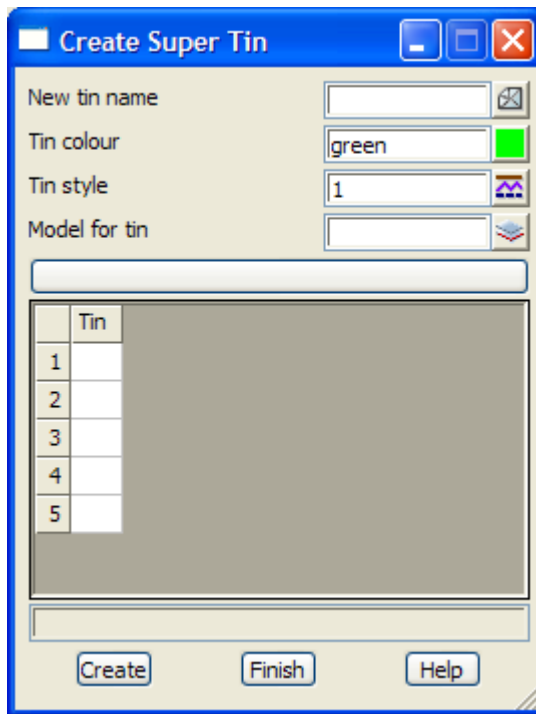

This means there are less steps in creating a SuperTin merged triangulation so a lot less time is required and there is less opportunity for errors. Also, if any of the component triangulations of the SuperTin are modified, then the SuperTin is also instantly modified.

The SuperTin is defined by a list of triangulations in increasing priority order. Wherever two triangulations overlap, the triangulation of higher priority takes precedence and is used to defined z-values and sections.

Hence, for any (x,y) point, the z-value on the SuperTin is defined to be the z-value from the triangulation of the highest priority which is under the (x,y) point.

A section through a SuperTin is made up of the sections through the triangulation of highest priority at each point along the section.

On selecting the Supertin option, the **Create Super Tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New tin name	input		
<i>name of the tin created from the triangulation of the model/view. If <enter> is type after the name, the model for tin field is filled out with the name tin_new_tin_name.</i>			
Tin colour	input	default tin colour	available colours
<i>the tin colour is used as the section colour when sectioning through the supertin. When displayed on plan or section views, the each tin making up the supertin is drawn in its own colour.</i>			
Tin style	input	1	available line styles

line style used for drawing sections through the SuperTin on the section view.

Model for tin input available models

if non-blank, the created SuperTin will be added to the model given in this field.

*if blank, the name tin new_tin_name will be placed in the field when the **create** button is selected.*

Tins to include table available tins

name of the tin to be included in the SuperTin.

Create button

create a SuperTin from the tins in the tins to include table. The created SuperTin will be stored with the name given in the new tin name field.

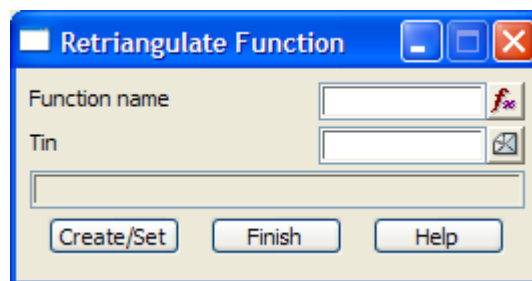

Function

retriangulate_function

Position of option on menu: Tins =>Create =>Function

The function option is used to construct a function which when recalced, will run a retriangulate on the tin.

On selecting the function option, the **retriangulate function** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Function name	input		available functions
----------------------	-------	--	---------------------

the name to give to the retriangulate function.

Tin	input		available tins
------------	-------	--	----------------

name of the tin to be retriangulated when the function is recalced.

Create/Set	button		
-------------------	--------	--	--

create or modify the retriangulate function.

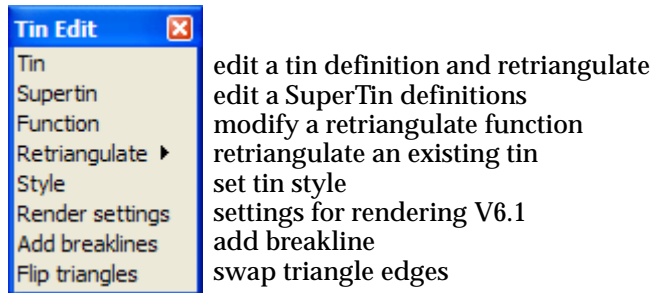

Edit

tin_edit

Position of menu: Tins =>Edit

The input data for a triangulation is either all the data in a selected model or all the data from all the models on a selected view

The options for both methods of selecting data are on the **create** walk-right menu. The **create** walk-right menu is

For the option *Tin*, please go to the section “Edit a Tin” .

<i>Supertin</i>	“Edit SuperTin” .
<i>Function</i>	“Edit Tin Function” .
<i>Retriangulate</i>	“Retriangulate” .
<i>Style</i>	“Style” .
<i>Render settings</i>	“Render Settings” .
<i>Add breaklines</i>	“Add Breaklines” .
<i>Flip triangles</i>	“Flip Triangles” .

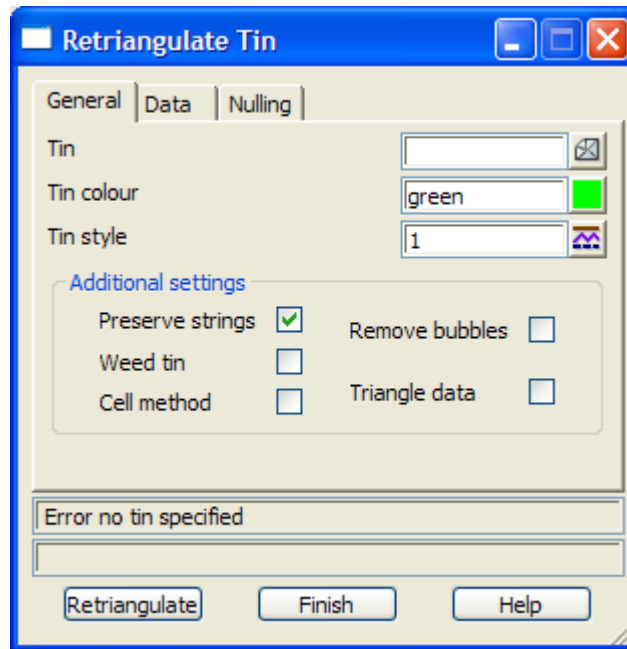

Edit a Tin

retriangulate_tin

Position of option on menu: Tins =>Edit =>Tin

When a tin is created, the settings and models used in the triangulation are recorded with the tin data. The **edit=>tin** option can be used to modify the models and setting used to define the tin and then **recreate** the tin from the new models and settings.

On selecting the **edit=>tin** option, the **retriangulate tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		
<i>name of the tin to be retriangulated. When the tin name is given, the list of models used for the tin and other settings, are displayed.</i>			
Tin colour	input	original colour	available colours
<i>original colour of the tin - this can be modified.</i>			
Tin style	input	original line style	available line styles
<i>original line style of the tin - this can be modified.</i>			
Preserve strings	tick box	original setting	
<i>if tick, all strings with breakline type line will be preserved as sides of triangles. Otherwise, all line strings will be treated as point strings for the triangulation.</i>			
Remove bubbles	tick box	original setting	
<i>if tick, post-processing occurs to try and stop all the points of a triangle coming from the same string.</i>			
Weed tin	tick box	original setting	
<i>if tick, all duplicate points all removed from the tin database.</i>			
Triangle data	tick box	original setting	
<i>if tick, only triangles in the tin that are under the centroid of a string representing a triangle in the model/view are considered valid, all others are set to null. That is, any triangles not under the centroid of a string from the model/view will be set to null. This is extremely useful when the original string data represents triangles and it will ensure that the triangles produced by the triangulation will exactly match, including null regions, the original triangle data. Weed tin is automatically set to tick if face data is set to tick.</i>			
Cell method	tick box	original setting	
<i>if tick, try to create the triangles in cells - an alternate method of ordering the data for use when the triangulation takes too long by the non-cell method.</i>			

Data polygon string-select original data polygon

if a string is selected as a data polygon, only string points that are inside the data polygon are used in the triangulation.

If no string is selected, then all the points in all the models are used in the triangulation.

Null polygon string-select original null polygon

if a string is selected as a null polygon, any triangle whose centroid is outside the null polygon is automatically nulled.

Retriangulate button

The original tin is deleted and the data in the models to include table used to create a new triangulation which is given the original tin name. The settings in this panel are used for the retriangulation.

Edit SuperTin

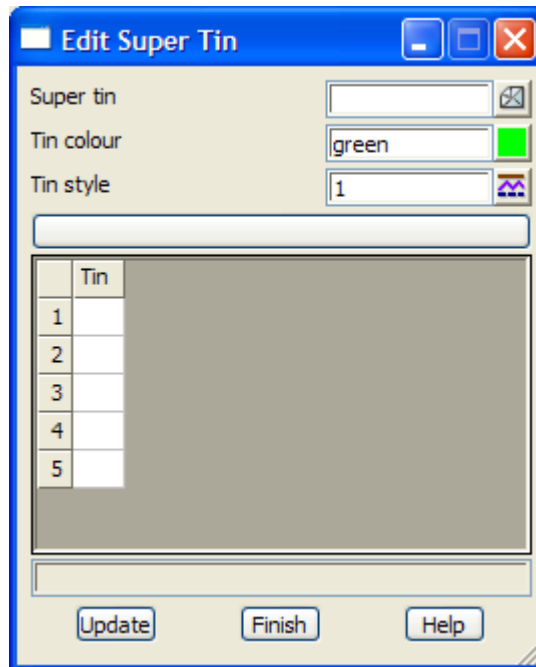

edit_super_tin

Position of option on menu: Tins =>Edit =>Supertin

When a Supertin is created, the tins and settings used to create the SuperTin are recorded.

The edit=>supertin option can be used to modify the tins and setting used to define the SuperTin.

On selecting the edit=>supertin option, the **edit super tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super tin name <i>name of the SuperTin to be modified.</i>	input		existing SuperTins
Tin colour <i>original colour for drawing sections through the SuperTin - this can be modified.</i>	input	existing super tin colour	available colours
Tin style <i>original linestyle for drawing sections through the SuperTin - this can be modified.</i>	input	existing supertin style	available line styles
Tins to include <i>original tin in the SuperTin - these can be modified.</i>	table	existing tins	available tins
Update <i>update the SuperTin definition with the information in the above panel fields.</i>	button		

Edit Tin Function

Position of option on menu: Tins =>Edit =>Function

The edit=>function option is used to edit a tin function.

On selecting the **function** option, the **retriangulate function** panel is displayed which is the same as for the option tins=>create=>function.

Retriangulate

Position of option on menu: Tins =>Edit =>Retriangulate

When a tin is created, the settings and models used in the triangulation are recorded with the tin data. The **retriangulate** option is used to **recreate** the tin from the **same** models and settings.

The **retriangulate** menu item operates two ways.

- The **retriangulate walk-right** brings up the tins menu which is a list of all the existing tins. By choosing one of the tins from the tins menu, the tin is retriangulated.
- If **retriangulate** itself is activated (by clicking LB when **retriangulate** is highlighted), the **retriangulate tin** panel appears. The **retriangulate tin** panel can be used to modify the tin definition and retriangulate the tin.

Style

tin_linestyle

Position of option on menu: Tins =>Edit =>Style

When a tin is created, it is given a linestyle (the tin linestyle) which is used for drawing the tin whenever it is profiled on a section view or plotted in long and cross section plots.

The **style** option is used to modify the tin linestyle.

On selecting the **style** option, the **tin linestyle** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to modify the linestyle of.</i>	input		available tins
Style <i>linestyle for the tin.</i>	input	1	available linestyles
Set <i>set the tin linestyle to that given in the style panel field.</i>	button		

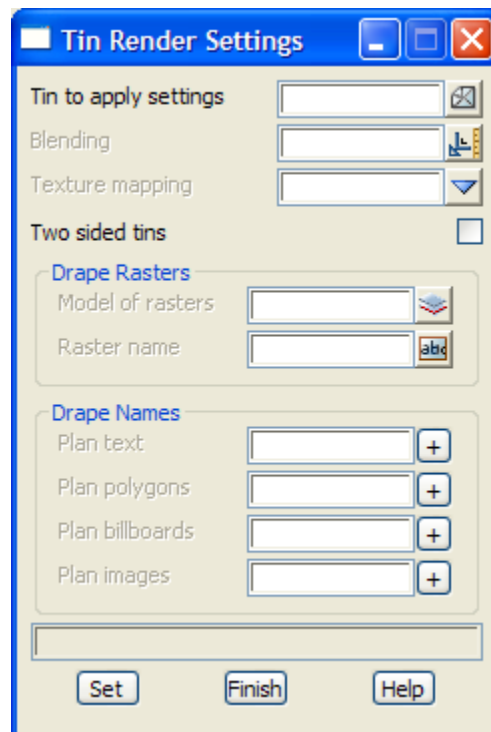

Render Settings

tin_render_settings

Position of option on menu: Tins =>Edit =>Render settings

This Option is currently under development.

On selecting the Render settings option, the **Tin Render Settings** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to apply settings <i>name of the tin to apply the render settings to.</i>	input		available tins
Model <i>if non blank, the model of ortho-rectified rasters to be associated with the tin (and hence draped onto the tin in an Perspective OpenGL view).</i>	input		available models
Raster name <i>if non blank, the name of an ortho-rectified raster to be associated with the tin (and hence draped onto the tin in an Perspective OpenGL view).</i>	input		
Texture mapping <i>if non blank, the name of the set of colour-to-texture mappings that is defined in the file textures.4d and are to be used for applying textures to the coloured triangles of the tin.</i>	input		
Blending <i>The value of blending is between 0 and 1. 0 means the tin is totally transparent (and hence invisible) and 1 means that the tin is opaque (non-translucent) and can't be seen through at all. If blank, then the value is taken as 1 and the tin is opaque (non-translucent).</i>	input		

Two sided tins

tick box

if tick, the tin is visible when viewed from both above and below. For example, the tin used for the bottom of a bridge needs to be two-sided.

If non-tick, then the tin is one sided and only shows when viewed from above.

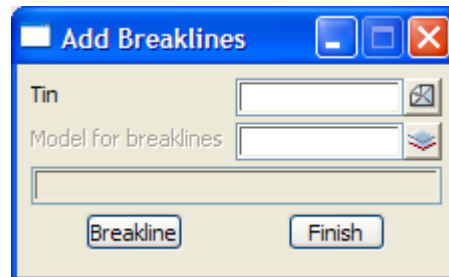

Add Breaklines

add_breaklines_panel

Position of option on menu: Tins =>Edit =>Add breaklines

This option allows extra breaklines joining existing vertices in the tin to be created. The new breaklines can be added to a model so that the results can be reproduced on a retriangulation.

On selecting the **Add breakline** option, the **Add Breaklines** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to add a breakline to.</i>	input		available tins
Model for breaklines <i>if non-blank, then as breaklines as created with this option, then the breakline is automatically added to this model so that the breakline modifications will try to be preserved on a retriangulation (this may not be possible with crossing breaklines).</i>	input	1	available models
Breakline <i>add a breakline by clicking near the two vertices of the tin that are to be connected by a breakline (cursor snap will do). As each breakline is added, the triangles are rearranged. If fast contours are turned on, the effect will be immediate. Note that you can have fast contours and tin edges toggled on at the same time.</i>	button		

Flip Triangles

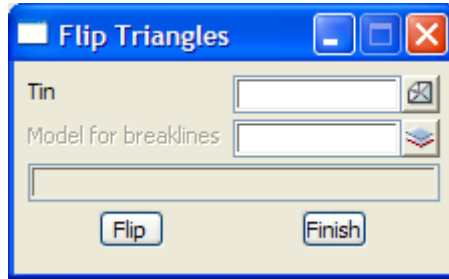

flip_triangles_panel

Position of option on menu: Tins =>Edit =>Flip triangles

This option works on a triangle side and if it is possible, it finds the two triangles with this common side, removes the common side and replaces it with a new common side which joins the non common triangle points in the original triangle. Note that this can't be done when the new side goes outside the two triangles.

A new breaklines can also be automatically added to a model so that the results can be reproduced on a retriangulation.

On selecting the **Flip triangles** option, the **Flip Triangles** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to add a breakline to.</i>	input		available tins
Model for breaklines <i>if non-blank, then as triangles are selected and flipped, then breaklines are is automatically added to this model so that the flip modifications will try to be preserved on a retriangulation (this may not be possible with crossing breaklines).</i>	input	1	available models
Flip <i>flip a triangle by clicking near the common edge (cursor snap will do). As each flip is done, the triangles are rearranged. If fast contours are turned on, the effect will be immediate. Note that you can have fast contours and tin edges toggled on at the same time.</i>	button		

Boundary

create_boundaries_for_tin

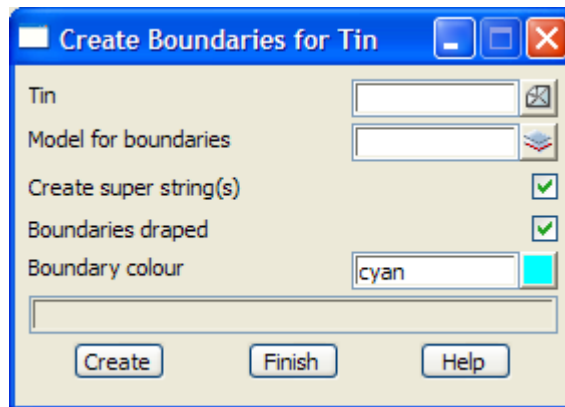

Position of option on menu: Tins =>Boundary

The boundary option is used to construct the boundary strings for a tin, i.e. the strings going around the edges between the null and non-null triangles in the tin.

If the tin has holes (internal null regions), then there will be more than one boundary string created.

Often the boundary strings is used as a first step in creating a polygon to be used to null out further triangles not required in the tin.

On selecting the **Boundary** option, the **Create Boundaries for Tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to calculate the boundary strings for.</i>	input		available tins
Model for boundaries <i>the model to place the boundary strings in.</i>	input		available models
Create super string(s) <i>if tick, the boundary string is a super string. If not tick, the boundary string is a 3d string.</i>	tick box		
Boundaries draped <i>if tick, the points of the boundary have the z-values from the tin. If not tick, the z-value is set to 1.</i>	tick box		
Boundary colour <i>the colour for the boundary strings</i>	input	cyan	available colours
Create <i>create the boundary polygons for the tin.</i>	button		

Colour

tin_colouring

Position of menu: Tins =>Colour

When a tin is created, all the triangles have the same colour (called the tin's base colour). This is the colour given by the user when creating the tin with the **triangulate model** or **triangulate view** panel. The base colour can be changed at any time using the colour of tin option.

However, it often necessary to colour specific triangles in some other colour than the base colour. The option colour within polygon is designed to do just that.

The colour menu item operates in two ways.

First, if colour itself is activated (by clicking LB when colour is highlighted), the **colour of tin** panel appears (see the next section).

Secondly, the colour walk-right brings up the tin colouring menu.

The tin colouring walk-right menu is

change base colour of tin
 colour triangles within a polygon
 reset all triangles to base colour
 colour height ranges
 colour depth ranges between two tins
 colour aspect ranges
 colour slope ranges

For the option *Colour of tin*, please go to the section "Colour of Tin" .

<i>Colour within polygon</i>	"Colour Within Polygon"
<i>Reset</i>	"Reset"
<i>Retriangulate</i>	"Retriangulate"
<i>Tin height colour</i>	"Tin Height Colour"
<i>Tins depths colour</i>	"Tins Depths Colour" .
<i>Aspect colouring</i>	"Aspect Colouring" .
<i>Slope colouring,</i>	"Slope Colouring" .

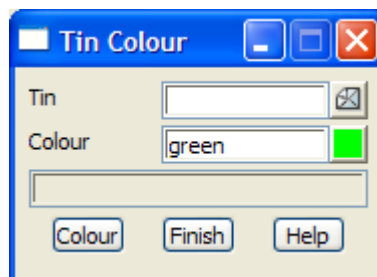

Colour of Tin

tin_colour

Position of option on menu: Tins =>Colour =>Colour of tin

A tin is given a base colour when it is originally constructed. The colour of tin option allows the user to change the base colour of the tin.

On selecting the **colour of tin** option, the **tin colour** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins
<i>name of the tin to have its base colour modified. The tin must exist in 12d Model. When the tin name is entered, the existing colour of the tin is displayed in the tin colour panel field.</i>			
Colour	input	default tin colour	available colours
<i>the new base colour for the tin given.</i>			
Colour	button		
<i>colour all the base triangles with the colour given in the colour field.</i>			

Colour Within Polygon

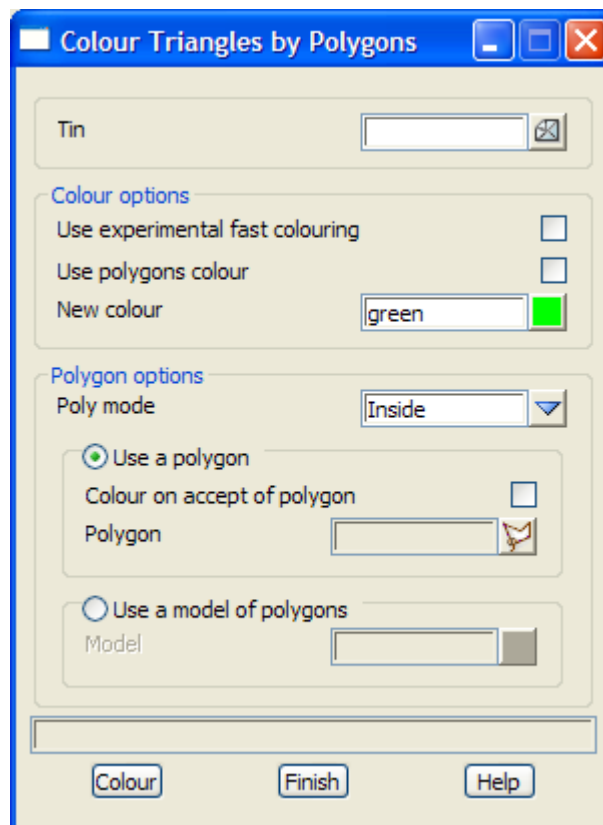

colour_triangles_by_polygons

Position of option on menu: Tins =>Colour =>colour within polygon

Although a tin is given a base colour when constructed, it is useful to be able to change the colour of selected triangles. For example, in a design tin with a road and terrain, the road and the terrain could be displayed in different colours. This is particularly effective in shades.

The colour within polygon option allows the user to colour all the triangles whose centroids lie inside (or outside) a selected polygon, or for all the polygons in a given model, with either a user specified colour or the colour of each polygon. If a model of polygons is used, the polygons are processed in the order that they occur in the model. The option can be applied any number of times to a tin.

On selecting the colour within polygon option, the **colour triangles by polygons** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to have some of its triangles coloured. The tin must exist in 12d Model.</i>	input		available tins
Use experimental fast colouring <i>if tick, an experimental fast colouring algorithm is used.</i>	tick box		
Use polygons colour <i>if tick, the colour of the polygons is used as the colour for the triangles.</i>	tick box		
New colour <i>if use polygons colour is not set to tick, this is the colour to set all the triangles within/out a polygon to.</i>	input	default tin colour	available colours

Poly mode choice inside inside, outside
*mode to select whether the triangles with centroids **inside** or **outside** the selected polygons are to be coloured.*

Use a polygon tick box
*if **tick**, then individual polygons are selected and the tin coloured within them.*

Colour on accept of polygon tick box
*if **tick**, then the colouring is done as soon as a polygon is accepted.*

Polygon polygon selected button string pop-up

this is used to
 (a) select an individual string to use as a polygon for colouring
 (b) dynamically define a rectangle to use as a polygon for colouring
 (c) dynamically define a trapezoid to use as a polygon for colouring
 (d) dynamically define a lasso to use as a polygon for colouring

Use a model of polygons tick box
*if **tick**, then all the polygons in the given model are used for colouring.*

Model input available models
*model of polygons which are used for selecting triangles to be coloured. Colour happens when the **Colour** button is selected.*

Colour button
each string in the model of polygons is used to colour the triangles in the tin given in the tin field.

Reset

reset_colour_of_triangles

Position of option on menu: Tins =>Colour =>Reset

The reset option is used to change all the non base-coloured triangles in a tin back to the base colour.

On selecting the reset option, the **reset colour of triangles** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins
<i>name of the tin to have any non base-coloured triangles reset to the base colour. The tin must exist in 12d Model.</i>			

Reset button
change any selectively coloured triangles back to the base colour.

Tin Height Colour

colour_height_range_for_tin

Position of option on menu: Tins =>Colour =>Tin height colour

The tin height colour option is used to calculate height bands for the tin and colour a view and/or create faces. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

The calculated heights and colours are given in a user supplied range file. A plan view can be temporarily coloured on the height basis using the **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

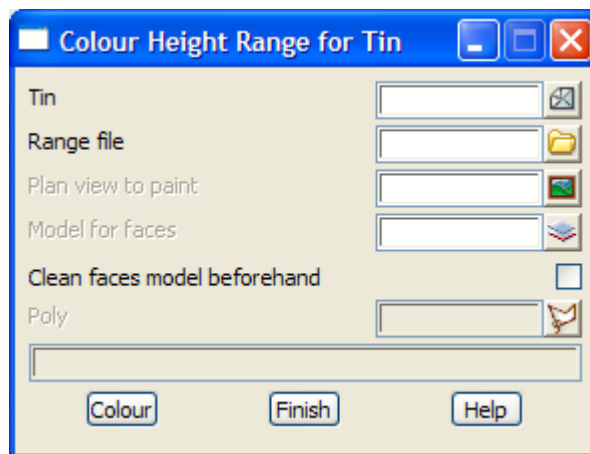

For tin height colour, the range file consists of a list of ranges and colours, one set per line, in the format

```
lower_height upper_height range_colour
```

where this line represents all heights satisfying

```
lower_height < height <= upper_height.
```

On selecting the tin height colour option, the colour height range for tin panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the height ranges of the triangles will be calculated and a view coloured.</i>	input		available tins
Range file <i>the user supplied range file is used to give the colour ranges for heights of the tin.</i>	input		*.hrf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the range colours given in the range file.</i>	input		available views
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	input		available models
Clean faces model beforehand	tick box		

if tick, the model of faces is cleaned out before the option runs.

Select polygon string-select

if selected, this string is used as the bounding polygon for the height calculations.

Colour button

On selecting this button, the heights of the triangles of the tin within the selected bounding polygon are calculated.

<esc> can be used to terminate the option during height calculations.

Tins Depths Colour

colour_depth_range_for_tins

Position of option on menu: Tins =>Colour =>Tin depths colour

The tins depths colour option is used to calculate colour bands for the depths between two tins and colour a view and/or create faces. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the common portions of the tins are used.

The calculated depths and colours are given in a user supplied range file. A plan view can be temporarily coloured on the depth basis using the **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

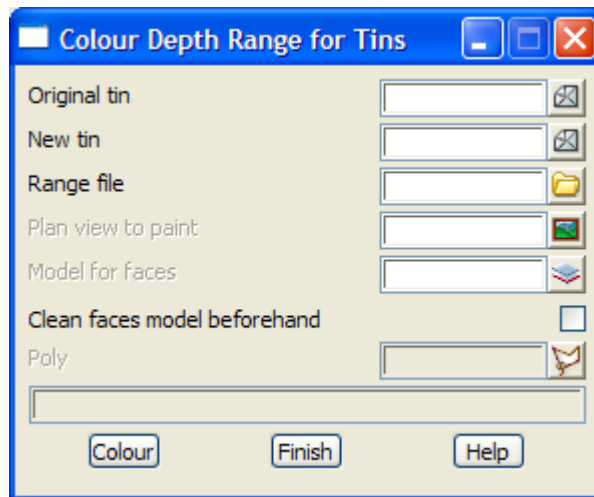

For tins depths colour, the range file consists of a list of ranges and colours, one set per line, in the format

lower_depth upper_depth range_colour

where this line represents all depths satisfying

lower_depth < depth <= upper_depth.

On selecting the tins depths colour option, the colour depth range for tins panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New tin <i>name of the original/new tin to colour depths between. Cut is when the new tin is below the original tin.</i>	input		available tins
Range file <i>the user supplied range file is used to give the colour ranges for depths.</i>	input		*.hrf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the range colours given in the range file.</i>	input		available views
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	input		available models
Clean faces model beforehand	tick box		

if tick, the model of faces is cleaned out before the option runs.

Select polygon string-select

if selected, this string is used as the bounding polygon for the height calculations.

Colour button

colour the depths between the tins within the selected bounding polygon.

<esc> can be used to terminate the option during depth calculations.

Aspect Colouring

aspect_analysis_colour

Position of option on menu: Tins =>Colour =>Aspect colouring

The aspect colouring option is used to colour the triangles according to the aspect (direction) of the triangles in the tin. An aspect range file is used to define the colour ranges.

Note that the actual colours of the triangles are changed - not a face model produced.

For aspect colouring, the range file consists of a list of aspect ranges and colours, one set per line, in the format as for aspect analysis:

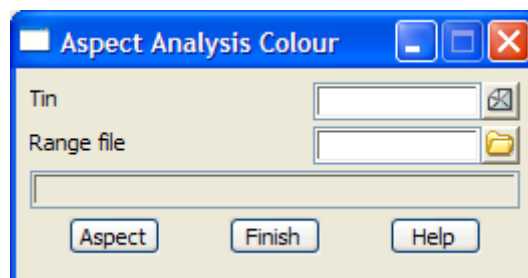

```
lower_bearing upper_bearing range_colour
```

where this line represents all bearings satisfying

```
lower_bearing < bearing <= upper_bearing.
```

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the aspect colouring option, the **Aspect Analysis Colour** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the aspects of the triangles will be calculated and then the tin coloured.</i>	input		available tins
Range file <i>the user supplied range file is used to give the colour ranges for aspects to use to colour the triangles.</i>	input		*.arf
Aspect <i>On selecting this button, the aspects of the triangles of the tin are calculated and the triangle coloured according to the range file.</i>	button		

<esc> can be used to terminate the option during aspect calculations.

Slope Colouring

slope_analysis_colour

Position of option on menu: Tins =>Colour =>Slope colouring

The slope colouring option is used to colour the triangles in the tin according to the slope of the triangles. A slope range file is used to define the colour ranges.

Note that the actual colours of the triangles are changed - not a face model produced.

For slope colouring, the range file consists of a list of ranges and colours, one set per line, in the format

lower_value upper_value range_colour

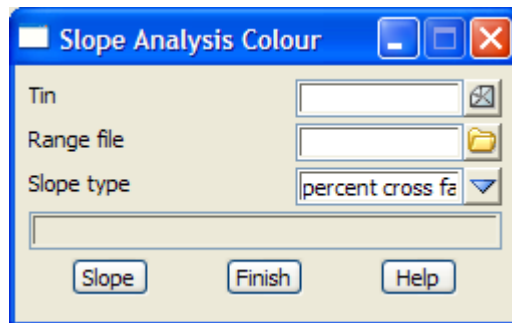

where this line represents all angle satisfying

lower_value < value <= upper_value.

The values can be percent cross fall, "1v in" slope or degrees (in 12d Model dms format).

The range_colour is used to colour all triangles in the tin satisfying the range.

On selecting the slope colouring option, the **Slope Analysis Colour** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the slope of the triangles will be calculated and then the tin coloured.</i>	input		available tins
Range file <i>the user supplied range file is used to give the colour ranges for slopes to use to colour the triangles.</i>	input		*.arf
Slope type <i>the units used for slope in the range file.</i>	input	percent cross fall	percent cross fall, degrees, 1v in
Slope <i>On selecting this button, the slopes of the triangles of the tin are calculated and coloured according to the slope range file.</i>	button		

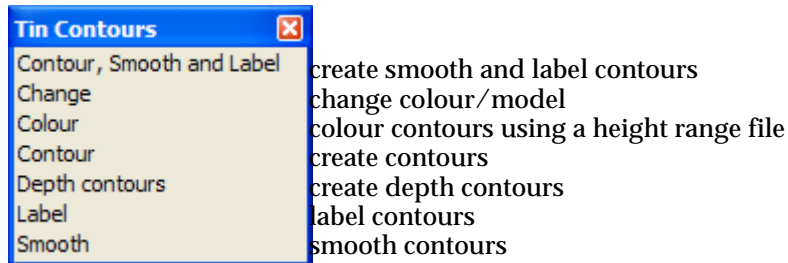

<esc> can be used to terminate the option during aspect calculations.

Contour

tin_contours

Position of menu: Tins =>Contour

The tin contours walk-right menu is

For the option *Contour, smooth and label*, go to the section “Contour, Smooth and Label”

<i>Change</i>	“Change Contours”
<i>Colour</i>	“Colour”
<i>Contour</i>	“Contour”
<i>Depth contours</i>	“Depth Contours”
<i>Label</i>	“Label Contours”
<i>Smooth</i>	“Smooth”

For information on creating contours, go to the section “Creating, Smoothing and Labelling Contours” .

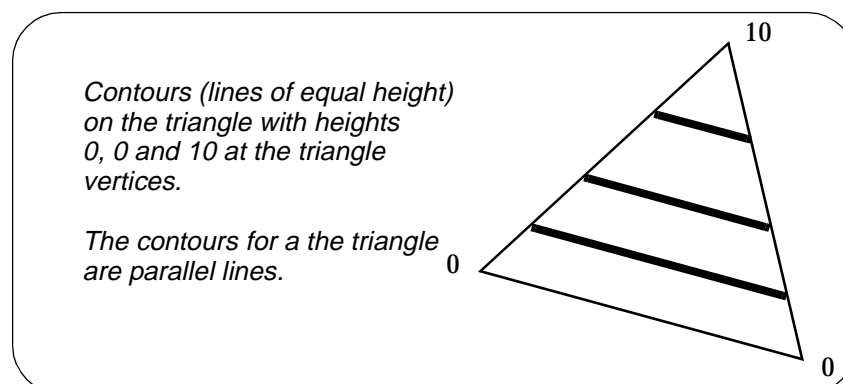

Creating, Smoothing and Labelling Contours

Creating Contours

Contours (or level lines) for a surface are the strings of constant height. Contours are often produced on maps and labelled with the height of the contours.

A 12d Model tin represents a surface in three dimensions and there is an option in 12d Model for producing the contours for the tin.

For a triangle in three dimensions, a string of constant height is actually a straight line across the triangle and the contour lines of different heights for a triangle are parallel lines.

Because triangles in a tin have common sides, a contour of a given height for one triangle will connect to the contour of the same height in an adjacent triangle.

So the contour lines on adjacent triangles join up to form continuous contour strings, each segment of which is straight across a triangle.

The contours for a tin lie on the surface of the tin.

The options to create contours in 12d Model has five parameters to define which contours are calculated. They are the

- minimum contour value
- maximum contour value
- contour increment
- contour reference
- bold increment

The elevation range over which the contours are to be produced is defined by the minimum and maximum contour values. If the minimum (maximum) value is not specified, the tin minimum (maximum) z-value is used.

The increment between successive contours is given by the contour increment.

For example, if contours are required every two metres from 100.0 metres to 200.0 metres, the parameters needed are

- contour minimum = 100.0
- contour maximum = 200.0
- contour increment = 2.0

This would be sufficient information to produce the contours

100.0, 102.0, 104.0... 198.0, 200.0.

However, 12d Model also provides a parameter to allow the following contours to be produced

101.0, 103.0, 105.0 197.0, 199.0

For this and similar cases, the contour reference value is used.

When a contour reference value is specified, all the contour increments are taken from the contour reference value.

In the first example, the contour reference value is the default value of 0.0. In the second example, the contour reference value is 1.0.

If **major** (or **bold** or **index**) contours are required, the major contour increment is given a non-zero value. Major contours will be drawn at the integer multiples of the major increment instead of the standard contours.

For information on labelling contours, go to the section "Labelling Contours".

For information on smoothing contours, go to the section "Smoothing Contours".

Smoothing Contours

If the triangles in a tin, or sections of a tin, are large then the contours for that section of the tin may appear angular. Consequently some people like to "smooth" the contours to take out the angularity.

Be careful of smoothing because "smoothing" of contours produces strings that no longer sit on the triangulation.

12d Model smooths contours by apply a smoothing algorithm to each of the contour strings that were produced from the triangulation.

Two smoothing algorithms are available

- (a) Preserve string points - this method ensures that the smoothed contour goes through all the vertices from the original contour string.
- (b) Don't preserve string points - this method does not have to include the vertices from the original contours in the smoothed contour.

For information on creating contours, go to the section "Creating Contours" .

For information on labelling contours, go to the section "Labelling Contours" .

Labelling Contours

12d Model labels contours by placing text labels at user controlled distances along the contour string.

The position and frequency of the contour labels along a contour string is controlled by two parameters, the *start distance* and the *separation distance*.

The first contour label is placed at a chainage distance of **start distance** from the beginning on the contour and the labels are repeated at a chainage distance of **separation distance** from the previous contour label.

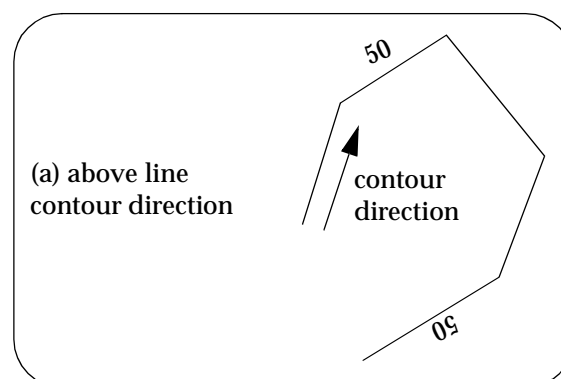

There is also a parameter to specify that contours are to be labelled at the start and the end regardless of the *start distance* and *separation distance*.

The number of decimal places used for the contour label is also user specified.

12d Model has seven methods for positioning the contour labels. They are the

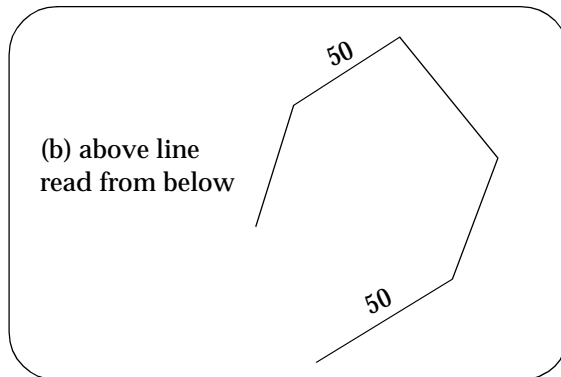

- (a) above line contour direction

contour labels are created with the text parallel to the contours line and in the same direction as the contour string. The text is raised slightly above the contour string.

- (b) above line read from below

contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and +90 degrees. The text is raised slightly above the contour string.

(c) centre line read from below

contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and +90 degrees. The text is centred on the contour string so the contour string goes through the text.

(d) line removal & centred line read from below

contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and +90 degrees. The text is centred on the contour string so the contour string goes through the text. Also the contours are cut so that gaps are left for the labels.

(e) above line facing up hill

contour labels are created with the text parallel to the contours line in the same direction as the contour string. The text is orientated so that it faces uphill. The text is raised slightly above the contour string.

(f) centre line facing up hill

contour labels are created with the text parallel to the contours line in the same direction as the contour string. The text is orientated so that it faces uphill. The text is centred on the contour string so the contour string goes through the text.

(g) line removal & centred line facing up hill

contour labels are created with the text parallel to the contour line. The text is orientated so that it faces uphill. The text is centred on the contour string so the contour string goes through the text. Also the contours are cut so that gaps are left for the labels.

For information on creating contours, go to the section “Creating Contours” .

For information on smoothing contours, go to the section “Smoothing Contours” .

Contour

contour_a_tin

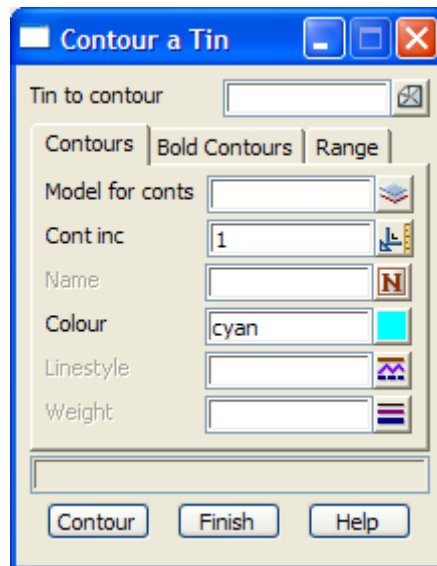

Position of option on menu: Tins =>Contour =>Contours

One method of visualizing tin data is with contours. In 12d Model, contour strings can be produced over any user defined elevation range and at any interval.

For more information on contouring in 12d Model, go to the section “Creating Contours”

The contour option can be applied to a tin any number of times. This may be necessary if the contour parameters vary over the total range to be contoured.

On selecting the contour option, the **contour a tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to contour <i>name of the tin to be contoured.</i>	input		available tins

Contours tab

Model for conts <i>name of the model to place the contours in.</i>	input		available models
Cont inc <i>increment between contoured values.</i>	input	1.0	
Name <i>if non-blank, name to give the contour strings.</i>	input		
Colour <i>colour of the contours</i>	input	cyan	available colours
Linestyle <i>linestyles for the contour strings.</i>	input	1	available linestyles
Weight <i>if non-blank, weight to give the contour strings.</i>	input		

Bold Contours tab

Model for bolds	input		available models
<i>name of the model to place the bold contours in. If blank, the same model is used as for the ordinary contours.</i>			
Bold inc	input	5.0	
<i>increment for the bold contours. If blank or zero, then no bold contours are drawn. If non-zero, it must be an integer multiple of the contour increment</i>			
Bold colour	input	magenta	available colours
<i>colour of the bold contours</i>			
Name	input		
<i>if non-blank, name to give the bold contour strings.</i>			
Colour	input	cyan	available colours
<i>colour of the bold contours</i>			
Linestyle	input	1	available linestyles
<i>linestyles for the bold contour strings.</i>			
Weight	input		
<i>if non-blank, weight to give the bold contour strings.</i>			

Range tab

Cont min	input		
<i>minimum value of the z range to be contoured. If blank, the tin's minimum z-value is used.</i>			
Cont max	input		
<i>maximum value of the z range to be contoured. If blank, the tin's maximum z-value is used.</i>			
Cont ref	input	0.0	
<i>reference value for the contour increments.</i>			

Contour button

contour the tin given in the tin field and place the contours in the model given in the model field. The contour range, contour increment and bold contour increment are used specify which contours are calculated.

Panel Messages

Progress messages - sent to the panel message area

start contouring
contouring level z-value

Completion message - sent to the panel message area

finished contouring - no. contours

<esc> can be used to abort the calculation of contours.

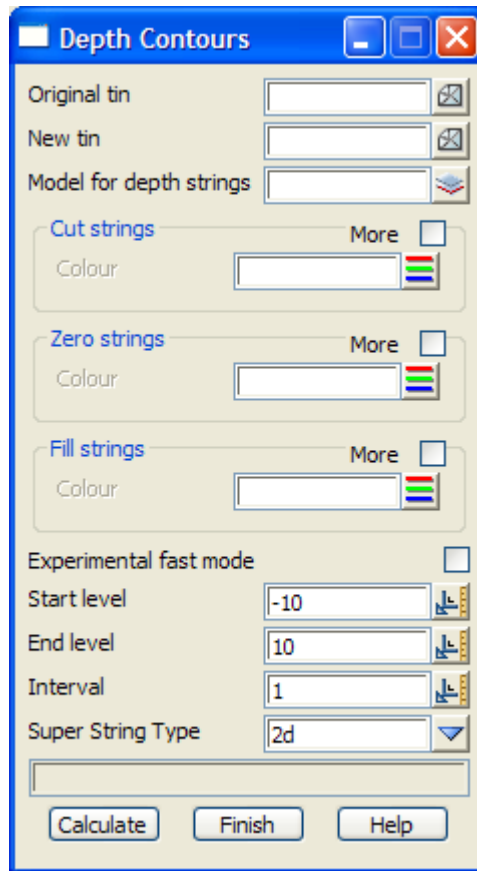

Depth Contours

depth_contours

Position of option on menu: Tins =>Contour =>Depth contours

The depth contours option finds the contours lines for the difference between two tins. That is, it calculates the isopachs between the two tins.

On selecting the depth contours option, the **Depth Contours** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New tin <i>name of the original/new tin to contour between. Cut is when the new tin is below the original tin.</i>	input		available tins
Model for depth strings <i>name of the model to contain the depth strings.</i>	input		available models
Cut/Zero/Fill strings section <i>if no tick then only the Colour panel field is displayed</i>	More tick box		
Colour <i>if non-blank, colour for the strings</i> <i>if tick then Name, Colour, Linestyle and Weight fields are displayed</i>	input	cyan	available colours

Name	input		
	<i>if non-blank, name to give the strings.</i>		
Colour	input	cyan	available colours
	<i>if non-blank, colour for the strings</i>		
Linestyle	input	1	available linestyles
	<i>linestyles for the strings.</i>		
Weight	input		
	<i>if non-blank, weight to give the strings.</i>		
Start level	input	-10	
	<i>the minimum depth to start the depth contours at.</i>		
End level	input	10	
	<i>the maximum depth to calculate the depth contours to.</i>		
Interval	input	1	
	<i>the interval between the depth contours.</i>		
2d/3d strings	input	2d	2d, 3d original, 3d new
	<i>If 2d, the created strings are 2d strings with a z-value equal to the depth.</i>		
	<i>If 3d original/new, the depth strings are draped over the original/new tin to form 3d strings.</i>		
Calculate	button		
	<i>calculate the depth contours between two tins given in the panel fields. The resulting strings are added to the model given in the model for depth strings field.</i>		

Label Contours

label_contours

Position of option on menu: Tins =>Contour =>Label

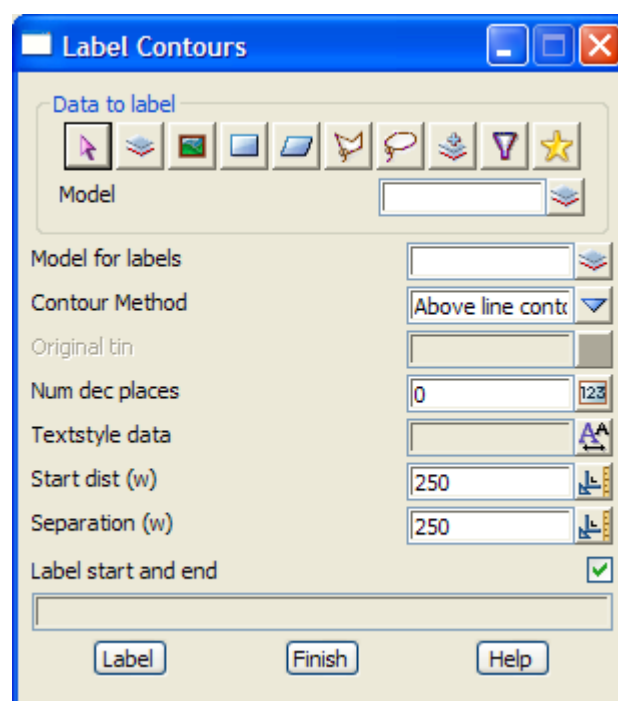

The label contours option can be used to label individual contour (2d) strings, or all the contour strings in a model.

The user has control over the label size, colour, number of decimal places, the distance between the labels and the distance to the first label on a string (start distance).

Note - this option cannot label fast contours. Contours strings must already exist or be generated using *Tins => Contour=> Contour*.

For more information on labelling contours, go to the section “Labelling Contours” .

On selecting the label contours option, the **label contours** panel is displayed.

When the **label** button is selected, then all the contour strings given by the data source field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the **label contours** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to “Data Source” in the chapter “Tools and Concepts” .</i>			
Data source	input		
<i>source of data is to be triangulated - only Model or View allowed for this option.</i>			
Model for labels	input		available models
<i>name of the model to place the contour labels in.</i>			
Label method	input		above line contour direction above line read from below centred line read from below

line removal and centred line read from below
 above line facing uphill
 centred line facing uphill
 line removal & centred facing uphill

in all cases, contour labels are created and added to the model 'Model for contours'.

For information on each of the methods of labelling contours, go to the section "Labelling Contours".

Original tin input available tins
only needed for the "facing uphill" methods - name of the tin used to generate the contours. This is needed to calculate which direction is uphill.

Num dec places input 1 0,1,2,3,4,5
number of decimal places used in the contour label.

Textstyle data input 1 textstyle favourites
textstyle information to use for the contour labels.

Start dist (w) input 0
chainage distance to the first label on the string - world units

Separation (w) input 250
chainage interval between the labels - world units

Pick button

*if a number of individual contour strings need to be labelled, the pick button is used. After **pick** is chosen, any strings selected are then labelled using the information in the panel fields. After labelling one string, another pick and label cycle automatically begins.*

*The cycle is terminated by clicking RB to raise the **pick ops** menu and selecting cancel from it.*

Label button

label all the contour strings selected by the "Data to label" data source.

Smooth

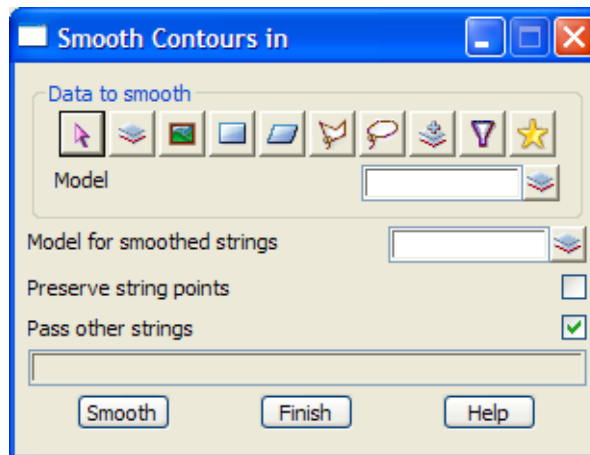

smooth_contours_in

Position of option on menu: Tins =>Contour =>Smooth

The smooth options are used to add extra points into a contour string (2d strings) to make a smoother string.

For more information on labelling contours, go to the section “Smoothing Contours” .

On selecting Smooth, the Smooth Contours in panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Data source type <i>data selection type - for a full description go to “Data Source” in the chapter “Tools and Concepts” .</i>		Model	
Data source type <i>data selection type</i>		Model	
Data source <i>data source to be smoothed.</i>	input		
Model for smoothed strings <i>model for the smoothed strings to go to</i>	input		available models
Preserve string points <i>if tick, the smoothed contour will still contain all the original points. if not tick, the smoothed contour may deviate from the original string points</i>	tick box		
Pass other strings <i>if tick, any non-contour string is copied and added to the smoothed strings model.</i>	tick box	tick	
Smooth <i>smooth the selected contour (2d) strings.</i>	button		

Change Contours

change_Contours

Position of option on menu: Tins =>Contour =>Change

The Change option is for changing the model and/or colour of contours with a given height interval.

The main purpose of the option is to separate contours to be used as index contours from other contours. For example, when contours are supplied by a third party and all the contours are in the same model with the same colour, change contour colour can move contours to be used as index contours to a different model and give them a different colour.

For this option the selection process for a Data source is extended.

After the data is selected as defined by the Data source, the two extra parameters, interval and reference, are used to further specify which contours are to be moved and/or coloured.

Only contour strings whose heights satisfy

$$\text{height} = \text{reference} + \text{integer} * \text{interval}$$

are selected.

For example, if the contours 5, 10, 15 etc. are required, the reference and interval would be

$$\text{reference} = 0$$

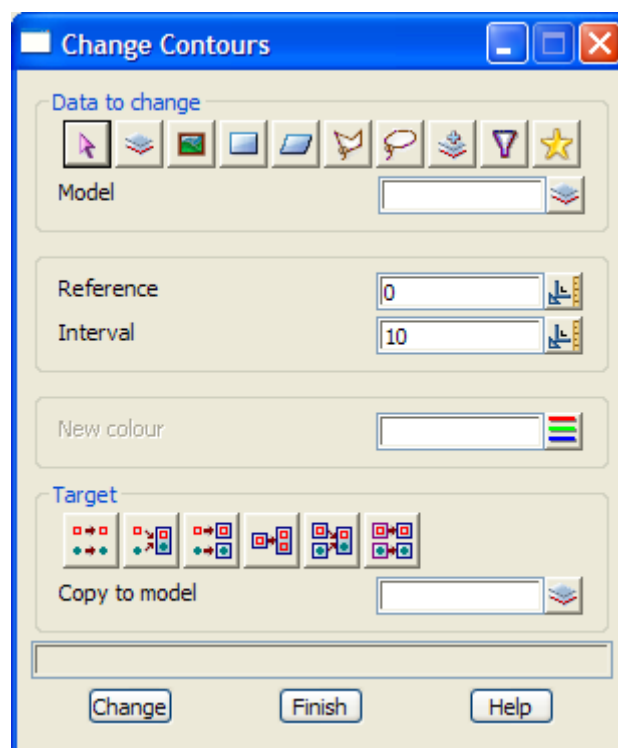

$$\text{interval} = 5$$

However, to modify the contours 6, 11, 16 etc., the required parameters are

$$\text{reference} = 1$$

$$\text{interval} = 5$$

On selecting the Change option, the **Change Contours** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input	
<i>source of data is to be processed.</i>		
Reference	input	0
<i>the reference value to use to select contours.</i>		
Interval	input	10
<i>the interval to use to select contours.</i>		
New colour	input	available colours
<i>if non-blank, then the colour of the selected strings will be changed to the colour given in the new colour field.</i>		
Target type		
<i>data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"</i>		
Target info	input	
<i>extra information required for the target.</i>		
Colour	button	
<i>process the selected strings</i>		

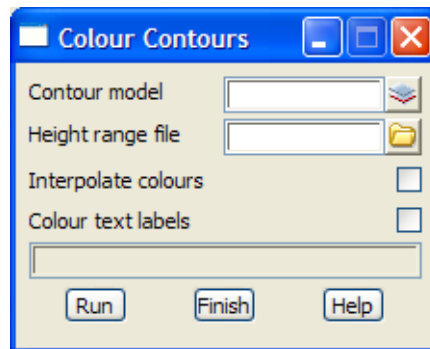

Colour

colour_contours

Position of option on menu: Tins =>Contour =>Colour

The colour option is used to colour contours in a model according to a selected height range file.

On selecting Colour, the Colour Contours panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Contour model <i>model of contours to colour</i>	input		available models
Height range file <i>height range file to specify the colour of the contour.</i>	input		.hrf files
Interpolate colours <i>if tick, the colour of the contour will be interpolated between the colour for the range and the colour for the next range in the height range file. If not tick, all contours in the same range in the height range file will have the same colour</i>	tick box		
Colour text labels <i>if tick, any text labels in the model will also be coloured.</i>	tick box	tick	
Run <i>colour the contours according to the height range file.</i>	button		

Contour, Smooth and Label

tin_contour_smooth_and_label

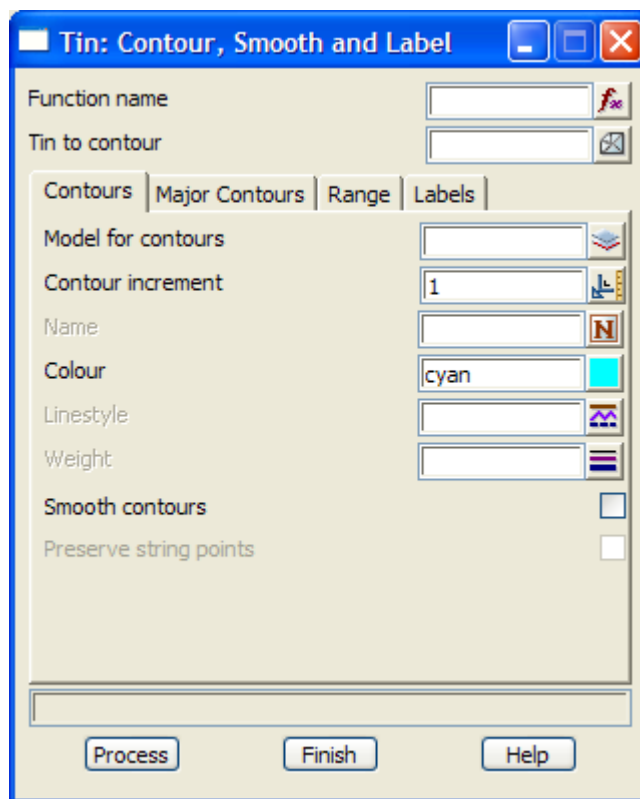

Position of option on menu: Tins =>Contour =>Contour, smooth and label

One method of visualizing tin data is with contours. In 12d Model, contour strings can be produced over any user defined elevation range and at any interval.

This option creates contours and can also smooth and label them. It is a function and so if a function is re-run it will remove any data from its last run.

For more information on contouring, smoothing and labelling in 12d Model, go to the section "Creating Contours"

On selecting the Contour, smooth and label option, the **Contour, Smooth and Label** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the contour, smooth and label function.</i>	function box		available contour fns
Tin to contour <i>name of the tin to be contoured.</i>	input		available tins

Contours tab

Model for contours <i>name of the model to place the contours in.</i>	model box		available models
Contour increment <i>increment between contoured values.</i>	input	1.0	

Name	input		
	<i>if non-blank, name to give the contour strings.</i>		
Colour	input	cyan	available colours
	<i>colour of the contours</i>		
Linestyle	input	1	available linestyles
	<i>linestyles for the contour strings.</i>		
Weight	input		
	<i>if non-blank, weight to give the contour strings.</i>		
Smooth contours	tick box		
	<i>if tick, the contours are smoothed.</i>		
Preserve string points	tick box		
	<i>if tick, then the smoothed string goes through the original vertices of the non smoothed contour strings. If not tick, then the smoothed strings do not have to include the vertices from the non-smoothed contours.</i>		

Major Contours tab

Create major contours	tick box		
	<i>if tick, then major contours can be given a different name, colour, style, weight and model.</i>		
Model for major contours	model box		available models
	<i>if non blank, the name of the model to place the major contours in. If blank, the same model is used as for the ordinary contours.</i>		
Major contour increment	input	5.0	
	<i>increment for the major contours. If blank or zero, then no bold contours are drawn. If non-zero, it must be an integer multiple of the contour increment.</i>		
Name	input		
	<i>if non-blank, name to give the major contour strings. If blank, the same name is used as for the ordinary contours.</i>		
Colour	input	off yellow	available colours
	<i>colour of the major contours. If blank, the same colour is used as for the ordinary contours.</i>		
Linestyle	input	1	available linestyles
	<i>if non blank, linestyles for the major contour strings. If blank, the same linestyle is used as for the ordinary contours.</i>		
Weight	input		
	<i>if non-blank, weight to give the major contour strings. If blank, the same weight is used as for the ordinary contours.</i>		

Range tab

Cont min	input		
	<i>minimum value of the z range to be contoured. If blank, the tin's minimum z-value is used.</i>		
Cont max	input		
	<i>maximum value of the z range to be contoured. If blank, the tin's maximum z-value is used.</i>		
Cont ref	input	0.0	

reference value for the contour increments.

Labels tab

Label contours tick box

if tick, then the contours are labelled.

Label major contours only tick box

if tick, then only the major contours are labelled.

Model for labels model box available models

if non blank, the name of the model to place the contour labels in. If blank, the same model is used as for the contours.

Contour method input

- above line contour direction
- above line read from below
- centred line read from below
- line removal and centred line read from below
- above line facing uphill
- centred line facing uphill
- line removal & centred facing uphill

For information on each of the methods of labelling contours, go to the section "Labelling Contours".

Decimal places

number of decimal places used in the contour label.

Textstyle data input 1 textstyle favourites

textstyle information to use for the contour labels.

Start dist (w) input 0

chainage distance to the first label on the string - world units

Separation (w) input 250

chainage interval between the labels - world units

Model of label lines model box available models

if non blank then instead of using the start distance and separation parameters to define where the contour labels are placed, the Model of label lines is used. In this case, a label is created where ever a string in the Model of label lines cuts a contour.

Label start and end tick box tick

if tick, the start and end of the contours are labelled regardless of the values of start distance and separation.

Process button

contour, smooth and label the tin given in the tin field and place the contours in the model given in the model field.

Drape

tin_drape

Position of menu: Tins =>Drape

The drape option sections along a string and creates a new 3d-string which sits over the original string in plan view (with line approximations for arcs and spirals) but with z-values taken from a triangulated surface (a tin).

The drape alignment option takes an alignment string and creates a new alignment string with the identical horizontal geometry and vertical intersection points with z-values taken from a tin.

The tin drape walk-right menu is

The options in the tin contours menu will now be discussed.

For the option *Drape*, please go to the section "Drape"

<i>Alignment</i>	"Drape Alignment (Macro)"
<i>Heights</i>	"Heights for Tin Boundary"
<i>String heights for tin,</i>	"Update Z-values from Tin"

Drape

drape

Position of option on menu: Tins =>Drape =>Drape

The drape operation is simply sectioning along a string.

Draping is a very useful method for attaching a z-value for strings defined in plan only. For example, cadastral information often has only (x,y) co-ordinates. The drape operation could be used to apply z-values to the cadastral information, for example, z-values from the natural surface tin. The draped cadastral information would then sit on the natural surface and could be used effectively in perspective views as well as plan views to delineate properties etc.

Instead of simply producing a section along a string, *drape* can also be used to produce a face for every segment of the string by draping the segment onto the tin and forming a face by perpendicularly connecting the end points of the segment and the draped segment. For example, if the strings represented the tops of buildings, the created faces would be the sides of the buildings down to the terrain.

The data to be draped can be selected in three ways - an individual string can be selected and draped, all the strings in a model can be draped, or all the strings in a view can be draped.

On selecting *drape*, the **drape** panel is displayed.

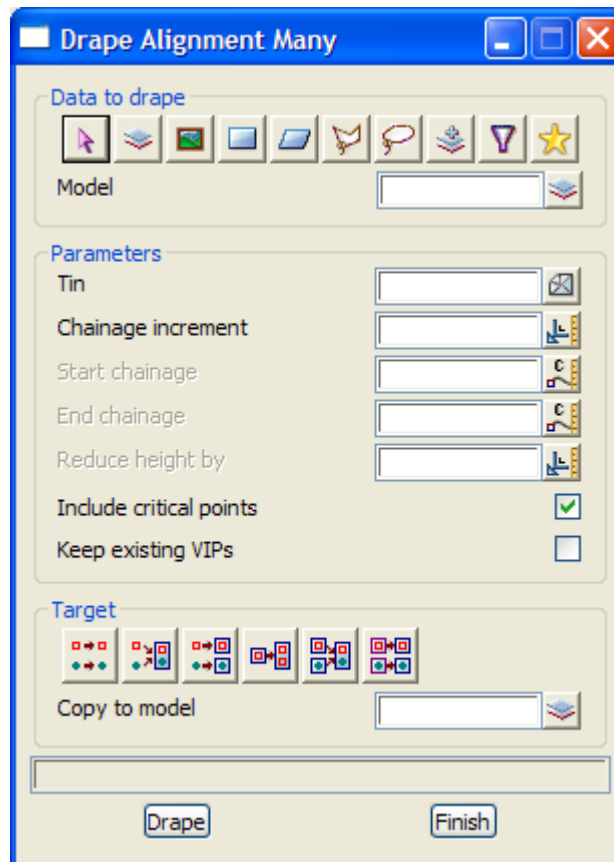

Drape Alignment

drape_alignment_many

Position of option on menu: Tins =>Drape =>Alignment

The Drape alignment operation takes an alignment/super alignment string and creates a new alignment/super alignment string with identical horizontal geometry and the z-value for vertical intersection points taken from a tin. The z-values are taken over a user specified chainage interval and chainage increment. Vertical intersection points outside the chainage range can be kept.

On selecting **Alignment**, the **Drape Alignment Many** panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts" .

Data source	input		
--------------------	-------	--	--

source of data of alignment/super alignment strings to drape.

Tin	input box		
------------	-----------	--	--

triangulation to take z-values from.

Chainage increment	input box		
---------------------------	-----------	--	--

the chainage interval to create VIP points for. Each created VIP point is given the z-value from the tin

and the (x,y) position of the VIP.

Start/End chainage input box

*if non blank, the chainage range to create VIP's over.
If blank, use the start/end chainage of the selected string.*

Reduce height by input box

*if non blank, the value is **subtracted** from the z-value on the tin.*

Include critical points tick box tick

if tick, VIP's are created at the horizontal tangent points.

Keep existing VIPs tick box

*if tick, any existing VIP's outside the given chainage range are kept.
If not tick, don't create any VIP points outside the chainage range.*

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Drape button

create new alignment/super alignment strings with the same horizontal geometry as the selected strings and the z-value for VIP points taken from the given tin.

Drape Alignment (Macro)

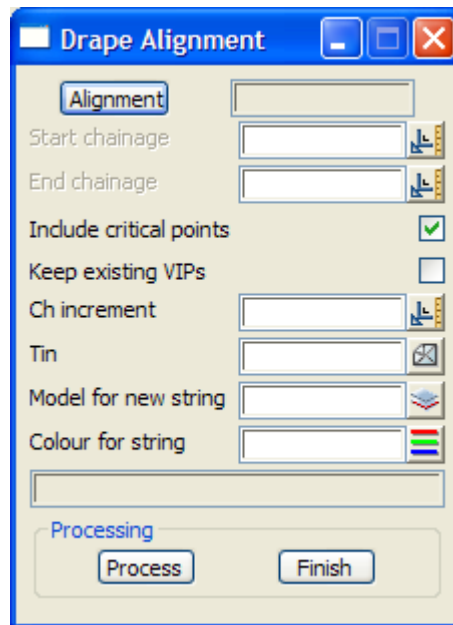

drape_alignment_panel

Position of option on menu: Tins =>Drape =>Alignment (macro)

This is the *Drape =>Alignment* option from V7C1f. It has now been superseded.

The Drape alignment (macro) operation takes an alignment string and creates a new alignment string with identical horizontal geometry and the z-value for vertical intersection points taken from a tin. The z-values are taken over a user specified chainage interval and chainage increment. Vertical intersection points outside the chainage range can be kept.

On selecting Alignment (macro), the **drape alignment** panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Alignment <i>alignment string to drape.</i>	string select		
Start/End chainage <i>the chainage range to create VIP's over. if blank, use the start/end chainage of the selected string.</i>	input box		
Include critical points <i>if tick, VIP's are created at the horizontal tangent points.</i>	tick box	tick	
Keep existing VIPs <i>if tick, any existing VIP's outside the given chainage range are kept. If not tick, don't create any VIP points outside the chainage range.</i>	tick box		
Ch increment <i>the chainage interval to create VIP points for. Each created VIP point is given the z-value from the tin and the (x,y) position of the VIP.</i>	input box		

Tin input box

triangulation to take z-values from.

Model for new string input box

model for the draped string.

Colour for string input box

Colour for the draped string.

Process button

create a new alignment string with the same horizontal geometry as the selected string and the z-value for VIP points taken from the given tin.

Heights for Tin Boundary or Drape Using Closest Tin Node

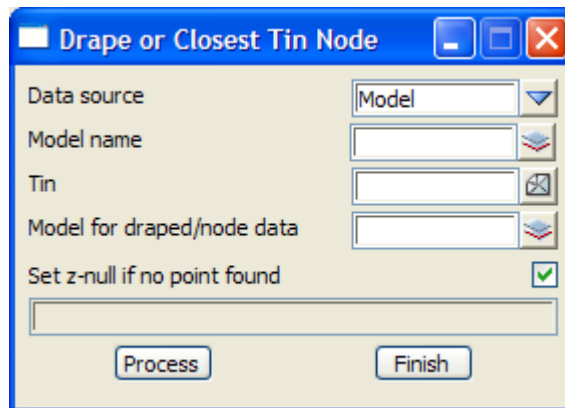

drape_or_closest_tin_node_panel

Position of option on menu: Tins =>Drape =>Heights for boundary

This option takes strings and for each vertex of each string, replaces the z-value by the z-value at the same (x,y) position from a given tin, or if there is no tin at the (x,y) position, takes the z-value from the closest non-null tin node to the (x,y) position.

The option is useful for taking a tin boundary with no z-values and creating z-values for each vertex from the tin.

On selecting Heights from boundary, the Update Z-values from Tin panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>type of the data source</i>	choice box	model	model, view, string

Model/View/String name
source of the data to drape vertices for.

Tin
tin to drape the vertices onto.

Model for draped/node data
model for the draped strings.

Set z-null if no point found	tick box	tick	
<i>if tick, the vertex z-value is set to null if no tin exists at the vertex. If not tick and the tin does not exist at the vertex, the z-value for the vertex is taken from the closest non-null tin node.</i>			

Process	button	
<i>run the option.</i>		

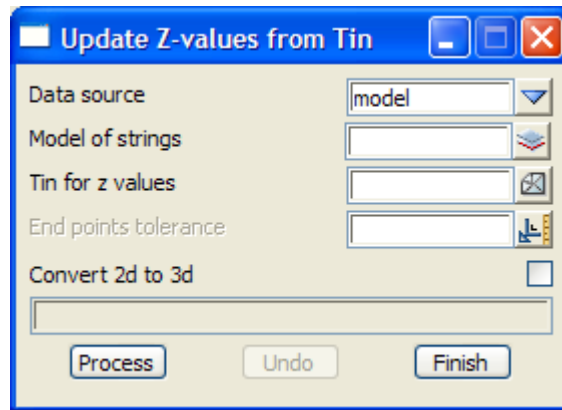

Update Z-values from Tin

string_zvalues_from_tin_panel

Position of option on menu: Tins =>Drape =>String heights from tin

The Update z-values from tin option takes a string (not an alignment string) and replaces the z-value at a vertex by the z-value from the tin at that (x,y) position.

On selecting Update z-values from tin, the Update Z-values from Tin panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type <i>data selection type.</i>		model	string, model, view
Data source <i>source of data to process.</i>		model	string, model, view
Tin for z values <i>triangulation to take z-values from.</i>	tin box		
Convert 2d to 3d <i>if tick, any 2d strings are converted to 3d string so that each point can have a different z-value.</i>	tick box	tick	
Process <i>takes all strings (not an alignment string) in the data source and replaces the z-value at a vertex by the z-value from the tin at that (x,y) position.</i>	button		

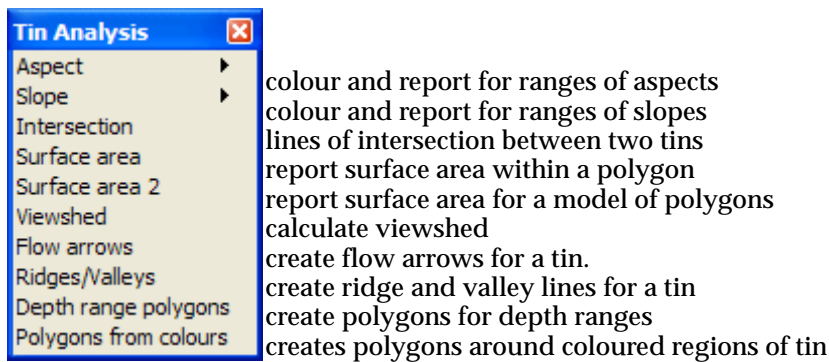

Tin Analysis

tin_analysis

Position of menu: Tins =>Tin analysis

The tin analysis options are used to calculate the direction and slope of triangles, the intersection between tins, surface areas, flow arrows, ridge and valley lines and viewsheds.

The tin analysis walk-right menu is

For the options *Aspect*, please go to the section “Aspect” .

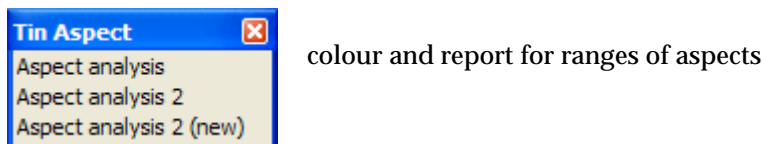

<i>Slope</i>	“Slope”
<i>Intersection</i>	“Intersection”
<i>Surface area</i>	“Surface Area” .
<i>Surface area 2</i>	“Surface Area 2”
<i>Viewshed</i>	“Viewshed”
<i>Flow arrows</i>	“Flow Arrows”
<i>Ridge/Valleys</i>	“Ridge/Valleys”
<i>Depth range polygons</i>	“Depth Range Polygons”
<i>Polygons from colours</i>	“Polygons from Tin Colours”

Aspect

tin_aspect

Position of menu: Tins =>Tin analysis =>Aspect

The tin aspect options calculate and report on the directions of the triangles. The tin aspect walk-right menu is

The options in this menu will now be discussed.

Aspect Analysis

aspect_analysis

Position of option on menu: Tins =>Tin analysis =>Aspect => Aspect Analysis

This panel is used to calculate the aspect or direction that the triangles of a tin face. The

calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

The calculated aspects can be produced and reported over user supplied bearing ranges. Similarly, a plan view can be temporarily coloured on an aspect basis using the same **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For aspect analysis, the range file consists of a list of aspect ranges and colours, one set per line, in the format

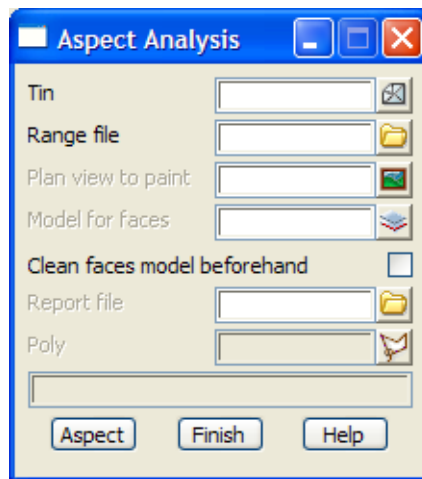

lower_bearing upper_bearing range_colour

where this line represents all bearings satisfying

lower_bearing < bearing <= upper_bearing.

For each range in the file, the plan and slope areas of the triangles in the bearing range will be reported on, and the range_colour can be used to colour all areas on a plan view satisfying the range.

On selecting the aspect analysis option, the **Aspect Analysis** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the aspects of the triangles will be calculated.</i>	input		available tins
Range file <i>the user supplied range file is used to split up the aspect report and define the range colours used for painting a plan view.</i>	input		*.arf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the range colours given in the range file.</i>	input		available views
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	input		available models
Clean faces model beforehand <i>if tick, the model of faces is cleaned out before the option runs.</i>	tick box		

Report file input *.rpt
name of the file to contain the aspect report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly string-select
if selected, this string is used as the bounding polygon for the aspect calculations.

Aspect button
the aspects of the triangles of the tin within the selected bounding polygon are calculated.

<esc> can be used to terminate the option during aspect calculations.

Example of an Aspect Range File

```
// aspect range file
// format: lower_bearing upper_bearing colour_for_range
0 45 red // colour red the triangles with bearing greater than 0 and less than or equal to 45
45 90 green // colour green the triangles with bearing > 45, and <= 90
90 123.30 "dark green" // colour dark green triangles with bearing > 90 and <=1 to 123 deg 30'
```

Aspect Analysis 2 and 2 (new)

aspect_analysis_2

Position of option on menu: Tins =>Tin analysis =>Aspect => Aspect Analysis 2

Position of option on menu: Tins =>Tin analysis =>Aspect => Aspect Analysis 2 (new)

As with the aspect analysis option, the aspect analysis 2 option is used to calculate the aspect or direction that the triangles in the tin face. [aspect_analysis_2_new](#)

However, this option can also create the strings that bound the triangles in the same aspect range. The aspect analysis 2 (new) option is the same as aspect analysis 2 except the boundary polygons have slightly different names.

One restriction for this option is that the calculations **can not** be restricted to be within a polygon and the entire tin is used.

For aspect analysis 2, the range file consists of a list of aspect ranges and colours, one set per line, in the format as for aspect analysis:

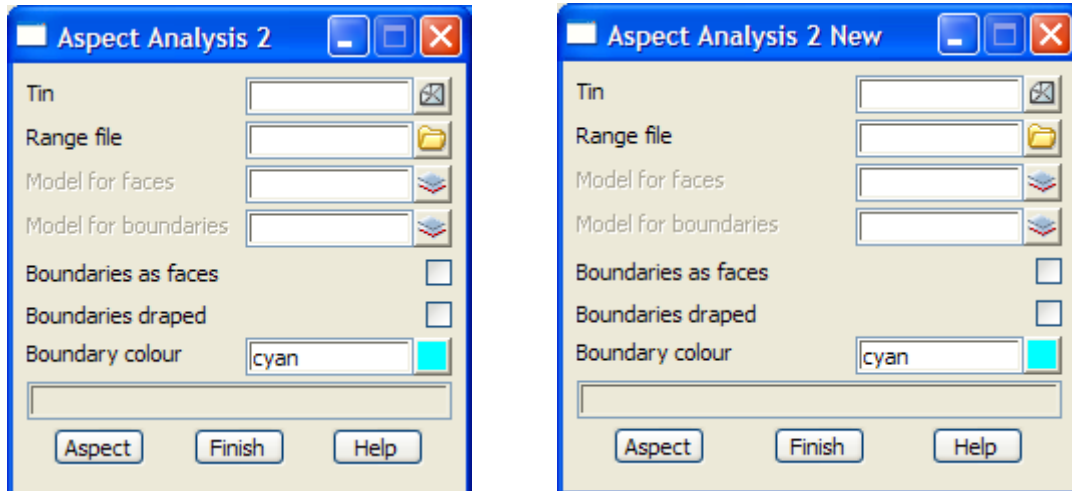

```
lower_bearing upper_bearing range_colour
```

where this line represents all bearings satisfying

```
lower_bearing < bearing <= upper_bearing.
```

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the aspect analysis 2 option, the **Aspect Analysis 2** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the aspects of the triangles will be calculated.</i>	input		available tins
Range file <i>the user supplied range file is used to split the triangles into groups of common aspects so that boundary strings can be created and the range colours used for faces and the boundary strings.</i>	input		*.arf
Model for faces <i>if non-blank, a faces will be created (with the colour given in the range file) for each triangle.</i>	input		available models
Model for boundaries <i>if non-blank, for each range of aspects in the range file, boundary strings will be created for regions of common aspect. The boundary strings are given the name "aspect boundaries" plus the number of the entry in the range file. Many of the boundaries will exist twice since they are the upper boundary for one range and the lower boundary for the next range but will have a different colour and name. For aspect analysis 2 (new), the boundary name also has the addition of "face" and a number to more clearly differentiate the boundaries of the same range.</i>	input		available models
Boundaries as faces <i>if tick, output the regions of common aspect as faces.</i>	tick box		
Boundary colour <i>not used - was the colour for the aspect boundaries.</i>	input	cyan	available colours
Aspect <i>On selecting this button, the aspects of the triangles of the tin are calculated and the appropriate boundaries and faces created.</i>	button		

<esc> can be used to terminate the option during aspect calculations.

Slope

tin_slope

Position of menu: Tins =>Tin analysis =>Slope

The tin slope options calculate and report on the slopes of the triangles. The tin slope walk-right menu is

colour and report for ranges of slopes

The options in this menu will now be discussed.

Slope Analysis**slope_analysis**

Position of option on menu: Tins =>Tin analysis =>Slope =>Slope analysis

This panel is used to calculate the slopes of triangles in the tin. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

The calculated slopes can be produced and reported over user supplied slope ranges. Similarly, a plan view can be temporarily coloured on a slope basis using the same **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For slope analysis, the range file consists of a list of ranges and colours, one set per line, in the format

```
lower_slope upper_slope range_colour
```

where this line represents all slopes satisfying

```
lower_slope < slope <= upper_slope.
```

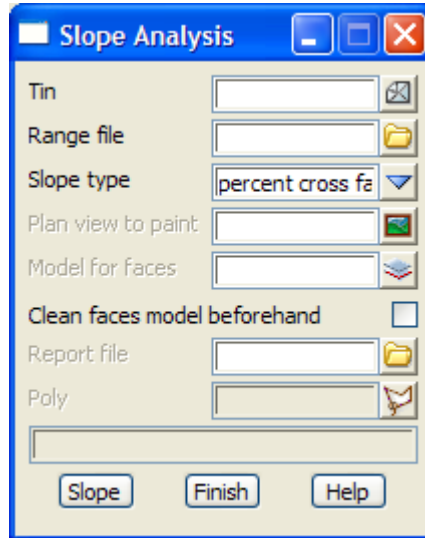

The slopes in the file can be percent cross fall, "1v in" slope or degrees (in **12d** Model dms format) but they must **all be of the same type** in the file.

Note - if "1v in" is used, the range is converted to:

```
smaller_slope_as_percent_cross_fall < slope <= larger_slope_as_percent_crossfall
```

For each range in the file, the plan and slope areas of the triangles in the range will be reported on, and the range_colour used to colour all areas on a plan view satisfying the range.

On selecting the Slope analysis option, the **Slope Analysis** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the slopes of the triangles will be calculated.</i>	input		available tins
Range file <i>the user supplied range file is used to split up the slope report and define the range colours used for painting a view.</i>	input		*.srf
Slope type <i>the units used for slope in the range file.</i>	input		percent cross fall, degrees, 1v in
Plan view to paint <i>if non-blank, the given plan view will be painted according to the range colours given in the range file.</i>	input		available views
Clean faces model beforehand <i>if tick, the model of faces is cleaned out before the option runs.</i>	tick box		
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	input		available models
Report file <i>name of the file to contain the slope report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>	input		*.rpt
Poly <i>if selected, this string is used as the bounding polygon for the slope calculations.</i>	string-select		
Slope <i>On selecting this button, the slopes of the triangles of the tin within the selected bounding polygon are calculated.</i>	button		

<esc> can be used to terminate the option during slope calculations.

Example of a Slope Range File

```
// slope range file in percent cross fall
// format: lower_slope upper_slope colour_for_range
0 5 red // colour red the triangles with slope greater than 0% and less than
// or equal to 5% x-fall
5 10 green // colour green the triangles with slope > 5%, and <= 10% x-fall
10 300 "dark green" // colour dark green triangles with slope greater than 10%
// and less than or equal to 300% x-fall

// slope range file in "1v in" slopes
// format: lower_slope upper_slope colour_for_range
0 20 red // colour red the triangles with slope greater than flat and
// less than or equal to 1:20
20 10 green // colour green the triangles with slope between 1:20 and equal to 1:10
10 1 blue // colour blue triangles with slope between 1:10 and equal to 1:1
```

Slope Analysis 2 and 2 (new)

[slope_analysis_2](#)

[slope_analysis_2_new](#)

Position of option on menu: Tins =>Tin analysis =>Slope =>Slope analysis 2

Position of option on menu: Tins =>Tin analysis =>Slope =>Slope analysis 2 (new)

As with the slope analysis option, the slope analysis 2 option is used to calculate the slope of triangles in the tin. However, this option can also create the strings that bound the triangles in the same slope range.

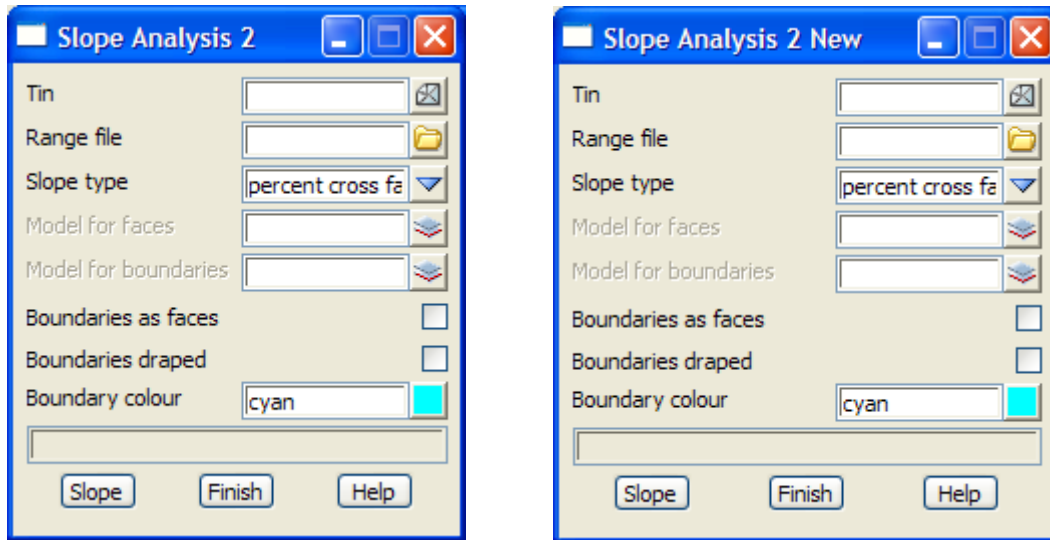

The slope analysis 2 (new) option is the same as *slope analysis 2* except the boundary polygons have slightly different names.

One restriction for this option is that the calculations **can not** be restricted to be within a polygon and the entire tin is used.

The range file for slope analysis 2 has the same format as for slope analysis.

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the Slope analysis 2 option, the **Slope Analysis 2 new** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the slopes of the triangles will be calculated.</i>	input		available tins
Range file <i>the user supplied range file is used to split the triangles into groups of common slopes so that boundary strings can be created and the range colours used for faces.</i>	input		*.srf
Slope type <i>the units used for slope in the range file.</i>	input		percent cross fall, degrees, 1v in
Model for faces <i>if non-blank, a faces will be created (with the colour given in the range file) for each triangle.</i>	input		available models
Model for boundaries <i>if non-blank, for each range of slopes in the range file, boundary strings will be created for regions of common slope. The boundary strings are given the name "slope boundaries" plus the number of the entry in the range file. Many of the boundaries will exist twice since they are the upper boundary for one range and the lower boundary for the next range but they will have a different colour and name. For slope analysis 2 (new), the boundary name also has the addition of "face" and a number to more clearly differentiate the boundaries of the same range.</i>	input		available models
Boundaries as faces <i>if tick, output the regions of common aspect as faces.</i>	tick box		
Boundary colour <i>colour for the slope boundaries.</i>	input	cyan	available colours
Slope	button		

On selecting this button, the slopes of the triangles of the tin are calculated and the appropriate boundaries and faces created.

<esc> can be used to terminate the option during slope calculations.

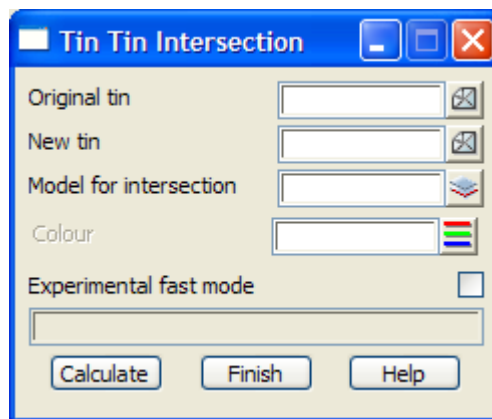

Intersection

tin_tin_intersection

Position of option on menu: Tins =>Tin analysis =>Intersection

The intersection option finds the lines of intersection between two tins.

On selecting the intersection option, the **Tin Tin Intersection** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original tin <i>name of one of the tins to be intersected.</i>	input		available tins
New tin <i>name of the other tin to be intersected.</i>	input		available tins
Model for intersection <i>name of the model to contain the intersection strings.</i>	input		available models
Colour for intersection <i>colour to make the intersection strings</i>	input	default colour	available colours
Calculate <i>calculate the intersection between two tins given in the panel fields. The resulting intersection strings are added to the model given in the model for intersection field.</i>	button		

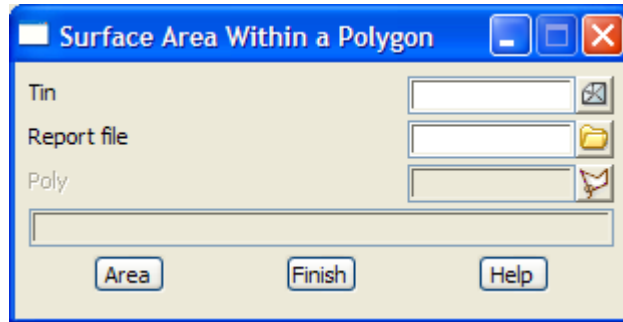

Surface Area

surface_area_within_a_polygon

Position of option on menu: Tins =>Tin analysis =>Surface area

The surface area option is used to calculate the surface area of a tin within a user selected string.

On selecting the surface area option, the **surface area within a polygon** panel is placed on the screen.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>the tin to calculate the surface area on.</i>	input		available tins
Report file <i>if non-blank, the name of the file to write the surface area within the selected polygon to.</i>	input		*.rpt files
Poly <i>select the string to find the slope area within.</i>	button		
Area <i>calculate the surface area of the tin within the selected polygon.</i>	button		

Surface Area 2

surface_area_within_a_model_of_polygons

Position of option on menu: Tins =>Tin analysis =>Surface area 2

The **surface area 2** option is used to calculate the surface area of a tin within each polygon in a model.

On selecting the **surface area 2** option, the **Surface Area Within a Model of Polygons** panel is placed on the screen.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>the tin to calculate the surface area on.</i>	input		available tins
Model <i>the model of polygons for calculating surface area within.</i>	input		available models
Report file <i>if non-blank, the name of the file to write the surface area within each polygons in the model, plus the total of the surface area.</i>	input		*.rpt files
Area <i>calculate the surface area of the tin within each polygons in the model, and sum the areas.</i>	button		

Viewshed

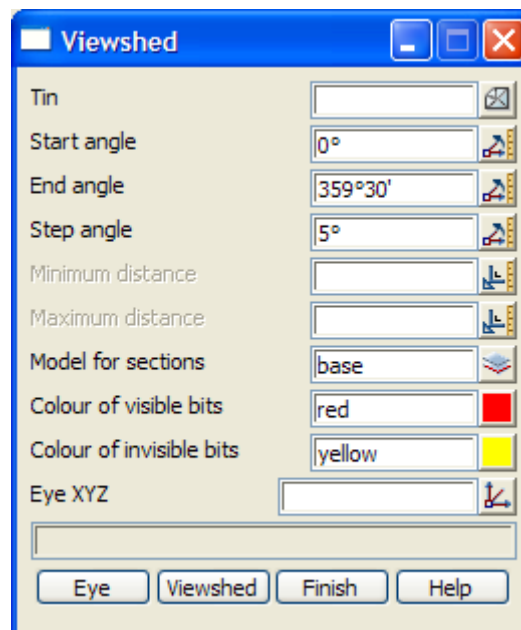

viewshed

Position of option on menu: Tins =>Tin analysis =>Viewshed

This panel is used to calculate the points that are visible and invisible from a user selected eye position. This is equivalent to calculating the points that can or can not see a selected point.

The calculations are made along rays emanating from the eye point from a minimum to a maximum distance from the eye point. The rays are created at regular angular steps from a start angle to an end angle.

On selecting the viewshed option, the **Viewshed** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to be used for the viewshed analysis.</i>	input		available tins

Start angle	input	0	
			<i>the angle to begin taking sight rays emanating from the eye point.</i>
End angle	input	359.30	
			<i>the angle to stop taking sight rays emanating from the eye point.</i>
Step angle	input	5	
			<i>the angle between successive sight rays emanating from the eye point.</i>
Minimum distance	input		
			<i>if non-blank, the minimum distance from the eye point along the sight ray to begin recording visible/invisible points.</i>
			<i>If blank, the minimum distance is zero.</i>
Maximum distance	input		
			<i>the maximum distance from the eye point along the sight ray to record visible/invisible points.</i>
			<i>If blank, the entire tin is considered.</i>
Model for sections	input		available models
			<i>the model for the visible/invisible sight strings.</i>
Colour of visible bits	input		default line colour
			<i>if non-blank, the colour for the visible parts of the rays.</i>
			<i>If blank, the visible parts are not created.</i>
Colour of invisible bits	input		default point colour
			<i>if non-blank, the colour for the invisible parts of the rays.</i>
			<i>If blank, the invisible parts are not created.</i>
Eye XYZ	input/output		xyz ops menu
			<i>the XYZ co-ordinates of the eye point.</i>
Eye	button		
			<i>if picked, an eye point is selected and then the height displayed in an enter height input box. If required, a new height can be typed into the enter height box. After typing an <enter> into the input box, the box is removed from the screen and the x, y and height is piped into the eye XYZ panel field.</i>
Viewshed	button		
			<i>On selecting this button, the lines of sight emanating from the eye XYZ point are calculated.</i>
			<esc> can be used to terminate the option during viewshed calculations.

Flow Arrows

flow_arrows

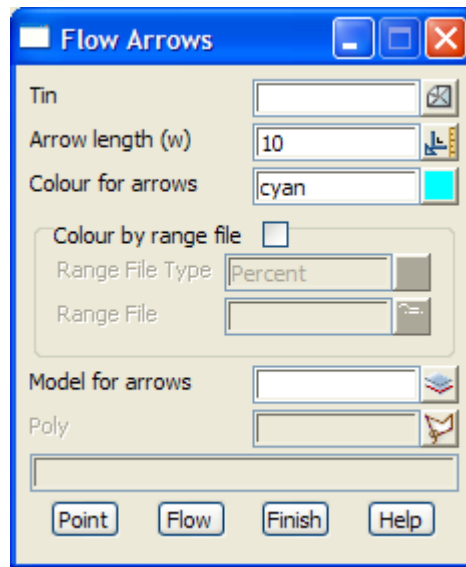

Position of option on menu: Tins =>Tin analysis =>Flow arrows

The **flow arrows** option draws arrows indicating the flow direction across triangles in a tin.

The flow arrows can be drawn for selected points, for all the triangles within a polygon, or if no polygon is selected, for all triangles in the tin.

The arrows are drawn at the centroid of the triangle and have a fixed user given length.

On selecting the **flow arrows** option, the **flow arrows** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to calculate flow arrows for.</i>	input		available tins
Arrow length (w) <i>length in world units to draw the flow arrows.</i>	input		
Colour for arrows <i>colour for the arrows.</i>	input	cyan	available colours
Model for arrows <i>model to put flow arrows in. Must be non-blank.</i>	input		available models
Pick <i>after selecting pick, a flow arrow is drawn at each selected point. This continues until cancel is selected from the pick ups menu.</i>	button		
Poly <i>if a polygon is selected, then the spot heights will be restricted to within the polygon. If no polygon is selected, the spot heights will be calculated over the entire tin.</i>	button		
Flow <i>calculate the flow arrows for all the triangles in the tin, or if a polygon has been selected, for the triangles whose centroid is inside the polygon.</i>	button		

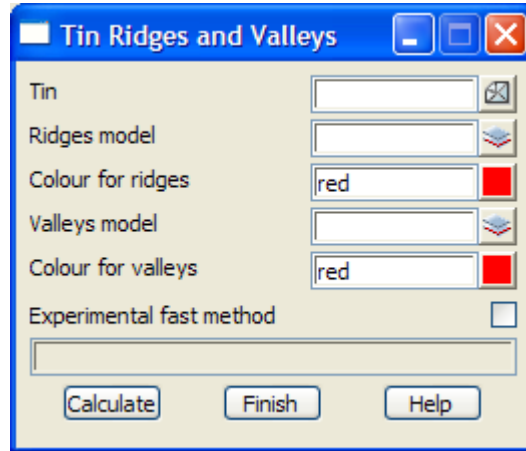

Ridge/Valleys

tin_ridges_and_valleys

Position of option on menu: Tins =>Tin analysis =>Ridges/Valleys

In the ridge/valleys option, ridge and valley lines are calculated for the given tin.

On selecting the ridge/valley option, the **tin ridges and valleys** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to calculate ridge and valley lines for.</i>	input		available tins
Ridge model <i>if non-blank, the name of the model to contain the ridge lines. If blank, the ridge lines are not created.</i>	input		available models
Colour for ridges <i>colour for the ridge lines</i>	input	default colour	available colours
Valleys model <i>if non-blank, the name of the model to contain the valley lines. If blank, the valley lines are not created.</i>	input		available models
Colour for valleys <i>colour for the valley lines</i>	input	default colour	available colours
Calculate <i>ridge and valley lines will be calculated for the given tin and placed in the ridge and valley models.</i>	button		

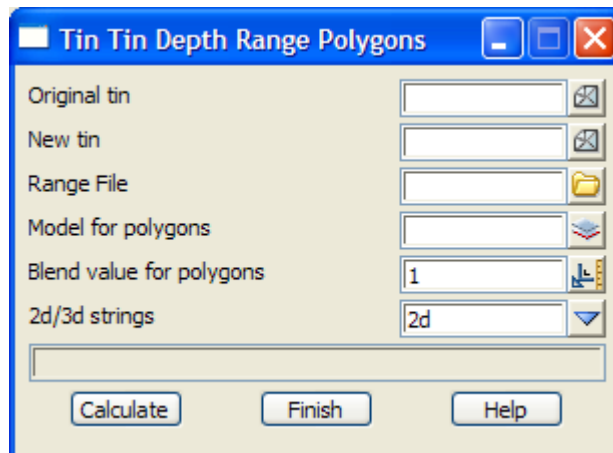

Depth Range Polygons

tin_tin_depth_range_polygons

Position of option on menu: Tins =>Tin analysis =>Depth range polygons

In the Depth range polygons option, polygons are created around the regions given by a depth range file.

On selecting the Depth range polygons option, the **Tin Tin Depth Range Polygons** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New Tin <i>name of the original/new tin for determining depths between.</i>	tin box		available tins
Range file <i>the user supplied range file for splitting up the depths.</i>	input		*.drf
Model for polygons <i>model to contain the polygons.</i>	model box		available models
Calculate <i>create the polygons surrounding regions of different heights between the tins.</i>	button		

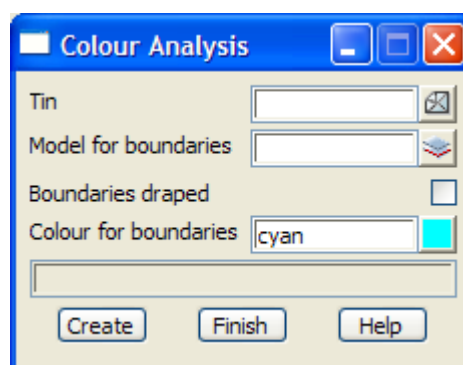

Polygons from Tin Colours

colour_analysis

Position of option on menu: Tins =>Tin analysis =>Polygons from colours

In the Polygons from colours option, polygons are created around the different coloured regions of the tin.

On selecting the Polygons from colours option, the **Colour Analysis** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin to calculate polygons around the coloured regions.

Model for boundaries input available models

model to contain the polygons.

Colour for boundaries input default colour available colours

colour for the polygons

Boundaries draped tick box

if tick, the z-values for the vertices for the boundary strings come from the vertices of the coloured triangles.

If not tick, the boundaries have constant z-values.

Colour for boundaries input default colour available colours

colour for the polygons

Create button

create the polygons surrounding regions of different colours on the tin.

Inquire

tin_inquire

Position of menu: Tins =>Inquire

The inquire options are used to display at the current cursor position the height (z-value) on a tin, the colour of the triangle, the depth from a fixed height to a tin, and the depth between two tins.

Once the user specifies which tin or tins are to be analysed, then as the cursor moves around in any plan view, the triangles below the cursor are examined and the appropriate information displayed.

The tin inquire walk-right menu is

report aspect of triangles
report colour of tin
calculate depth from height to tin
calculate depth from string to a tin
calculate depth between tins
report height on tin
report slope of triangles

The options in the tin inquire menu will now be discussed.

For the options *Aspect*, please go to the section “Aspect Inquire” .

<i>Colour</i>	“Colour Inquire”
<i>Depth from height</i>	“Depth from Height”
<i>Depth from string</i>	“Depth from String”
<i>Depth between tins</i>	“Depth Between Tins”
<i>Height</i>	“Height Inquire”
<i>Slope</i>	“Slope Inquire”

Aspect Inquire

tin_aspect_inquire

Position of option on menu: Tins =>Inquire =>Aspect

The aspect inquire option calculates and displays the aspect (direction) of the triangles under the current plan view cursor position. The aspect is displayed in bearings in degrees, minutes and seconds.

On selecting the tin aspect inquire option, the **tin aspect inquire** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		avail tins

name of the tin for which the aspect of the triangle that the cursor is above will be displayed in the

panel's message area.

Colour Inquire

tin_colour_inquire

Position of option on menu: Tins =>Inquire =>Colour

colour inquire displays the colour of the triangles under the current plan view cursor position.

On selecting the tin colour inquire option, the **tin colour inquire** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin for which the colour of the triangle at the current cursor position is displayed in the panel's message area.

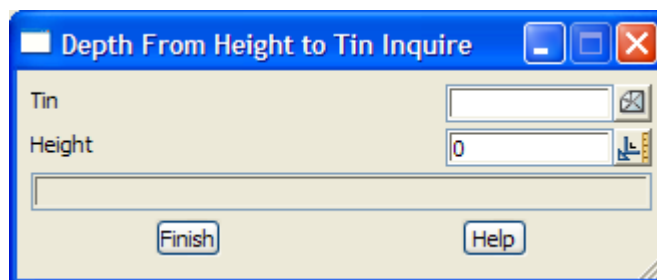

Depth from Height

depth_from_height_to_tin_inquire

Position of option on menu: Tins =>Inquire =>Depth from height

The depth from height option calculates and displays the difference between the z-value of a tin and a given height for the current plan view cursor position.

On selecting the depth from height option, the **depth from height to tin inquire** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin used for calculating the distance from the tin to the given height at the cursor position.

Height	input	0	
---------------	-------	---	--

the difference between the tin value and the value given in this field is displayed in the panel's message area.

Depth from String

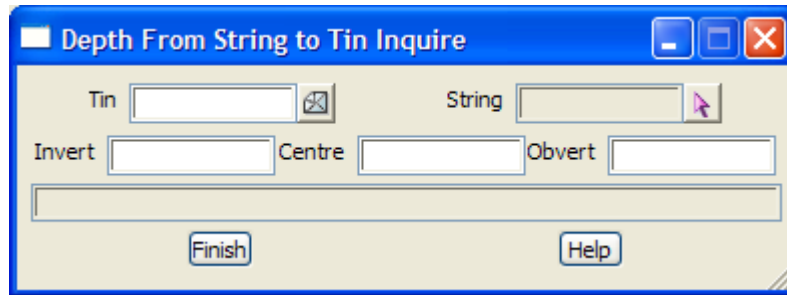

depth_from_string_to_tin_inquire

Position of option on menu: Tins =>Inquire =>Depth from string

The depth from string option calculates and displays the difference between the z-value of a tin and the height of a selected string at the current plan or section view cursor position projected back onto the selected string.

The obvert (top of the string) value is also known as the **cover** above a string to a tin.

On selecting the Depth from string option, the **Depth From String to Tin Inquire** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin used for calculating the z-value at the cursor position.

String	string-select
---------------	---------------

if a string is selected, the difference between the tin value and the height of the selected string (to the invert, centre and obvert of the string) at the current plan or section view cursor position, projected back onto the selected string, is displayed in the panel's message areas.

Invert/Centre/Obvert	output
-----------------------------	--------

displays the distance between the tin and the invert (bottom), centre and obvert (top) of the selected string

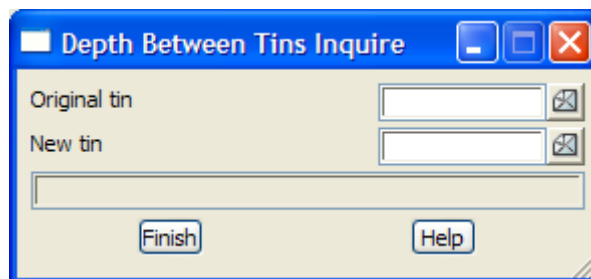

Depth Between Tins

depth_between_tins_inquire

Position of option on menu: Tins =>Inquire =>Depth between tins

The depth between tins option calculates and displays the difference between the z-values of two given tins at the current plan view cursor position.

On selecting the **depth between tins** option, the **depth between tins inquire** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/new tin	input		available tins
<i>name of the two tins or which the z-value is to be calculated at the current plan view cursor position and the difference between the z-values ($z_{\text{new}} - z_{\text{original}}$) is displayed in the panel's message area.</i>			

Height Inquire

tin_height_inquire

Position of option on menu: Tins =>Inquire =>Height

The height inquire option calculates and displays the height (z-value) of triangles from a tin at the current plan view cursor position.

On selecting the tin height inquire option, the **tin height inquire** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin for which the z-value at the current plan view cursor position is displayed in the panel's message area.

Slope Inquire

tin_slope_inquire

Position of option on menu: Tins =>Inquire =>Slope

The slope inquire option calculates and displays the slope of triangles from a tin at the current plan view cursor position. The slope is displayed as a percent cross fall, a "1v in "slope and as an angle in degrees, minutes and seconds.

On selecting the tin slope inquire option, the **tin slope inquire** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		avail tins

name of the tin for which the slope of the triangle that the cursor is above is displayed in the panel's message area.

Null

tin_null

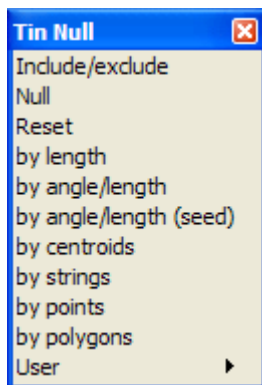

Position of menu: Tins =>Null

The triangulation process forms triangles throughout the convex polygon enclosing the data set. This means that triangles may cross regions where there is very little data and may produce strange results in the ill-defined regions.

In **12d** Model, it is possible to make triangles invisible (called **nulling** triangles) so that they are not used in any options.

Note - nulled triangles are **not** deleted and can be made visible again at any time.

The **null** walk-right menu is

set a polygon to include/exclude all triangles inside the polygon
 null triangles outside a polygon
 reset all null triangles
 null triangles by length of sides
 null triangles by length of sides and angle
 null/reset triangle under the centroid of strings
 null triangles that are crossed by strings
 pick triangles to null/reset
 null/reset triangles inside/outside polygons

The three options in the tin colouring menu will now be discussed.

For the options *Include/exclude*, please go to the section "Include/Exclude Boundaries" .

<i>Null</i>	"Null"
<i>Reset</i>	"Reset"
<i>by length</i>	"Null by Length"
<i>by angle/length</i>	"Null by Angle and Length"
<i>by centroids</i>	"Null by Centroids"
<i>by string</i>	"Null by Strings"
<i>by points</i>	"Null by Points"
<i>by polygons</i>	"Null by polygons"

Include/Exclude Boundaries

tin_include_exclude_boundaries

Position of option on menu: Tins =>Null =>Include/excludes

The **Include/exclude** option is used to tag a polygon that is part of the data set for a Tin so that all the triangles inside the polygon are either set to null or non-null.

On selecting the **Include/exclude** option, the **Tin Include/Exclude Boundaries** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boundary mode	choice box	none	none, include, exclude

mode to set the polygon to.

*If the mode is **exclude**, then any triangles inside the polygon are set to null.*

*If the mode is **include**, then any triangles inside the polygon are reset so that they aren't null.*

*If the mode is **none**, then the polygon is not used for automatically nulling/resetting triangles.*

Pick button

select the polygon to define a boundary mode for.

Set button

set the boundary mode for the selected polygon.

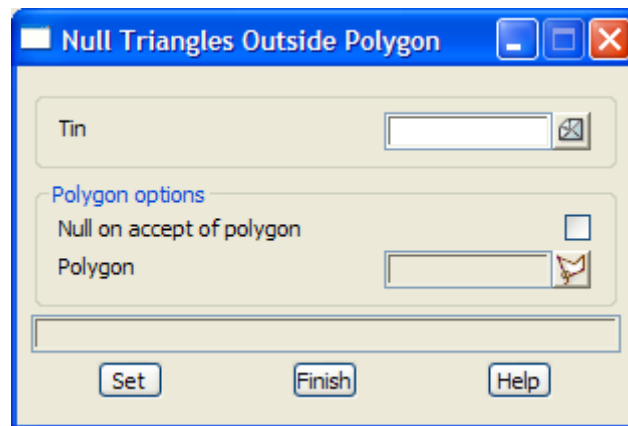

Null

null_triangles_outside_polygon

Position of option on menu: Tins =>Null =>Null

The null option is used to **null** any triangle whose *centroid* is outside a user selected polygon.

On selecting the Null option, the **Null Triangles Outside Polygon** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin to null triangles in.

Null on accept of polygon tick box

if tick, the triangles will be nulled as soon as the string is accepted.

*If not tick, the triangles will not be nulled until the **Set** button is selected.*

Polygon button

the string to be used as the polygon is selected after choosing this button. If Null on accept of polygon is set, then the polygon is processed immediately.

Set button

process the selected string/. Any triangle whose centroid is outside the selected boundary polygon is set to null.

Reset

null_triangles_reset

Position of option on menu: Tins =>Null =>Reset

The reset option is used to change all the nulled triangles in a tin back to the visible triangles.

On selecting the reset option, the **Null Triangles Reset** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to have any nulled triangles reset to being visible triangles.</i>	input		available tins
Reset <i>the reset button resets all null triangles in the tin to the base colour.</i>	button		

Null by Length

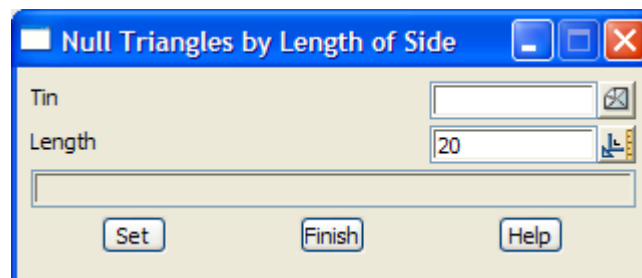

null_triangles_by_length_of_side

Position of option on menu: Tins =>Null =>by length

The null by length option is used to **null** any triangle with a side of length greater than a user specified length.

Warning - this option will null out *internal* triangles. The next option, Null by angle/length will only null triangles on the outer shell.

On selecting the by length option, the **null triangles by length of side** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to null triangles in.</i>	input		available tins
Length	input		

length to check triangle sides against.

Set button

*after selecting the **set** button, the tin will be processed and any triangle with a side of length greater than the value given in the length panel field, will be nulled.*

Null by Angle and Length

null_triangles_by_angle_and_length

Position of option on menu: Tins =>Null =>by angle/length

The null by angle/length option is a more powerful nulling option which tries to remove most of the external triangles that one expects should be removed. For example, for a T-intersection, all the long, thin outer triangles should be removed. The option has two sets of tests - one to remove long thin triangles and the other which uses a combined test to remove squat triangles.

Unlike the *null by length* option, *null by angle/length* only works on triangles which have an outer null triangle on one or two sides (it does not work on internal holes). These triangles are called *external triangles* and sides with an outer null triangle on them are called *external sides*.

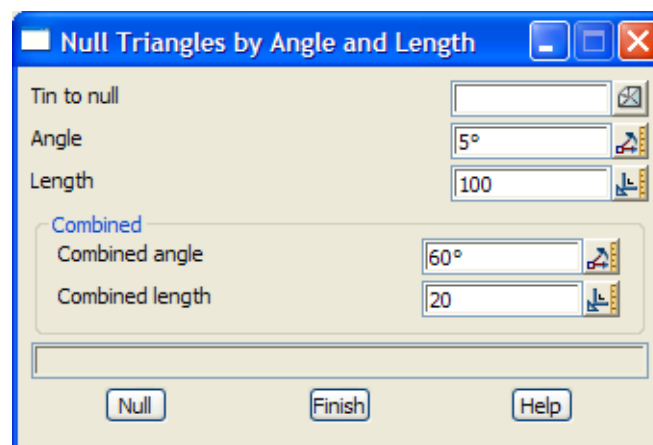

The *null by angle and length* option **does not** remove triangles whose external side is a breakline. Hence, as expected, breaklines will stop the nulling process.

Note that *null by angle and length* keeps processing the remaining non-nulled triangles until no more can be nulled or are stopped by breaklines. Hence the nulling works inwards as outer triangles are nulled revealing new external triangles to be tested. The nulling process is like peeling off layers of an onion.

Important note - the setting for this option are **stored** by the triangulation and the option is automatically re-run if the triangulation is re-run. To turn off the tests, just set the panel fields to blank.

Warning - this option should be the first nulling option used because all null triangles are first reset to valid triangles before this option is applied.

On selecting the null by angle/length option, the **Null Triangles by Angle and Length** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Tin to null	input		available tins
--------------------	-------	--	----------------

name of the tin to have triangles nulled. If this option has been previously run on the tin, the previous panel values are written into the panel fields.

Angle	input	5	
--------------	-------	---	--

if a triangle has an external side (that is not a breakline) with an angle on it less than Angle, then the triangle is nulled. The default value works most of the time.

If blank then no triangles are nulled by this test.

Length input 100

if a triangle has an external side (that is not a breakline) greater than Length, the triangle is nulled.
If blank then no triangles are nulled by this test.

Combined angle input 60

Combined length input 20

For the Combined case, a triangle is nulled if it:

has an external side (that is not a breakline) and the **sum** of the two angles on it is **less** than Combined angle (the default value works most of the time)
and

has an external side (that is not a breakline) whose length is **greater** than Combined length. A suggested value is one third to one half of Length.

If either Combined angle or Combined length is blank, then no triangles are nulled by this test.

Null button

after selecting the **Null** button, all nulled triangles are reset to be valid triangles and the tin then processed and triangles nulled.

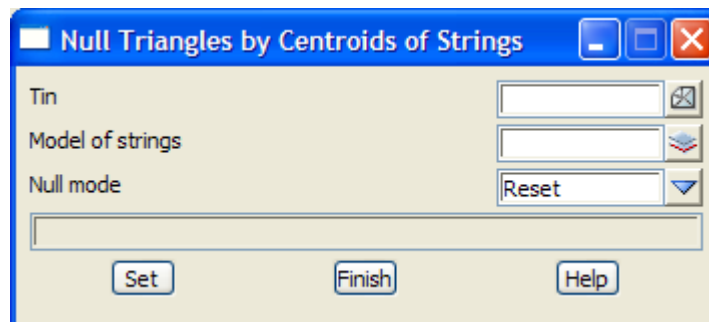

Null by Centroids

[null_triangles_by_centroids_of_strings](#)

Position of option on menu: Tins =>Null =>by centroids

null by centroids is used to **null/reset** any triangle that lies **under** the centroid of a string.

On selecting the by centroids option, the **null triangles by centroids of strings** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Tin	input		available tins
------------	-------	--	----------------

name of the tin to null/reset triangles in.

Model of strings	input		available models
-------------------------	-------	--	------------------

model of strings to be used to select triangles that are under a centroid of one of the model's strings.

Null mode	input	Reset	Reset, Null
------------------	-------	-------	-------------

*if **null**, any triangle under the centroid of a string from the model of strings, will be nulled.*

***reset**, any triangle under the centroid of a string from the model of strings, will be made visible again.*

Set	button		
------------	--------	--	--

*after selecting the **set** button, the tin will be processed and any triangle under the centroid of a string will be set according to the null mode panel field.*

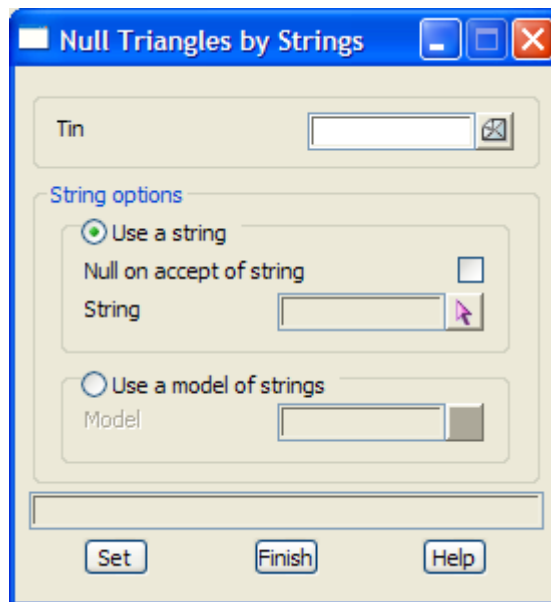

Null by Strings

null_triangles_by_strings

Position of option on menu: Tins =>Null =>by strings

The null by strings option is used to **null** any triangle that is cut by a string.

On selecting the by strings option, the **null triangles by strings** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin to null triangles in.

Use a string	radio button
---------------------	--------------

if set, strings will be selected and used to null any triangle that the string passes through.

Null on accept of string	tick box
---------------------------------	----------

if tick, the triangles will be nulled as soon as the string is accepted.

*If not tick, the triangles will not be nulled until the **Set** button is selected.*

String	string select	existing string	string pop-up
---------------	---------------	-----------------	---------------

if string, a strings will be selected and used to null any triangle that the string passes through.

If line, a temporary two point line is drawn and used to null any triangle that the line passes through

If polyline, a temporary polyline is drawn and used to null any triangle that the string passes through

If closed polyline, a temporary closed polyline is drawn and used to null any triangle that the string passes through

Use a model of strings	radio button
-------------------------------	--------------

if set, a model of strings is used and a triangle is nulled if it is cut by any one of the strings.

Model	input	available models
--------------	-------	------------------

model of strings to cut the triangles.

Set	button
------------	--------

*after selecting the **set** button, the tin will be processed and any triangle that is cut by a string from the*

Model, or a selected string for the User a string case, will be nulled.

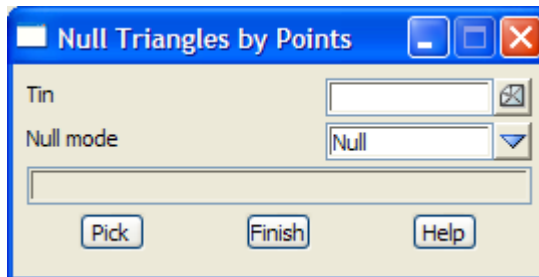

Null by Points

null_triangles_by_points

Position of option on menu: Tins =>Null =>by points

The null by points option is used to **null/reset** any triangle that the user selected with the mouse.

On selecting the **by points** option, the **null triangles by points** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to null/reset triangles in.</i>	input		available tins
Null mode <i>if null, any triangles under a cursor pick will be nulled. reset, any nulled triangles under a cursor pick will be turned back on.</i>	input	Null	Reset, Null
Pick <i>any triangle under the cursor select will be processing according to the null mode panel field.</i>	button		

Null by polygons

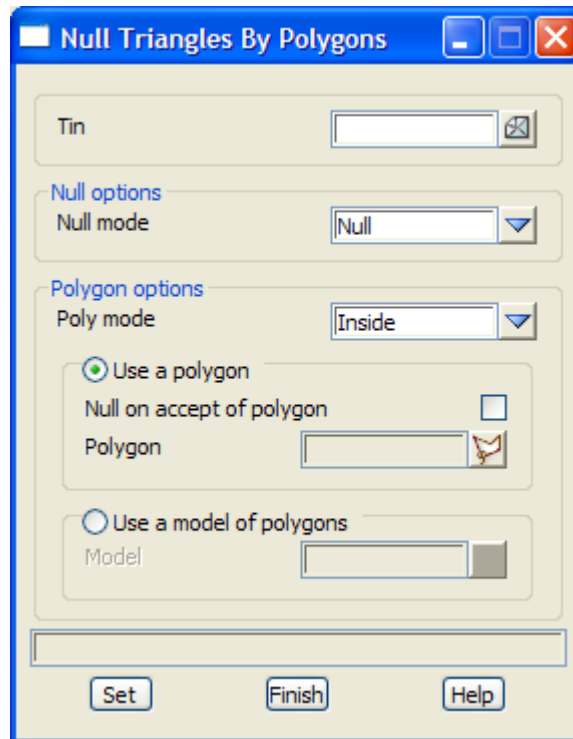

null_triangles_by_polygons

Position of option on menu: Tins =>Null =>by polygons

The null by polygons option is used to **null/reset** any triangles that are inside or outside a user selected polygon, or model of polygons.

If a string is selected to use and it is not closed, then a polygon is formed by joining the first and the last points of the string.

On selecting the **by polygons** option, the **null triangles by polygons** panel is displayed

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to null/reset triangles in.</i>	input		available tins
Null mode <i>if null, any triangles selected will be nulled. reset, any nulled triangles selected will be turned back on.</i>	input	Null	Reset, Null
Poly mode <i>mode to select whether the triangles with centroids inside or outside the selected polygons are to be nulled.</i>	input	inside	inside, outside
Use a polygon <i>if set, strings will be selected and used as the polygon to null/reset all triangles with centroids inside/outside the polygon.</i>	radio button		
Null on accept of polygon <i>if tick, the triangles will be nulled/reset as soon as the polygon (string) is accepted. If not tick, the triangles will not be nulled/reset until the Set button is selected.</i>	tick box		
Use a model of polygons <i>if set, a model of strings will be used as the polygons to null/reset triangles whose centroids are inside/outside one of the polygons.</i>	radio button		
Model <i>model of strings to provide the polygons for nulling/resetting triangles.</i>	input		available models
Set <i>each string in the model of polygons is used to null/reset the triangles in the tin given in the tin field</i>	button		

according to the null mode and poly mode panel field.

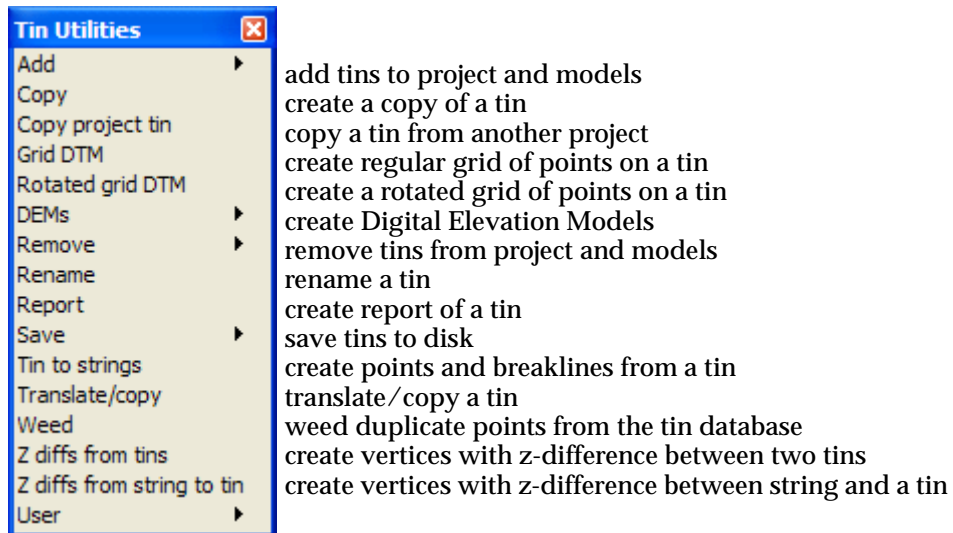

Utilities

tin_utilities

Position of option on menu: Tins =>Utilities =>Tin Utilities

The triangles=>utilities menu contains miscellaneous options involving tins.

The utilities walk-right menu is

Each option will now be described.

For the options <i>Add</i> , go to the section	"Add"
<i>Copy</i>	"Copy"
<i>Copy project tin</i>	"Copy Project Tin"

<i>Tin to strings</i>	"Tin to Strings"
<i>Translate/copy</i>	"Translate/Copy"
<i>Weed</i>	"Weed"
<i>Z diffs from tins</i>	"Z Differences from Tins"
<i>Z diffs from string to tin</i>	"Z Differences from String to Tin"

Add

tin_adds

Position of menu: Tins =>Utilities =>Add

Tins can be added to the project and to models.

The tin adds walk-right menu is

The options in this menu will now be described.

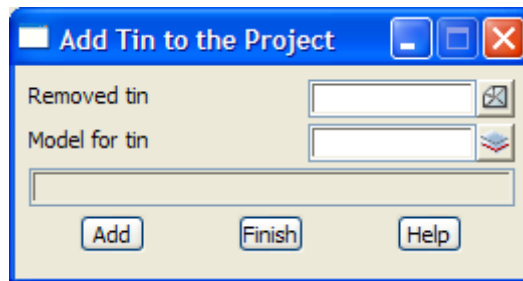

Add to Project

add_tin_to_the_project

Position of option on menu: Tins =>Utilities =>Add =>Add to project

The add to project option is used to add a removed tin back into the project.

On selecting the add tin to project option, the **add tin to the project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Removed tin <i>name of the tin to be added to the working project. The tin must exist on the disk in the project area and not already be in the project.</i>	input		available tins
Model for tin <i>if non-blank, the loaded tin will be added to the model given in this field.</i>	input		available models
Add <i>Add the tin given in the Tin field to the working project. If the model for tin field is non-blank, the tin will be added to the model given in that field - if the model does not exist, it will be created.</i>	button		

Add All To Project

add_all_tins_to_project

Position of option on menu: Tins =>Utilities =>Add =>Add all to project

The add all tins option is used to add all the removed tins back into the project.

On selecting the add all to project option, the **add all tins to project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Add	button		

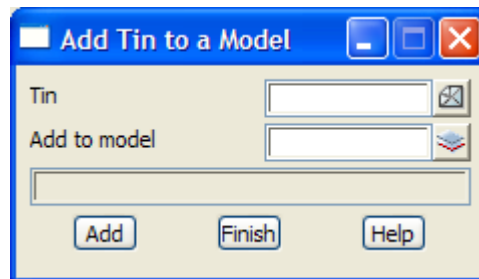

after selecting this button, all removed tins in the working project will be added to the project.

Add to Model

[add_tin_to_a_model](#)

Position of option on menu: Tins =>Utilities =>Add =>Add to model

On selecting the **add to model** output option, the **add tin to a model** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins
Add to model	input		available models

name of the tin to be added to a model.

name of the model to which the tin given in the tin field will be added.

Add	button		
------------	--------	--	--

add the tin given in the tin field to the model given by the add to model field.

Copy

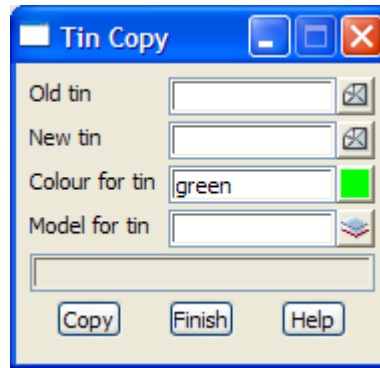

tin_copy

Position of option on menu: Tins =>Utilities =>Copy

A copy of an existing tin can be made using the copy option.

A SuperTin can also be copied and what is created is a new super tin with a new name but exactly the same tins making it up.

On selecting copy, the **tin copy** panel is displayed.

The fields and buttons used in this panel have the following functions.

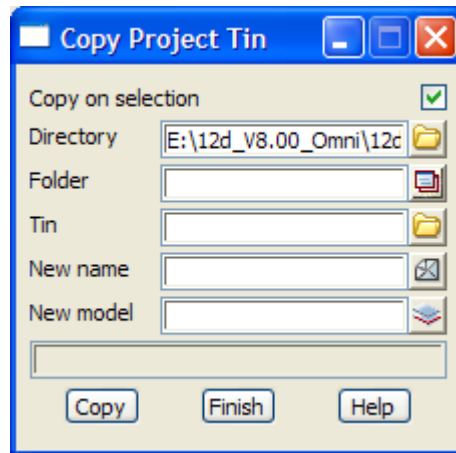

Field Description	Type	Defaults	Pop-Up
Old tin <i>name of the tin to be copied.</i>	input		available tins
New tin <i>name of the copy of the tin - this can't be the same as any existing tin in the project.</i>	input		available tins
Colour of tin <i>if non-blank, the colour of the new tin. If blank, use the old tin colour</i>	input		available colours
Model for tin <i>if non-blank, the name of the model for the new tin. If blank, the tin is not put in any model.</i>	input		available models
Copy <i>after selecting this button, the tin given in the old tin field will be copied and the copy given the name in the new tin field and placed in the model given in the model for tin field.</i>	button		

Copy Project Tin

copy_project_tin

Position of option on menu: Tins =>Utilities =>Add =>Copy project tin

On selecting the copy project tin option, the **copy project tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder that the project to get the tin from, is in.</i>	input		current directories
Project <i>name of the project in the folder given in the folder field, that the tin is to be copied from.</i>	input		current projects
Tin <i>name of the tin to be copied.</i>	input		available tins
New name <i>if non-blank, the new name to be given to the copied tin which must be different to all the exiting tins names in the working project. If blank, keep the name of the original tin (as long as it is different to the existing tins).</i>	input		
New model <i>if non-blank, the tin will be placed in this model.</i>	input		available models
Copy <i>copy to this project, the tin given in the tin field from the project given in the project field.</i>	button		

Grid DTM

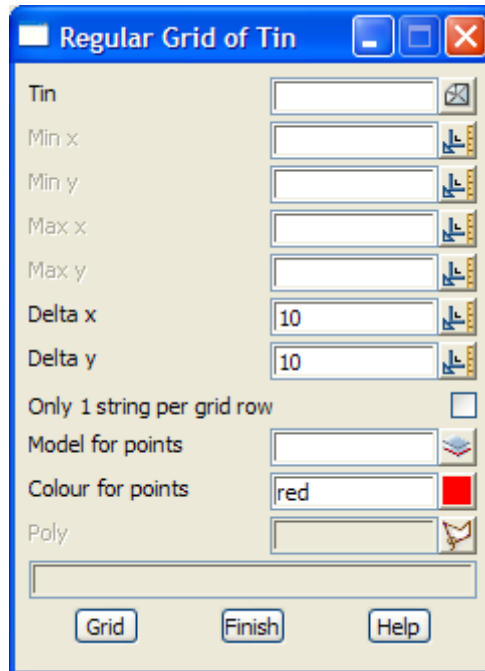

regular_grid_of_tin

Position of option on menu: Tins =>Utilities =>Grid

The **grid** option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon.

Also see the “DEMs” options for creating a file of a regular grid to different formats (Arc View, Quantm, Sokkia).

On selecting the Grid option, the **Regular Grid of Tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin on which the spot heights will be calculated.</i>	tin box		available tins
Min x/y <i>minimum x/y values to calculate spot heights for.</i>	input		
Max x/y <i>maximum x/y values to calculate spot heights for.</i>	input		
Delta x/y <i>difference between the x/y-values for the grid.</i>	input		
Model for points <i>if blank, no point strings will be created. If non-blank, points strings of the spots heights will be created and stored in this model.</i>	input		available models
Colour for points <i>colour to make the point strings.</i>	input	default colour	available colours
Poly	poly-select		

*if a polygon is selected, then the spot heights will be restricted to within the polygon.
If no polygon is selected, the spot heights will be calculated over the entire tin.*

Grid button

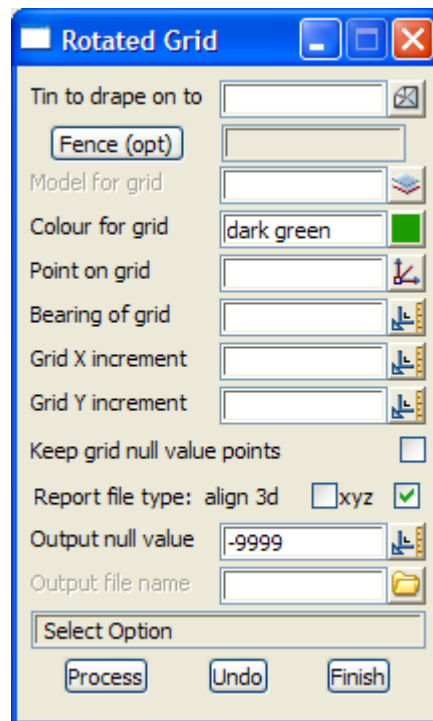

calculate the spot heights at regular points over the area given by the min and maximum x and y values and restricted to be inside the polygon.

Rotated Grid

rotated_grid_panel

Position of option on menu: Tins =>Utilities =>Rotated Grid

This panel is used to create a grid of points with z-values from a given tin. The grid can be rotated and a polygon can be used to restrict the created points. A report of grid points can also be calculated in either simple x y z (one point per line) form or if no polygon is used, in a format accepted by Quantm (formerly Align 3D).

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Tin to drape on to <i>Tin to get the z-values from.</i>	tin box		available tins
Fence (opt) <i>Optional – if selected, the grid is restricted to being inside the polygon.</i>	string select		
Model for grid <i>Model for the created grid.</i>	model box		available models
Colour for grid <i>Colour for the created grid</i>	colour box	dark green	available colours
Point on grid <i>The selected point is on the grid. The other grid points are integer multiples of the “Grid X increment” and “Grid Y increment” (with the bearing “Bearing of grid”) from this point.</i>	input box		

Bearing on grid input box

Bearing of the side of the grid.

Grid X increment input box

The grid is made up of points of integer multiple of “Delta X” in the X direction.

Grid Y increment input box

The grid is made up of points of integer multiple of “Delta Y” in the Y direction.

Keep grid null value pointstick box

If tick, the “Output null value” is written out for any null z-values.

Report file type radio button align 3d/xyz xyz

If xyz – the grid is written out as x y z with one point per line. The” Output null value” is used for any null z-values in the grid.

If align 3d – the grid is written out in a format suitable for align 3d. The” Output null value” is used for any null z-values in the grid.

Output null value input box -9999

The z-value to write out if any grid z-value is null.

Output file name file box *.rpt files

Name of the output file for the grid data.

Process button

Run the option

Undo button

Undo the last grid created whilst the panel is up.

DEMs

tin_dems

Position of menu: Tins =>Utilities =>Dems

DEMs (Digital Elevation Models) can be created from a tin. DEMs are only regular arrays of z-values, rather than the random values and break lines supported by Tins.

Unfortunately there is not just one formats for DEMs.

The DEMS walk-right menu is

For the option *Arc View*, go to the section “Write Arc View DEM”

- | | |
|---------------------------------|---|
| <i>Arc View Act/Min/Max/Avg</i> | “Write Arc View DEM (Actual, Min, Max, Av)” |
| <i>Quantm</i> | “Quantm” |
| <i>Sokkia</i> | “Sokkia” |

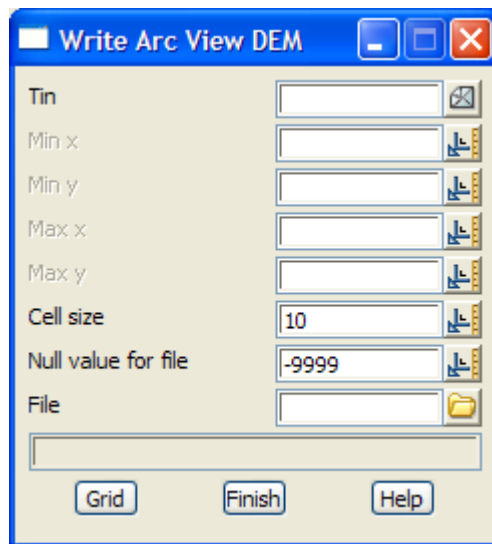

Write Arc View DEM

write_Arc_View_DEM

Position of option on menu: Tins =>Utilities =>DEM =>Arc View

The Arc View option calculates heights at points at regular x and y increments (cell size) between given minimum and maximum x and y values and writes out the data in the Arc View DEM format.

On selecting the Arc View option, the **Write Arc View DEM** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins
<i>name of the tin on which the DEM heights will be calculated.</i>			

Min x/y input

minimum x/y values to calculate spot heights for.

Max x/y input

maximum x/y values to calculate spot heights for.

Cell size input

size of the delta x and delta y - cell is a square.

Null value for file input -9999

value to use when writing null z-values out to the file.

File input *.grd

the file name for the spot height values in Arc View DEM format.

Grid button

calculate the spot heights at regular points over the area given by the min and maximum x and y values and write out the file.

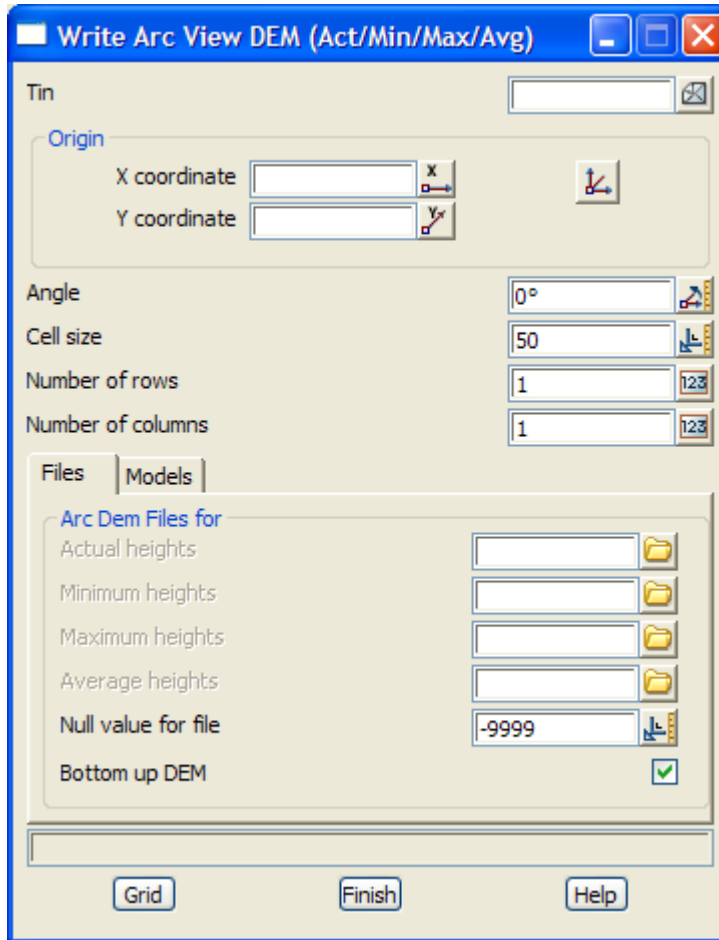

Write Arc View DEM (Actual, Min, Max, Av)

Write_Arc_View_DEM_Act_Min_Max_Avg_

Position of option on menu: Tins =>Utilities =>DEM =>Arc View Act/Min/Max/Avg

The Arc View Act/Min/Max/Agg option calculates heights at points at regular x and y increments (cell size) between given minimum and maximum x and y values, and also the minimum, maximum and average values for the cell. The data is written out in the Arc View DEM format.

On selecting the Arc View Act/Min/Max/Avg option, the **Write Arc View DEM (Act/Min/Max/Avg)** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin on which the DEM heights will be calculated.

Cell size	input		
------------------	-------	--	--

size of the delta x and delta y - cell is a square.

Null value for file	input	-9999	
----------------------------	-------	-------	--

value to use when writing null z-values out to the file.

Grid	button		
-------------	--------	--	--

calculate the spot heights at regular points over the area given by the min and maximum x and y values and write out the file.

Quantm

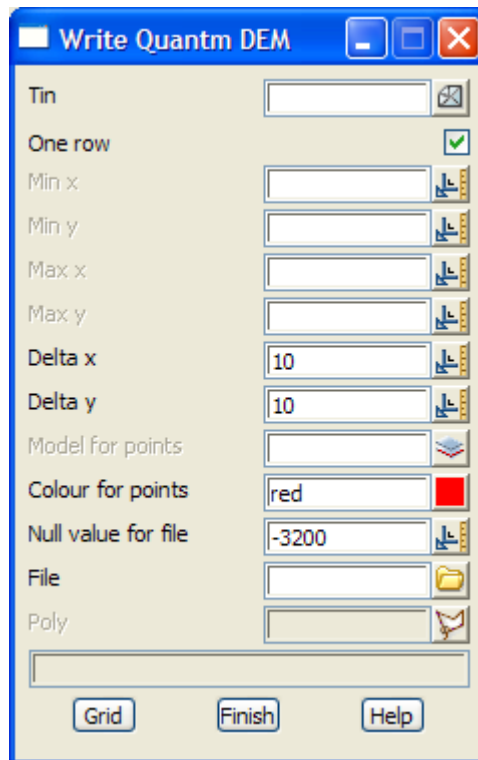

write_quantm_DEM

Position of option on menu: Tins =>Utilities =>DEM =>Quantm

The Quantm option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon.

Actual point strings and/or a file of heights at the points in Quantm (formerly Align 3D) format can be generated. For Quantm no polygon should be used and if there is no z-value (no tin) at a point, then a null z-value is written to the output file.

On selecting the Quantm option, the **Write Quantm DEM** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin on which the spot heights will be calculated.</i>	tin box		available tins
One row <i>If tick, null points are added in for any missing (x,y) so that there is only one row of data (one string) for each x-value.</i>	tick box		
Min x/y <i>minimum x/y values to calculate spot heights for.</i>	input		
Max x/y <i>maximum x/y values to calculate spot heights for.</i>	input		
Delta x/y <i>difference between the x/y-values.</i>	input		
Model for points <i>if blank, no point strings will be created. If non-blank, points strings of the spots heights will be created and stored in this model.</i>	input		available models
Colour for points <i>colour to make the point strings.</i>	input	default colour	available colours
Null value for file	input	-3200	

value to use when writing null z-values out to the file.

File input *.grd

If non-blank, a file of the spot height values in Quantm format is created.

Poly poly-select

if a polygon is selected, then the spot heights will be restricted to within the polygon.
If no polygon is selected, the spot heights will be calculated over the entire tin.

Grid button

calculate the spot heights at regular points over the area given by the min and maximum x and y values and restricted to be inside the polygon.

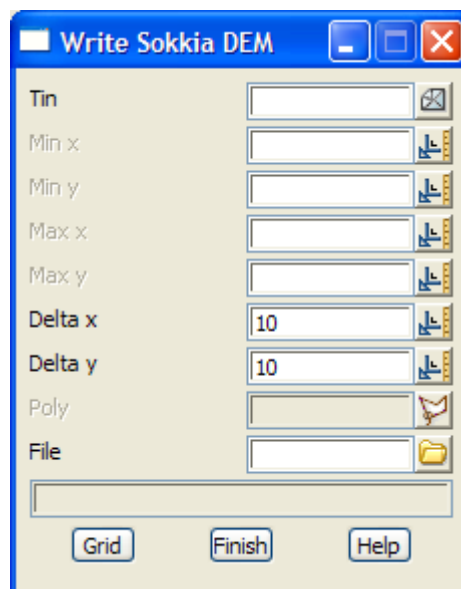

Sokkia

write_Sokkia_DEM

Position of option on menu: Tins =>Utilities =>DEM =>Sokkia

The Sokkia option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon. A file of heights at the points in Sokkia format is generated.

On selecting the Sokkia option, the **Write Sokkia DEM** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin on which the spot heights will be calculated.</i>	tin box		available tins
Min x/y <i>minimum x/y values to calculate spot heights for.</i>	input		
Max x/y <i>maximum x/y values to calculate spot heights for.</i>	input		
Delta x/y	input		

difference between the x/y-values.

Poly poly-select

*if a polygon is selected, then the spot heights will be restricted to within the polygon.
If no polygon is selected, the spot heights will be calculated over the entire tin.*

File input *.grd

If non-blank, a file of the spot height values in Sokkia format is created.

Grid button

calculate and write a file of the spot heights at regular points over the area given by the min and maximum x and y values and restricted to be inside the polygon.

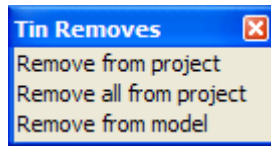

Remove

tin_removes

Position of menu: Tins =>Utilities =>Remove

Tins can be removed from models and from the project. Remove tins are not deleted but simply taken off the tin list in the project. Removed tins are left in the project area and can be added in again using the add option.

The tin removes walk-right menu is

The options in the menu will now be described.

Remove From Project

remove_tin_from_the_project

Position of option on menu: Tins =>Utilities =>Remove =>Remove from project

On selecting the remove from project option, the **remove tin from the project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin to be removed from the working project.

Remove button

remove the tin given in the tin field from the project.

Remove All From Project

remove_all_tins_from_the_project

Position of option on menu: Tins =>Utilities =>Remove =>Remove all from project

On selecting the remove all from project option, the **remove all tins from project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Remove	button		

remove all the tins from the working project. If no errors occur, the panel will be removed after the tins have been removed.

Remove From Model

remove_tin_from_a_model

Position of option on menu: Tins =>Utilities =>Remove =>Remove from model

On selecting the remove from model option, the **remove tin from a model** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins
<i>name of the tin to be removed from a model.</i>			
Model	input		available models
<i>name of the model from which the tin given in the tin field will be removed.</i>			
Remove	button		
<i>remove the tin given in the tin field from the model given in the model field.</i>			

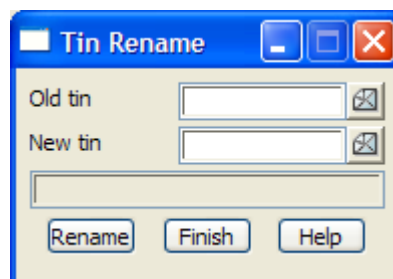

Rename

tin_rename

Position of option on menu: Tins =>Utilities =>Rename

On selecting the rename option, the **tin rename** panel is displayed.

This panel can be used to change the names of existing tins

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old tin	input		available tins

name of the tin to be renamed.

New tin input

new name for the tin

Rename button

change the name of the tin in the old tin field to the name given in the new tin field.

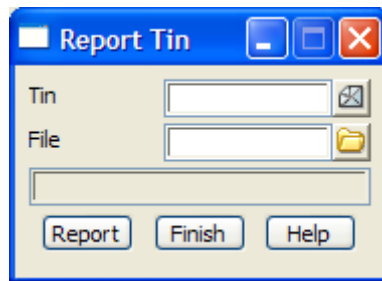

Report

report_tin

Position of option on menu: Tins =>Utilities =>Report

This panel produces a report on the tin including the models making up the tin and all the settings used when creating the tin.

On selecting the Tin report option, the **Report Tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to create report for.</i>	input		available tins or super tins
File <i>name of the report file</i>	file box		*.rpt files
Report <i>create the tin report.</i>	button		

Save

tin_saves

Position of menu: Tins =>Utilities =>Save

Tins are automatically saved on disk when they are first created but various operations can then be applied to tins which may not be immediately updated on disk.

The tin saves walk-right menu is

The options in the menu will now be described.

Save a Tin

save_tin

On selecting the save a tin option, the **save tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to be saved to disk.</i>	input		available tins
Save <i>after selecting this button, the tin given in the tin field will be saved to disk.</i>	button		

Save/Forced Save All Tins

save_all_tins

forced_save_all_tins

Position of option on menu: Tins =>Utilities =>Save =>Save all tins

Position of option on menu: Tins =>Utilities =>Save =>Forced Save all tins

On selecting the save/force save all tins option, the **save/forced save all tins** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Save	button		

for save all tins: after selecting this button, all tins in the working project that have been modified since their last save, will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

for force save all tins: after selecting this button, all tins in the working project will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

Tin to Strings

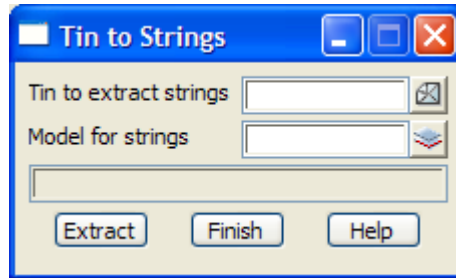

tin_to_strings

Position of option on menu: Tins =>Utilities =>Tin to strings

The points and breaklines of an existing tin can be extracted using the Tin to strings option.

Note that only the final points and breaklines used in creating the tin are extracted. Original string name, colours etc. are not obtainable.

, Selecting Tin to strings displays the **Tin to Strings** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to extract strings <i>name of the tin to extract points and breaklines from.</i>	tin box		available tins
Model for strings <i>model to hold the extracted point and breakline strings.</i>	input		available models
Colour for point strings <i>colour of the extracted point strings.</i>	colour box		available colours
Colour for breakline strings <i>colour of the extracted breakline strings.</i>	colour box		available colours
Extract <i>extract the points and breaklines that make up a tin.</i>	button		

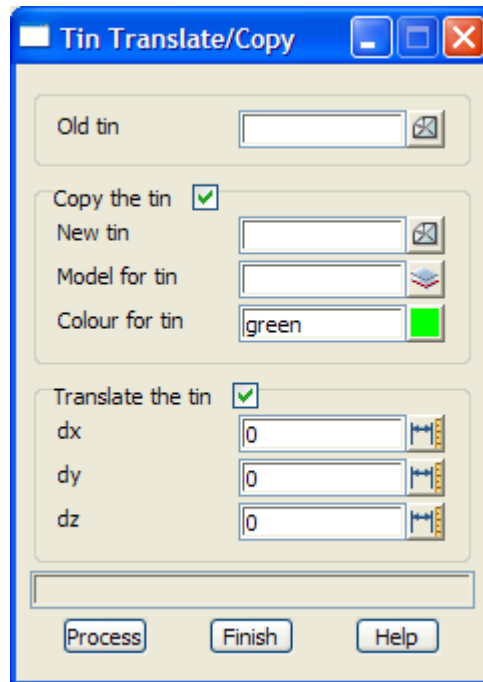

Translate/Copy

tin_translate_copy

Position of option on menu: Tins =>Utilities =>Translate/copy

An existing tin can be translated and/or copied using the Translate/copy option.

Selecting Translate/copy, displays the **Tin Translate/Copy** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old tin <i>name of the tin to be copied/translated.</i>	input		available tins
Copy the tin <i>if tick, the New tin, Model for Tin and Colour for tin fields are activated and supply the information for the new tin.</i>	tick box	tick	
New tin <i>name of the copy of the tin - this can't be the same as any existing tin in the project.</i>	input		available tins
Model for tin <i>if non-blank, the name of the model for the new tin. If blank, the tin is not put in any model.</i>	input		available models
Colour of tin <i>if non-blank, the colour of the new tin. If blank, use the old tin colour</i>	input		available colours
Translate the tin <i>if tick, the dx, dy and dz fields are activated and supply the information for translating the tin</i>	tick box	tick	
dx, dy, dz <i>the delta amounts to translate the tine by.</i>	real box	0	
Process <i>translate/copy the tin.</i>	button		

Weed

tin_weed

Position of option on menu: Tins =>Utilities =>Weed

When a tin is created, a copy of all the points and lines used in creating the tin is saved with the tin, including any duplicate points and lines.

The weed option will remove all the duplicate points and lines from the tin database.

On selecting the **Weed** option, the **tin weed** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to weed.</i>	input		available tins
Weed <i>remove all duplicate points and lines from the tin database.</i>	button		

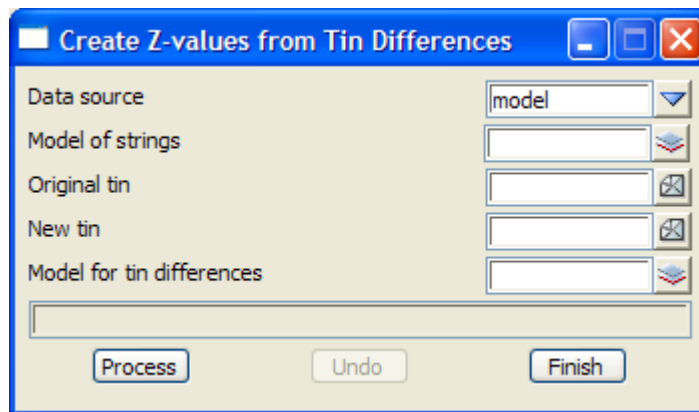

Z Differences from Tins

tin_diffs_to_z_panel

Position of option on menu: Tins =>Utilities =>Z diffs from tins

This option takes a data source and for each point in the data source, creates a new point whose z-value is the difference in z-values from two given tins at the plan position of the data source point.

On selecting the Z diffs from Tins option, the **Create Z-Values from Tin Differences** panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type <i>data selection type</i>		Model	
Data source <i>data to be processed.</i>	input		
Original tin <i>name of the tin to get the z-value from.</i>	tin box		available tins
New tin <i>name of the tin to get the z-value from.</i>	tin box		available tins
Model for tin differences <i>model to place the strings containing the z values with the difference between the tins.</i>	input		available models
Process <i>for all strings in the data source, calculate the difference in the z-values from the two tins at the string vertices.</i>	button		

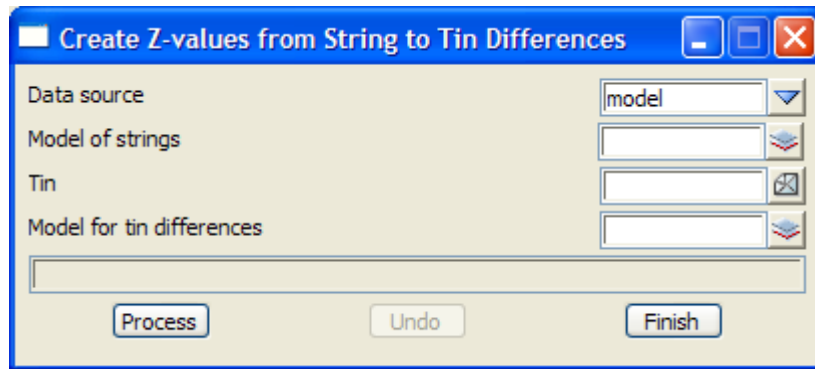

Z Differences from String to Tin

Tin_diffs_to_string_z_panel

Position of option on menu: Tins =>Utilities =>Z diffs from string to tin

This option takes a data source and for each string in the data source, creates a plan copy of the string and for each vertex in the new string, the z-value at a vertex is the difference in z-values from the original string vertex and the z-value of the tin at the (x,y) position of the vertex.

On selecting the Z diffs from string to tin option, the **Create Z-Values from String to Tin Differences** panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type <i>data selection type</i>		Model	
Data source <i>data to be processed.</i>	input		
Tin <i>name of the tin to get the z-value from.</i>	tin box		available tins
Model for tin differences <i>model to place the strings containing the z values with the difference between the original string and the tin.</i>	input		available models
Process <i>for all strings in the data source, calculate the difference in the z-values from the string to the tin.</i>	button		

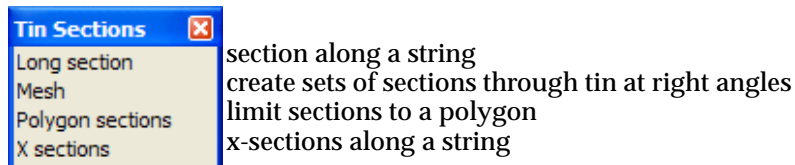

Sections

tin_sections

Position of menu: Tins =>Sections

The triangles=>sections menu contains options involving sections through the tin.

The sections walk-right menu is

For the option *Long section*, please go to the section “Long Sections” .

Long Sections

long_section_along_a_string

Position of option on menu: Tins =>Sections =>Long Section

The **long section** option calculates the section through a tin along a particular string. This option is rarely used because tins are automatically profiled through on the section view and in long section and x-section plots.

On selecting the long section option, the **long section along a string** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin that the string will be sectioned against.</i>	input		available tins
Section name <i>name to give the long section string</i>	input		
Colour for section <i>colour to make the long section string</i>	input	default colour	available colours
Model for section	input		available models

name of the model to contain the long section string.

Pick string-select

select the string to be sectioned along.

Section button

*calculate the long section along the string selected by the **pick** button, against the tin given in the tin field. The resulting section string is added to the model given in the Model for Section field.*

Mesh

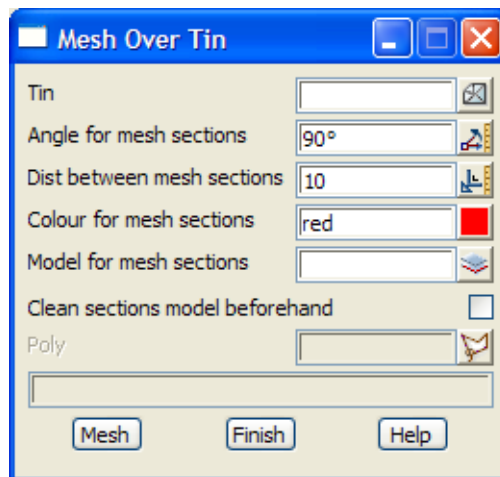

mesh_over_tin

Position of option on menu: Tins =>Sections =>Mesh

A **12d** Model mesh is simply a series of lines cutting through the tin (sections) at a given angle and spacing, and at right angles to the given angle with the same spacing.

A mesh is an effective method of visualizing a triangulation when displayed in a perspective view and for hidden views.

On selecting the mesh option, the **mesh over tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin that the mesh sections will be calculated through.</i>	input		available tins
Angle for mesh sections <i>angle (in degrees) of the lines to section along. The sections are also created at rights angles to this angle as well.</i>	input	90.0	0,45,90
Dist between mesh sections <i>distance between the lines to section along</i>	input	10.0	1,10,100
Colour for mesh sections <i>colour to make the calculated sections</i>	input	default colour	available colours
Model for mesh sections <i>name of the model to contain the calculated sections.</i>	input		available models
Clean sections model beforehand <i>if tick, the model of sections is cleaned out before the option runs.</i>	tick box		
Poly <i>if a polygon is selected, then the sections are restricted to remaining within the polygon.</i>	button		
Mesh <i>two sets of sections through the tin given in the tin field are created within the selected polygon, or if no polygon is selected, the bounding polygon for the tin. One set of sections are calculated along straight lines at the angle given by the angle field and at a separation given by the dist field and the second set at right angles to the first set.</i>	button		

<esc> can be used to abort the mesh option.

Polygon Sections

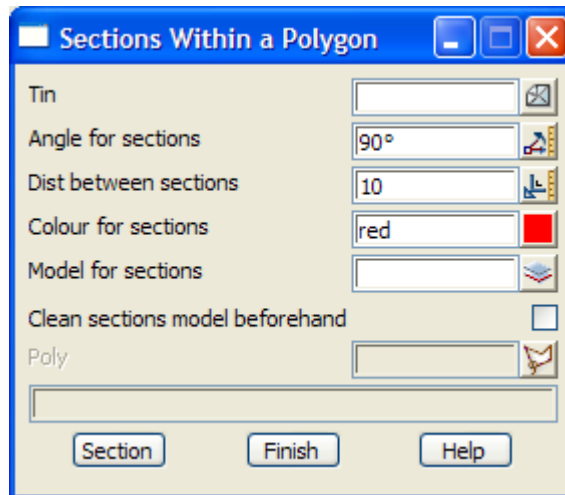

sections_within_a_polygon

Position of option on menu: Tins =>Sections =>Polygon sections

In the polygon sections option, sections are calculated for a series of parallel lines covering the polygon, or if no polygon is given, the tin. The angle of the parallel lines and the distance between them are set by the user.

This option provides a quick method for producing a one directional set of sections covering a polygonal region on a tin.

On selecting the **poly** sections option, the **sections within a polygon** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin that the sections will be calculated through</i>	input		available tins
Angle for sections <i>angle (in degrees) of the lines to section along</i>	input	90.0	0,45,90
Dist between sections <i>distance between the lines to section along</i>	input	10.0	1,10,100
Colour for sections <i>colour to make the calculated sections</i>	input	default colour	available colours
Model for section <i>name of the model to contain the calculated sections.</i>	input		available models
Clean sections model beforehand <i>if tick, the model of sections is cleaned out before the option runs.</i>	tick box		
Poly <i>A string is selected from a view. The string will be used as the polygon for this option. If no polygon is selected, sections are created over the entire tin.</i>	string-select		
Section <i>Sections within the polygon selected by poly will be calculated along parallel straight lines at the angle given by the angle field and at a separation given by the dist field. The sections are made against the tin</i>	button		

given by the Tin field. The sections colour is that given in the colour field and the section strings are placed in the model given in the model field.

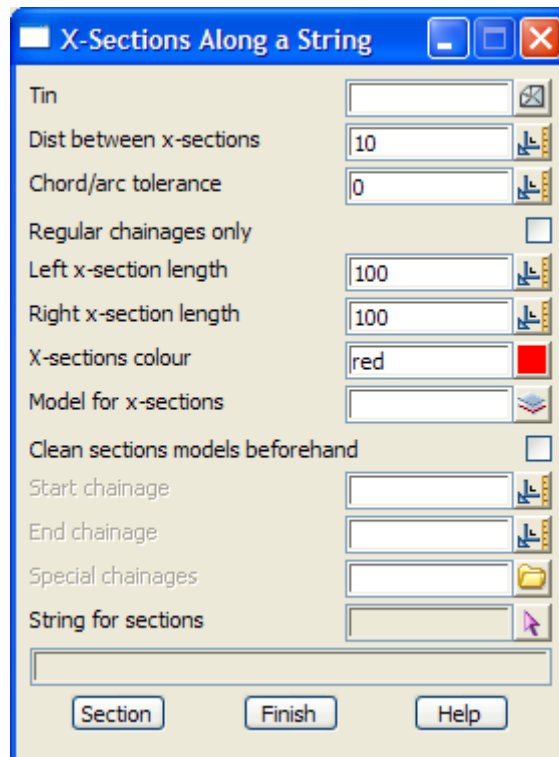

X-Sections

x_sections_along_a_string

Position of option on menu: Tins =>Sections =>X Sections

The X-sections (cross sections) option calculates cross sections at a given interval along a string.

On selecting the x-section option, the **x-sections along a string** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin that the x-sections will be calculated through.

Dist between x-sections	input	10	
--------------------------------	-------	----	--

the distance between points on the selected string where the x-sections are calculated.

Regular interval only	yes-no	no	yes, no
------------------------------	--------	----	---------

*if yes, sections are only calculated at points at the given distance apart.
If no, extra sections are created at horizontal tangent points and horizontal IPs.*

Left x-section length	input	100	
------------------------------	-------	-----	--

the plan distance for the left side of the x-section - that is, the distance that the x-section extends to the left of the selected string.

Right x-section length	input	100	
-------------------------------	-------	-----	--

the plan distance for the right side of the x-section - that is, the distance that the x-section extends to the right of the selected string.

X-sections colour	input	default colour	available colours
--------------------------	-------	----------------	-------------------

colour to make the x- sections

Model for x-sections	input		available models
-----------------------------	-------	--	------------------

name of the model to contain the x-sections.

Start/End chainage input

the string chainage to start/end the x-sections. If blank, the start/end chainage is taken to be the chainage at the beginning/finish of the string.

Pick string-select

select the string to calculate the x-sections along.

Section button

*calculate the x-sections along the string selected by the **pick** button, against the tin given in the tin field. The resulting x-section strings are added to the model given in the model for x-sections field.*

Sharing

shared_tins

Position of menu: Tins =>Sharing

Sharing allows tins from a project (the server project) to be added to other projects (client projects).

Before any tins can be added to a client project, they must first be tagged in the server project as allowed to be shared.

The Sharing walk-right menu is

allow tins in this project to used by other projects
 add a tin from another project
 remove a shared tin
 updated shared tins

For the option *Share*, go to

Add

Remove

Synchronize

“Share Tins”

“Add Shared Tins”

“Remove Shared Tins”

“Synchronize Shared Tins”

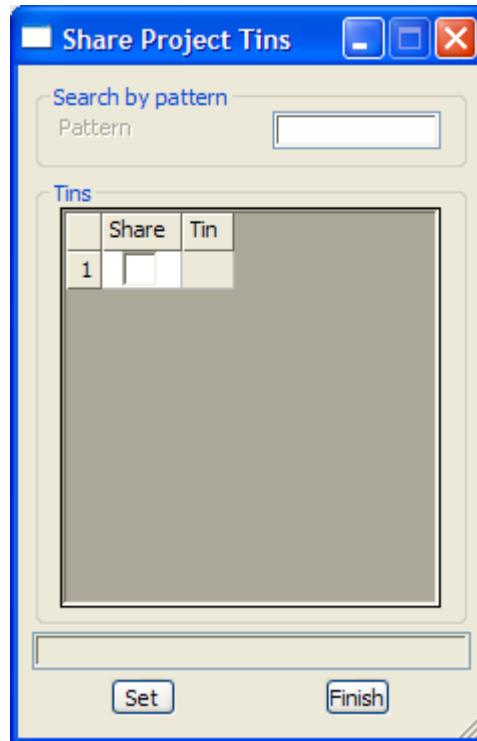

Share Tins

share_project_tins

Position of option on menu: Tins =>Sharing =>Share

Before tins in a server project can be added to client projects, the tins must be made available for sharing in the server project by using the Share option.

Selecting Share displays the **Share Project Tins** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
-------------------	------	---------	--------

*All the models in the project are listed in the **Share Project Tins** panel and if a tin has been tagged for Sharing, a tick will be displayed in the **Share** column of the grid.*

Pattern

*if a pattern is typed then all the tins matching the pattern will have a tick placed in the **Share** column. If * is typed then all tin are ticked for sharing.*

Share grid column

*tick if the tin is to be made available for sharing when the **Set** button is pressed.*

*Clicking RB on **Share** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.*

Tin grid column

this column lists all the tins in the project

Set button

*clicking **Set** tags all the tins with a tick in the **Tick** column as being available for sharing. Those tins without a tick will not be available for sharing.*

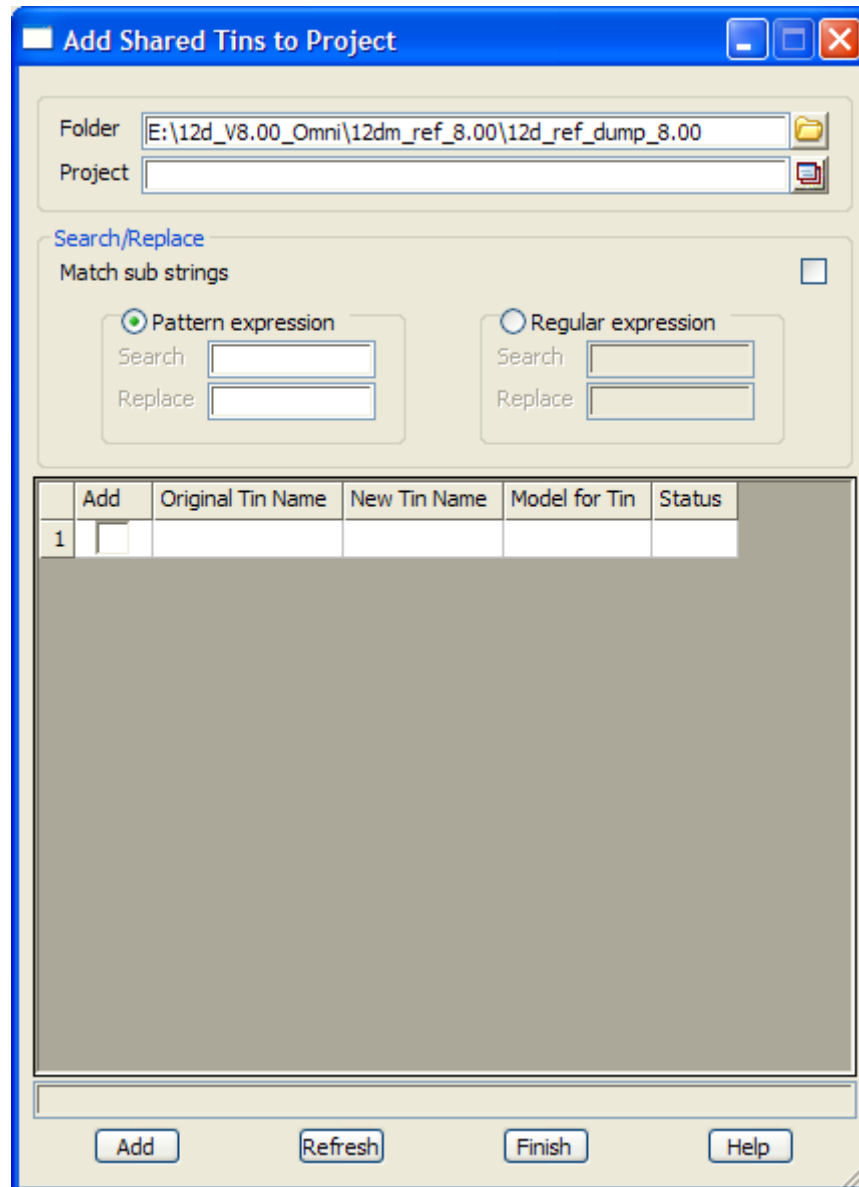

Add Shared Tins

add_shared_tins_to_project

Position of option on menu: Tins =>Sharing =>Add

The Add option is used to add shared tins (from a server project) to this project (a client project).

Selecting Add displays the **Add Shared Tins to Project** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	folder box		select folder

*folder to look for 12d Model projects. When a folder is selected, all the 12d Model projects in the folder will be displayed in a **Projects** pop-up list.*

Project	folder box		select folder
----------------	------------	--	---------------

12d Model project to search for tins that can be shared.

Search and Replace section:

Match sub strings	tick box
--------------------------	----------

*if **tick**, the Search expression is used to match against part of each tin name.
If **not tick**, the Search expression is used to match against the entire tin name.*

***Pattern expressions** or **Regular expressions** can be used to create New Tin Names when a shared tin is added to the project*

***Search** - type in the expression*

Replace - type in the expression to replace the **Search** expression.

Copy tick boxes in grid column

if tick, the tin will be added to the project when the **Add** button is pressed.

Clicking RB on **Copy** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.

Note - a shared tin that has been previously added can only be removed by using the Tins =>Sharing =>Remove option.

Original Tin Name grid column

this column lists all the tins in the server project that are available for adding to this client project.

New Tin Name grid column

if **non blank**, the name to use instead of the **Original Tin Name** when the tin is added to the project.

If **blank**, the **Original Tin Name** is used for the tin when it is added to the project.

Model for Tin grid column

if **non blank**, the model name to use in the client project for this tin added to the project
If **blank**, the model name is the same as that in the server project.

Status output grid column

displays if there is a **match** or **no match** when a pattern or regular expression is used

Add button

clicking **Add** adds all the tins with a tick to this project (a client project).

Refresh button

clicking **Refresh** refreshes the list of all tins available for sharing in the selected 12d Model project (server project).

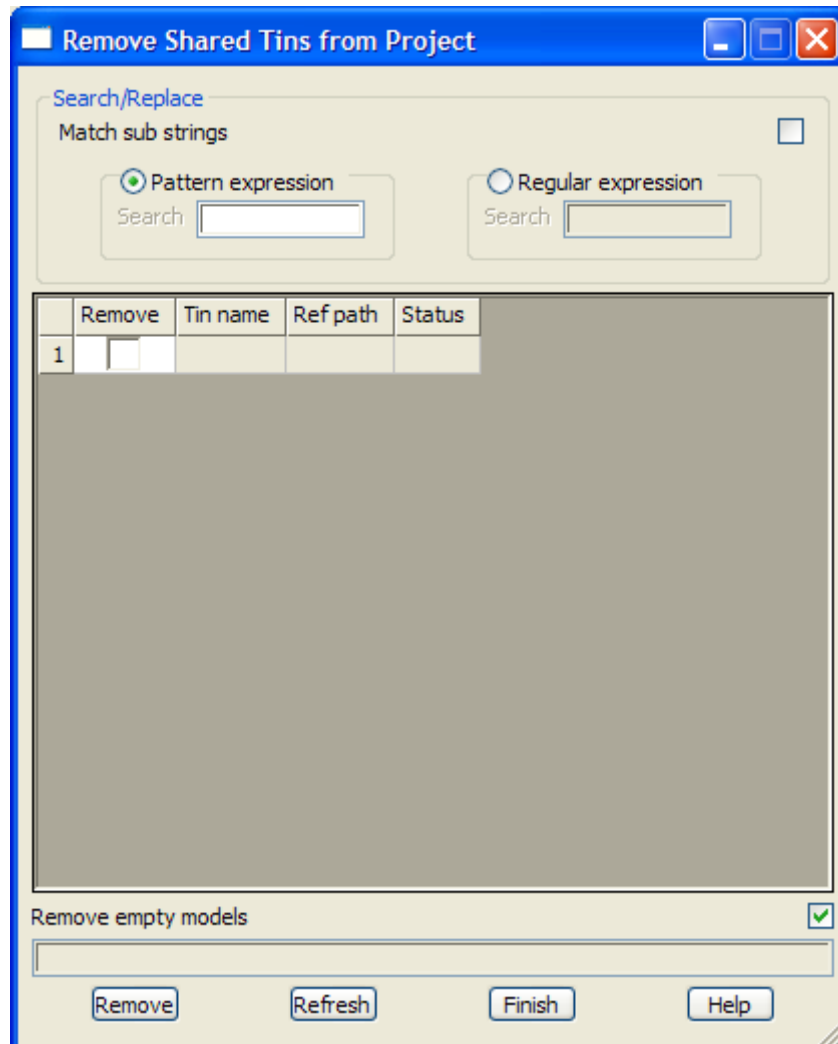

Remove Shared Tins

remove_shared_tins_from_project

Position of option on menu: Tins =>Sharing =>Remove

The Remove option is used to remove shared tins from the project. The shared tins would have been previously added to the project with the Tins =>Sharing =>Add option.

Selecting Remove displays the **Remove Shared Tins from Project** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Search and Replace section:

Match sub strings tick box

if tick, the Search expression is used to match against part of each tin name.

If not tick, the Search expression is used to match against the entire tin name.

Pattern expressions or **Regular expressions** can be used to select and tick shared tin.

Remove tick boxes in grid column

*if tick, the tin will be removed from the project when the **Remove** button is pressed.*

Clicking RB on **Copy** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.

Tin Name grid column

this column lists all the tins in this project that have been added from other (server) projects

Ref path

this column lists the full path name to the server project and the original tin name in the server project

Remove button

*clicking **Remove** removes all the tins with a tick from this project (a client project).*

Refresh button

*clicking **Refresh** refreshes the list of all shared tins previously added to the project*

Synchronize Shared Tins

`synchronize_shared_tins`

Position of option on menu: Tins =>Sharing =>Synchronize

The **Synchronize** option is used to updated any added shared tins. The shared tins would have been previously added to the project with the Tins =>Sharing =>Add option.

Three environment variables control the synchronization of updates of added shared models and tins. For more information on synchronizing, go to the section “Share Settings” .

Selecting Synchronize displays the **Synchronize Shared Tins** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Synchronize	tick boxes in grid column		
--------------------	---------------------------	--	--

*if tick and the tin has changed in the server project, then it will be re-copied from the server project when the **Synchronize** button is pressed.*

*Clicking RB on **Copy** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.*

Tin	grid column		
------------	-------------	--	--

this column lists all the tins in this project that have been added from other (server) projects

Synchronize	button		
--------------------	--------	--	--

*clicking **Synchronize** re-copies any tins with a tick from the server projects*

Refresh	button		
----------------	--------	--	--

*clicking **Refresh** refreshes the list of all shared tins previously added to the project*

Delete

tin_deletes

Position of menu: Tins =>Delete

The delete option is used to delete tins from the project and from the computer disk so that they no longer can be accessed or take up disk space.

To help protect against disasters, a **yes-no** pop-up menu is used to confirm that the user did intend deleting the tin. If deletion is confirmed, the selected tin is removed from the project (if its in the project) and deleted from the disk.

The tin Deletes walk-right menu is

For the option *Delete a tin*, please go to the section “Delete a Tin” .

Delete all tins

“Delete All” .

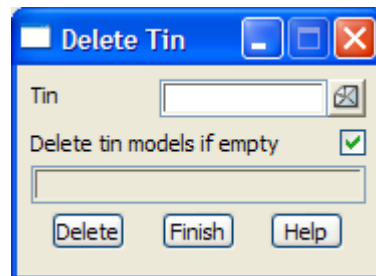

Delete a Tin

delete_tin

Position of option on menu: Tins =>Delete =>Delete a tin

The delete a tin option can be used to delete a tin in the project.

On selecting the delete a tin option, the **delete tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		project tins

name of the tin to be deleted from the computer disk.

Delete tin models if empty tick box

if tick then the models containing the tin are also deleted if they are empty after the tin is deleted.

Delete button

*after selecting this button, the tin given in the tin field will be deleted from the computer disk. A **yes-no** pop-up is used to confirm that deletion is required.*

Delete All

delete_all_tins

Position of option on menu: Tins =>Delete =>Delete all tins

The delete all option will delete all tins in the working project. It does not delete tins that are in the working project area but not yet added to the project.

On selecting the delete all option, the **delete all tins** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Delete tin models if empty	tick box		

if tick then the models containing the tins are also deleted if they are empty after the tins are deleted.

Delete	button
---------------	--------

*after selecting this button, a **yes-no** pop-up is used to confirm that deletion is required. If it is, all tins in the working project will be deleted from disk. Unless an error occurs, the panel will be removed.*

16 Survey

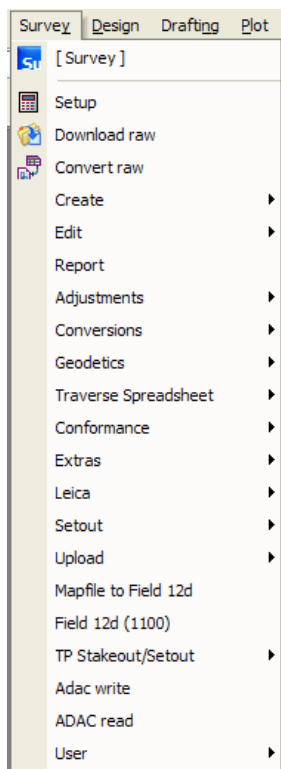

survey

Position of menu: Survey

The Survey walk-right menu is laid out to reflect the normal sequence of operations when handling field survey data.

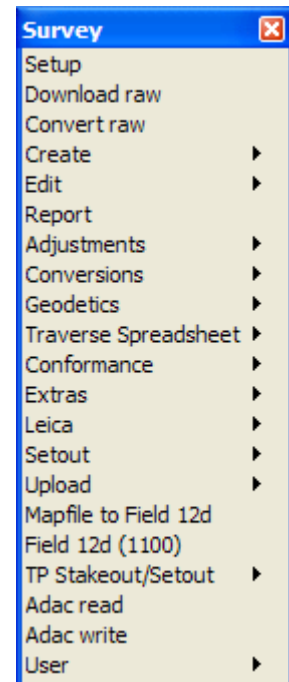

The description of the options on the Survey menu assumes that the reader is familiar with surveying, the 12d Model method of field coding for their particular data collector, data collector definitions and the 12d Model field file. A description of the 12d Model field coding and data collector definitions is given in the Appendix "12D Survey Guide"

on Main menu

create floating Survey menu
 select data collector (DC)
 transfer data from DC to 12d field file
 convert raw data collector data to 12d field file
 create 12d Survey function
 edit 12d Survey function - text and graphically
 report on 12d Survey function
 bowditch, least squares etc.
 conversion functions
 Geodetic measure functions
 traverse spreadsheet functions
 conformance reporting options
 extra survey functions - bd entry etc.
 outputs for various Leica instruments
 setout macros
 create upload file & upload to data collectors
 create field 12d file from map file
 compile Field 12d code
 Mick Gunter's TP Stakeout/Setout macros
 test for ADAC read
 test for ADAC write

on 12d Model menu and floating menu

For the option *Setup*, go to the section

Download raw

Convert raw

Create

Edit

Report

Adjustments

Conversions

Geodetics

Traverse Spreadsheet

Conformance

Extras

Leica

"Setup"

"Download Raw"

"Convert Raw"

"Create Survey Function"

"Edit Survey Function"

"Report"

"Adjustments"

"Conversions"

"Geodetic Measures and Entry"

"Traverse Spreadsheet"

"Conformance"

"Extras"

Setout	"Setout"
Upload	"Upload"
Mapfile to Field 12d	"Mapfile to Field 12d"
Field 12d	"Field 12d"
Adac read	"Read Adac XML File"
Adac write	"Create Adac XML File"
TP Stakeout/Setout	"TP Stakeout/Setout"

Setup

survey_data_setup

Position of option on menu: Survey =>Setup

Selecting setup brings up the **survey data setup** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data collector <i>name of the data collector definition used to define how to read and interpret the raw survey data file. The list of available data collectors definitions is given in the file pointed to by the environment variable DATA_COLLECTORS_4D.</i>	input		available data collectors

A data collector definition can be created/edited edited by

*(a) clicking on the choice button at the end of the **Data collector** panel field and selecting [Edit] at the bottom of the pop-up list of defined data collectors to bring up the Survey.4d Edit/Create panel.*

*(b) using **Project=>Browse=>Survey data collectors** the create/edit the Survey.4d file.*

Please see the "Data Collector Definitions" of Appendix "12D Survey Guide" for more information on setting up a data collector definition.

Station prefix <i>if non-blank, the prefix to be used for any text given for new instrument stations.</i>	input
--	-------

Set <i>store the selected data collector as being the currently selected one.</i>	button
---	--------

Note: Selecting [Edit] at the bottom of the pop-up list of data collectors will bring up the **Survey.4d Create/Edit** panel.

Download Raw

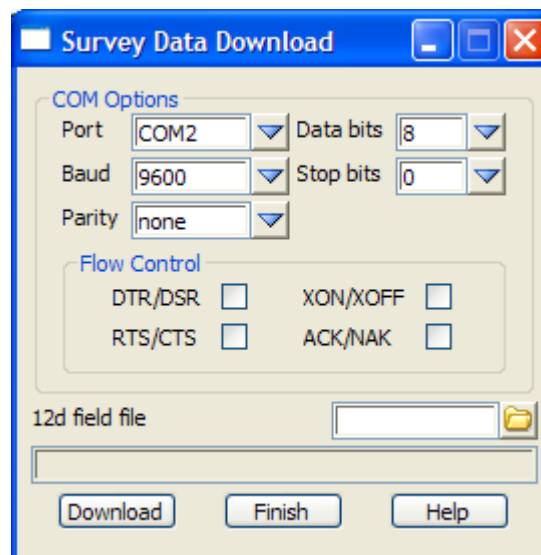

survey_data_download

Position of option on menu: Survey =>Download raw

The **download raw** option will read data from the data collector connected to the computer's serial port, save it in a file (the raw data file) and once the download is completed, automatically convert the raw data file into a 12d field file using the currently defined data collector.

Hence the **download** option downloads data from the data recorder and creates a data collector raw file and an equivalent 12d field file.

Selecting **download raw** brings up the **Survey Data Download** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Port <i>name of the computer serial port that the data collector is connected to. The default port is specified in the data collector configuration file.</i>	input	from configuration file	
Data bits <i>number of bits</i>	input	from configuration file	5,6,7,8
Baud rate <i>speed of the serial port</i>	input	from configuration file	
Stop bits <i>number of stop bits</i>	input	from configuration file	
Parity <i>parity</i>	input	from configuration file	
DTR/DSR <i>if tick, use DTR/DSR flow control</i>	tick	from configuration file	
RTS/CTS <i>if tick, use RTS/CTS flow control</i>	tick	from configuration file	

XON/XOFF tick from configuration file
if tick, use Xon/Xoff

ACK/NAK tick from configuration file
if tick, use ACK/NAK

12d Field file input *.fld files
name of the 12d field file that the raw file is to be converted to. The raw file is given the same name but with the extension specified in the configuration file, e.g., “.gre”.

Download button

On clicking the download button, the software will read a data stream from the serial port and store the raw data into a file. The extension of this file, will be specified in the configuration file. The name will be the same as the field file, with any “.fld” removed.

On completion of the download, the raw data file is automatically converted to a 12d field file of name given in the field file field.

Convert Raw

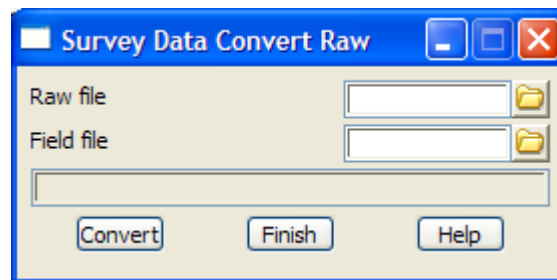

survey_data_convert_raw

Position of option on menu: Survey =>Convert raw

The **convert raw** option is used to convert an existing raw data file of the type given by the data collector setup, into a 12d field file.

The raw data file may have been previously down loaded by **12d** Model or obtained via another mechanism.

Selecting **convert raw** brings up the **survey data convert raw** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Raw file	input		available raw files
<i>name of the raw data file to be converted to a 12d field file. The popup will contain all files with the extension specified in the configuration file for raw data files, e.g. ".gre".</i>			
Field file	input		*.fld files
<i>name of the 12d field file that the raw file is to be converted to. When the raw file name is given, the file of the same name but with the extension .fld is automatically piped into the field file field.</i>			
Convert	button		
<i>convert the raw data given in the raw file field into the 12d field file format and save it in the file given in the field file field.</i>			

Create Survey Function

create_reduction

Position of menu: Survey =>Create

The create walk-right menu contains options to create a 12d Model *Survey* function from either a 12d field file or from scratch using *Survey Reduction edit commands*.

Basically, a Survey function keeps track of the field data, the information involved in the survey reduction and all the strings and models created by the Survey function. The field data for the Survey function can be edited and the reduction re-run and all the old reduced strings automatically deleted and replaced by the updated reduced strings.

The create walk-right menu is:

create survey reduction function from a 12d field file - reduces data
create survey reduction function by typed entry into 12d field file.

For the option *Field file*, go to the section "Field File"
Typed entry "Typed Entry"

Field File

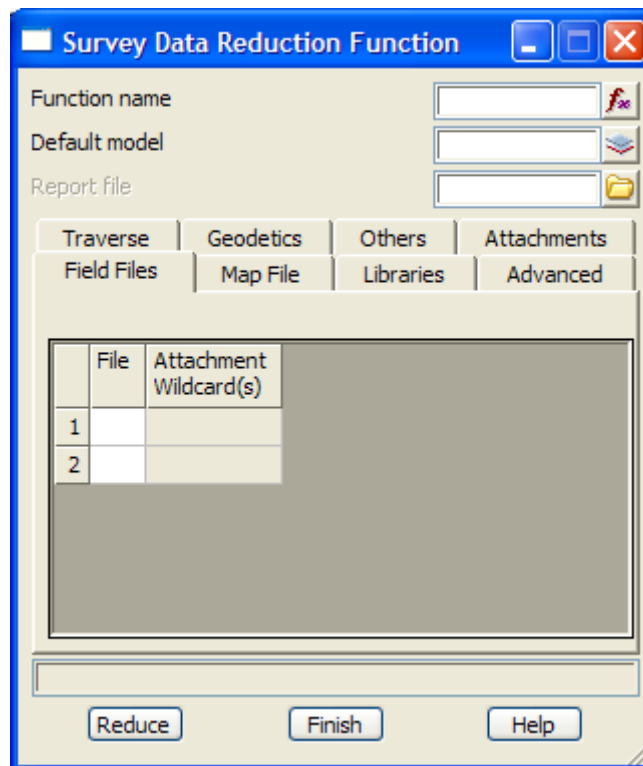

[survey_data_reduction_function](#)

[survey_data_edit](#)

Position of option on menu: Survey =>Create =>Field file

The field file option creates a Survey *function* from a 12d field file

Selecting field file brings up the **survey data reduction function** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	input		available Survey functions
<i>name of the 12d Survey function. If the Survey function exists, then it is loaded into the panel. If the Survey function does not exist, then a new Survey function is created.</i>			
Default model	input		available models
<i>if a feature code is not found in the map file, or no map file is selected, the strings and points of that feature code will be placed in the default model. The colour used will be the default line or point colour for 12d Model. The default model field is compulsory. Check measurements will be always placed in the default model if a check model is not given (on the Advanced tab).</i>			
Report file	input		*.rpt
<i>if non-blank, a log of the reduction steps, including new instrument stations, new target heights, scale factors, backsights and check measurements is created. Any errors are also logged.</i>			

Field Files tab

list of field files to read in

Field file	input	*.fld files
<i>name of the 12d field file to be read into the function as its initial field data, and then reduced. The field data in the Survey function can be edited either by command or graphically.</i>		

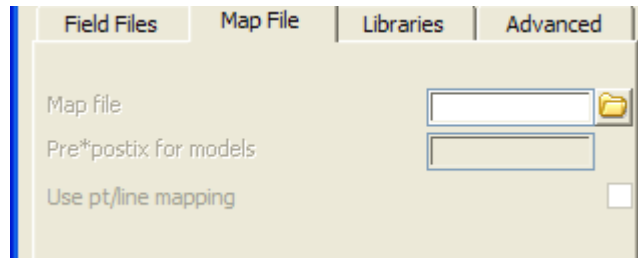

Attachment wildcards input
not yet used

Button at Bottom

Reduce button

On clicking the reduce button, the software converts the field measurements in the selected 12d field file, using coordinates from the control model if necessary, and produces super strings. The super strings will be assigned names and models using the name library and map file.

Map File tab

Map file input *.mf files

*if **non-blank**, the **map file** is used to map feature codes to string names, models, colours, line styles, etc. In general, strings will be created as line strings by assigning a non-zero string number in the field, and strings will be created as point strings by assigning a zero string number in the field. This behaviour may be overridden with field codes 92, 93 and 94.*

Pre*postfix for models input available models

*the **pre*postfix for models** text is applied to all model names in the map file.*

Use pt/line mapping tick

*if **tick** and a **map file** is used, the **column** in the map file that specifies the point/line type of the string is be used to set the point/line type of the string.*

*If **not tick** and a **map file** is used, the **column** is ignored (not used for setting point/line type of the string).*

Libraries tab

Name library input *.nl files

*if **non-blank**, the name library can be used to automatically create vertex text for the string if no vertex text is given in the field. A name library file contains two columns separated by one or more spaces. The text in the first column is matched against the feature code (wild cards * and ? can be used). The second column contains the vertex text to use if a match occurs.*

Note that if vertex text is given in the field then it is used instead of the text in the name library.

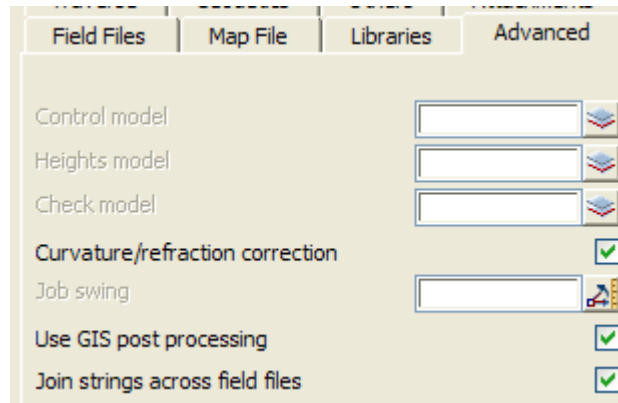

*Pre-super strings: if **non-blank**, the name library will be used to automatically create 4d strings and to assign text to 4d strings. Name library files will contain two columns. The first column in the name*

library will be matched against the feature code. Note that if a match is found, a 4d string is always created, as opposed to another string type. The second column will contain the text for the 4d string.

Attribute library input *.al files

if **non-blank**, the attribute library is used to give names to any unnamed attributes. The first word of each line in the file is the code to define the attribute for (can include wild cards) and the next n words are the names for each unnamed attributes in order. If the attribute library is mission, then the unnamed attributes will be given the names "unnamed attribute i" for 1=1,

Advanced tab

Control model input available models

if non blank, name of the model containing instrument and backsight stations that can be referenced during the reduction. The name of the string is taken as the station name and if the string contains more than one point, the first point in the string is used for the co-ordinates of the station.

Heights model input available models

if non blank, name of the model containing points that are used for the heights of points during reduction. The points in the heights model have the point id of required point and a height which is used whenever that point id is found in the reduction. The (x,y) co-ordinates of the point are ignored.

Check model input available models

if non-blank, then all check shots will go to this model.
If blank then check shots go to the default model.

Curvature/refraction correction tick box tick

if **tick**, during the reduction, each EDM tacheometry measurement (field code 7) has a correction for earth curvature and refraction applied to the measurement.

Job swing

if non-blank, then the job is swung through this value. The rotation is in a clockwise direction and the value is in hp dms format.

Use GIS post processing tick box tick

if tick, run the given 12d macro to process attribute blocks

Join strings across field files tick box tick

if **tick**, points with the same code and string number will be included in the same string in any of the field files. The order that the points are placed in the string is the order of the field files in the **Field File** tab.

If **not tick**, any strings will terminate at the end of a field file. Even if the string has the same name and string number is any following field file, a new string is started in the following field files.

Traverse tab

Do traverse calcs tick box not tick

if tick, the traverse coded points are placed into a network model, and an adjustment done at the time of reduction.

Traverse code input

if valid, this code will be used to identify traverse data. This will effectively be the same as stringing features in the field except the user has the option of isolating the model, adjusting the strings etc.

E.g. TL. The reduction function will look at the field file and extract any observations involving field codes with the TL code. Only backsights and measurements with the point name field populated will be processed.

Each traverse will have a separate string number: i.e. The main traverse with a feature code/string number of e.g. TL7 and a side traverse having a feature code/string number of e.g. TL3. Note the string numbers do not have to be in any particular order. The reduction will determine the order on which the separate traverses will be processed (by dependencies).

Adjustment method choice bowditch, compass,
transit, least square, none

*method of adjustment. The adjustment will be made to the extracted traverse strings from known point to known point. **If a traverse string goes through a number of known points (known coordinates), the adjustment will made from known point to known point rather than the first known to the last known point.***

Network model model box

if non blank, any valid traverse strings are placed in this model

Geodetics tab

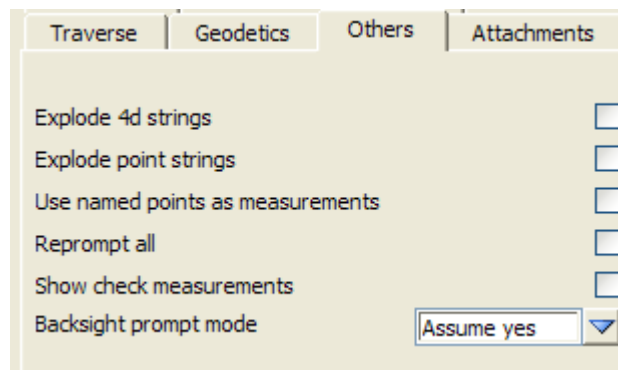

Projection projection box current projection available projections

*the projection of the data to be reduced. If a valid projection is specified, the reduction will be done taking into account the projection scale factors. **If this method is used it is paramount that the known coordinates(e.g station setups) are in terms of the projection coordinates and are not truncated (i.e. full coordinate values).** These coordinates will allow the calculation of the relative longitude and latitude values which are used to compute coordinates from observations from the setup points. For more information about how to setup different projections see the section "Projections" .*

N values choice box currently set method Available n value methods
the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are defined in the project n value settings. For more information on the n value settings see the section "N values"
The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculations only. The original z value for the point will remain unchanged

For more information about geodetic terminology including projections and N values, see the Appendix "Geodetics Summary".

Others tab

Explode 4d strings tick box
if tick, any 4d strings created during the reduction process will have only one vertex (point), i.e., no stringing of 4d strings will occur.

Explode point strings tick box
if tick, point strings are created as one vertex (point) strings i.e., no stringing of any point strings will occur.

Use named points as measurements tick box
if tick, named points are also created as measurements.

Reprompt all
if tick, all check measurements are redisplayed on recalcs. Also if Backsight prompt mode is set to prompt, then backsights are redisplayed on recalcs.
if not tick, check measurements are not redisplayed on a recalc and backsights depend on the backsight prompt mode.

Show check measurements tick box
if tick, when a check measurement is processed a panel is displayed showing the calculated (x,y,z) for the check measurement.

Backsight prompt mode choice box prompt, assume yes
 assume no
if prompt, then the backsight panel is brought up in a command has not been answered adequately previously or if something has changed that warrants a redisplay of the panel.
If assume yes, then yes is assumed for all the backsights and the panel is not brought up.
If assume no, then no is assumed for all the backsights and the panel is not brought up.

Attachments tab

Wildcards(s)

space delimited list of wildcards for attaching files to shots. For example, photo images taken in the field.

Tolerance (seconds) input 600

the shot must be taken first and then any files with time less than this number of seconds after the shot, but before any subsequent shots, are attached to the shot

Photos to plan images tick box

if tick, 12d plan images are created for any attached image in jpeg, tiff, bmp or png format

During the reduction, the coordinates of a point may need to be supplied. This occurs when:

- ▲ an undefined point is named as the new instrument point (field code 3)
- ▲ backsight measurements are made to an undefined point (field code 4)
- ▲ check measurements are made to an undefined point (field code 6)

In this situation, a **define station coordinate** panel will pop up:

The coordinates may be typed in, or selected from existing strings. The station may also be added to a model to allow it to be used as a station later.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Station name	output		
<i>the station name</i>			

Use control model radio button

if ticked, the point is added to the control model.

if not ticked, the point is created but is not placed in the control model.

Easting/Northing/Height input xyz ops menu

the easting (x)/northing (y)/height (z) co-ordinates for the station.

Station prefix input

if non-blank, the created station name will be prefixed by this value.

Add to model input control model available models

if non-blank, a 4d string is created using the Easting/Northing/Height values as co-ordinates, and the station name (with a possible prefix) as the text and name of the 4d string. The station can then be referred to later in the reduction.

Pick button

pick a point whose co-ordinates are piped into the Easting/Northing/Height fields.

OK button

on selecting ok, the coordinates entered in the station xyz field are used as the station co-ordinates and if the add to model field is non-blank, a 4d string created.

Edit button

on selecting Edit, the next new instrument station entry is shown which allows the station number and associated fields to be edited.

Cancel button

the cancel button will remove the panel and terminate the reduction.

If the Backsight prompt mode is set on, then at each backsight measurement, the **bearing datum difference** panel is displayed

:

	Observed	Calculated	Observed - Calculated	Corrected	Corrected - Calculated
Easting	982.767	982.770	-0.003	982.770	0.000
Northing	5096.699	5096.700	-0.001	5096.700	-0.000
Height	115.976	115.750	0.226	115.976	0.226
Bearing	349° 53' 42"	349° 53' 49"	- 0° 0' 7"	349° 53' 49"	0° 0' 0"
Distance		98.223			

No distance was measured on this check measurement.
We assume the correct distance so that we get a measure of the accuracy of the check.

Horizontal collimation +

Vertical collimation +

Apply Swing

If **yes** button is selected, the bearing datum difference is applied to this horizontal circle reading.

If **yes to all** button is selected, the bearing datum difference is applied to all subsequent horizontal circle readings.

The **cancel** button terminates the reduction.

If **no** is selected, this horizontal circle reading is treated as actual bearing.

If **no to all** is selected, all the horizontal circle reading are treated as actual bearings.

This facility allows the horizontal circle to have any orientation during data capture.

At each check measurement, the **check measurement** panel is displayed giving information about the measurement, the point it was a check measurement for and the differences between the two.

:

	Observed	Calculated	Difference
Easting	982.770	982.770	-0.000
Northing	5096.687	5096.700	-0.013
Height	115.749	115.750	-0.001
Bearing	349° 53' 44"	349° 53' 49"	- 0° 0' 5"
Distance	98.211	98.223	-0.013

If the **Continue** button is selected, the reduction continues.

The **Cancel** button terminates the reduction

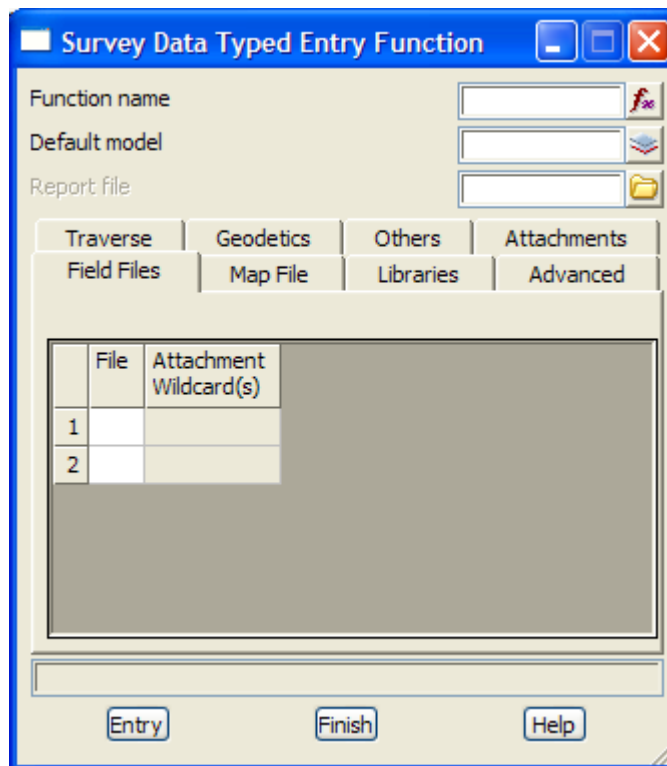

Typed Entry

`survey_data_typed_entry_function`

Position of option on menu: Survey =>Create =>Typed entry

The **Typed** entry option creates a *Survey function* from scratch using the edit commands.

Selecting **Typed** entry brings up the **survey Data Typed Entry Function** panel

The fields and buttons are identical to those in the **Survey Data Reduction Function** panel in the previous section "Field File" .

Edit Survey Function

edit_reduction

Position of menu: Survey =>Edit =>Edit Reduction

The edit reduction walk-right menu contains options to create a *12d Model Survey function* from either a *12d field file* or from scratch using *Survey Reduction edit commands*.

Basically, a *Survey* function keeps track of all the information involved in the survey data reduction and all the strings and models created by the *Survey* function. The *Survey* function can be re-run and all the old information automatically deleted and replaced by the updated information.

Once the *Survey* function is created, it then reduces the data according to the information supplied and stored with the *Survey* function. As with other *12d Model* functions, the *Survey* function information can be modified and the function recalculated.

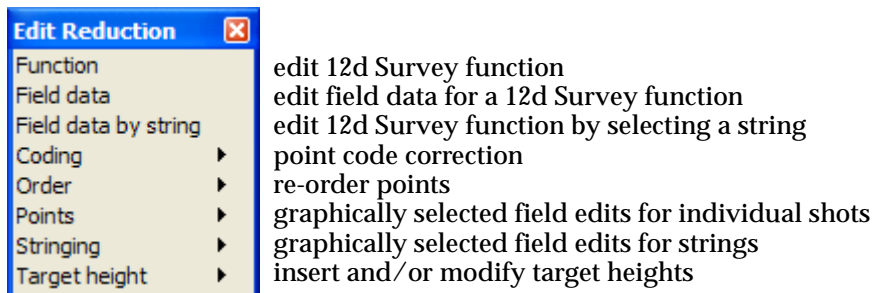

Many errors in a raw data file are only detected after the reduction has taken place. These are then corrected and the function recalculated to re-reduce the data.

Some of the types of problems that regularly occur during electronic field surveys are:

- ▲ Instrument height incorrectly entered
- ▲ Target height incorrectly entered
- ▲ Change of target height not entered
- ▲ Backsight station incorrectly named
- ▲ Instrument station incorrectly named
- ▲ Feature code and string number errors

The *12d Survey* edits allow for all commands in the field data to be modified and new commands added. Selection for some edits can be done graphically (for example incorrect target height) and others through interactive editing of the Survey field data. In all cases, once the edit is completed, the effect is immediately calculated and displayed.

The edit walk-right menu is

Each option will now be described in detail.

For the option *Function*, please go to the section

Field data

Field data by string

Coding

Order

Points

Stringing

Target height

“Function”

“Field Data”

“Field Data by String”

“Coding”

“Order”

“SDR Point Edits”

“SDR Strings Edit”

“Target Height”

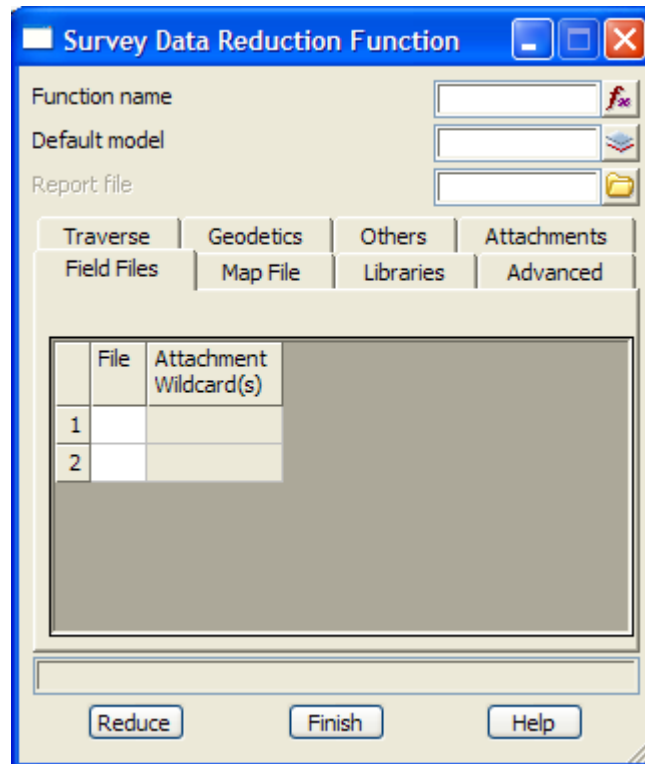

Function

Position of option on menu: Survey =>Edit =>Function

The **function** option is used to edit the set-up panel values for a *Survey* function.

Note - to edit the *field data* rather than the set-up panel, the **Field data** option is used.

Selecting **function** brings up the **Survey Data Reduction Function** panel (which is the same panel used to create the function in the Survey =>Create =>Field file option).

A *Survey* function is selected for editing by choosing the survey function from the Function name pop-up list which loads up the panel information for that function.

The panel information is then modified and the new values stored and used by selecting the **Reduce** button. This recalcs the function and hence re-reduces the data using the new panel fields.

For more information on the fields in the panel, go to the section “Edit Survey Function” .

For information on the *Survey Field Data Editor*, go to the section “Survey Field Data Editor” .

Field Data

edit_survey_field_data

Position of option on menu: Survey =>Edit =>Field data

The **field data** option is used to edit the *field data* from a Survey function. As the changes are made, the field data is automatically reduced to reflect the changes.

Selecting **Field data** brings up the **Edit Survey Field Data** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the Survey function to have the field data modified.</i>	function box		all survey functions

Edit button
clicking edit will start the Survey Field Data Editor for the given Survey function. This will be documented in the section Survey Field Data Editor.

For information on the *Survey Field Data Editor*, go to the section “Survey Field Data Editor” .

Field Data by String

[edit_mtf_survey_function_data](#)

Position of option on menu: Survey =>Edit =>Field data by string

The Field data by string option is used to edit the *field data* by selecting a string created from a Survey function.

Selecting Field data by string brings up the **Edit MTF/Survey Function Data** panel:

After selecting the **Pick Edit** button, a string created by Survey function is selected and the Survey Field Data Editor is started for the given Survey function.

For information on the *Survey Field Data Editor*, go to the section “Survey Field Data Editor” .

Coding

sdr_code_edits

Position of menu: Survey =>Edit =>Coding

The **coding** options are used to modify the feature code and/or string number of selected points. The 12d field file is automatically updated.

The coding walk-right menu is

change for feature code, string number
 same of change feature code, string number for many point

Each option will now be described in detail.

For the option *Change*, go to the section

Quick change

Quick multi-code

“Change”

“Quick Change”

“Quick Multi Coding”

Change

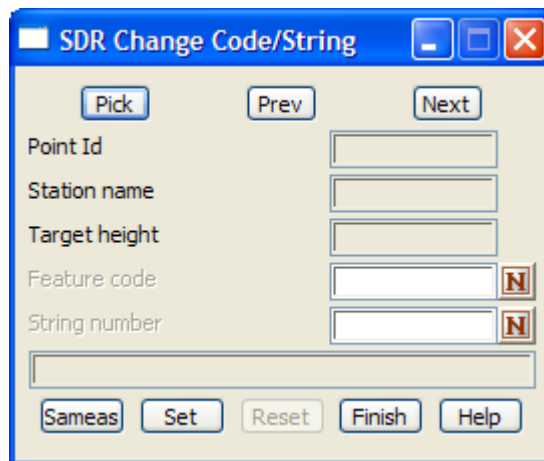

sdr_change_code_string

Position of option on menu: Survey =>Edit =>Coding =>Change

Change is used to modify a points feature code and/or string number. When a point is selected, its point id, station name and target height are displayed as well as feature code and string number.

If either the feature code or string number is then modified in the panel, selecting the set button will give the selected point the new values for feature code and/or string number.

Selecting **Change** brings up the **SDR Change Code/String** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick	button		
-------------	--------	--	--

select a point whose information will be displayed in the panel fields. A highlighted line joining the point to the station that it was surveyed from is also displayed.

Prev	button		
-------------	--------	--	--

move to the previous point in the string.

Next button
move to the next point in the string.

Point id display only
point id of the selected point.

Station name display only
name of the station that the point was surveyed from.

Target height display only
height of the target when the point was surveyed.

Feature code input/output
*when a point is selected, its feature code is displayed in this field. The value can then be changed by the user and if **set** is selected, the point is given the new feature code.*

String number input/output
*when a point is selected, its string number is displayed in this field. The value can then be changed by the user and if **set** is selected, the point is given the new string.*

Same as button
*after selecting **same as**, a point is selected and its feature code and string number are piped into the panel fields.*

Set button
*selecting **set** gives the selected point the values in the panel fields.*

Reset button
reset undoes the changes.

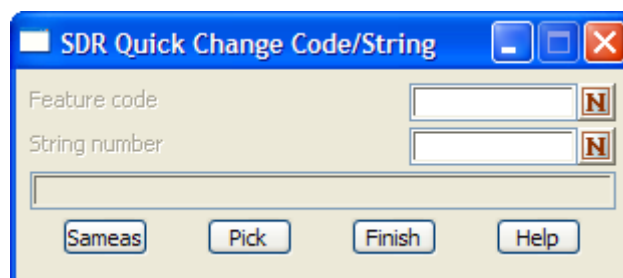

Quick Change

[sdr_quick_change_code_string](#)

Position of option on menu: Survey =>Edit =>Coding =>Quick change

The **quick change** option is for more advanced users wishing to modify the same feature code and/or string number for many points.

The new feature code and/or string number is entered into the panel and whenever a point is selected and accepted, it is given the new feature code and/string number. The picking of points continues until the picking is cancelled from the pick ops menu.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Feature code	input/output		

if not blank, when a point is accepted its feature code is changed to the value in this field.

String number input

if not blank, when a point is accepted its string number is changed to the value in this field.

Same as button

after selecting same as, a point is selected and its feature code and string number are piped into the panel fields.

Pick button

selecting pick starts the picking sequence and any accepted point will have its feature code and/or string number modified if the corresponding panel field is not blank. The pick is terminated by selecting cancel from the pick ops menu.

Quick Multi Coding

sdr_multiple_coding

Position of option on menu: Survey =>Edit =>Coding =>Quick multi-code

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick button

after selecting Pick, pick the vertex that you want to multi-code, and then pick a string and the code and string number from the string will be added to the selected vertex as a multi-code.

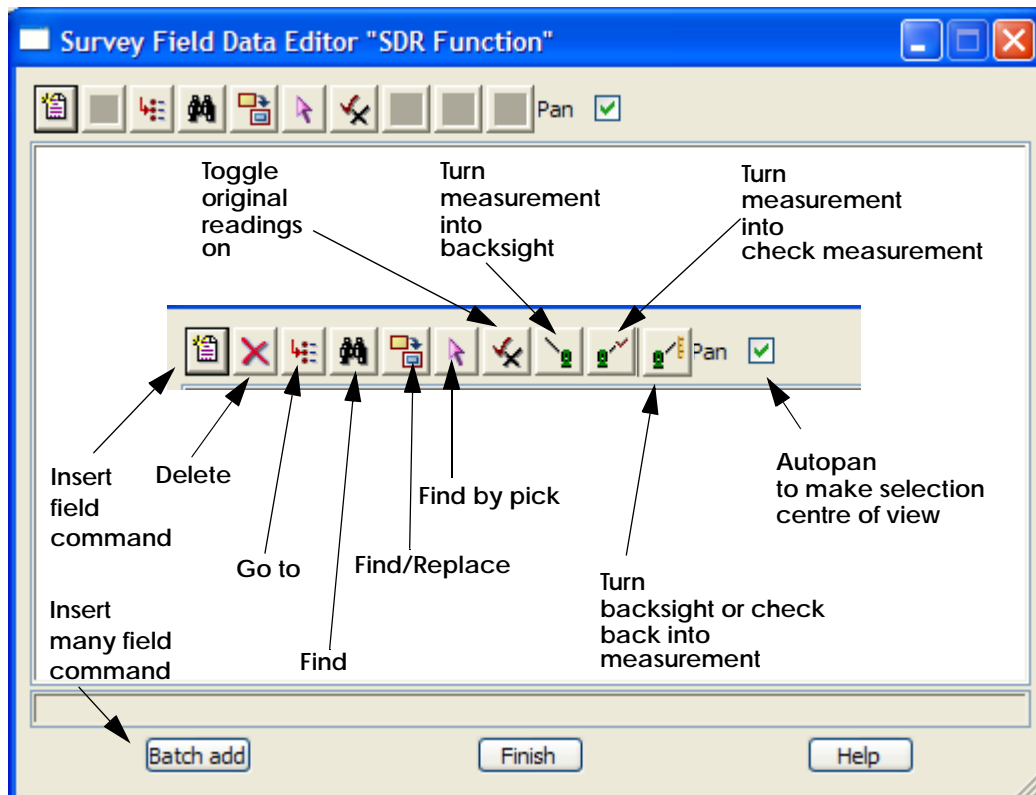

The sequence start again and continues until the pick is terminated by selecting Cancel from the Pick ops menu.

Survey Field Data Editor

survey_field_data_editor

The Survey Field Data Editor is used to interactively edit the field data of a **Survey** function. All the commands in the field data can be modified or deleted, or new commands added. When changes are made, the field data is automatically re-reduced so the effects can be immediately checked.

If the Editor is opened using the Survey=>Create=>Typed Entry option the editor will appear blank.

For information on using things inside the panel, go to "Using the Survey Field Data Panel"

For information on the field commands, go to "List of Field Data Commands and Panels"

For information on the icons and buttons on the panel:

 - Insert	go to	"Insert and Batch Add button"
 - Delete		"Delete"
 - Go to		"Goto"
 - Find		"Find"
 - Find/Replace		"Find/Replace"
 - Find by Pick		"Find by Pick"
 - Toggle		"Toggle"
 - Make backsight		"Make Measurement into a Backsight"
 - Make check measurement		"Make Measurement into a Check Measurement"
 - Change to measurement		"Make into a Measurement"
 Pan <input checked="" type="checkbox"/>	- Autopan	"Autopan"

- Batch add

"Insert and Batch Add button"

Using the Survey Field Data Panel

Colour Coding of the Field Data

Normally data has been loaded into the Survey function by a raw data file being downloaded from a data collector, converted to a 12d field file and then loaded into a Survey function.

When 12d Model converts the raw file to a 12d field file, all the raw data can be included in the 12d field file as comments.

All **comments** lines are displayed in **green**.

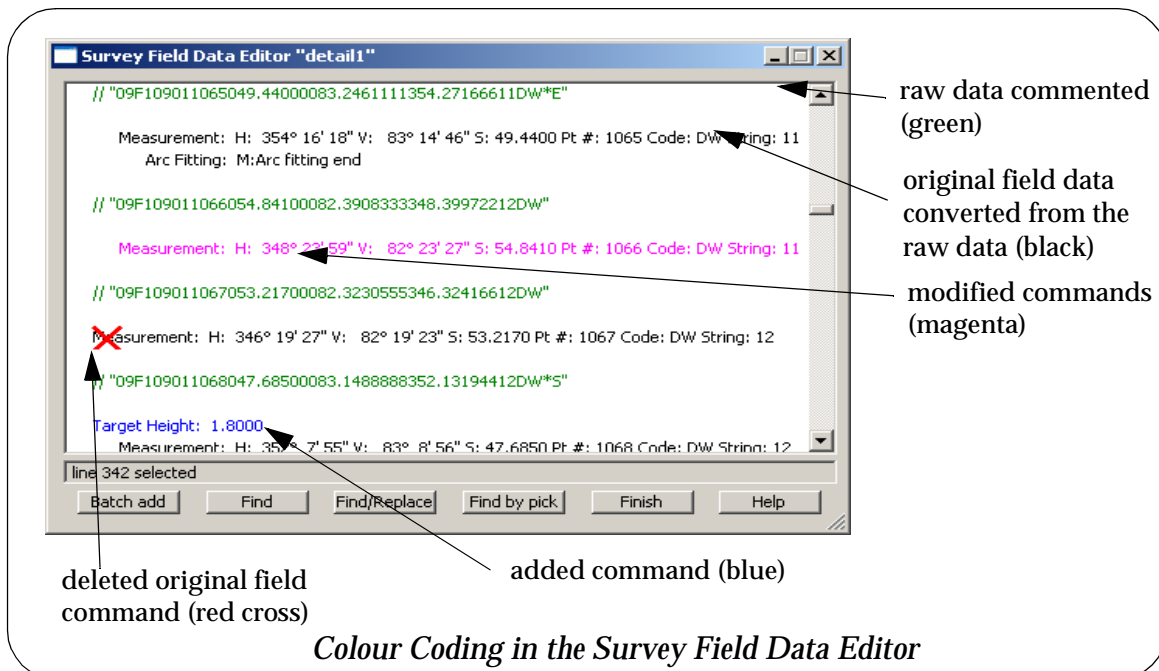

Each line (or lines if necessary) of raw data is converted into one or more equivalent 12d field file commands. These field file commands are placed straight after the commented line containing the raw data lines so it is easy to see what the raw data was converted to.

The **original 12d field commands** converted from the raw data are displayed in **black**.

If a field command has been **inserted**, it is coloured in **blue**. If a comment has been inserted, it will still be displayed in green but the word ": added" will be appended to the end of the comment.

If a field command has been **modified**, it is displayed in **magenta**.

If an **original** command has been **deleted**, the original command is left in the file but it has a **large red cross** placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply deleting the command again.

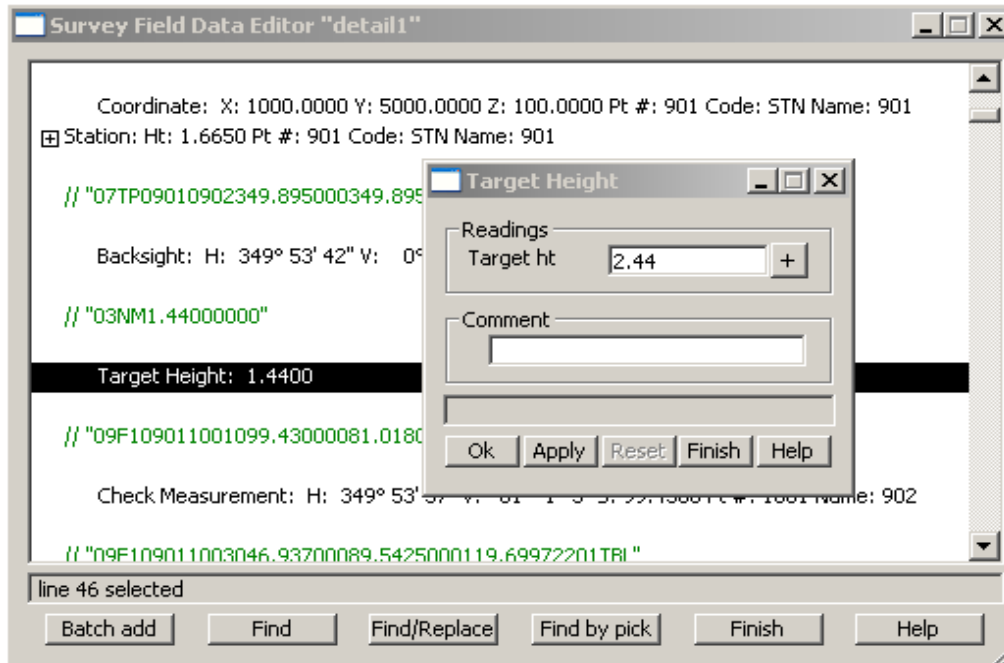

Modifying the Field Data

To modify an existing command in the field data, double click on the line to be modified and the appropriate panel for the line of field data is displayed. The data in the panel can then be

modified and stored by selecting either the **OK** or **Apply** buttons. The colour of the line of modified field data is then magenta.

For example, double clicking on **target height** command in the field file brings up the **Target Height** panel with the values loaded into the appropriate panel field. The data in the panel can be modified and saved by clicking **OK**.

Deleting Field Data

To delete a line from the field data, simply highlight the data by clicking in the line and then delete key on the keyboard or select the delete icon from the top of the panel. If the line was an original command, a red cross is placed

If an **original** command has been **deleted**, the original command is left in the file but it has a **large red cross** placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply highlighting the deleting command and pressing the delete icon or delete key again.

If an **inserted** command has been **deleted**, the command is removed from the field data.

More than one line can be selected for deletion by using the standing Windows selection commands to highlight the commands and then press the delete key on the keyboard or select the delete icon from the top of the panel. Similarly to undelete multiple commands.

For information on the field commands, go to “List of Field Data Commands and Panels”

For information on the icons and buttons on the Survey Field Data panel, go to “Icons and Buttons on the Survey Field Data Editing Panel”

Icons and Buttons on the Survey Field Data Editing Panel

The use of the buttons at the bottom of the survey field data editing panel will now be described.
[new_field_data_command](#)

Insert and **Batch Add** button

To insert a new command into the field data, simply click on the line where the data is to be inserted and press the **Batch Add** button or select the **Insert** icon from the top of the panel.

The difference between the button and the icon, is that the button allows multiple entries whilst the icon allows one entry at a time.

Selecting either the icon or the **Batch Add** button, displays the **New Field Data Command** panel.

By clicking on the Command choice box selector, a full list of field commands is displayed and the required command is selected from the list.

Clicking **Create** then brings up the panel for the selected command type. The description of the field data commands panels is given in the section “List of Field Data Commands and Panels”

Alternatively, if the **12d Field Data Op Code** is known, this can be entered into the choice box instead of selecting from the list. For example, to enter a **Measurement EDM** field data command, the number 7 can be inserted in the choice box field.

When using **Batch Add**, once a command is selected, it will remain as a default for subsequent entries until another type is chosen. This allows a number of the same command to be quickly entered such as in the case of **Measurement EDM** by entering data into the appropriate fields and continuing to press <enter> through the default choices

For a more detailed explanation on each of the fields within the panels and the appropriate field **12d Field File Op Codes** see the section “Full Description of 12d Field File Op Codes” .

For a summary of just the field file op codes, see the section “Summary of 12d Field File Op Codes”

Delete

To delete a line from the field data, highlight the data by clicking in the line and then either use the **Delete** key on the keyboard or select the **Delete** icon from the top of the panel.

If an **original** command has been **deleted**, the original command is left in the file but has a **large red cross** placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply highlighting the deleted command and pressing the **Delete** icon or **Delete** key again.

If an **inserted** command has been **deleted**, the command is removed from the field data.

More than one line can be selected for deletion by using the standing Windows selection commands to highlight the commands and then press the **Delete** key on the keyboard or the **Delete** icon from the top of the panel. Similarly to undelete multiple commands.

[Field_Data_Goto](#)

Goto

Selecting the **Goto** icon brings up the **Field Data Goto** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Line number

line number to go to

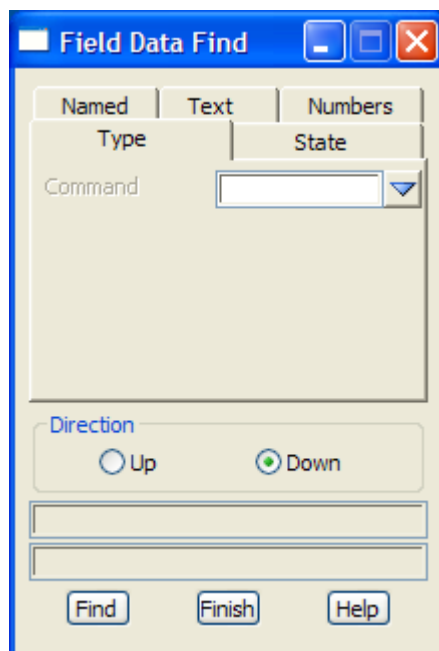

Goto	button		
-------------	--------	--	--

go to the given line number

field_data_find

Find

Selecting **Find** brings up the **Field Data Find** panel.

Each of the tabs sets the panel for the required data.

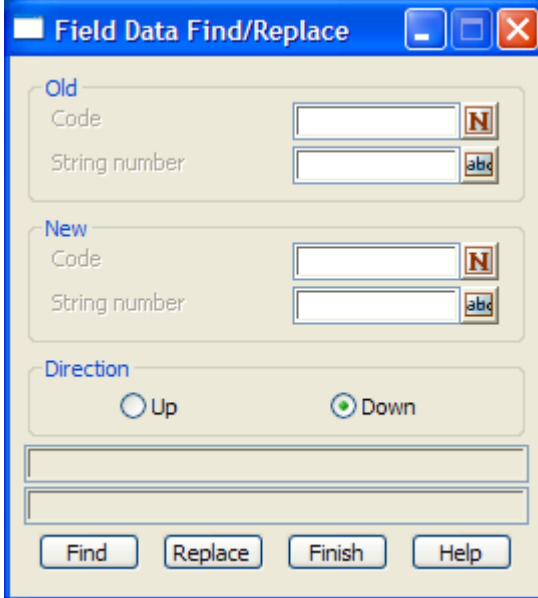

Named	find given code, string number, point id etc.
Numbers	find numbers between given minimum and maximum.
State	find a field command in a given modification state (added, changed, deleted, field)
Text	find text containing given text.
Type	find a field command of a given type. For example "New String".

The up/down radio button define which direction to search in the field data.

Field_Data_Find_Replace

Find/Replace 

Selecting the **Find/replace** icon brings up the **Field Data Find/Replace** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

The user specifies the old and new **Code** and old and new **String number** fields, and the search and replace is done using those parameters.

The **Up/Down** radio button define which direction to search in the field data.

Find by Pick 

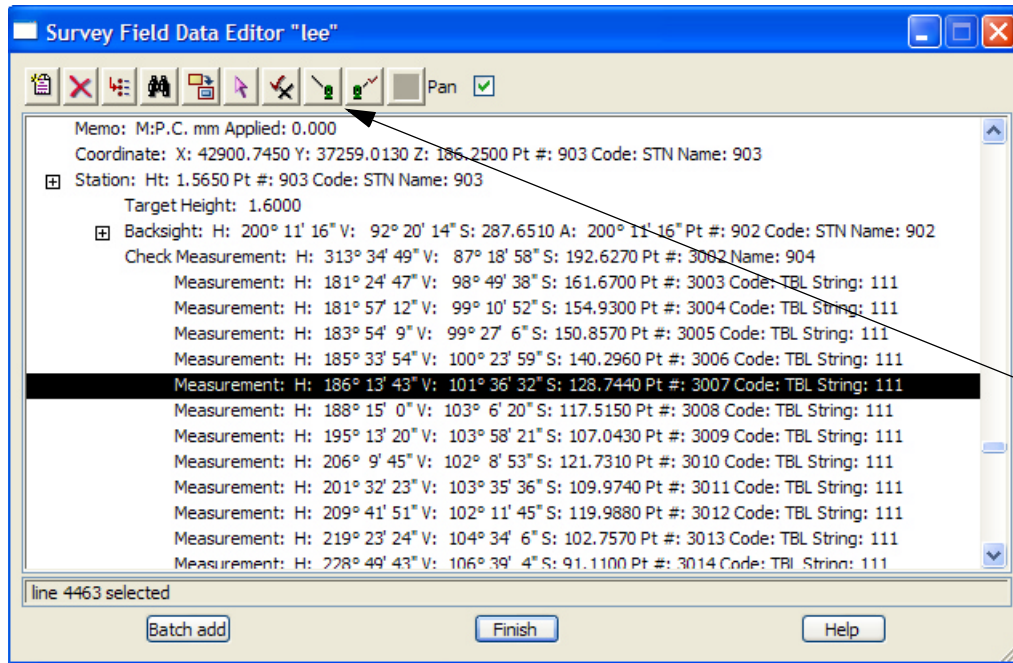

After selecting **Find by pick**, the user selects a point created by the Survey function and the field data editor will scroll to the line of the field data that created the point.

Toggle 

The toggle button allows commented information to be shown/ not shown. Simply press the **Toggle** icon to move from one state to another.

Make Measurement into a Backsight 

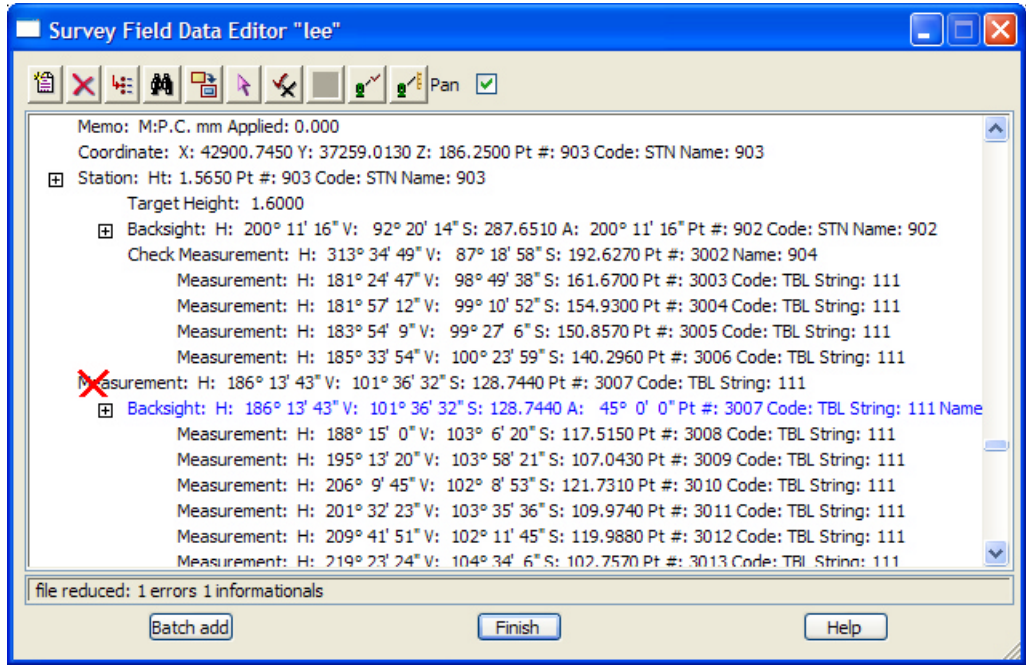

The **Make Backsight** icon is visible when a **measurement** line has been selected (highlighted) in the field data.

Highlighting a **Measurement** then displays the **Make Backsight** and **Make Check Measurement** icons

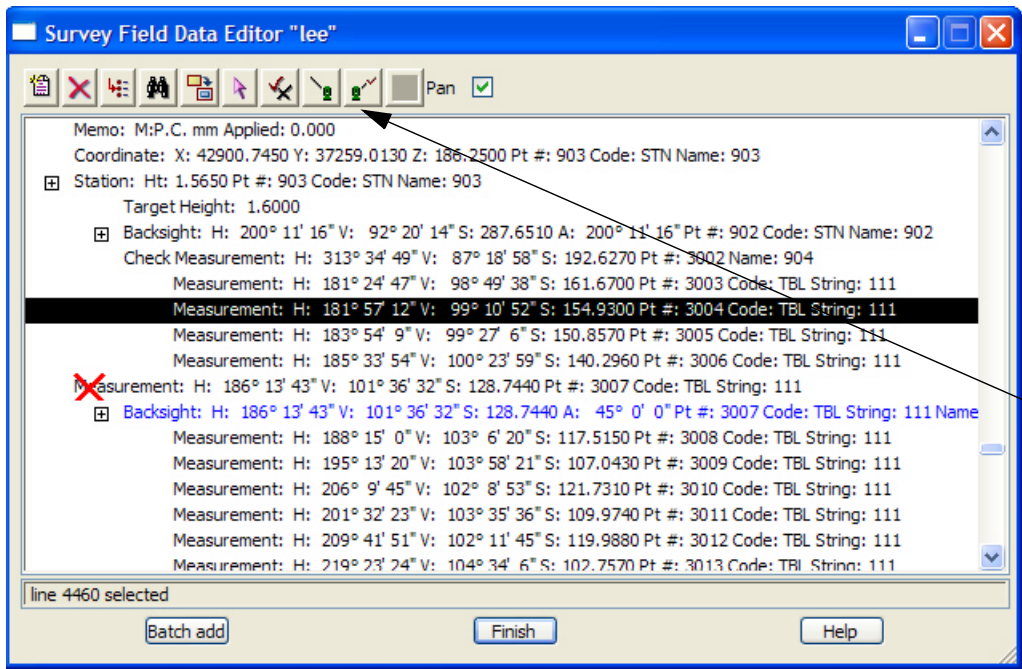

When the measurement line is highlighted, clicking on the **Make Backsight** icon brings up the **Backsight** panel with the highlighted measurement details filled in.

The **Azimuth** and **Backsight point** fields are filled in and the **OK** or **Apply** button selected. The original measurement will then be shown as deleted and a new Backsight record created.

Make Measurement into a Check Measurement

The **Make Check Measurement** icon is only visible when a *measurement* or *backsight* line has been selected (highlighted) in the field data.

When the measurement line is highlighted, clicking on the **Make Check Measurement** icon brings up the **Check Measurement** panel with the details from the highlighted measurement filled in.

Check Measurement

Readings

Horizontal angle: 181°57'11.88"

Vertical angle: 99°10'51.96"

Slope distance: 154.93

Description

Code: TBL

String number: 111

Check point:

Batch add Finish Help

Autopan Pan

Ticked on - when a line is selected (highlighted) in the survey data editor panel, if the point is not visible in a plan view that the model for the data is on, the view is modified so that the selected point is at the centre of the view (keeping the same scale for the view).

List of Field Data Commands and Panels

Panel buttons

The buttons that appear on the bottom of the panels used in this section have the following functions.

OK - Changes field data and closes the panel

Apply - Changes the field data but keeps the panel in view

Reset - If the record was an original field record (i.e. the command was not inserted manually) pressing the reset button will revert the record back to the original values.

Help and **Finish** are standard 12d buttons.

Existing point search

Some commands such as ***Backsight***, ***New instrument***, ***Check*** etc. allow the user to enter existing *point names* (i.e. backsight point, Setup point and Check point) or in the case of measurements from a data collector, both *point name* and *point ids*. The difference between *point names* and *point ids* is that *point names* are usually specified by the user and should be a unique identifier for a point, whilst for that same physical point a number of measurements (and hence point ids) may be assigned (usually by the data collector). This may be particularly true of control station measurements where measurements are made to a given point name but each measurement is given a different point id by the data collector.

In most instances, a measurement to a point has a point id (from the data collector) and 12d automatically gives it the same point name as it is rare to measure a non-control point more than once (the point name can be over ridden by the user).

The names allow the reduction routine to search for the details of that point (eg coordinates) to allow for the reduction of further measurements. The order in which this searching takes place is as follows:

First search the Control model (if it exists):

1. A search is made of the control model for a string whose name is the same as the specified *point name*. If a string is found, the first point of the string is used for the (x,y,z) co-ordinates.
2. A search is made of the control model for a vertex of a string whose point id is the same as the specified *point name*. If a vertex is found its (x,y,z) co-ordinates are used.
3. If only a *point id* was specified, a search is made of the control model for a vertex of a string whose point id is the same as the specified *point id*. If a vertex is found its (x,y,z) co-ordinates are used.

Next search the already entered directly entered co-ordinates (DEC) in the field file:

4. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point name* is the same as the specified *point name*. If a DEC is found, its (x,y,z) co-ordinates are used.
5. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point id* is the same as the specified *point name*. If a DEC is found, its (x,y,z) co-ordinates are used.
6. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point id* is the same as the specified *point id*. If a DEC is found, its (x,y,z) co-ordinates are used.

Next search the previous measurements in the field file:

7. A search is made of previous measurements in the field file for a measurement whose *point name* is the same as the specified *point name*. If a measurement is found, its (x,y,z) co-ordinates are used.
8. A search is made of previous measurements in the field file for a measurement whose *point id*

is the same as the specified *point name*. If a measurement is found, its (x,y,z) co-ordinates are used.

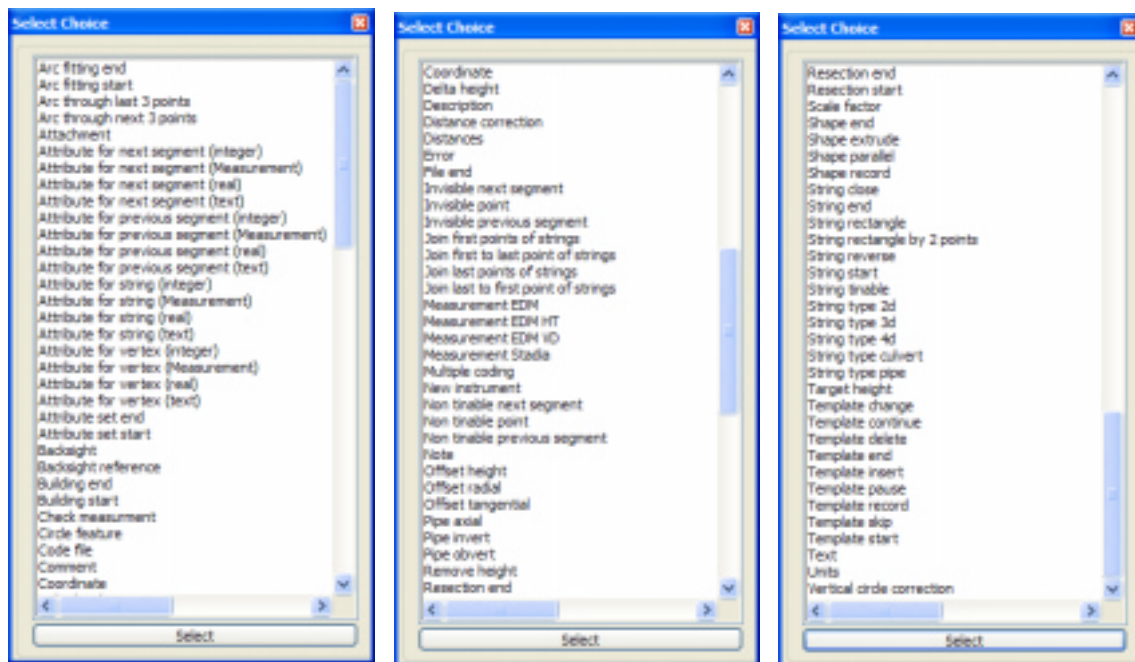

9. A search is made of previous measurements in the field file for a measurement whose *point id* is the same as the specified *point id*. If a measurement is found, its (x,y,z) co-ordinates are used.

Finally

10. If no match is found, the user will be prompted for the details of the previously undefined point. The user is asked to type in the (x,y,z) co-ordinates in the **Define Station coordinate** panel. If a model is specified in the Add to model field of the panel, then a new one point super string is created with the name *point name*, and as the vertex text for the point, the Station label prefix field value followed by *point name*

Field Data commands

The list of field commands in the pop-up from **Insert** or **Batch Add** are:

For a summary of the field file op codes see the section “Summary of 12d Field File Op Codes”

For details on each option in the pop-up:

<i>Arc fitting end</i>	go to	“Arc Fitting”

arc_fitting

Arc Fitting

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Arc mode	choice box	Arc through last 3 pts	Arc thro last 3 pts Arc thro next 3 pts Start arc fitting End arc fitting

Arc through last 3 pts

Named point is not used.

If no *feature code*, *string number*, *named point* or *point id* is given, then the current measurement point and the two previous points with the same feature code and string number as the current measurement point, are joined by an arc. If there is less than three such points, no arc is fitted.

If the *feature code* and *string number* exist, the last three previous measurement points of the same *feature code* and *string number* are joined by an arc. If the current measurement point has that feature code and string number, then it is the third of the three points used. If there is less than three points, no arc is fitted.

If a *point id* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point id. That point and two measurement points previous to the predefined point of the same *feature code* and *string number*, are joined by an arc. If there is less than three points, no arc is fitted.

Arc through next 3 pts

Named point is not used.

If no *feature code*, *string number*, *named point* or *point id* is given, an arc is inserted through the current measurement point and the next two measured points with the same feature code and string number as the current measurement point. If there is less than three points, no arc is fitted.

If a *feature code*, *string number* or *point id* exists, then either the *feature code* and/or *string number* and/or the *point id* section of the *point description* can be used.

If the *feature code* or *string number* exist, a search is made for a previously defined measurement with the same feature code or string number. An arc is inserted through this previous measurement and the

next two measured points following this previous measurement with the same feature code and string number. If the current point has that feature code and string number, then it is the first of the three points. If there is less than three points, no arc fitted.

If the *point id* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point id, and an arc is inserted through that point and the next two measurement points with the same *feature code* and *string number*. If there is less than three points, no arc is fitted

Start arc fitting

Named point is not used.

If no *feature code*, *string number*, *named point* or *point id* is given, arcs are inserted through the following sets of measurement points with the same feature code and string number as the current measurement point. The current measurement point is the first of the points.

The arcs are fitted as follows - the first arc is fitted through points one, two and three, the next arc through points three, four and five etc. If the current point has that feature code and string number, then it is the first of the points. If there is less than three points, then no arc is fitted.

If the *feature code* and *string number* exist, a search is made for a previously defined measurement with the same feature code or string number. An arc is inserted through the following measured points with the same feature code and string number as given. If the current point has that feature code and string number, then it is the first of the points.

If the *point id* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point id, and arcs are inserted through that point and the following measured points with the same *feature code* and *string number*.

End arc fitting

Named point is not used.

If no *feature code*, *string number*, *named point* or *point id* is given, the fitting of arcs through the current string is stopped. The current measurement point is the last of the points used in the arc fitting.

If the *feature code* and *string number* exist, then the fitting of arcs through the points of the previous string with the same *feature code* and *string number* is stopped. If the current measurement point has that feature code and string number, then it is the last point used in the arc fitting.

If the *point id* from the *point description* exists, then the point with that point id is the last point used in the arc fitting.

If 12d Model encounters an *End Arcs* (62) but no *Start Arcs through sets of three points* (61) command for the string, then a *Start Arcs through sets of three points* (61) is assumed to apply at the beginning of the string and hence arc fitting will be applied to the entire string.

Code

feature code. See the description of the panel field *Arc mode for usage*

String number

string number. See the description of the panel field *Arc mode for usage*

Named point

not used

Point id

point id. See the description of the panel field *Arc mode for usage*

Field Description	Type	Defaults	Pop-Up
Mode	choice box	String (integer)	String (integer) String (real) String (text) Vertex (integer) Vertex (real) Vertex (text) Next segment (integer) Next segment (real) Next segment (text) Previous segment (integer) Previous segment (real) Previous segment (text)

String (integer)

Add an user defined integer attribute to the current string.

String (real)

Add a real (floating point) user defined attribute to the current string.

String (text)

Add a text user defined attribute to the current string.

Vertex (integer)

Add an integer user defined attribute to the current measurement point.

Vertex (real)

Add a real (floating point) user defined attribute to the current measurement point.

Vertex (text)

Add a text user defined attribute to the current measurement point.

Next segment (integer)

Add an integer user defined attribute to the next segment from the current measurement point.

Next segment (real)

Add a real (floating point) user defined attribute to the next segment from the current measurement point.

Next segment (text)

Add a text user defined attribute to the next segment from the current measurement point.

Previous segment (integer)

Add an integer user defined attribute to the previous segment for the current measurement point.

Previous segment (real)

Add a real (floating point) user defined attribute to the previous segment for the current measurement point.

Previous segment (text)

Add a text user defined attribute to the previous segment for the current measurement point.

Name

The name of the attribute.

Value

The attribute data in the form specified by the mode.

backsight

Backsight

Individual backsight measurements can be entered or they can exist of pairs of Face1/Face2 measurements. To enter a Face1/face2 measurement the backsight command should be entered twice, with the appropriate values entered into the panel each time.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Horizontal angle

the horizontal angle to the backsight in dd.mmss format.

Vertical angle

the vertical angle to the backsight in dd.mmss format. If the value is in the range 0 -180 degrees the measurement is considered a Face 1 measurement, and for measurements in the range 180-360 degrees they are considered Face2.

Slope distance

the slope distance to the measurement to the backsight. If a pair of face1/face2 measurements exist, the mean value of the slope distance is used for reduction purposes.

Value

the azimuth to the backsight in dd.mmss format. This allows backsights to be specified by azimuth only. In the case of a differing azimuth and horizontal angle, a swing will be computed by the subtraction of the azimuth value and the horizontal angle.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Backsight point

point name.of the backsight point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search”

Point id

point id.of the backsight point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search” . If a new backsight entry is inserted into the file, this field will be non-editable since only the backsight point is required.

Attribute

Time surveyed

time when the command (op code) was created

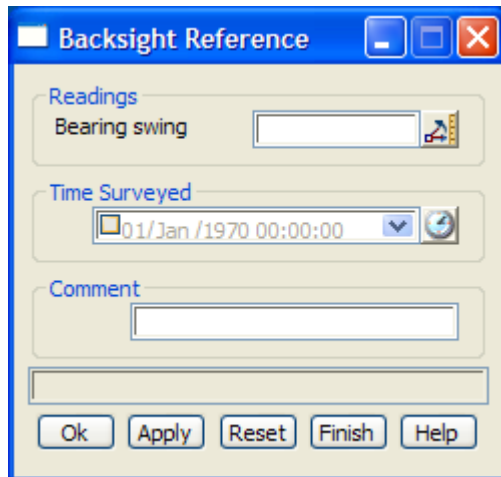

Comment

comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section “Panel buttons”

backsight_reference

Backsight Reference

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Bearing swing

the angle (measured positive, clockwise from north) to swing following measurements. It is equivalent to the bearing datum difference. Note, this swing is only current for measurements following the command and for that particular station setup. It also negates any previous swings calculated from

backsight measurements (bearing datum difference) for that station setup. Therefore, measurements after the command will use the new swing value. The direction of the swing is positive in the clockwise direction

Time surveyed

time when the command (op code) was created

Comment

comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section “Panel buttons”

buildings

Buildings

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode			Buildings end Buildings start

Building end

If no *name* exists, the current building face observation set is finished (including the current measurement point).

Buildings start

Start recording a field template with the given name. If *name* is non-blank, then the default building face is defined by the *feature code* and *string number* of the following measurements until a *Finish* code (111) are stored as the building face. There is no limit to the number of points in a building face.

Name

Name has the meaning as outlined above in Building end/start definition.

Time surveyed

time when the command (op code) was created

check_measurement

Check Measurement

Individual check measurements can be entered or they can exist of pairs of Face1/Face2 measurements. To enter a Face1/face2 measurement the check command should be entered twice, with the appropriate values entered into the panel each time.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Horizontal angle

the horizontal angle to the check point in dd.mmss format.

Vertical angle

the vertical angle to the check point in dd.mmss format. If the value is in the range 0 -180 degrees the measurement is considered a Face 1 measurement, and for measurements in the range 180-360 degrees they are considered Face2.

Slope distance

the slope distance to the measurement to the check point. If a pair of face1/face2 measurements exist, the mean value of the slope distance is used for reduction purposes.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Check point

point name.of the check point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search”

Point id

point id.of the check point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search” . If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

height_or_depth

Height Or Depth

Note - this option **does not alter heights**. It just adds a text comment of the given height value.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Value

value is converted to text and added to the string name as specified in the description fields.

Code, String number, Named point

Named point is not used.

If no feature *code*, *string number*, *named point* or *point id* is given, the value is added to all string names with the same code and string number as the current measurement. This applies to the entire field file.

If the *feature code* and *string number* exist, then the value is added to all string names with the same code and string number. This applies to the entire field file.

If the *point id* exists, then the value is added to all string names with the same code and string number

as the point defined by the point id. This applies to the entire field file.

Time surveyed

time when the command (op code) was created

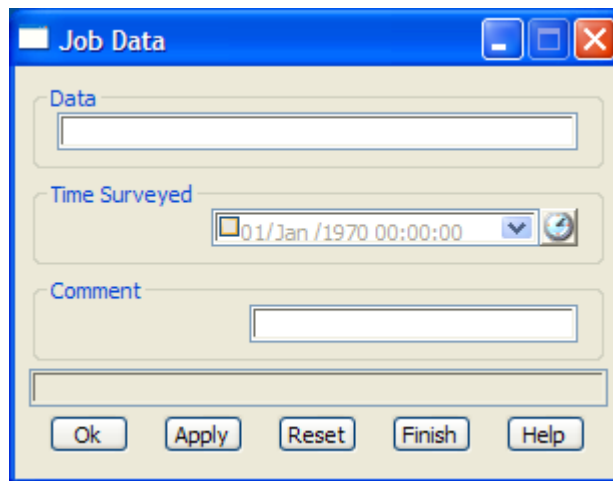

Comment

invisible

Invisible

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tinable mode			Last segment of point invisible Next segment of point invisible Point invisible

Make the previous segment invisible

If no *description* is given, the previous segment containing the current measurement point is set to invisible.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the segment containing the point with that point id as an end point, is set to invisible.

Make the next segment invisible

If no *description* is given, the next segment containing the current measurement point as a starting point is set to invisible. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the segment containing the point with that point id as a start point, is set to invisible.

Make a point invisible

If no *description* is given, the current measurement point is set to invisible. That is, it will not be included in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the point with that point id is set to invisible.

Code

the feature code of the nominated point.

String number

the string number of the nominated point.

Named point

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section "Existing point search"

Point id

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section "Existing point search". If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

strings_join

Strings Join

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Join mode			Last points of strings First to last points of strings Join first points of strings Last to first points of strings

Join last points of strings

In the final reduction, the last point of the string with the given *feature code* and *string_number_1* is joined to the last point of the string with given *feature code* and *string_number_2*. The created string has the given *feature code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

Join first to last point of strings

In the final reduction, the first point of the string with the given *feature code* and *string_number_1* is joined to the last point of the string with given *feature code* and *string_number_2*. The created string has the given *feature code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

Join first points of strings

In the final reduction, the first point of the string with the given *feature code* and *string number 1* is joined to the first point of the string with given *feature code* and *string number 2*. The created string has the given *feature code* (no string number is needed since it is the final reduction when the string numbers are then dropped).

Join last to first point of strings

In the final reduction, the last point of the string with the given *feature code* and *string_number_1* is joined to the first point of the string with given *feature code* and *string_number_2*. The created string has the given *feature code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

Code

the feature code of the strings to be joined

String number 1

the string number of the first string

String number 2

the string number of the second string

edm_measurement

EDM Measurement

Individual measurements can be entered or they can exist of pairs of Face1/Face2 measurements. To enter a Face1/face2 measurement the command should be entered twice, with the appropriate values entered into the panel each time.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Horizontal angle

the horizontal angle to the point in dd.mmss format.

Vertical angle

the vertical angle to the point in dd.mmss format. If the value is in the range 0 -180 degrees the measurement is considered a Face 1 measurement, and for measurements in the range 180-360 degrees

they are considered Face2.

Slope distance

the slope distance to the measurement to the point. If a pair of face1/face2 measurements exist, the mean value of the slope distance is used for reduction purposes.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search”

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search” . If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

edm_measurement_HT

EDM Measurement (HA,HD,HT)

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Horizontal angle

the horizontal angle to the point in dd.mmss format.

Horizontal distance

the reduced horizontal distance.

Height

the height of the observation point.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section "Existing point search"

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section "Existing point search" . If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

edm_measurement_VD

Edm measurement (HA,HD,Diff HT)

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Horizontal angle

the horizontal angle to the point in dd.mmss format.

Horizontal distance

the reduced horizontal distance.

Vertical distance

the change in height as measured from the collimation height of the instrument to the target point (usually centre of target).

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search”

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search” . If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

multiple_coding

Multiple Coding

A new measurement point is created at the same position as the current measurement point but with the *feature code* and *string number* if specified.

The *point id* and *text* are recorded as the point id and text for that vertex of the super string.

If a *point name* exists, then it is a **named measurement** and a 4d point string of name *point name* is created and mapped using the mapping file. The 4d text is the station prefix followed by *point name*.

The *point name* is added to the internal list of named points for searching for co-ordinates.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section "Existing point search"

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. tunable

Tunable

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tunable mode			Last segment of point non-
tunable			Next segment of point non-
tunable			Point non-tunable

Make the previous segment non-tinable

If no *description* is given, the previous segment containing the current measurement point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point id* exists, then the segment containing the point with that point id as an end point, is set to non-tinable.

Make the next segment non-tinable

If no *description* is given, the next segment containing the current measurement point as a starting point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point id* exists, then the segment containing the point with that point id as a start point, is set to non-tinable.

Make a point non-tinable

If no *description* is given, the current measurement point is set to non-tinable. That is, it will not be included in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point id* exists, then the point with that point id is set to non-tinable.

offset_measurement

Offset Measurement

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Offset mode			radial tangential height

radial

The *radial offset* is used to adjust the position of the specified point by a plan distance from the specified points original position, along the plan line joining the current station to the specified point. A positive offset is away from the station, negative is toward the station.

If no *point description* is given, the offset is used to adjust the position of the current measured point.

If a *point description* exists, then either the *feature code* and *string number* or the *point id* section of the *point description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point id* exists, then the point with that point id is adjusted.

tangential

The *tangential offset* is used to adjust the position of the specified point by a plan distance from the specified points original position, at rights angles to the plan line joining the current station to the specified point. A negative offset is to the left (looking from the station), and positive is to the right (looking from the station).

If no *point description* is given, the offset is used to adjust the position of the current measured point.

If a *point description* exists, then either the *feature code* and *string number* or the *point id* section of the *point description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point id* exists, then the point with that point id is adjusted.

height

If the height of the specified point is not null, then the *height offset* adjusts the height of the point. A positive offset adds to the height, a negative offset reduces the height.

If no *point description* is given, the offset is used to adjust the position of the current measured point.

If a *point description* exists, then either the *feature code* and *string number* or the *point id* section of the *point description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point id* exists, then the point with that point id is adjusted.

pipe_justification

Pipe Justification

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pipe mode			Invert Axial Obvert

Invert

If no *point description* is given, the current measurement point is on the invert (bottom) of a pipe. This is the default for measurements to points on pipe strings. If the point is not part of a pipe string, it is ignored.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point description* is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point id* exists, then the point with that point id is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

Axial

If no *point description* is given, the current measurement point is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point description* is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point id* exists, then the point with that point id is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

Obvert

If no *point description* is given, the current measurement point is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point description* is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point id* exists, then the point with that point id is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

shaping

Shaping

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode			Shape end Shape record Shape extrude Shape parallel

Shape end

Stops using the current shape or stops recording a shape.

Shape record

Start recording a shape with the shape name. If *Shape_name* is non-blank, then the default field Shape is defined by the *feature_code* and *string_number* of the following measurements until a *shape end* co. There is no limit to the number of points in a shape.

Shape extrude

extrude the current shape along the specified super string.

Shape parallel

parallel the current shape along the specified super string. This creates a number of strings to represent each feature code of the shape record. In the case of shapes which contain curves, a number of strings will be created according to an arc/chord tolerance.

Name

the name of the shape.

Time surveyed

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section “Panel buttons”

rectangle_by_2_points

Rectangle By 2 Points

The rectangle is defined by two points (reference side) and a offset.

If a positive offset value is given, two points will be created to the right of the reference side.

If a negative offset value is given, two points will be created to the left of the reference side.

If no *Description* is given, the two new points will be joined to the given points in a closed rectangular string, and will have the same feature code as the points given.

If the *feature code* and *string number* exist, then a search is made for the last occurrence of two points with the same *feature code* and *string number*. If found, then these points are used to define the reference side of the rectangle.

If the *point id* exists, then a search is made for the last occurrence of two points with the same *feature code* and *string number* as the point given by the point id. If found, then these points are used to define the reference side of the rectangle.

Two consecutive rectangles are unable to be defined side by side. In other words if the two points given are part of string of greater than two vertices, the command will only work for sets of two points that are exclusively defined. i.e. For a 5 point string, a rectangle can be defined by points 1 and 2, and 4 and 5.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Code

the feature code of the measurement.

String number

string_type

String Type

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
String type		2d	2d 3d 4d

2d - the string has one height for the entire string

3d - the string can have different heights at each vertex

4d - the string can have different heights and text at each vertex

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section "Existing point search"

Point id

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section "Existing point search". culvert

Culvert

Culvert strings are always line strings and are stored with the justification of the majority of the string points. Individual culvert points are picked up either top (obvert), centre (axial) or bottom (invert) of the culvert using op codes 80, 81 and 82.

If no *point_description* is given, the current string is created as a culvert string with the given width and height.

If a *point_description* exists, then either the *feature code* and *string number* or the *point id* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last string with the same *feature code* and *string number* is created as a culvert with the given width and height.

If the *point id* exists, then the string containing that point id is created as a culvert string with the given width and height.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Width

the width of the culvert

Height

the height of the culvert

Code

the feature code of the measurement

String number

the string number of the measurement

Named point

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search”

Point id

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search”. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

pipe_diameter

Pipe Diameter

Pipe strings are always line strings and are stored with the justification of the majority of the string points. Individual pipe points are picked up either top (obvert), centre (axial) or bottom (invert) of the pipe using op codes 80, 81 and 82.

If no *point_description* is given, the current string is created as a pipe string with the given diameter.

If a *point_description* exists, then either the *feature code* and *string number* or the *point id* section of

the *point_description* can be used.

If the *feature code* and *string number* exist, the last string with the same *feature code* and *string number* is created as a pipe with the given diameter.

If the *point id* exists, then the string containing that point id is created as a pipe string with the given diameter.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Diameter

the diameter of the pipe.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search”

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section “Existing point search” . If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

templating

Templating

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode			Template start Template end Template pause Template continue Template record Template skip Template insert Template delete

Template start

Start using the field template *Template_name*. If *Template_name* is blank, the default field template is used.

If *mode* is **for**, then the field template is used as a *forward* template.

rev, then the field template is used as a *reverse* template.

zig, then the field template is used as a *zig_zag* template and is used in the *forward* definition direction first (that is starts on a zig).

zag, then the template is used as a *zig_zag* template and is used in the *reverse* direction first (that is, starts on a zag).

If *mode* is **blank**, or anything other than **for**, **rev**, or **zag** then the field template is used as a zig-zag template starting on a *zig*.

Template end

Stops using the current field template or stops recording a field template.

Template pause

Pause using the current field template or defining a field template, until a continue field template (54) or a finish field template (52) code is given.

Template continue

Continue using or defining the current field template, which has been stopped by a *Pause* field template command (53). The *Continue* command only needs to be given once and applies to all following measurements until another *Pause* or *Finish* command is given.

Template record

Start recording a field template with the name *Template_name*. If *Template_name* is blank, then it is the default field template that is defined. The *feature_code* and *string_number* of the following measurements until a *Finish* code (52) are stored as the field template. There is no limit to the number of points in a field template.

Template skip

Allows the user to skip picking up one or more points from the field template currently being used. The next measurement takes the *feature_code* and *string_number* from the next point of the field template definition. If *num_skipped_points* is missing, then only one point is skipped otherwise *num_skipped_points* are skipped.

Template insert

Allows the user to insert new string definitions into the template. These may be new strings or multiple coded strings.

Template delete

Allows the user to delete 1 or more points on the template. Picking up will use the updated template definition.

Order

SDR_string_ordering

Position of menu: Survey =>Edit =>Order

This option is still under development.

The order option re-orders points in a string.

The Order walk-right menu is

By Points

sdr_order_string

Position of option on menu: Survey =>Edit =>Order =>by points

This option is still under development.

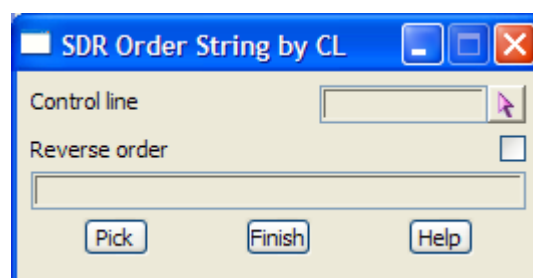

By CL

sdr_order_string_by_CL

Position of option on menu: Survey =>Edit =>Order =>by CL

This option is still under development.

Auto Order

sdr_auto_order_string

Position of option on menu: Survey =>Edit =>Order =>Auto order

This option is still under development.

Remove Order

`sdr_remove_order_string`

Position of option on menu: Survey =>Edit =>Order =>Remove

This option is still under development.

SDR Point Edits

SDR_points_edit

Position of menu: Survey =>Edit =>Points

The Points walk-right menu contains options that work on individual points (vertices).

Note - a point may be individual point (one vertex strings) or a vertex of a string.

The Points walk-right menu is:

SDR Point Edits	
Additional text	add text to the vertex
Attachment	attach an image to the vertex
Arc next 3 points	put an arc through the next 3 points
Arc last 3 points	put an arc through the preceding 3 points
Arc fitting start	start arc fitting
Arc fitting end	end arc fitting
Circle feature	make the vertex a feature
Invisible	make the vertex invisible
Invisible last seg	make the last segment invisible
Invisible next seg	make the next segment invisible
Non tinable	make the vertex non tinable
Non tinable last seg	make the last segment non tinable
Non tinable next seg	make the next segment non tinable
Pipe invert	the z-value is the invert of a pipe
Pipe cl	the z-value is the centre of a pipe
Pipe obvert	the z-value is the overt of a pipe
Rectangle last 3 points	make a rectangle of the last 3 points
Rectangle last 2 points	make a rectangle of the last two points
Remove point	delete a point
Remove height	make the height null

For the option *Additional text*, go to the section "Additional Text"

<i>Attachment</i>	"Attach a File"
<i>Arc next 3 points</i>	"Arc Through Next Three Points"
<i>Arc last 3 points</i>	"Arc Through Last Three Points"
<i>Arc fitting start</i>	"Start Arc Fitting"
<i>Arc fitting end</i>	"End Arc Fitting"
<i>Circle feature</i>	"Create a Feature String"
<i>Invisible</i>	"Make a Vertex Invisible"
<i>Invisible last seg</i>	"Make the Previous Segment Invisible"
<i>Invisible next seg</i>	"Make the Next Segment Invisible"
<i>Non tinable</i>	"Make a Vertex Non Tinable"
<i>Non tinable last seg</i>	"Make the Previous Segment Non Tinable"
<i>Non tinable next seg</i>	"Make the Next Segment Non Tinable"
<i>Pipe invert</i>	"Make a Vertex an Invert Level of a Pipe"
<i>Pipe axial</i>	"Make a Vertex an Axial Level of a Pipe"
<i>Pipe obvert</i>	"Make a Vertex an Obvert Level of a Pipe"
<i>Rectangle last 3 points</i>	"Make a Parallelogram from the Last Three Points"
<i>Rectangle last 2 points</i>	"Make a Rectangle from the Last Two Points"
<i>Remove point</i>	"Delete a Vertex"
<i>Remove height</i>	"Set a Vertex Height to Null"

Additional Text

sdr_additional_text

Position of option on menu: Survey =>Edit =>Points =>Additional text

Additional text adds text to selected vertices. The user selects the vertex to add text to, and then types in the text.

Selecting **Additional text** brings up the **SDR Additional Text** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an **Additional text** typed input panel is displayed to type the text into. A **Text** code is then inserted into the 12d field file.*

*The option continues until the **Finish** button is selected.*

*If the **pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Attach a File

sdr_attachment

Position of option on menu: Survey =>Edit =>Points =>Attachment

Attachment adds files to selected vertices. The user selects the vertex to add an attachment to, and then enters the name of the file to attach.

Selecting **Attachment** brings up the **SDR Attachment** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an **Attachment file name** typed input panel is displayed to enter the file name into. An **Attachment** field code is then inserted into the 12d field file.*

*The option continues until the **Finish** button is selected.*

*If the **pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Arc Through Next Three Points

sdr_arc_next_3_points

Position of option on menu: Survey =>Edit =>Points =>Arc next 3 points

Arc next 3 points adds an arc through the selected vertex and the next two vertices of the same string.

Selecting Arc next 3 points brings up the **SDR Arc Next 3 Points** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an arc is placed through the selected vertex and the next two vertices of the same string by inserting an **Arc through next 3 points** field code.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Arc Through Last Three Points

sdr_arc_last_3_points

Position of option on menu: Survey =>Edit =>Points =>Arc last 3 points

Arc last 3 points adds an arc through the selected vertex and the previous two vertices of the same string.

Selecting Arc last 3 points brings up the **SDR Arc Last 3 Points** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an arc is placed through the selected vertex and the previous two vertices of the same string by inserting an **Arc through last 3 points** field code.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Start Arc Fitting

sdr_arc_fitting_start

Position of option on menu: Survey =>Edit =>Points =>Arc fitting start

Arc fitting start starts arc fitting through from the selected vertex until the end of the string or an stop arc fitting field code is encountered for that string.

Selecting Arc fitting start brings up the **SDR Arc Fitting Start** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, arc fitting is started at the selected vertex by inserting an **Arc fitting start** field code.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

End Arc Fitting

sdr_arc_fitting_end

Position of option on menu: Survey =>Edit =>Points =>Arc fitting end

Arc fitting end ends any arc fitting for that string at the selected vertex.

Selecting Arc fitting end brings up the **SDR Arc Fitting End** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, any arc fitting for the string is stopped at the selected vertex by inserting an **Arc fitting end** field code.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Create a Feature String

sdr_feature

Position of option on menu: Survey =>Edit =>Points =>Circle feature

Circle feature creates a feature string of a given radius at the selected vertex.

Selecting Circle feature brings up the **SDR Feature** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an **Feature radius** typed input panel is displayed to type the radius into. A **Feature** code is then inserted into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Make a Vertex Invisible**sdr_invisible_point**

Position of option on menu: Survey =>Edit =>Points =>Invisible

Invisible turns the selected vertex invisible.

Even if the segments on either side of the invisible vertex **are** tagged as visible, the segments can not be drawn because the start/end point of the segment is invisible.

Selecting Invisible brings up the **SDR Invisible Point** panel:

**Pick** button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the vertex is turned invisible by inserting an **Invisible Point** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Make the Previous Segment Invisible**sdr_invisible_previous_segment**

Position of option on menu: Survey =>Edit =>Points =>Invisible previous segment

Invisible previous segment turns the segment ending on the selected vertex invisible. The vertex itself is not invisible.

Selecting Invisible previous segment brings up the **SDR Invisible Previous Segment** panel:

**Pick** button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

Each time a vertex is picked and accepted, the segment ending on the vertex is turned invisible by

inserting an **Invisible Previous Segment** code into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.

Make the Next Segment Invisible

sdr_invisible_next_segment

Position of option on menu: Survey =>Edit =>Points =>Invisible next segment

Invisible next segment turns the segment starting on the selected vertex invisible. The vertex itself is not invisible.

Selecting **Invisible next segment** brings up the **SDR Invisible Next Segment** panel:

Pick button

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, the segment starting on the vertex is turned invisible by inserting an **Invisible Next Segment** code into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.

Make a Vertex Non Tenable

sdr_non_tenable_point

Position of option on menu: Survey =>Edit =>Points =>Non tenable

Non tenable sets the selected vertex to be non tenable (that is, the vertex is not included in any triangulation).

Even if the segments on either side of the non tenable vertex **are** tenable, the segments can not be included in any triangulation because the start/end point of the segment is non tenable.

Selecting **Non tenable** brings up the **SDR Non Tenable Point** panel:

Pick button

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, the vertex is set to non tenable (that is, the vertex is not included in any triangulations) by inserting a **Non tenable point** code into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.

Make the Previous Segment Non Tinable

sdr_non_tinable_previous_segment

Position of option on menu: Survey =>Edit =>Points =>Non tinable previous segment

Non tinable previous segment sets the segment ending on the selected vertex non tinable. That is, the segment is not included as a breakline in any tins (triangulations) The vertex itself can be tinable.

Selecting **Non tinable previous segment** brings up the **SDR Non Tinable Previous Segment** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the segment ending on the vertex is set to non tinable by inserting a **Non tinable previous segment** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Make the Next Segment Non Tinable

sdr_non_tinable_next_segment

Position of option on menu: Survey =>Edit =>Points =>Non tinable next segment

Non tinable next segment sets the segment starting on the selected vertex non tinable. That is, the segment is not included as a breakline in any tins (triangulations) The vertex itself can be tinable.

Selecting **Non tinable next segment** brings up the **SDR Non Tinable Next Segment** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the segment starting on the vertex is set to non tinable by inserting an **Non tinable next segment** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Make a Vertex an Invert Level of a Pipe

sdr_pipe_invert_justification

Position of option on menu: Survey =>Edit =>Points =>Pipe invert

Pipe invert sets the z-value of the selected vertex to be used as an invert level (pipe top) when the vertex is in a pipe string.

Selecting Pipe invert brings up the **SDR Pipe Invert Justification** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the vertex is set to be an invert level (top of the pipe) for any pipe string it is in by inserting a **Pipe invert** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Make a Vertex an Axial Level of a Pipe

sdr_pipe_axial_justification

Position of option on menu: Survey =>Edit =>Points =>Pipe axial

Pipe axial sets the z-value of the selected vertex to be used as an axial level (pipe centre) when the vertex is in a pipe string.

Selecting Pipe axial brings up the **SDR Pipe Axial Justification** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the vertex is set to be an axial level (centre of the pipe) for any pipe string it is in by inserting a **Pipe axial** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Make a Vertex an Obvert Level of a Pipe

sdr_pipe_obvert_justification

Position of option on menu: Survey =>Edit =>Points =>Pipe obvert

Pipe obvert sets the z-value of the selected vertex to be used as an obvert level (bottom of pipe)

when the vertex is in a pipe string.

Selecting **Pipe obvert** brings up the **SDR Pipe Obvert Justification** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the vertex is set to be an obvert level (bottom of the pipe) for any pipe string it is in by inserting a **Pipe obvert** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Make a Parallelogram from the Last Three Points

sdr_rectangle

Position of option on menu: Survey =>Edit =>Points =>Rectangle last 3 points

Rectangle last 3 points creates a parallelogram (squashed rectangle) from the selected vertex and the previous two vertices in the same string.

Selecting **Rectangle last 3 points** brings up the **SDR Rectangle** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

Each time a vertex is picked and accepted, a parallelogram (squashed rectangle) is created using the selected vertex and the previous two vertices of the same string (three vertices in total) and creating a four vertex to form the parallelogram of four vertices. The three vertices are removed from the original string and any following vertices are used in a new string.

*A **String rectangle** code is inserted into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Make a Rectangle from the Last Two Points

sdr_rectangle_by_2_points

Position of option on menu: Survey =>Edit =>Points =>Rectangle last 2 points

Rectangle last 2 points creates a rectangle from the selected vertex and the previous vertex in the same string, and a width supplied by the user.

The rectangle is formed by using the two vertices as the base of the rectangle and using the given

width as the length of the other side of the rectangle. Two new vertices are created to from the rectangle.

Selecting Rectangle last 2 points brings up the **SDR Rectangle by 2 Points** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, a **Rectangle width** type input box is displayed and filled in.*

The rectangle is formed by using the two vertices as the base of the rectangle and using the given width as the length of the other side of the rectangle. Two new vertices are created to from the rectangle.

The two vertices are removed from the original string and any following vertices are used in a new string.

*A **String rectangle by 2 points** code is inserted into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Delete a Vertex

sdr_delete_point

Position of option on menu: Survey =>Edit =>Points =>Remove point

Remove point deleted the selected vertex.

The adjacent vertices in the string containing the deleted vertex will then be joined together.

Selecting Remove point brings up the **SDR Delete Point** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

Each time a vertex is picked and accepted, the vertex deleted from the field file.

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Set a Vertex Height to Null

sdr_remove_height

Position of option on menu: Survey =>Edit =>Points =>Remove height

Remove height sets the height of the selected vertex to null.

Selecting Remove height brings up the **SDR Remove Height** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the height of the selected vertex is set to null by inserting a **Remove height** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

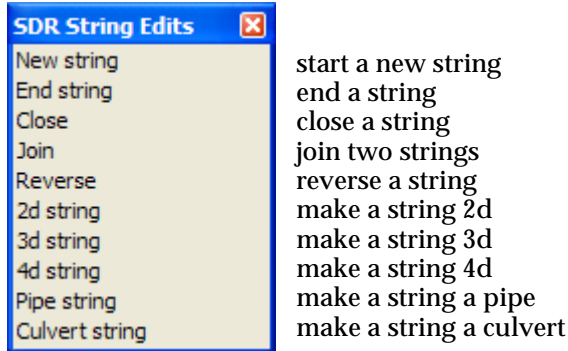

SDR Strings Edit

SDR_points_edit

Position of menu: Survey =>Edit =>Stringing

The Stringing walk-right menu contains options that work on strings rather than individual points.

The Stringing walk-right menu is:

For the option *New string*, go to the section

End string

Close

Join

Reverse

2d string

3d string

4d string

Pipe string

Culvert string

“New String”

“End String”

“Close String”

“Join Two Strings of Same Feature Code”

“Reverse String Direction”

“Make a 2d String”

“Make a 3d String”

“Make a 4d String”

“Make a Pipe String”

“Make a Culvert String”

New String

sdr_start_new_string

Position of option on menu: Survey =>Edit =>Stringing =>New string

New string corrects the problem of not changing string numbers which creates the error of the last point of one string being joined to the first point of what should have been the next string. Hence there is a link between the two points that should not exist.

With **new string**, the user selects the incorrect link and a **new string** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

Selecting **New string** brings up the **SDR Start New String** panel:

Pick button

As soon as the option is selected, the **Pick** is active and string links can be selected. If the pick is

cancelled for some reason, the **Pick** button can be used to restart the option.

Each time a string segment is picked and accepted, a **string start** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.

End String

sdr_end_string

Position of option on menu: Survey =>Edit =>Stringing =>End string

End string corrects the problem of not changing string numbers which creates the error of the last point of one string being joined to the first point of what should have been the next string. Hence there is a link between the two points that should not exist.

With **end string**, the user selects the incorrect link and a **end string** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

Selecting **End string** brings up the **SDR End String** panel:

Pick button

As soon as the option is selected, the **Pick** is active and string links can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.

Each time a string segment is picked and accepted, an **string end** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.

Close String

sdr_close_string

Position of option on menu: Survey =>Edit =>Stringing =>Close

With **Close**, the user selects any part of the string to be closed and a **close string** command is inserted into the 12d field file.

Selecting **Close** brings up the **SDR Close String** panel:

Pick button

As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.

Each time a string is picked and accepted, a **string close** command is inserted in the 12d field file which closes the selected string.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the **Pick** button can be used to restart the option.

Join Two Strings of Same Feature Code

sdr_join_strings

Position of option on menu: Survey =>Edit =>Stringing =>Join

With Join, the two strings of the same name (code) are selected with direction and the strings are joined by inserting the appropriate **join string** command in the 12d field file.

Selecting Join brings up the **SDR Join Strings** panel:

Pick button

As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.

Each time two strings of the same name (code) are picked with direction, the appropriate join string field code (**Join first points of strings**, **Join first to last point of strings**, **Join last points of strings**, **Join last to first point of strings**) is inserted into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the **Pick** button can be used to restart the option.

Reverse String Direction

sdr_reverse_string

Position of option on menu: Survey =>Edit =>Stringing =>Reverse

With Reverse, the selected strings is reversed by inserting the **String reverse** command into the 12d field file.

Selecting Reverse brings up the **SDR Reverse String** panel:

Pick button

As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.

Each time a string is selected, a **String reverse** field code is inserted into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.

Make a 2d String

sdr_string_type_2d

Position of option on menu: Survey =>Edit =>Stringing =>2d string

With 2d string the user selects any vertex of a string and a **string type 2d** command is then inserted into the *12d field file*.

Selecting 2d string brings up the **SDR String Type 2d** panel:

Pick button

As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.

Each time a string is picked and accepted, a **String type 2d** command is inserted in the *12d field file*.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.

Make a 3d String

sdr_string_type_3d

Position of option on menu: Survey =>Edit =>Stringing =>3d string

With 3d string the user selects any vertex of a string and a **string type 3d** command is then inserted into the *12d field file*.

Selecting 3d string brings up the **SDR String Type 3d** panel:

Pick button

As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.

Each time a string is picked and accepted, a **String type 3d** command is inserted in the *12d field file*.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.

Make a 4d String

sdr_string_type_4d

Position of option on menu: Survey =>Edit =>Stringing =>4d string

With 4d string the user selects any vertex of a string and a **string type 4d** command is then inserted into the 12d field file.

Selecting 4d string brings up the **SDR String Type 4d** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is picked and accepted, a **String type 4d** command is inserted in the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Make a Pipe String

sdr_pipe_diameter

Position of option on menu: Survey =>Edit =>Stringing =>Pipe string

With Pipe string, the user selects any vertex of a string, gives a pipe diameter and then a **string type pipe** command is inserted into the 12d field file.

Selecting Pipe string brings up the **SDR Pipe Diameter** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is picked and accepted, a **Pipe diameter** text input is displayed and after a value is typed in, a **String type pipe** command is inserted in the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Make a Culvert String

sdr_culvert

Position of option on menu: Survey =>Edit =>Stringing =>Culvert string

With Culvert string, the user selects any vertex of a string, gives a culvert width and height and then a **string type culvert** command is inserted into the 12d field file.

Selecting Culvert string brings up the **SDR Culvert** panel:

Pick button

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is picked and accepted, **Culvert width** and **Culvert height** text inputs are displayed and after values are typed in, a **String type culvert** command is inserted in the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.*

Target Height

SDR_target_edits

Position of menu: Survey =>Edit =>Target height

The Target height option is used to correct target height errors. This includes giving an incorrect value for a target height or forgetting to change the target height.

The Target height walk-right menu is

insert an new target height
change existing target height

Each option will now be described in detail.

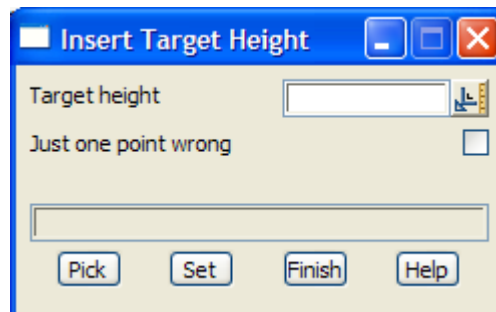

Insert Target Height

insert_target_height

Position of option on menu: Survey =>Edit =>Target height =>Insert

The insert option inserts a new target height command into the 12d field file at a user selected point. The user can choose whether the new target height only applied for that one point or for all following points until a new target height is set.

Selecting insert brings up the **insert target height** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Target height	input/output		
----------------------	--------------	--	--

when a point is selected, the target height for that point is displayed. The value can then be changed by the user and if set is selected, the target height is modified and all affected points updated.

Just one point	tick		
-----------------------	------	--	--

if tick, the new target height only applied for that one point and then reverts pack to the previous target height.

if not tick, the new target height applies for all following points until a new target height is set.

Pick	button		
-------------	--------	--	--

pick the point to insert a new target height.

Set	button		
------------	--------	--	--

selecting set inserts the new target height command into the 12d field file.

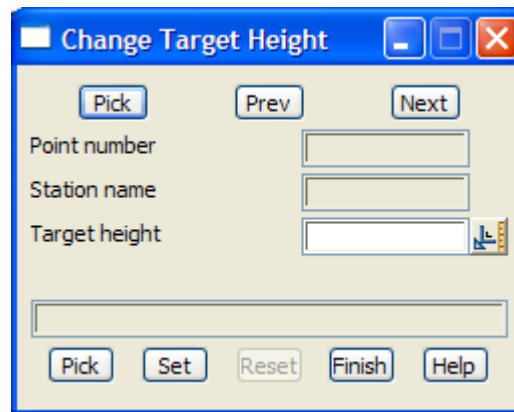

Change Target Height

change_target_height

Position of option on menu: Survey =>Edit =>Target height =>Change

The change option changes an existing target height to a new value.

Selecting change brings up the **change target height** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick	button		
-------------	--------	--	--

select a point whose information will be displayed in the panel fields. A highlighted line joining the point to the station that it was surveyed from is also displayed.

Prev	button		
-------------	--------	--	--

move to the previous point in the string.

Next	button		
-------------	--------	--	--

move to the next point in the string.

Point id	display only		
-----------------	--------------	--	--

point id of the selected point.

Station name	display only		
---------------------	--------------	--	--

name of the station that the point was surveyed from.

Target height	input/output		
----------------------	--------------	--	--

when a point is selected, the target height for that point is displayed. The value can then be changed by the user and if set is selected, the target height is modified and all affected points updated.

Pick	button		
-------------	--------	--	--

pick the point to change the target height.

Set	button		
------------	--------	--	--

selecting set changes the target height command in the 12d field file and updates affected points.

Reset	button		
--------------	--------	--	--

reset undoes the changes.

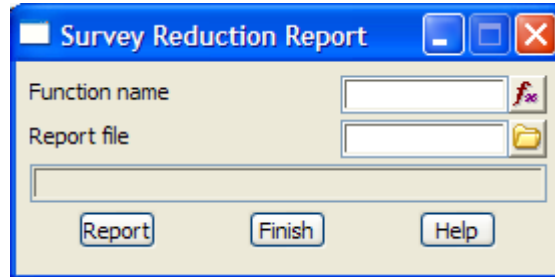

Report

survey_reduction_report

Position of option on menu: Survey =>Report

Report produces a report on the field data from a *Survey* function.

Selecting report brings up the **survey reduction report** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the 12d Survey function to report on.</i>	input		available Survey functions
Report file <i>name of the file for the Survey function report.</i>	input		*.rpt
Report <i>create the Survey report.</i>	button		

Adjustments

survey_adjustments

Position of menu: Survey =>Adjustments

The Adjustments walk-right menu is

For the option *2D Helmert*, go to the section

Least squares network

Level network

Height adjustment

Traverse Adjustment

Traverse Adjustment (new)

“2D Helmert” in the chapter “Utilities”

“Least Squares Network”

“Level Network”

“Height Adjustment”

“Traverse Adjustment”

“Traverse Adjustment”

2D Helmert

Position of option on menu: Survey =>Adjustments =>2D Helmert

The *2D Helmert* option performs a 2D helmert transformation on selected data. This transformation includes a rotation, scale and two translation parameters.

The *Helmert* Transformation has already been documented in the section “2D Helmert” in the chapter “Utilities”

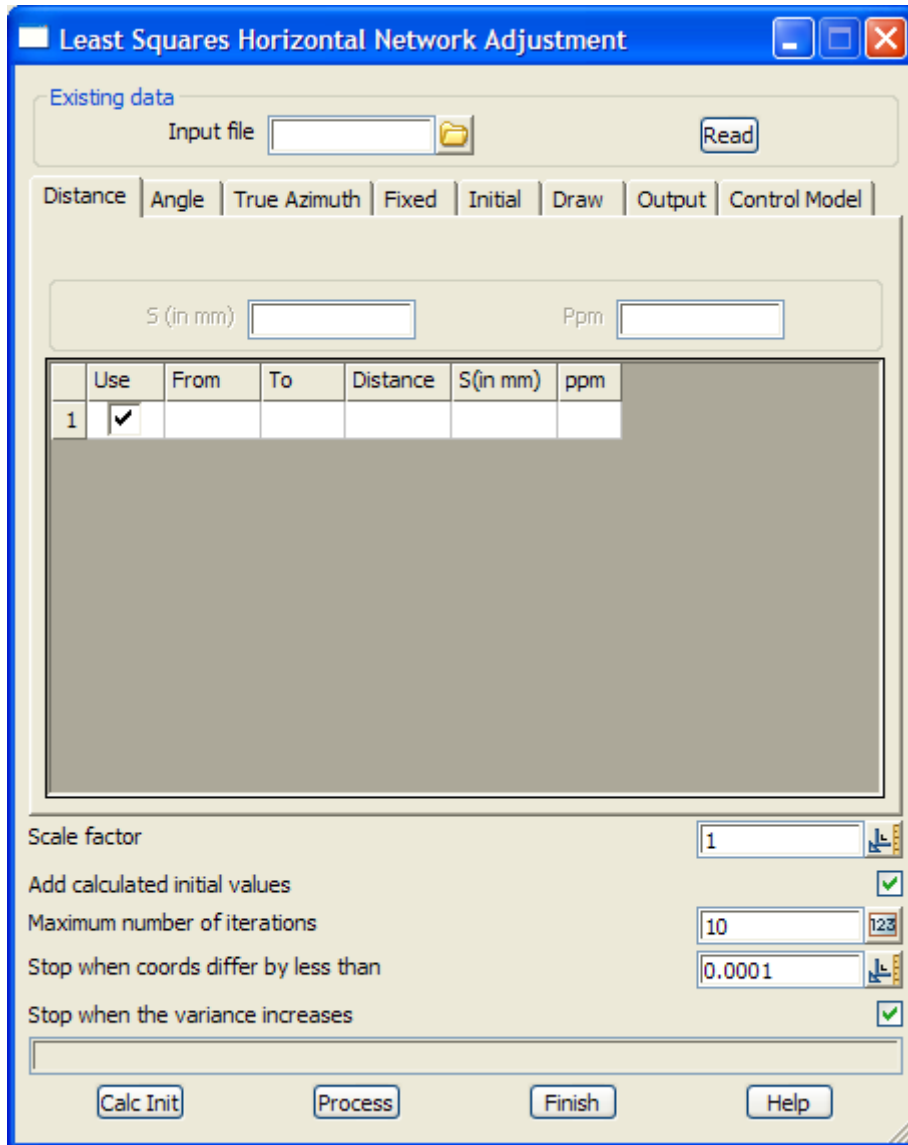

Least Squares Network

least_squares_horizontal_network_adjustment

Position of option on menu: Survey =>Adjustments =>Least squares network

The Least square network option performs a least square adjustment on a set of observations that can be manually entered into predefined grid box columns or by reading an existing input file. These observations can be of the form of distances, angles, azimuths or a combination of these.

Selecting Least squares network brings up the **Least squares horizontal network adjustment** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file	input box		*.in
<i>a pre existing .in input file can be specified. For the format of the .in file, go to "Format of the LSA .in File"</i>			
Read	button		
<i>on selection of the read button, if a valid .in input file has been specified, the relevant parameters will be</i>			

read into the grid controls.

Distance tab

	Use	From	To	Distance	S(in mm)	ppm
1	<input checked="" type="checkbox"/>					

The fields and buttons used in this tab have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

S(in mm)	input box		
-----------------	-----------	--	--

standard deviation of a single distance measurement in mm. If entered the value will be used for all lines in the grid. This eliminates the need to put the standard deviation on each line.

ppm	button		
------------	--------	--	--

parts per million error. If entered the value will be used for all lines in the grid. This eliminates the need to put the ppm on each line.

the grid control values can be entered using valid inputs into the various fields:

Use - if tick, the row is used in the adjustment. If **not ticked** then the row is ignored

From point id which represents the point from which the distance was read

To point id which represents the point to which the distance was read

Distance (horizontal) with all corrections having been made except for that of scale.

S(in mm) - if non blank, the standard deviation to use for this single distance measurement in millimetres. If blank, the default value in the panel field **S(in mm)** is used.

ppm - if non blank, the parts per million (ppm) error to use for this single distance measurement. If blank, the default value in the panel field **Pmm** is used.

Angle tab

	Use	Backsight	Instrument	Foresight	Cw angle(dms)	S(in second)
1	<input checked="" type="checkbox"/>					

The fields and buttons used in this tab have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

S(in sec)	input box		
------------------	-----------	--	--

standard deviation for a single angle measurement in seconds of arc. If entered the value will be used for all lines in the grid. This eliminates the need to put the standard deviation on each line.

the grid control values can be entered using valid inputs into the various fields. Angle input must be in

the form of degrees minutes and seconds in hp notation (e.g. 12.1055)

Use - if tick, the row is used in the adjustment. If **not ticked** then the row is ignored

Backsight - the backsight point id is entered.

Instrument - the point id of the instrument or observation station is entered.

Foresight - the point id of the foresight station is entered into the **Foresight** column.

Angle(dms) - the angle defined by the clockwise measurement from the backsight to foresight station as observed from the instrument station. Valid ranges of 0 -360 degrees.

S(in second) - if non blank, the standard deviation of the angular measurement in seconds of arc to use for this single angle measurement. If blank, the default value in the panel field **S (in sec)** is used.

Azimuth tab

The fields and buttons used in this tab have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

S(in sec)	input box		
------------------	-----------	--	--

standard deviation for a single azimuth measurement in seconds of arc. If entered the value will be used for all lines in the grid. This eliminates the need to put the standard deviation on each line.

the grid control values can be entered using valid inputs into the various fields.

Use - if tick, the row is used in the adjustment. If **not ticked** then the row is ignored

From - the instrument station point id should be entered.

To - the point id of the observed station is entered.

Azimuth - the true azimuth to the observed point is entered. Azimuth input should be in the form of degrees minutes and seconds (e.g. 12.1055) Valid ranges of 0 -360 degrees.

S(in second) - if non blank, the standard deviation of the azimuth in seconds of arc to use for this single angle measurement. If blank, the default value in the panel field **S (in sec)** is used.

Fixed tab

the grid control values can be entered using valid inputs into the various fields.

Use - if tick, the row is used in the adjustment. If **not ticked** then the row is ignored

Point name - the point id of the fixed stations

X coord - the fixed x coordinate value is entered

Y coord - the fixed y coordinate value is entered

Z coord - the fixed z coordinate value is entered

Initial tab

12d Model will try and calculate initial position for each point from the entered measurement but for some points this is not possible and then the user must enter an initial position.

Distance	Angle	Azimuth	Fixed	Initial	Draw	Output	Control Model
	Use	Point name	X coord	Y coord	Z coord		
1	<input checked="" type="checkbox"/>						

the grid control values can be entered using valid inputs into the various fields.

Use - if tick, the row is used in the adjustment. If **not ticked** then the row is ignored

Point name - the point id of a free or floating station should be entered.

X coord - the initial x coordinate estimate is entered.

Y coord - the initial y coordinate estimate is entered.

Z coord - the initial z coordinate estimate is entered.

NB. It is very important that the initial values are approximately equal to the true values. A solution will still be generated for rubbish values.

Draw tab

Distance	Angle	Azimuth	Fixed	Initial	Draw	Output	Control Model
Name							<input type="text" value=""/>
Model							<input type="text" value=""/>
Colour							<input type="text" value="red"/> 
Fixed station style							<input type="text" value="STATION"/> 
Fixed station size							<input type="text" value="1"/> 
Fixed station colour							<input type="text" value="green"/> 
Scale for error ellipses							<input type="text" value="1000"/> 
Symbol for given init pts							<input type="text" value="1"/> 
Symbol for calc init pts							<input type="text" value="1"/> 
Clear draw model							<input type="checkbox"/>

the following values can be entered to enable the production of a user defined plot of the adjustment.

Field Description	Type	Defaults	Pop-Up
Name	name box		defined names from names.4d file

if non-blank, the name of the new string

Model	model box		available models
--------------	-----------	--	------------------

if non-blank, the model of the new string (including error ellipse and station symbol if specified).

Colour	colour box	red	available colours
---------------	------------	-----	-------------------

if non-blank, the colour of the new string. If blank, the original string colour is used.

Fixed station style	input	Station	available line styles
----------------------------	-------	---------	-----------------------

line style of the station symbol. These will be placed at all of the fixed stations if specified.

Fixed station size	input	1	
---------------------------	-------	---	--

size of symbol in world units.

- Fixed station colour** colour box green available colours
if non-blank, the colour of the station symbols
- Scale for error ellipses** input 1000
this value will be applied to any error ellipses to enable an exaggerated view of the ellipse geometry
- Symbol for given init points** input 1 available line styles
line style of the given initial point symbols
- Symbol for calc init points** input 1 available line styles
line style of the calculated initial point symbols
- Clear draw model beforehand** tick box
if ticked, the draw model will be cleaned before the new strings are created

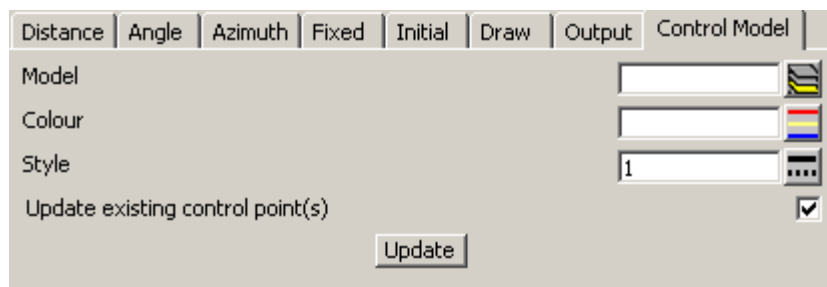

Output tab

The fields in this panel define the output parameters.

- | Field Description | Type | Defaults | Pop-Up |
|--|-----------|----------|--------|
| Output file
<i>if non blank, an output file is produced that can be read in the future.</i> | input box | | *.in |
| Report file
<i>if non blank, a report file of this name is creating giving the calculation specific parameters and result.</i> | input box | | *.rpt |
| No. decimal places for output
<i>the number of decimal place to use in the report</i> | input box | 5 | |
| Report standard error ellipse
<i>if tick, error ellipses for each new point are created</i> | tick box | ticked | |

Control Model tab

- Model** model box
