a new model or an existing model containing some control points an be entered.

If a new model, the calculated points will placed into that control model.

*If an existing model, if there is a point in the model with the same point id as a point being calculated, then that rather than a new point being created, the coordinates of the existing point can be updated after the reduction is complete (depends on the **Update existing controls points** tick box).*

Colour model box
colour used for control station symbol

Style linestyle box
style for control stations.

Update existing control points tick box ticked
if ticked, any existing coordinate positions from the adjustment will be updated in the given control model.

Update button
if pressed, the updating of changed level values in the given control model will be carried out.

The remaining fields refer to those located below the grid control

Scale factor input box project central meridian scale factor
a scale factor can be defined which will be applied to any entered distances. Final distances used in calculations are derived by multiplying the entered distance by the scale factor.

Add calculated initial values tick box tick
if this box is checked, then the initial values will be included in the report

Maximum number of iterations input box 10
the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations

Stop when coords differ... input box 0.0001
the calculation of the adjustment is stopped when the difference between successive calculations meet the defined tolerance

Stop when the variance increases tick box tick
if tick, the calculation of the adjustment is stopped when the variance between successive calculations increases

Process button
run the adjustment

Format of the LSA .in File

The data in each line of the *.in* file is space delimited. That is, each piece of data on the line is separated by one or more spaces.

Line 1:

The layout of the data on the first line is as follows:

Position	Description	Variable	Type
1	Number of distance observations	N-Dist	Integer
2	Number of angle observations	N-Ang	Integer
3	Number of true azimuth observations	N-Azi	Integer
4	Number of control (fixed) stations	N-Fix	Integer
5	Number of stations (including control stations)	N-Stn	Integer
6	Distance standard deviation (positive if used)	D-Std	Double
7	Distance part per million (non-negative if used)	D-Ppm	Double
8	Angle standard deviation (positive if used)	A-Std	Double
9	Azimuth standard deviation (positive if used)	Z-Std	Double
10	Scale factor		Double

Note: *D-Std*, is in millimetres, *A-Std* and *Z-Std* are in seconds.

Example:

```
63 71 0 16 35 5.00000 5.00000 15.00000 5.00000 1.00000
```

Next N-Stn lines:

The next *N-Fix* lines are *control station* records, followed by (*N-Stn - N-Fix*) *station* records.

The layout of the line of a *station record* is as follows:

Position	Description	Type
1	Flag (1 if the station is used, otherwise 0)	Integer
2	Point number	Text
3	X-coord	Double
4	Y-coord	Double

Example:

```
1 9338 3889.23700 5341.54800
```

```
....
```

```
....
```

```
0 9712a 4007.45700 5168.68700
```

```
....
```

Next N-Dist lines

The next *N-Dist* lines are *distance observation* records.

The layout of the line of a *distance observation record* is as follows:

Position	Description	Type
1	Flag (1 if the observation is used, otherwise 0)	Integer
2	Start point number	Text
3	End point number	Text
4	Distance	Double
5	Standard deviation (in meter, negative if not used)	Double
6	Part per million*	Double

Note: * Part per million is different to D-Ppm by a factor of 1000. That is, if you want a ppm value of 5, the number in the file should be 0.005

Example:

```
1 9542 9702 100.20200 0.00300 0.00200
1 9542 9703 142.98200 -1.00000 -1.00000
0 9700 9506 72.10700 -1.00000 -1.00000
....
```

Next N-Ang lines

The next *N-Ang* lines are *angle observation* records.

The layout of the line of a *angle observation record* is as follows:

Position	Description	Type
1	Flag (1 if the observation is used, otherwise 0)	Integer
2	Backsight point number	Text
3	Instrument point number	Text
4	Foresight point number	Text
5	Degree	Integer
6	Minute	Integer
7	Second	Double
8	Standard deviation (in mm, negative if not used)	Double

Example:

```
1 19206 9506 9701 174 29 20.00000 -1000.00000
....
```

Next N-Azi lines

The next *N-Azi* lines are *true azimuth observation* records.

The layout of the line of a *true azimuth observation record* is as follows:

Position	Description	Type
1	Flag (1 if the observation is used, otherwise 0)	Integer
2	Backsight point number	Text
3	Instrument point number	Text
4	Foresight point number	Text
5	Degree	Integer
6	Minute	Integer
7	Second	Double
8	Standard deviation (in mm, negative if not used)	Double

Example:

1 19206 9506 174 29 20.00000 3.00000

....

That is the end of data in the file.

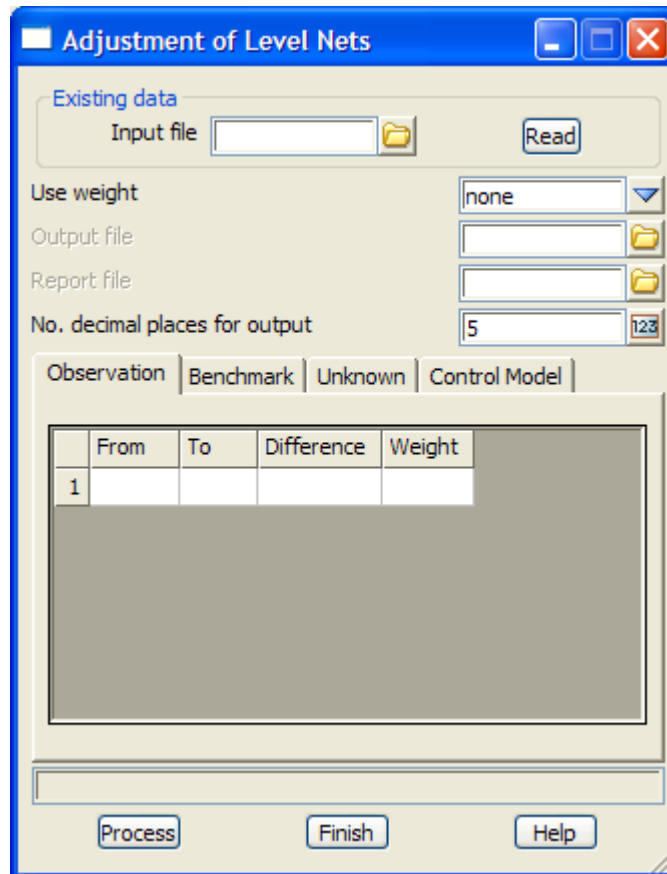

Level Network

adjustment_of_level_nets

Position of option on menu: Survey =>Adjustments =>Level network

The level network option performs a least square adjustment on a set of level observations that can be manually entered into predefined grid box columns or by reading an existing input file.

Selecting Level network brings up the **Adjustment of Level Nets** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Input file	input box		*.in
-------------------	-----------	--	------

a pre existing input file can be specified.

Read	button		
-------------	--------	--	--

on selection of the read button, if a valid input file has been specified, the relevant parameters will be read into the grid controls.

Use weight	choice box	none	none, distance, standard deviation
-------------------	------------	------	------------------------------------

*a weighting per observation can be made according to the **none**, **distance**, and **standard deviation** choices*

***None** - no weighting will be applied.*

***Distance** - if the distance of the level network legs are to be used. The horizontal distance is entered into the weight field. eg 101.23*

***Standard deviation** - to define a standard deviation. e.g. 0.005*

Note: The method of defining the weight should be kept consistent. i.e. one of the 3 options.

Output file input box *.in
an output file can be defined which will allow for the reading of the file in the future.

Report file *.rpt files
a report using the nominated file name is created.

No. decimal places for out,,,input box 5
the number of decimal places for the new levels can be defined.

Observation tab

Observation				
Benchmark Unknown Control Model				
	From	To	Difference	Weight
1				

the grid control values can be entered using valid inputs into the various fields:
From point id which represents the first point of the level difference
To point id which represents the second point to which the level difference refers
Difference the difference between the levels defined by the **From** point and the **To** point. i.e. the difference = (to point) level - (from point) level

Benchmark tab

Observation		
Benchmark Unknown Control Model		
	Station	Level
1		

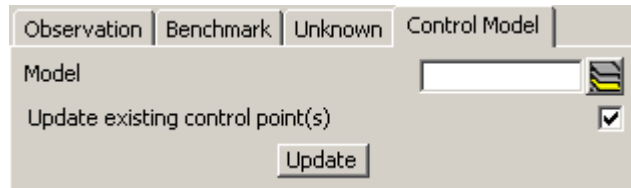

the grid control values can be entered using valid inputs into the various fields.
Station. The point id of a fixed level station should be entered.
Level. The corresponding level value of the fixed station.

Unknown tab

Observation		
Benchmark Unknown Control Model		
	Station	Level
1		

the grid control values can be entered using valid inputs into the various fields.
Station. The point id of any free or floating level stations should be entered.
Level. The corresponding approximate level value of free or floating level station.

a report using the nominated file name is created.

Control Model tab

Observation | Benchmark | Unknown | **Control Model**

Model

Update existing control point(s)

Update

Model model box

an existing control model can be entered so that changes to level values can be updated.

Update existing control points tick box ticked

if ticked, any new level values from the adjustment will be updated in the given control model.

Update button

if pressed, the updating of changed level values in the given control model will be carried out.

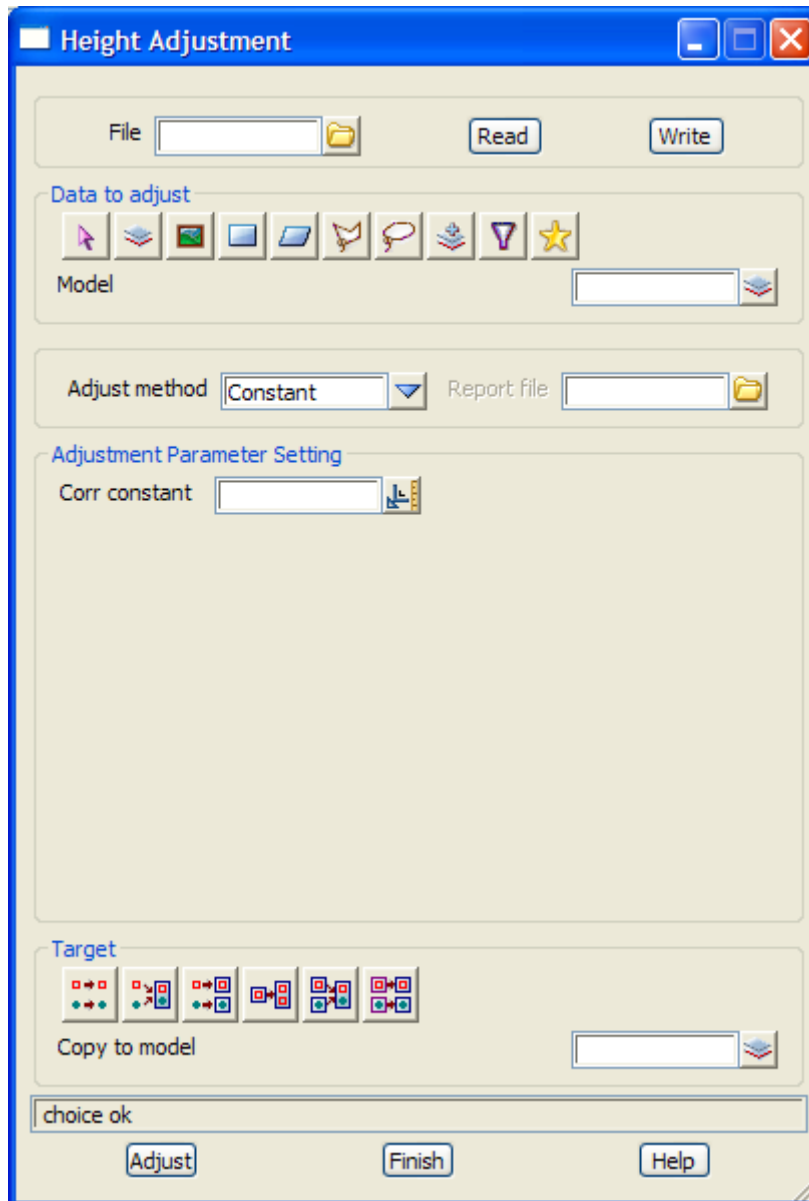

Height Adjustment

height_adjustment

Position of option on menu: Survey =>Adjustments =>Height adjustment

The Height adjustment option adjusts the selected data using either a constant z value, a plane defined by parameters, a plane defined by points (least square fit) or a tin of height differences.

Selecting Height adjustment brings up the Height Adjustment panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	file box		*.haf files
<i>a filename can be specified for reading or writing a file.</i>			
Read	button		
<i>if a valid file exists, the file contents can be loaded into the panel.</i>			
Write	button		

if a valid name is specified, the user can write the input data to a file.

Data to adjust input

the source of the data to be adjusted is selected using the data source box. For more information on the data source box see "Data Source"

Adjustment method choice box Constant Constant
Plane parameters
Plane by points
Difference tin

the adjustment method should be selected from the list. A description of each method is given below.

Report file *.rpt files

a report using the nominated file name is created.

Target target

the target for the adjusted data should be specified. For more information on how to use a data target box see the section "Data Target"

Transform button

perform the transformation.

Constant adjustment method

Adjust method: Constant Report file:

Adjustment Parameter Setting

Corr constant:

Corr constant input box

the value to be added to the selected data. This method is the same as a translation in the z values only.

Plane parameters adjustment method

Adjust method: Plane parameter Report file:

Adjustment Parameter Setting

Corr constant: Origin point: SL

Corr per unit N: North coord: 36971.386

Corr per unit E: East coord: 42663.658

Corr constant input box

the value to be added to the selected data.

- Corr per unit N** input box
the z value correction per unit northing.
- Corr per unit E** input box
the z value correction per unit easting.
- Origin point** string select [same as]
the name of the string of the origin pt.
- North coord** input box
the northing value of the origin point.
- East coord** input box
the easting value of the origin point.

Plane by points adjustment method

Adjust method: Report file:

Adjustment Parameter Setting

Corr constant: Origin point:

Corr per unit N: North coord:

Corr per unit E: East coord:

	Use pt	Point	Northing	Easting	Current_Ht	Correct_Ht	Adju
1	<input checked="" type="checkbox"/>						

the grid control values can be entered to build up the bench mark points from which the plane will be fitted to.

Use pt. *the point (bench mark point) can be included in the derivation of the parameters by selecting the Use pt option. If the point is not to be included, then uncheck the box.*

Point. *The point id of the bench mark*

Northing. *The northing value of the bench mark*

Easting. *The Easting value of the bench mark*

Current_Ht. *The current level value of the bench mark*

Correct_Ht. *The correct height in the adjusted level plane.*

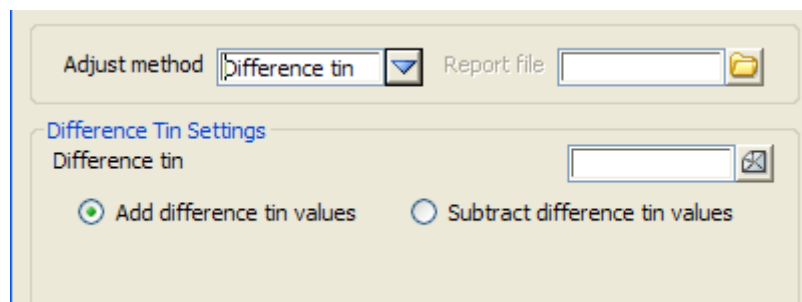

Adjusted_Ht. *This field shows the adjusted height after the adjustment is performed.*

Residual. This field shows the difference between the correct height and the adjusted height. This value is shown after the adjustment is performed.

The **Add pt** button used in this panel can be used to add points into the grid control from selecting points from a current view. After the button is selected, consequent selection and acceptance of points from the view will add the value into the grid. The **Correct_Ht** parameter will then have to be filled out by the user.

The **Calculate** button can be used to calculate the adjustment parameters and residuals so that they can be inspected before the adjustment is made.

Difference tin adjustment method

This option allows a difference tin to be specified as the adjustment reference. The selected points to be adjusted will be projected onto the difference tin to establish an interpolated adjustment value. This value is then applied to the data according to the add or subtract options. The fields used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Difference tin	tin box		available tins

the difference tin to be used to interpolate adjustment values.

Add difference tin values radio button

*if the button **Add difference tin values** is checked the interpolated value from the difference tin will be added to the existing levels of the adjusted points.*

Subtract difference tin values radio button

*if the button **Subtract difference tin values** is checked the interpolated value from the difference tin will be subtracted from the existing levels of the adjusted points.*

if **Constant**, a given value is subtracted from each z-value

Corr constant

the value to be subtracted from all z-values

Origin points

the value to be added to all z-values

if **Plan parameters**, a 3d-plane is defined and the z-value of the plane subtracted from any points

Corr constant

z-correction at the original point

Corr per unit N

z-correction per unit is the North (y) direction about the origin point

Corr per unit E

z-correction per unit is the East (x) direction

Origin point 2d select box

pick box for selected a pint to use for North and East coordinates about the origin point

North coordinate

East coordinate

if **Constant**, a given value is subtracted from each z-value

Corr constant

the value to be subtracted from all z-values

Origin points

the value to be added to all z-values

if **Plan by points** a 3d-plane is fitted using least squares adjustment to selecting points. The z-value of the plane is then subtracted from any points.

Corr constant

z-correction at the original point

Corr per unit N

z-correction per unit is the North (y) direction about the origin point

Corr per unit E

z-correction per unit is the East (x) direction

Origin point 2d select box

pick box for selected a pint to use for North and East coordinates about the origin point

North coordinate

East coordinate

if **Difference tin**, the z-value from a triangulation is added/subtracted from any points

Difference tin tin box available tins

tin of values to be added/subtracted from the z-values of points

Add difference tin values radio button

*if on, the values of the tin are **added** to the selected points*

Subtract difference tin values radio button

*if on, the values of the tin are **subtracted** to the selected points*

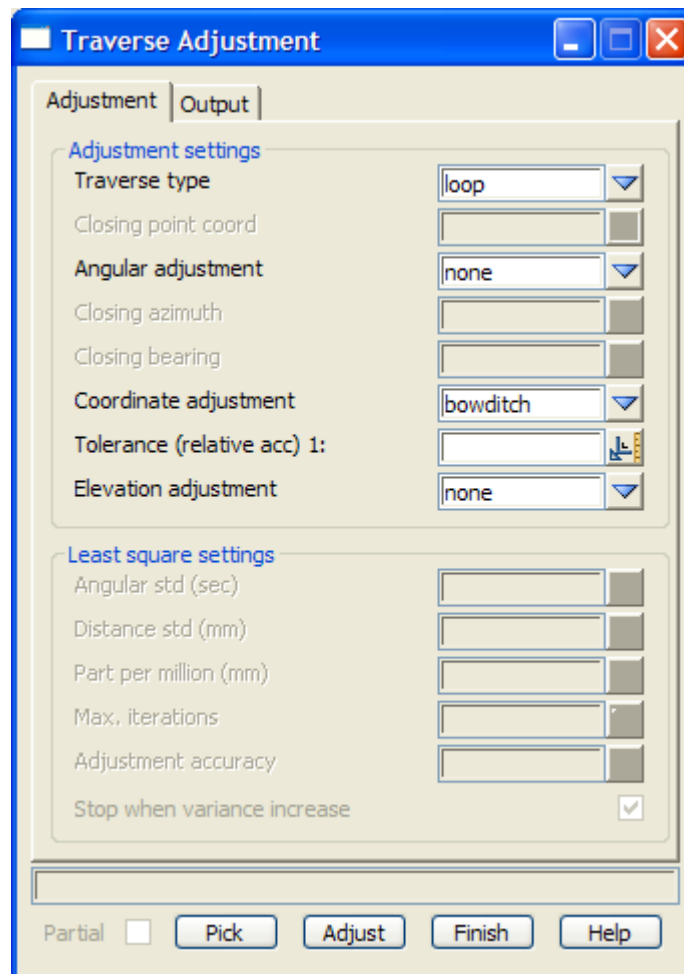

Traverse Adjustment

traverse_adjustment

Position of option on menu: Survey =>Adjustments =>Traverse adjustment

The traverse adjustment option performs a Bowditch, transit, compass or least square adjustment on a selected string. The adjustment can be for a closed string (loop) or an open string (non-loop).

Selecting traverse adjustment brings up the **traverse adjustment** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Adjust Settings tab			
Traverse type <i>the traverse can be a closed loop or a non loop.</i>	choice box	loop	loop, non-loop
Last point coord <i>co-ordinates of the last point of the traverse. Only applicable for a non-loop traverse.</i>	xyz		
Adjustment method <i>method of adjustment.</i>	choice box	transit	transit, bowditch, compass, least square
Distribute angular misclose	tick box	unticked	

if ticked, the closing azimuth and bearing fields are enabled, allowing the entry of the values so that a calculation of an angular misclose can be made. i.e. $\text{angular misclose} = \text{closing azimuth} - \text{closing bearing}$.

This requires a closing observation to be recorded separately to the adjustment string chosen.

This angular misclose can be distributed around the traverse before adjustment. The distribution follows standard survey practice, calculating a misclose value per setup station and then adding this constant to every traverse leg in an accumulative manner.

i.e. $\text{The 1st leg angle adjusted bearing} = \text{orig bearing 1st leg} + 1 * \text{misclose} / \text{setup stn.}$

$\text{The 2nd leg angle adjusted bearing} = \text{orig bearing 1st leg} + 2 * \text{misclose} / \text{setup stn.}$ and so forth.

The closing observation is not taken from the traverse string to be adjusted, but by direct entry into the closing azimuth and bearing fields.

Closing azimuth angle box

The closing azimuth is the bearing as calculated from the last point (known coordinate; equal to the start point if a loop traverse) to the closing station (known coordinate or bearing).

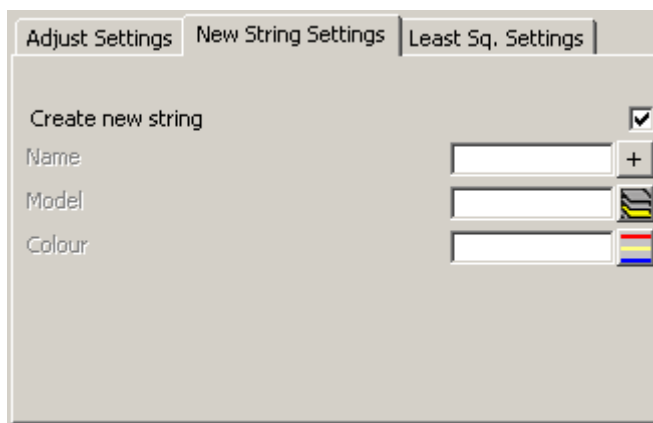

Closing bearing angle box

The closing bearing is the observation from the last traverse point to the closing station (known coordinate or bearing)

Tolerance (relative acc) 1:

The accuracy can be set which will be used to assess the misclose value before the adjustment is made. If the misclose is out of tolerance, a message box will appear notifying the user that the linear tolerance has not been met and prompting for further action. This may force the adjustment to continue or the exit of the process.

New String Settings tab

Create new string tick box tick

if tick, a new adjusted string is created. If not tick, the selected string is adjusted.

Name name box

if non-blank, the name of the new string. If blank, the original string name is used.

Model model box available models

if non-blank, the model of the new string. If blank, the original string model is used.

Colour colour box available colours
if non-blank, the colour of the new string. If blank, the original string colour is used.

*if the least square method is chosen the following parameters can be set in the **Least Sq. Settings** tab. If a different method is chosen the least square parameters are shown **greyed out** indicating that they are not used in the adjustment.*

Least Sq. Settings tab

Direction obs std (sec)

standard deviation of a single angular measurement in seconds of arc.

Distance obs std (mm)

standard deviation of a single distance measurement.

Distance ppm

distance error in parts per million.

This value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)

Iterations	input box	10
-------------------	-----------	----

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

Coords differ	input box	0.0001
----------------------	-----------	--------

the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

Variance increase	tick box	ticked
--------------------------	----------	--------

the calculation of the adjustment can stopped when the variance between successive calculations increases

The remaining values are as follows:

Report file	.rpt files
--------------------	------------

if non-blank, a report for the adjustment is created with this name. If non-blank, no report is created.

Partial	tick box
----------------	----------

if tick, only part of the selected string is adjusted.

Pick	button
-------------	--------

select the string to adjust.

Adjust	button
---------------	--------

perform the adjustment.

Conversions

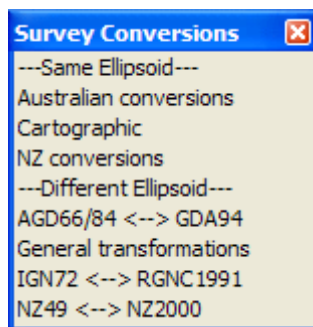

survey_conversions

Position of menu: Survey =>Conversions

The Conversions walk-right menu contains survey transformations for converting between most projections (or longitude, latitude) including Transverse Mercator, UTM etc.conversion options.

Conversions can involve the same ellipsoid or different ellipsoid. When using different ellipsoids, either a 7-parameter transformation or NTVT2 grids can be used to convert between the ellipsoids.

The Conversion walk-right menu is

Australian conversions (eg zone to zone) fro the same datum
 Cartographic conversion from one projection to another (same datum)
 NZ conversions (eg circuit to circuit) for the same datum

AGD 66/84 <--> GDA94 conversions (AMG <--> MGA
 General conversions with ellipsoid change
 IGN72 <-->RGN1991 conversions
 NZ49 <--> NZ2000 conversions

For converting between projections using the same ellipsoid:

For the option *Australian conversions*, go to the section "Australian Conversions" .

<i>Cartographic,</i>	"Cartographic"
<i>NZ conversions,</i>	"NZ Conversions"

For converting between projections with different ellipsoids:

For the option *AGD66/84<-->GDA94*, go to the section "AGD66/84 <---> GDA94" .

<i>General transformations</i>	"General Transformations"
<i>IGN72<-->RGNC1991,</i>	"IGN72 <---> RGNC1991"
<i>NZ49<-->NZ2000,</i>	"NZ49 <---> NZ2000"

For more information about terminology used in these sections, see the Appendix "Geodetics Summary" .

Australian Conversions

Australian_conversions

Position of option on menu: Survey =>Conversions =>Australian conversions

The **Australian conversions** option converts data from one form (AMG/MGA, Long Lat, Global XYZ) to another for the same common datum (AGD66/84 or GDA94). The option also allows for the conversion from one zone to another for a common datum. (e.g. from zone 54 to 55 in MGA).

For converting ISG co-ordinates in the same datum, use the option

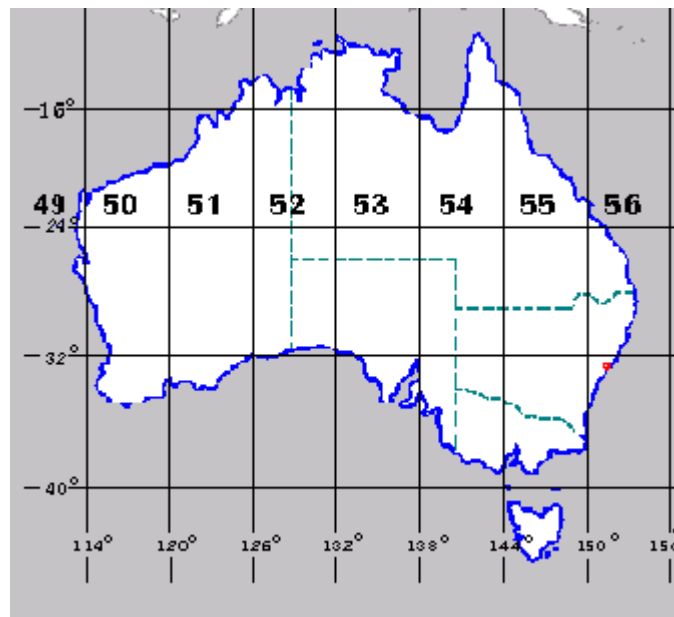

Survey =>Conversions =>Cartographic (see "Cartographic").

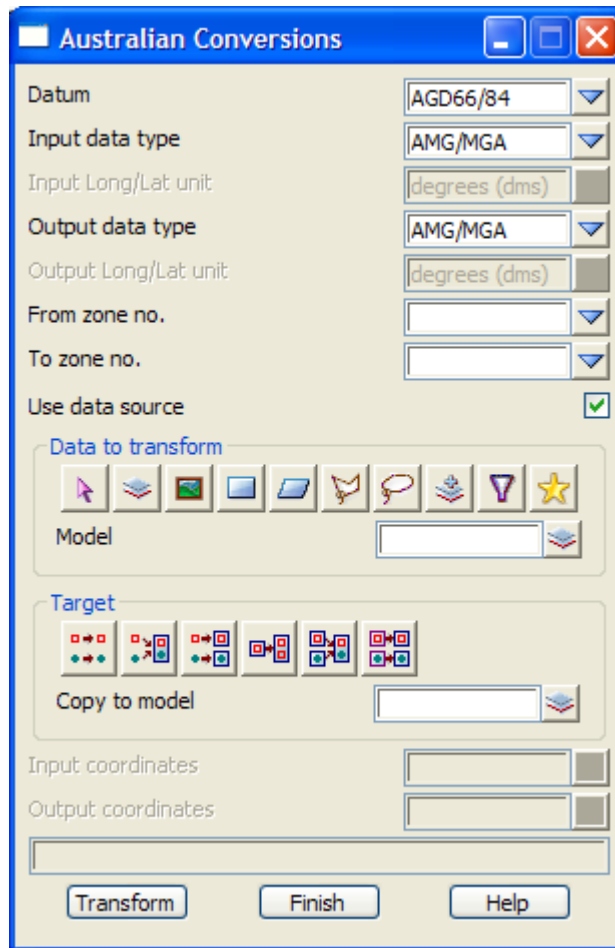

For converting between the **different** datums AGD66/84 and GDA94, use the option

Survey =>Conversions =>AGD66/84 <-> GDA94 (see "AGD66/84 <--> GDA94").

For more information, go to the section "Converting Between AMG, ISG and MGA" in the Appendix "Geodetics Summary" .

Selecting **Australian conversions** brings up the **Australian conversions** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum <i>either AGD66/84 or MGA94 is selected.</i>	choice box	AGD66/84	AGD66/84, GDA94
Input data type <i>type of the input data type.</i>	choice box	AMG/MGA	AMG/MGA, Long Lat Global XYZ
Input Lat/Long unit <i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>	choice box	degrees	radians, degrees, decimal degrees
Output data type <i>type of the input data type.</i>	choice box	AMG/MGA	AMG/MGA, Long Lat Global XYZ
Output Lat/Long unit <i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>	choice box	degrees	radians, degrees, decimal degrees
From zone no. <i>if AMG/MGA was selected for the input data type, the AMG/MGA zone is given is this field.</i>			49 -> 59
To zone no.			49 -> 59

if AMG/MGA was selected for the output data type, the AMG/MGA zone is given in this field.

Use data source tick box tick

if tick, a data source is used to select the data to be transformed. If not tick, a given co-ordinate is transformed.

Data source input

*if **use data source** is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see "Data Source"*

Target target

*if **use data source** in the data source is ticked, the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see "Data Target"*

Input coordinates XYZ box

*if **use data source** is not ticked, the co-ordinates in this field is transformed.*

Output coordinates XYZ box

*if **use data source** is not ticked, the transformed co-ordinates are displayed in this field.*

Transform button

perform the transformation.

Cartographic

cartographic

Position of option on menu: Survey =>Conversions =>Cartographic

Position of option on menu: Utilities =>A-G =>Cartographic

The Cartographic option is used to transform data based on the same datum between

- (a) two different cartographic projections (based on the same datum)
- (b) longitude and latitude and a cartographic projection (based on the same datum)
- (c) a cartographic projection and longitude and latitude (based on the same datum).

The datum, relates to the ellipsoid model used. This should be the same for both the to and from fields. i.e. a transform between data based on the ANS ellipsoid, to data based on the WGS84 ellipsoid would be incorrect.

(a) Transforming Between Two Cartographic Projections

For the first case, the data starts in one cartographic projection and is to be transformed into another cartographic projection.

This is achieved by converting the data in (x,y) co-ordinates in the original projection, to (longitude, latitude) and then converting from (longitude, latitude) to (x,y) in the new projection.

original projection \longrightarrow (longitude, latitude) \longrightarrow new projection

For example, to transform from MGA zone 50 to MGA zone 51, the original data starts in MGA zone 50, is transformed to (longitude, latitude) and then transformed from (longitude, latitude) to MGA zone 51.

Note that to make the transformation, the two cartographic projection must already be defined. That is in the example above, the two projections MGA zone 50 and MGA zone 51 must already be defined.

In **12d** Model, a *Cartographic projection* is defined by the option

Project => Projections =>Create/edit

and is documented in the section "Create/Edit Projection" of the chapter "Projects" .

The two cartographic projection definitions for the conversion are given in the **Cartographic** panel.

(b) Transform Between Longitude-Latitude and a Cartographic Projection

For the second case, the data starts in (longitude, latitude) is to be transformed into (x,y) co-ordinates in a cartographic projection.

(longitude, latitude) \longrightarrow cartographic projection

For example, to transform (longitude, latitude) to MGA zone 51.

To make the transformation, the required cartographic projection must already be defined by the option

Project => Projections =>Create/edit

which is documented in the section "Create/Edit Projection" of the chapter "Projects" .

Notes

1. In the southern hemisphere, the latitude values are **negative**. If the latitude is given as posi-

- tive rather than negative, then the option Factor can be used to multiply the latitude by -1.
- 2. If the information is given in (latitude, longitude) rather than the required (longitude, latitude), then the option Swap XY can be used to swap the order of the co-ordinates.

(c) Transform Between a Cartographic Projection and Longitude-Latitude

For the third case, the data starts in (x,y) co-ordinates in a cartographic projection and need to be transformed to (longitude, latitude).

For example, to transform from MGA zone 51 to (longitude, latitude).

To make the transformation, the required cartographic projection must already be defined by the option

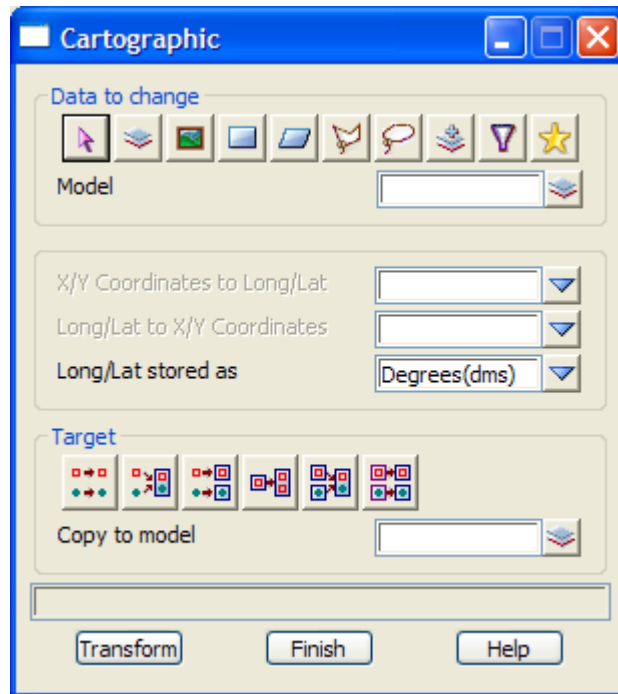

Project => Projections =>Create/edit

which is documented in the section “Create/Edit Projection” of the chapter “Projects” .

Notes

- 1. In the southern hemisphere, the latitude values are **negative**. If a positive value for latitude is required, then the option Factor can be used to multiply the latitude by -1.
- 2. If the information is required to be given in (latitude, longitude) rather than the (longitude, latitude) produced by the transformation, then the option Swap XY can be used to swap the order of the co-ordinates.

On selecting the **Cartographic** option, the **Cartographic** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type	Model		

NZ Conversions

New_Zealand_conversions

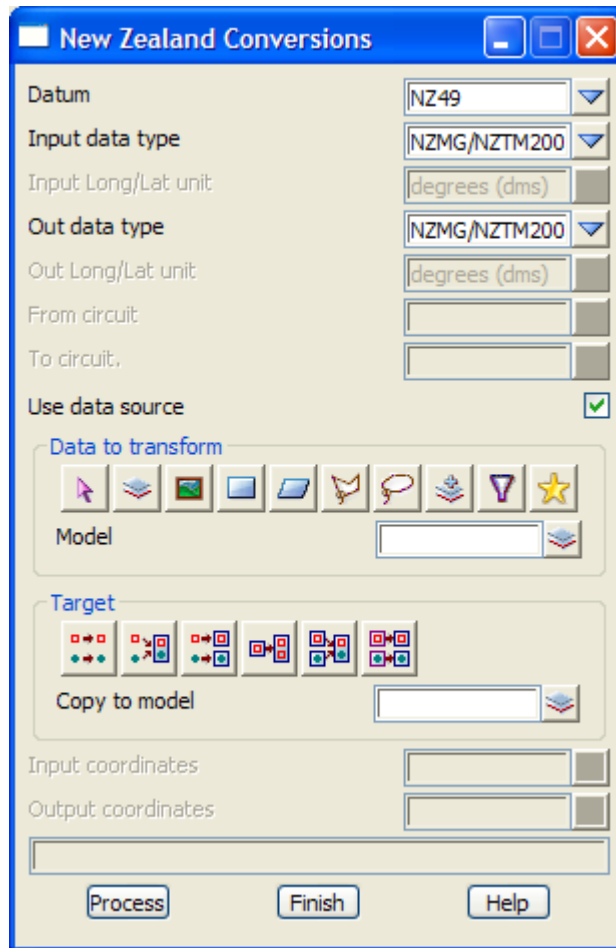

Position of option on menu: Survey =>Conversions =>NZ conversions

The NZ conversions option converts data from one form (NZMG/NZTM2000, Long Lat) to another for the same ellipsoid (i.e. datum NZ49 or NZ2000).

For converting between the **different** datums NZ 49 and NZ 2000, use the option

Survey =>Conversions =>NZ49 <-> NZ2000 (see "NZ49 <----> NZ2000").

Selecting **NZ conversions** brings up the **New Zealand Conversions** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum <i>either NZ49 or NZ2000 is selected.</i>	choice box	NZ49	NZ49, NZ2000
Input data type <i>type of the input data type.</i>	choice box	NZMG/NZTM2000	NZMG. Circuit, Long Lat
Input Lat/Long unit <i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>	choice box	degrees	radians, degrees, decimal degrees
Output data type	choice box	NZMG/NZTM2000	NZMG. Circuit, Long Lat

type of the input data type.

Output Lat/Long unit choice box degrees radians, degrees,
decimal degrees

if Lat/Long was selected, the Lat-Long coords have the selected units.

From Circuit

if Circuit was selected for the input data type, the NZ Circuit is given is this field.

To Circuit

if Circuit was selected for the output data type, the NZ Circuit is given is this field.

Use data source tick box tick

if tick, a data source is used to select the data to be transformed. If not tick, a given co-ordinate is transformed.

Data source type Model

if use data source is ticked, the data selection type

Data source input

if use data source is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see "Data Source"

Target target

if use data source in the data source is ticked, the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see "Data Target"

Input coordinates XYZ box

if use data source is not ticked, the co-ordinates in this field is transformed.

Output coordinates XYZ box

if use data source is not ticked, the transformed co-ordinates are displayed in this field.

Transform button

perform the transformation.

AGD66/84 <---> GDA94

agd66_84 _____ **gda94**

Position of option on menu: Survey =>Conversions =>AGD66/84 <-> GDA94

This option converts data between the two Australian Datums, AGD 66/84 and GDA 94. The transformation between the two datums can be by either a seven parameter similarity transformation for a State, or a NTV2 grid for either a State or Australia.

12d Model is GDA compliant for both the similarity transformations and NTV2 grids.

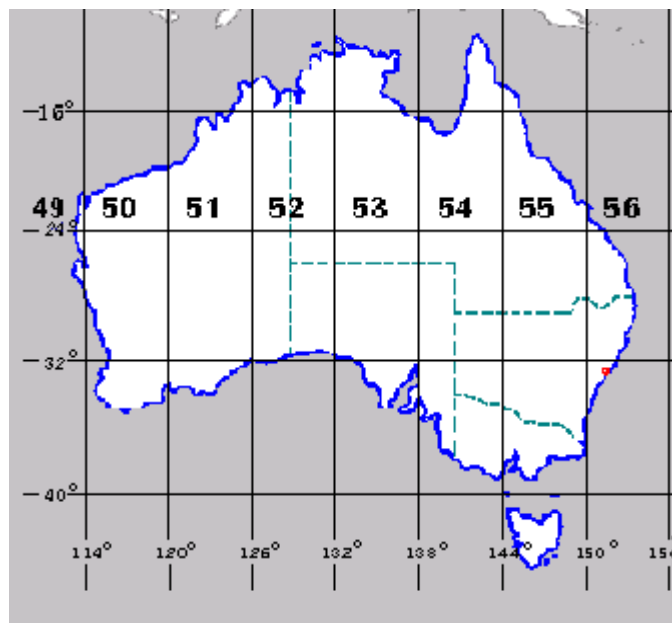

The AGD 66/84 data can be either longitude and latitude, co-ordinates in an AMG Zone or co-ordinates in an ISG Zone.

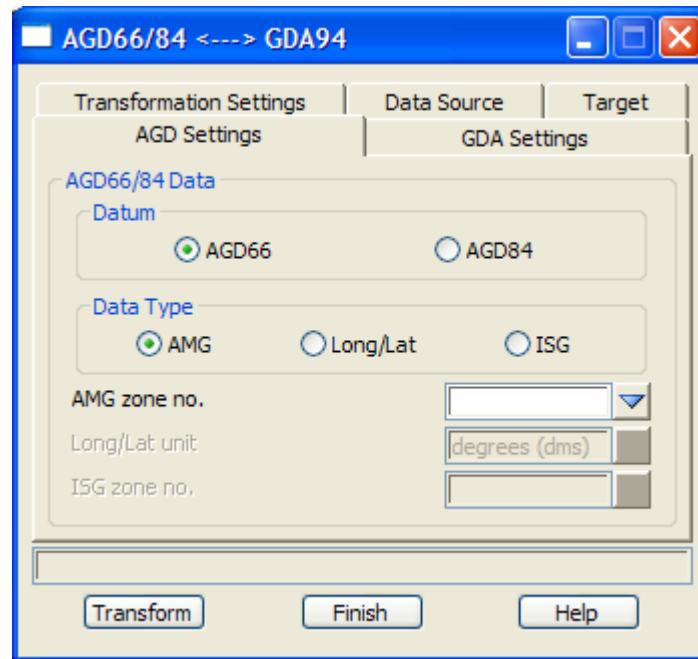

The GDA 94 data can be either longitude and latitude, Global XYZ or co-ordinates in a MGA Zone.

Hence the option will convert data from AMG 66/84 or ISG 66/84 to MGA 94 and vice-versa.

For more information, go to the section "Converting Between AMG, ISG and MGA" in the Appendix "Geodetics Summary"

Selecting **agd66/84 <---> gda94** brings up the **agd66/84 <---> gda94** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

AGD Settings

AGD66 AGD84	radio button		
<i>either AGD66 or AGD84 is selected. (AGD = Australian Geodetic datum)</i>			

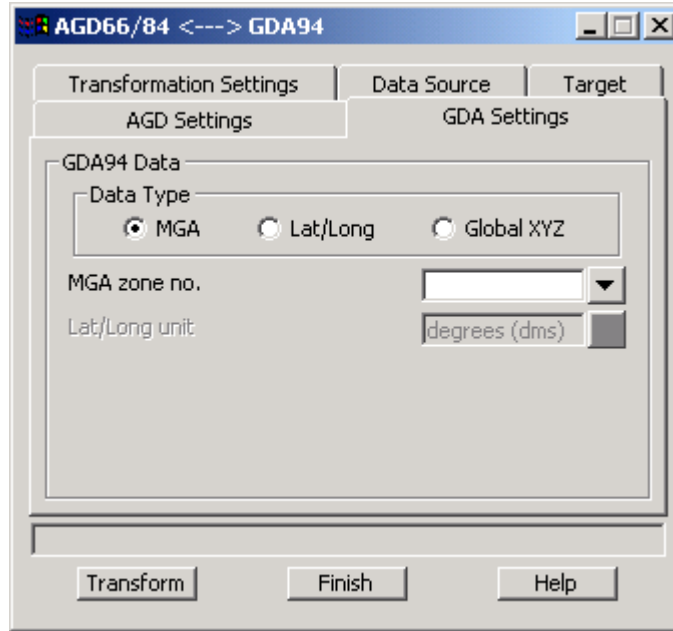

AMG Lat/Long ISG	radio button		
<i>either AMG, Lat/Long or ISG is selected. (AMG = Australian Map Grid, ISG = Integrated Survey Grid). The ISG relates to the state of New South Wales</i>			

AMG Zone no.	choice box		49 -> 59
<i>if AMG was selected, the AMG zone is given in this field.</i>			

Lat/Long unit	choice box	degrees	radians, degrees, decimal degrees
<i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>			

ISG Zone no.	choice box		ISG54/2 -> ISG56/3
<i>if ISG was selected, the ISG zone is given in this field.</i>			

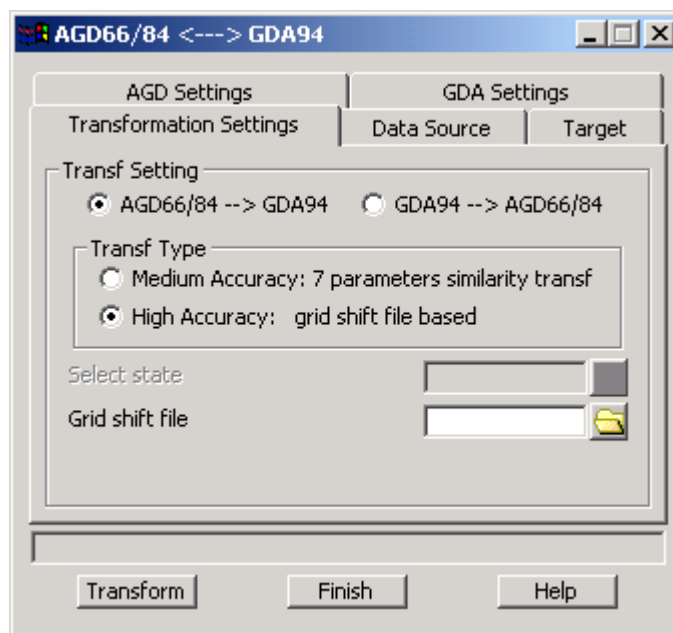

GDA Settings

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MGA Lat/Long Global XYZ	radio button		
<i>one of the three choices is selected.</i>			
MGA Zone no.	choice box		49 -> 59
<i>if MGA was selected, the MGA zone is given is this field.</i>			
Lat/Long unit	choice box	degrees	radians, degrees, decimal degrees
<i>if Lat/Long was selected, the Lat-Long coordinates have the selected units.</i>			

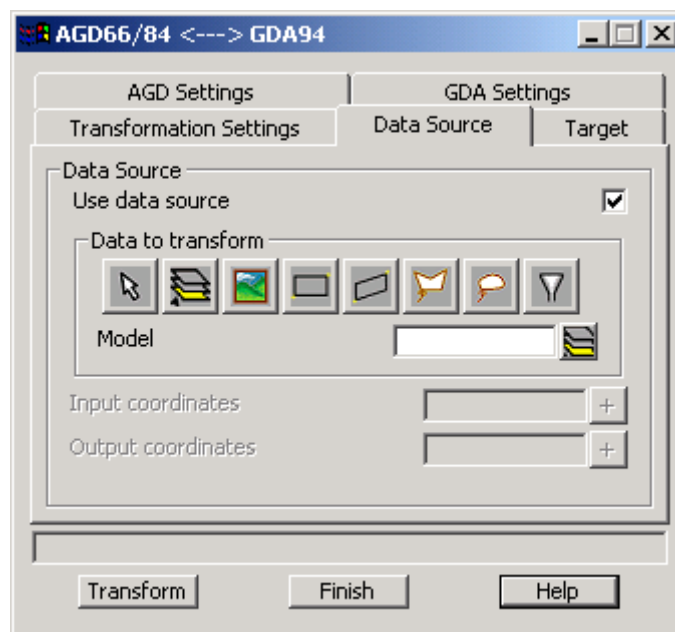

Transformation Settings

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
AGD66/84 --> GDA94 GDA94 --> AGD66/84	radio button		
<i>one of the two choices is selected.</i>			
Medium accuracy	radio box	tick	
<i>if tick, a seven parameter similarity transformation for the selected Australian State is used.</i>			
High accuracy	radio button		
<i>if tick, the NT V2 grid shift file is used.</i>			
Select State	choice box		ACT, NSW, TAS, VIC
<i>if the AGD66 datum has been selected, and the 7 parameter transformation is to be used, the seven parameter transformation parameters are different for each state. (i.e the states which adopted the AGD66 datum) By selecting the appropriate state, the corresponding values will be used.</i>			
<i>If the AGD84 datum has been selected, the parameters used are the Australian wide values and therefore the state selection is not appropriate.</i>			
Grid shift file	file box		*gsb
<i>for high accuracy, the NTv2 grid shift files can be used.</i>			

Data Source

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use data source	tick box	tick	
<i>if tick, a data source is used to select the data to be transformed. If not tick, a given co-ordinate is transformed.</i>			
Data source	input		

if use data source is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see “Data Source”

Input coordinates XYZ box

if use data source is not ticked, the co-ordinates in this field is transformed.

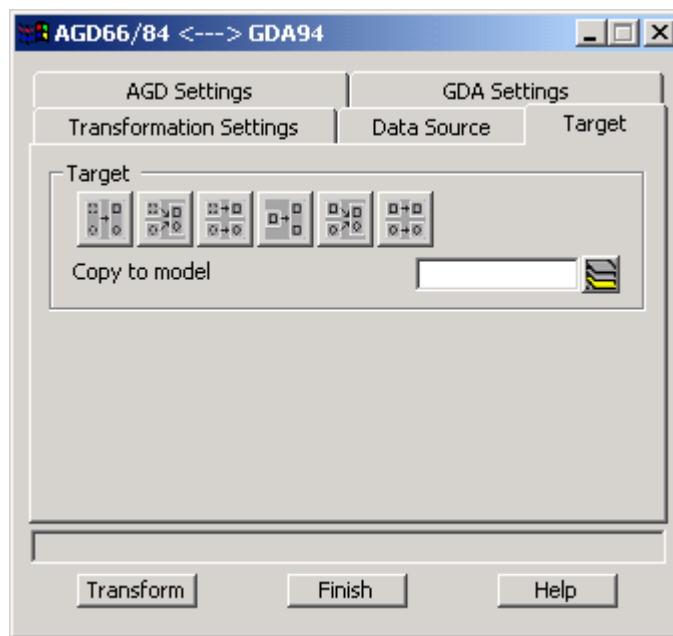

Output coordinates XYZ box

if use data source is not ticked, the transformed co-ordinates are displayed in this field.

Transform button

perform the transformation.

Target

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Target target

*if use data source in the data source is ticked, the target of the transformed data should be specified
The target for the data is selected using the data target box. For more information on the data target box see “Data Target”*

NZ49 <----> NZ2000

nz49 _____ **nz2000**

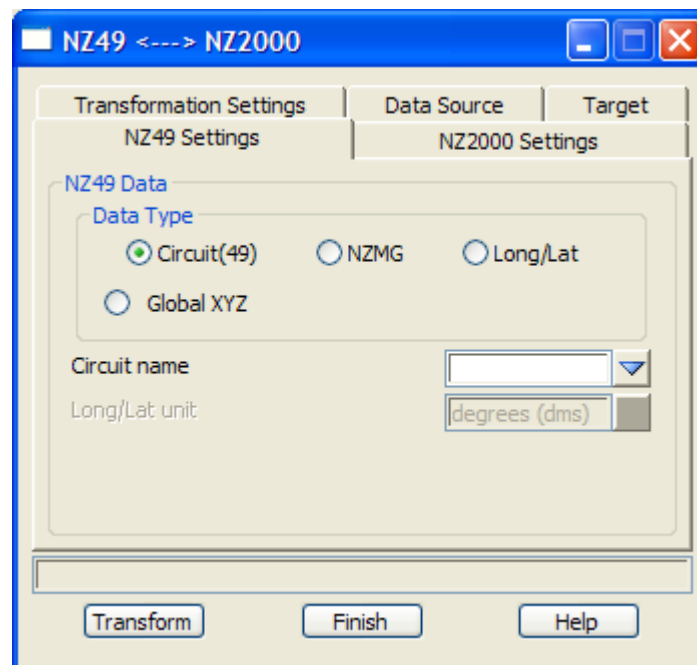

Position of option on menu: Survey =>Conversions =>NZ49 <-> NZ2000

This option converts data from the NZ 49 datum to the NZ 2000 datum and vice-versa.

The transformation between the two datums can be by either the NZ seven parameter similarity transformation or a NTv2 grid.

The data to be converted can be longitude and latitude, NZMG, circuits or Global XYZ.

Selecting **NZ49<----> NZ2000** brings up the **NZ49 <----> NZ2000** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

NZ 49 Settings

Circuit (49) radio button

*if the data in the NZ49 datum is of **circuit** type the circuit radio button is selected.*

NZMG radio button

*if the data in the NZ49 datum is of **NZMG** type the radio button is selected.*

Lat/Long radio button

*if the data in the NZ49 datum is of **Lat/Long** type the radio button is selected.*

Global XYZ radio button

*if the data in the NZ49 datum is of **Global XYZ** type the radio button is selected.*

Circuit name choice box

All NZ 1949 circuits

*if **Circuit (49)** was selected, the specific NZ Circuit should be selected.*

Lat/Long unit

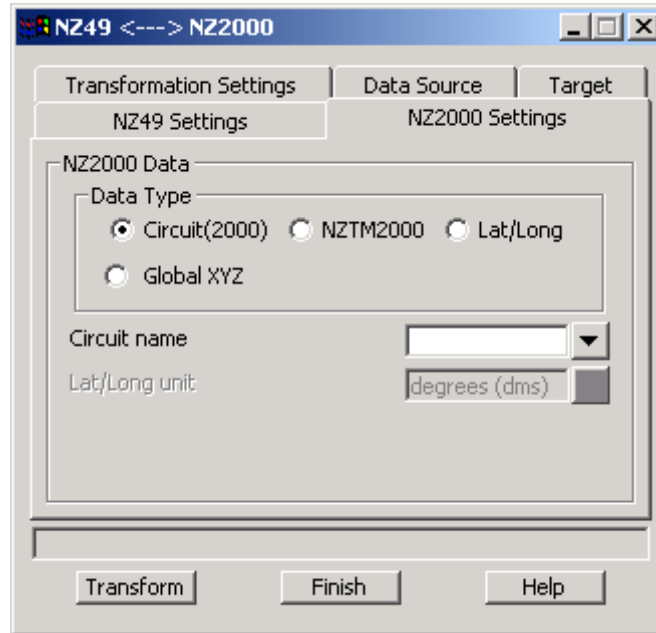

choice box

degrees

radians, degrees,
decimal degrees

if **Lat/Long** was selected, the Lat-Long coords have the selected units.

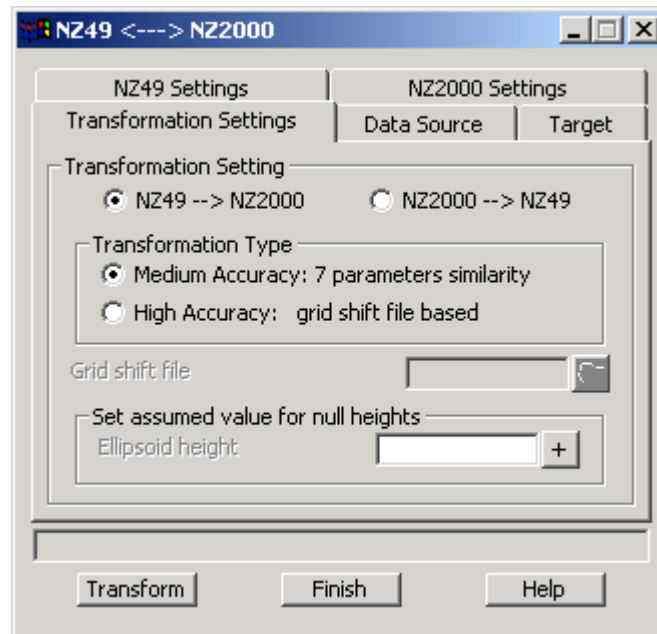

NZ 2000 Settings

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Circuit (2000)	radio button		
<i>if the data in the NZ2000 datum is of circuit type the circuit radio button is selected.</i>			
NZTM2000	radio button		
<i>if the data in the NZ2000 datum is of NZTM2000 type the radio button is selected.</i>			
Lat/Long	radio button		
<i>if the data in the NZ2000 datum is of Lat/Long type the radio button is selected.</i>			
Global XYZ	radio button		
<i>if the data in the NZ2000 datum is of Global XYZ type the radio button is selected.</i>			
Circuit name	choice box		All NZ 1949 circuits
<i>if Circuit (2000) was selected, the specific NZ Circuit should be selected.</i>			
Lat/Long unit	choice box	degrees	radians, degrees, decimal degrees
<i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>			

Transformation Settings

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

NZ49 --> NZ2000 **NZ2000 --> NZ49** radio button

the direction of the transformation is specified by the selection of one of the two choices.

Medium accuracy tick box tick

if tick, a seven parameter similarity transformation for NZ is used.

High accuracy tick box

if tick, the NT V2 grid shift file is used.

Grid shift file *file box*

if High accuracy is ticked, a NTv2 grid shift should be selected. A single file for New Zealand can be used.

Ellipsoid Height *input box*

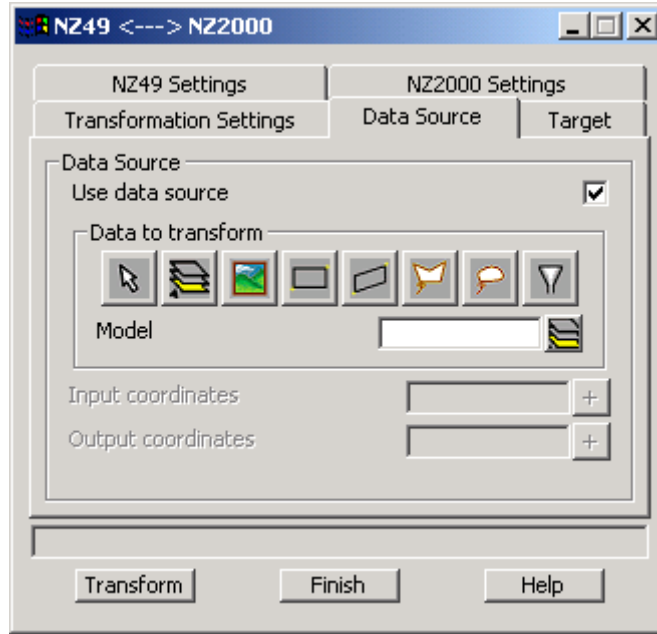

*this is only required if the data to be transformed contains null values **and** when*

*1) The 7 parameter **similarity transformation** is used and/or*

*2) When either the input or output types are of **Global XYZ** type*

An approximate ellipsoid level needs only to be +/- 100 m from the true value for most accuracy requirements. (An error in estimation of the ellipsoid height of a few hundred metres will introduce an error in the transformed horizontal position in the order of millimetres only).

Data Source

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

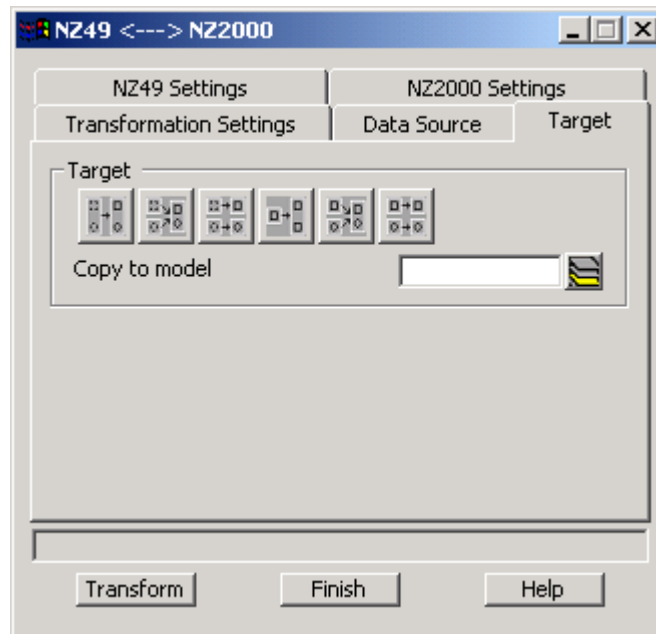

Use data source	tick box	tick	
<i>if tick, a data source is used to select the data to be transformed. If not tick, a given co-ordinate is transformed.</i>			

Data source	input		
<i>if use data source is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see "Data Source"</i>			

Input coordinates	XYZ box		
<i>if use data source is not ticked, the co-ordinates in this field is transformed.</i>			

Output coordinates	XYZ box		
<i>if use data source is not ticked, the transformed co-ordinates are displayed in this field.</i>			

Target

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Target	target		
---------------	--------	--	--

if use data source in the data source is ticked, the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see "Data Target"

Transform	button		
------------------	--------	--	--

perform the transformation.

General Transformations

general_transformations

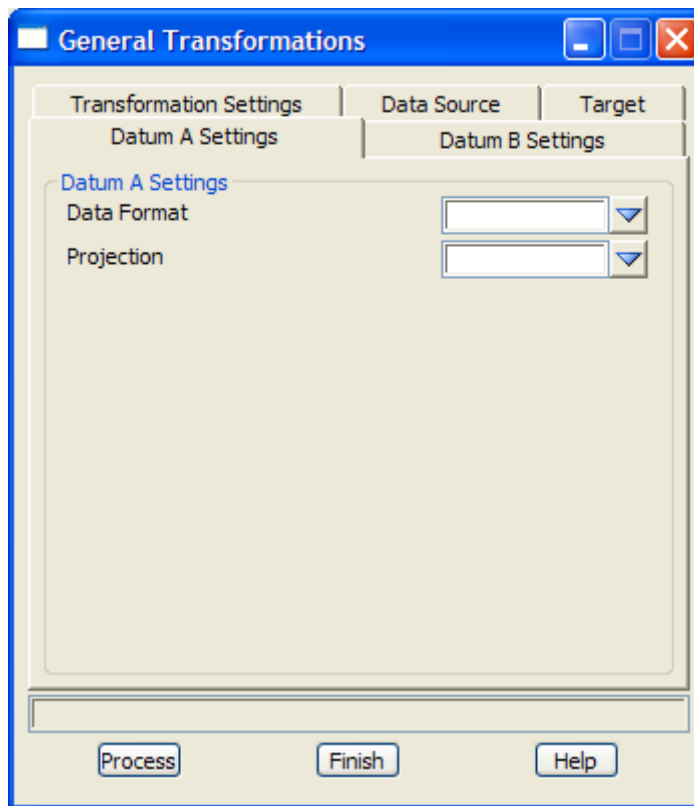

Position of option on menu: Survey =>Conversions =>General transformations

This option converts data between two datums (i.e. different ellipsoids).

The transformation between the two datums can be by either a seven parameter similarity transformation or a NTV2 grid.

The data to be converted can be longitude and latitude, a 12d supported projection (eg TM, UTM) or Global XYZ.

Selecting General transformations brings up the **General Transformations** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Datum A Settings, Datum B Settings

Data format	choice box		Global XYZ Easting Northing Long Lat - radians Long Lat - degrees (dms) Long Lat - decimal degrees
--------------------	------------	--	--

the type of data to be transformed/ transformed to.

*if **Easting, Northing**, the data is co-ordinates in the projection defined by the Projection field.*

*if **Long Lat - radians**, the data is (longitude, latitude) with the angles given in radians.*

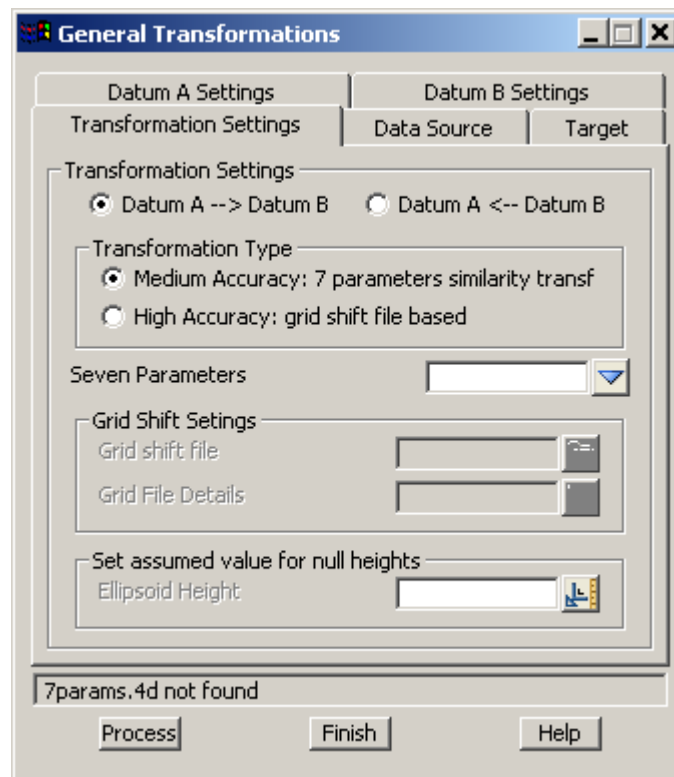

*if **Long Lat - degrees (dms)**, the data is (long,lat) with the angles given in hp format (i.e. ddd.mmssss).*

*if **Long Lat - decimal degrees**, the data is (long,lat) with the angles given decimal degrees.*

*if **Global XYZ**, the data is in the Global XYZ system.*

Projection projection box defined projections
the name of the cartographic projection that the data is in.

Transformation Settings

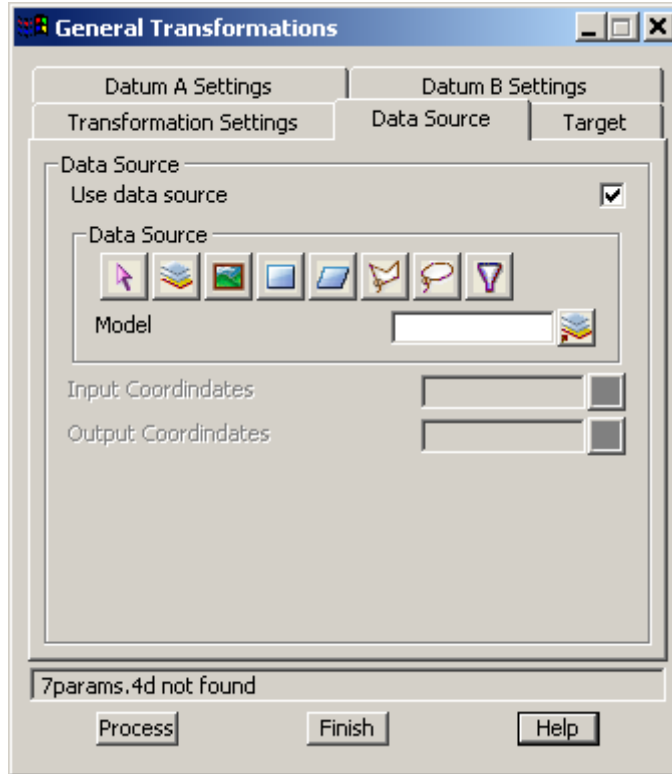

The fields and buttons used in this panel have the following functions.

----------------	--------	--	--

perform the transformation.

IGN72 <---> RGNC1991

ign72_____rgnc1991

Position of option on menu: Survey =>Conversions =>IGN72 <->RGNC1991

This option converts data between the old and new datums for Noumea.

The transformation between the two datums can be by either a seven parameter similarity transformation or a NTV2 grid.

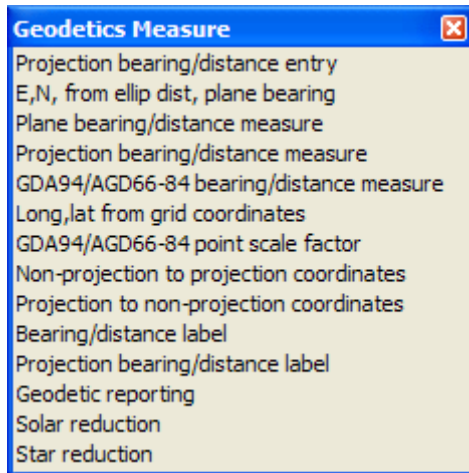

The data to be converted to/from can be (longitude, latitude) or (Easting, Northing).

Geodetic Measures and Entry

geodetics_measure

Position of menu: Survey =>Geodetics

The Geodetics walk-right menu is

Bearing distance entry for a projection
Use ellipsoid dist, plane brg to create point
Measure bearing, distance, with user input for scale
Measure plane brg, ellip dist, given projection
Bearing dist between 2 pts for GDA/AGD
Long and lat from projection (grid) co-ords
Point scale factor at a grid point for GDA/AGD
Non- projection to projection coordinate conversion
Projection to non-projection coordinate conversion
Bearing distance label for selected string/segment
Projection brg-dist label for selected string/segment
Create a report based on projection coordinates
Reduce solar observations
Reduce star observations

For the option Projection bearing /distance entry please continue to the section “Projection Bearing/Distance Entry”

Projection Bearing/Distance Entry

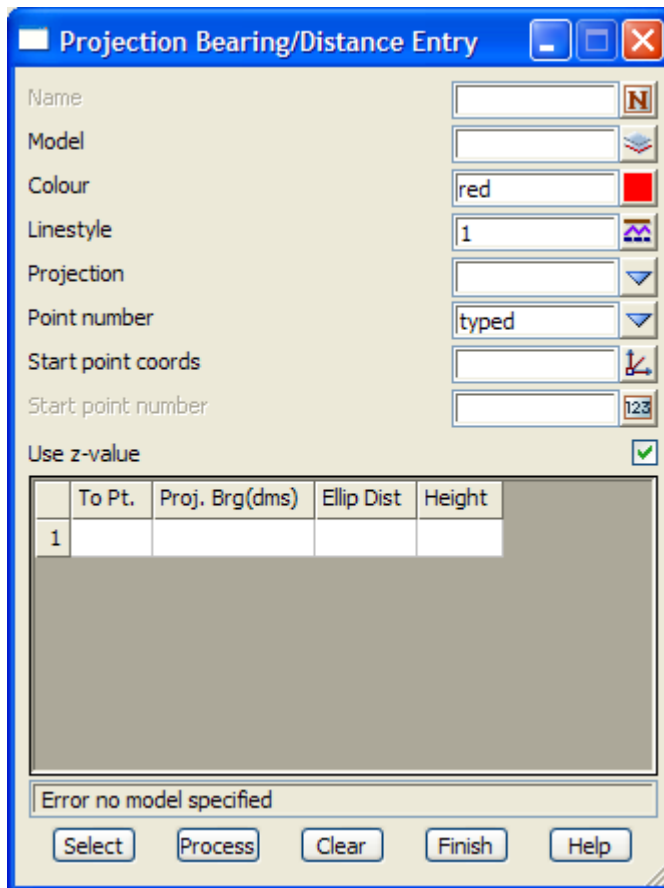

projection_bearing_distance_entry

Position of option on menu: Survey =>Geodetics =>Projection bearing/distance entry

The projection bearing/distance entry option allows the input of a traverse by manual input of projection bearings (the plane bearing) and ellipsoid distances or by selecting an existing string.

For each point, the projection co-ordinates are used with the projection bearing and ellipsoid distance from that point to calculate the projection co-ordinates for the new point taking the map projection into account.

Selecting Projection bearing/distance entry brings up the **Projection Bearing/Distance Entry** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>this field is optional. If non-blank, the name of the new string.</i>	name box		defined names from names.4d file
Model <i>if non-blank, the model of the new string. If blank, the original string model is used.</i>	model box		available models
Colour <i>if non-blank, the colour of the new string. If blank, the original string colour is used.</i>	colour box	red	available colours

Linestyle input 1 available line styles
line style of the string.

Projection input project projection available projections
This is the projection that is used for calculating the (Easting, Northing) values.

Use z- value tick box transit
*if tick, the z-values for each point are entered.
 If no tick then z-values are not entered and are not displayed in the grid.*

Point id input typed none, auto increment, typed
if none, no point ids are entered and the grid control will not show a column for point ids.

If auto increment then the values of point ids will be incremented by a value of 1 starting from the specified Start point id. If no Start point id is specified then no point ids will be allocated. No column for point ids is shown in the grid control.

if typed then the values of point ids will be incremented by a value of 1, starting from the specified Start point id. If no Start point id is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.

VALUES IN GRID grid box
The columns shown in the grid will depend on the selection of the Use z- value and Point id fields.

	To Pt.	Proj. Brg(dms)	Ellip Dist	Height
1				

To Pt. input
if none is selected for the Point id field, this column will not be displayed.

if auto increment is selected for the Point id field, this column will not be displayed.

if typed is selected for the Point id field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. If a new value is typed into the To Pt. field, the next line will increment from that number.

Proj.Brg angle box

The user should enter the projection bearing for the segment into this field. The projection bearing can be defined as the bearing resulting from plane geometry calculations between the two projection coordinates. This is sometimes called the grid bearing in some countries (e.g. New Zealand) and the plane bearing in others such as Australia as defined in the GDA technical manual (ICSM)).

Ellip Dist input box

the user should enter the ellipsoid distance. This distance is the measured horizontal distance that has been reduced onto the ellipsoid taking into account the heights above the ellipsoid at each end of the measured line. This reduction may be by the use of a height scale factor for example. Distances that are measured near mean sea level approximate the ellipsoid distance (since the MSL approximates the ellipsoid in many reference ellipsoids (eg AGD)). The amount of correction will be dependant on the length of line, the heights above the ellipsoid and the reference ellipsoid being used.

Height input box

This column will only be visible in the grid if the Use z- value tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.

Select button

on pressing the select button, a user is able to pick an existing string from the current view. If a non-traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the relevant information.

Process button

changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

E,N from Ellipsoid Distance and Plane Bearing

projection_coords_from_plane_brg_and_ellipsoid_dist

Position of option on menu: Survey =>Geodetics =>E,N from ellip dist, plane bearing

The E,N calc from ellip dist, plane brg option allows users to calculate projection coordinates given the projection, start coordinate, plane bearing and ellipsoid distance. The results are given inside the panel.

On selecting the E,N calc from ellip dist, plane brg option, the Projection Coords from plane brg and ellipsoid dist panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Projection <i>the projection of the data to be used.</i>	choice	current projection	available projections
Easting <i>the easting value of the start coordinate.</i>	input		
Northing <i>the northing value of the start coordinate.</i>	input		
Select Pt <i>if the point exists in a view, the coordinate can be entered by selecting the button and then on the required point. The selected points coordinates will be returned to the relevant coordinate boxes.</i>	button		
Plane bearing <i>the plane bearing (or Projection brg) of the line from the nominated start coordinate. The projection bearing can be defined as the bearing resulting from plane geometry calculations between the two projection coordinates. This is sometimes called the grid bearing in some countries (e.g. New Zealand) and the plane bearing in others (eg Australia as defined in the GDA technical manual (ICSM)).</i>	input		

Ellipsoid distance	input
<i>the ellipsoid distance of the line from the nominated start coordinate</i>	
Easting	input
<i>the calculated easting value of the 2nd point.</i>	
Northing	input
<i>the calculated northing value of the 2nd point.</i>	
Process	button
<i>perform the calculation.</i>	
Clear	button
<i>clear the input fields</i>	

Plane Bearing and Distance Measure

Position of option on menu: Survey =>Geodetics =>Plane bearing/distance measure

Measures the plane angle and plane distance between two selected points.

This option has already been documented in section "Bearing and Distance" of chapter "Utilities" .

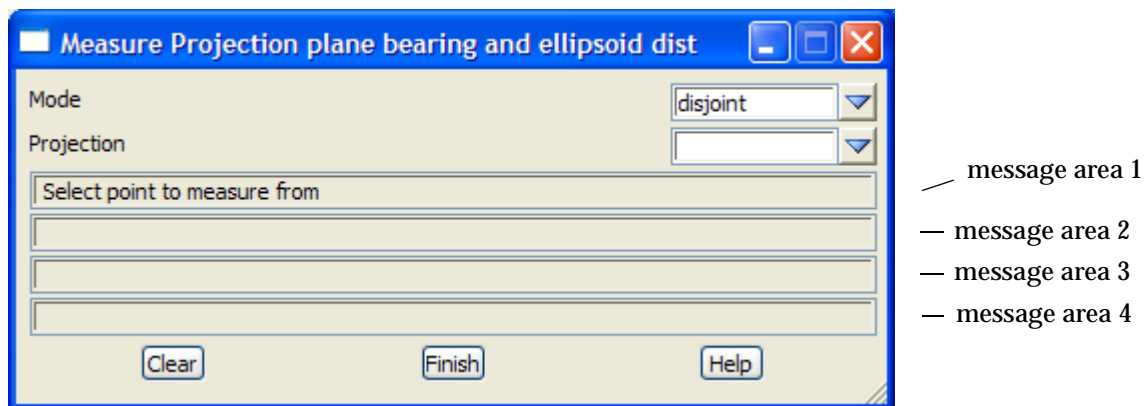

Projection Bearing and Distance Measure

measure_projection_plane_bearing_and_ellipsoid_dist

Position of option on menu: Survey =>Geodetics =>Projection bearing/distance measure

The Projection bearing and dist option allows users to measure projection plane bearing, plane distance, ellipsoid distance, arc-to chord values and a line scale factor.

On selecting the Projection bearing and dist option, the **Measure Projection Plane bearing and ellipsoid dist** panel is displayed.

This panel is principally used to display the distances between, and bearing of the line joining, pairs of user selected points.

message area 1: point selection comment

message area 2: $dx = dy =$

message area 3: plane brg = plane dist = ellipsoid dist =

message area 4: t-T fwd = t-T rev = l.s.f =

where dx is the x coordinate difference between the points, dy is the y coordinate difference between the points

plane brg is the angle measured clockwise from north and is calculated using the coordinate values (Inverse value)

plane dist is the distance calculated using the coordinate values (Inverse value)

ellipsoid dist is the ellipsoid distance calculated using the specified projection and coordinate values.

t-T fwd is the forward arc-to chord correction.

t-T rev is the reverse arc-to chord correction.

l.s.f is the line scale factor. It is calculated by plane distance/ellipsoid distance.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous

In disjoint mode, only the distance between the two points and the bearing (in degrees, minutes and seconds) of the (imaginary) line connecting the two points are displayed.

In continuous mode, after the initial reporting of the bearing/distance, the user is prompted to select the next point(2nd point). In this case the previously selected second point becomes the first point.

Projection	choice	current projection	available projections
-------------------	--------	--------------------	-----------------------

the projection of the data to be used.

Clear button

when this button is selected, the selection sequence is re-initialised.

GDA94/AGD66-84 Bearing and Distance Measure

[measure_bearing_and_distance_gda94_agd66_84_](#)

Position of option on menu: Survey =>Geodetics =>GDA94/AGD66-84 bearing/distance measure

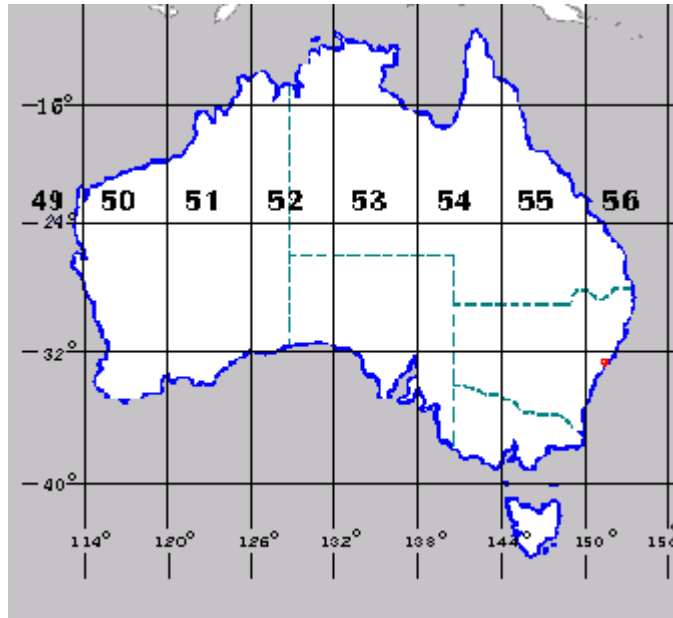

The Bearing and distance (GDA94/AGD66-84) is specifically for Australian use. It allows users to select two AMG/MGA coordinates and return the calculated geodetic parameters.

On selecting the Bearing and distance (GDA94/AGD66-84) option, the Bearing and distance (GDA94/AGD66-84) panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous
<p><i>In disjoint mode, the geodetic parameters between the two points are displayed. After the first calculation, further selections must include both the first and second points.</i></p> <p><i>In continuous mode, after the initial reporting of the values, the user is prompted to select the next point(2nd point). In this case the previously selected second point becomes the first point.</i></p>			
Datum	choice	current projection	AGD66/84 GDA94
<p><i>the datum of the data to be used.</i></p>			

1

Zone	choice	current zone	49 50 51 52 53 54 55 56 57 58 59
-------------	--------	--------------	--

the zone of the data to be used.

Select N value setting

radio button selected

if the data has non-ellipsoid heights then a conversion to ellipsoid heights is available using a method defined in the N value interpolation method choice box.

Note: The ellipsoid height is required to calculate the values. However most level datums, such as AHD approximate geoid heights. Therefore, one of the selected points should at least have a non-null value and a means for computing a ellipsoid height. If one point has a valid height and the other does not, an option will be given to assume the other point has the same value.

Various options of converting non-ellipsoid geoid heights to ellipsoid are given by the N value interpolation method choice box or the user can enter N values for the first and second points.

N value interpolation method choice box currently set method Available n value methods

the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are define d in the project n value settings. For more information on the n value settings see the section “N values”

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height

= geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

Input N values radio button unselected

if an N value is known for the area or for the selected points, it will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

1st pt N value input box

if the Input N value option is chosen, an N value is entered for the first point.

2nd pt N value input box

if the Input N value option is chosen, an N value is entered for the second point.

How to Use the Panel and Panel Messages

The results are returned to the panel in the following format:

message area 1	Messages
message area 2	plane brg =, plane dist, dx =, dy =
measure area 3	grid brg =, ellipsoid dist =, line scale factor =
message area 4	Mean height factor =, (Plane dist/level terrain dist) scale factor =
measure area 5	Mean level terrain distance =

Note: Mean height factor is the factor to apply to a measured horizontal distance (usually measured at a height above or below the ellipsoid) to reduce it down to an ellipsoid distance. The other geodetic values and terminology are clearly defined in the GDA technical manual. See <http://www.anzlic.org.au/icsm/gdatm/>

The cycle can then be repeated for another point by simply selecting another point without leaving the option. The **clear** button resets the message areas.

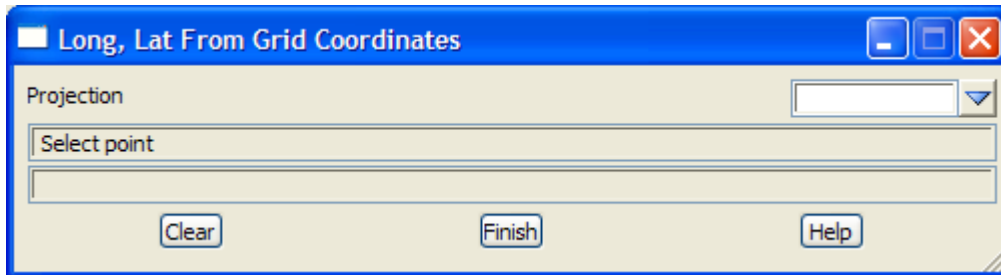

Longitude, Latitude from Grid Coordinates

[long_lat_from_grid_coordinates](#)

Position of option on menu: Survey =>Geodetics =>Long, lat from grid coordinates

The Longitude, latitude from grid coordinates option allows a user to calculate Longitude, latitude and convergence of a point, given a projection and selection of a grid coordinate.

On selecting the Longitude, latitude from grid coordinates option, the Longitude, latitude from grid coordinates panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Projection	choice	current projection	available projections
<i>the projection of the data to be used.</i>			

The cycle can then be repeated for another point by simply selecting another point without leaving the option. The **clear** button resets the message areas.

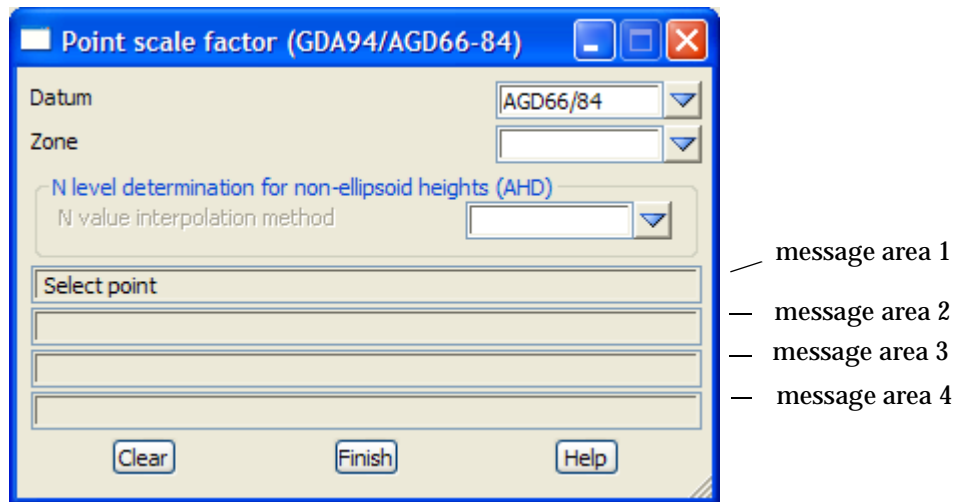

GDA94/AGD66-84 Point Scale Factor

point_scale_factor__gda94_agd66_84_

Position of option on menu: Survey =>Geodetics =>GDA94/AGD66-84 point scale factor

The Point scale factor (GDA94/AGD66-84) is specifically for Australian use. It allows users to select AMG/MGA coordinates and return the point scale factor and latitude and longitude of the point.

On selecting the Point scale factor (GDA94/AGD66-84) option, the Point scale factor (GDA94/AGD66-84) panel is displayed.

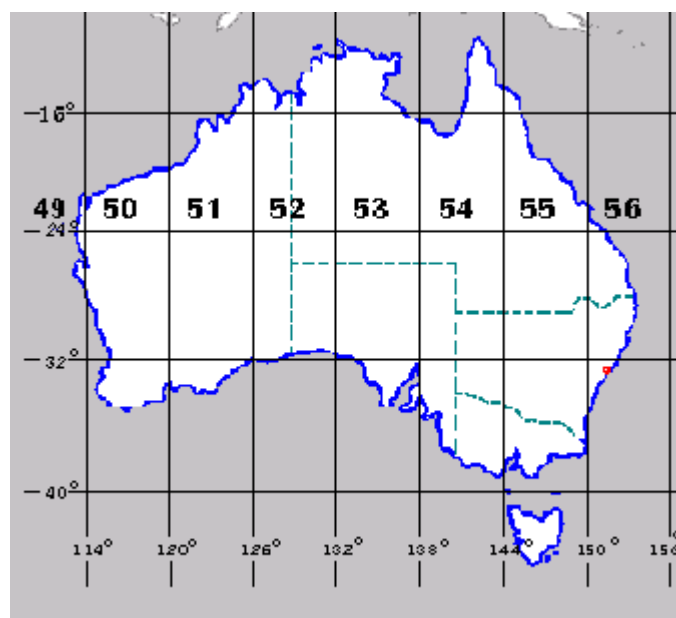

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum	choice	current projection	AGD66/84 GDA94

the datum of the data to be used.

1

Zone	choice	current zone	49
			50
			51
			52
			53
			54
			55
			56
			57
			58
			59

the zone of the data to be used.

Note: *The ellipsoid height is required to calculate the point scale factor. However most level datums, such as the AHD approximate geoid heights. Therefore, selected points should at least have a non-null value and a means for computing a ellipsoid height. Various options of converting non-ellipsoid geoid heights to ellipsoid are given.*

Select N value setting

radio button selected

*if the data has non-ellipsoid heights then a conversion to ellipsoid heights is available using a method defined in the **N value interpolation method choice box**.*

N value interpolation method choice box currently set method Available n value methods

the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are define d in the project n value settings. For more information on the n value settings see the section “N values”

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

Input N value radio button unselected

if an N value is known for the area or for the selected point, it will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

Enter N value input box

if the Input N value option is chosen, an N value is entered.

How to Use the Panel and Panel Messages

The results are returned to the panel in the following format:

message area 1	Messages
message area 2	Point scale = , Interpolated or entered N value = (if applicable)
message area 3	Combined point scale/height factor =
message area 4	Longitude = Latitude =

The cycle can then be repeated for another point by simply selecting another point without leaving the option. The **clear** button resets the message areas.

Non-Projection to Projection Coordinates

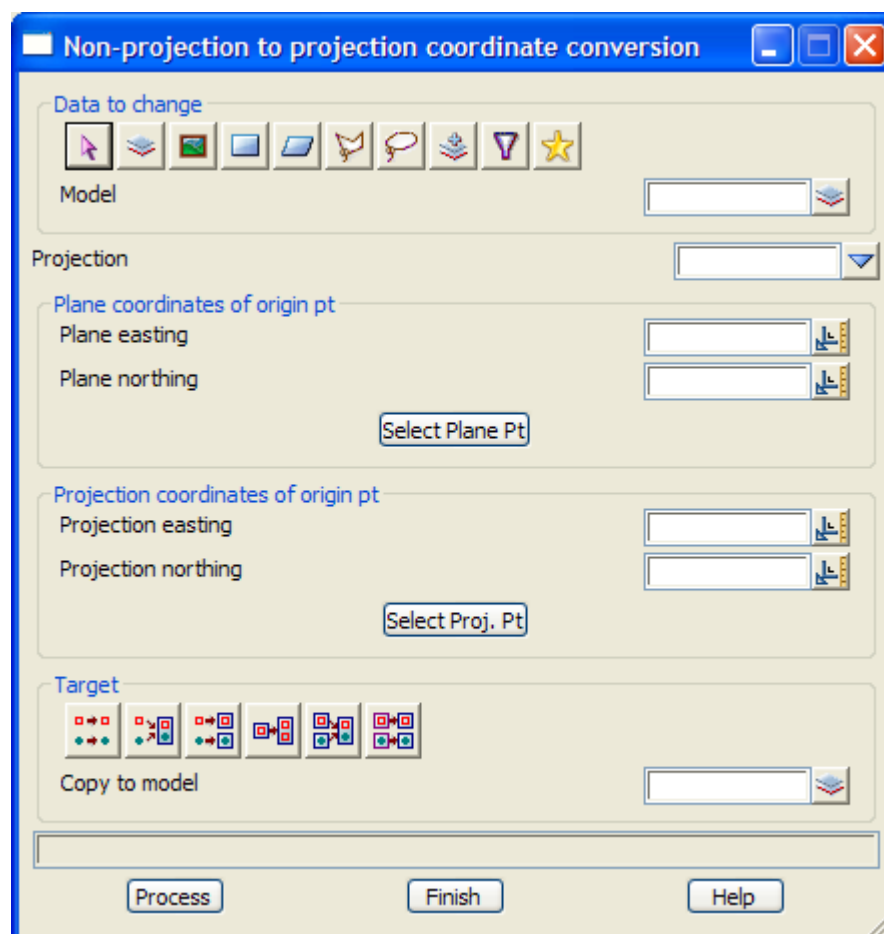

Non_projection_to_projection_coordinate_conversion

Position of option on menu: Survey =>Geodetics =>Non-projection to projection coordinate conversion

The Non-projection to projection coordinate conversion is for the conversion of non-projection coordinates (plane) to a specified projection system. This is done by calculating a series of vectors from an origin point. The origin coordinates in both the plane and projection are known. The plane vector is calculated between the origin and other selected points. Then using the projection coordinates of the origin and the plane vector a projection vector is calculated which allows the projection coordinates of the selected points to be calculated. **The azimuth orientation should be the same in both systems, i.e. no swing should be required.**

The process will convert the vertex of straight segments very effectively. However, care should be taken when trying to convert non-linear segments such as curves. These may have construction entities such as TP's that no longer have the same relationship with a centre point after conversion for example. This is due to differing scale factors of points due to the projection.

On selecting the Non-projection to projection coordinates option, the Non-projection to projection coordinate conversion panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to change	source box	model	

the source of objects to be converted are selected using the data source box. For more information on the

data source box see "Data Source"

Projection projection box current projection available projections
the projection to which the data is to be converted to is specified in the projection box.

Plane easting input box
the plane easting value of the origin point.

Plane northing input box
the plane northing value of the origin point.

Select Plane Pt button
selection of the button allows the point to be picked from a view. The user selects and accepts the point and then the values are placed into the relevant input boxes.

Projection easting input box
the projection easting value of the origin point.

Projection northing input box
the projection northing value of the origin point.

Select Projection Pt button
selection of the button allows the point to be picked from a view. The user selects and accepts the point and then the values are placed into the relevant input boxes.

Target target
the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see "Data Target"

Projection to Non-Projection Coordinates

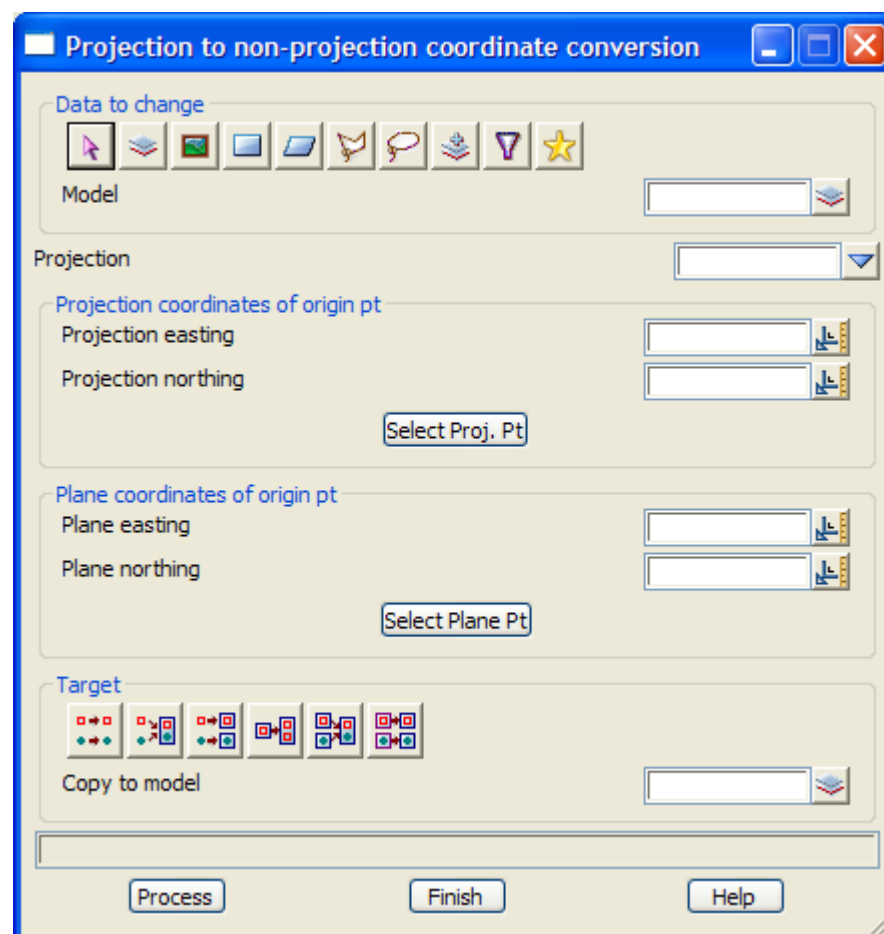

Projection_to_non_projection_coordinate_conversion

Position of option on menu: Survey =>Geodetics => Projection to non-projection coordinate conversion

The Projection to non-projection coordinate conversion is for the conversion of projection coordinates to plane coordinates. This is done by calculating a series of vectors from an origin point. The origin coordinates in both the plane and projection are known. The projection vector is calculated between the origin and other selected points. Then using the plane coordinates of the origin and the projection vector a plane vector is calculated which allows the projection coordinates of the selected points to be calculated. **The azimuth orientation should be the same in both systems, i.e. no swing should be required.**

The process will convert the vertex of straight segments very effectively. However, care should be taken when trying to convert non-linear segments such as curves. These may have construction entities such as TP's that no longer have the same relationship with a centre point after conversion for example. This is due to differing scale factors of points due to the projection.

On selecting the Projection to non-projection coordinates option, the Projection to non-projection coordinate conversion panel is displayed.

The fields and buttons used in this panel have the following functions.

the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see "Data Target"

Bearing/Distance Label

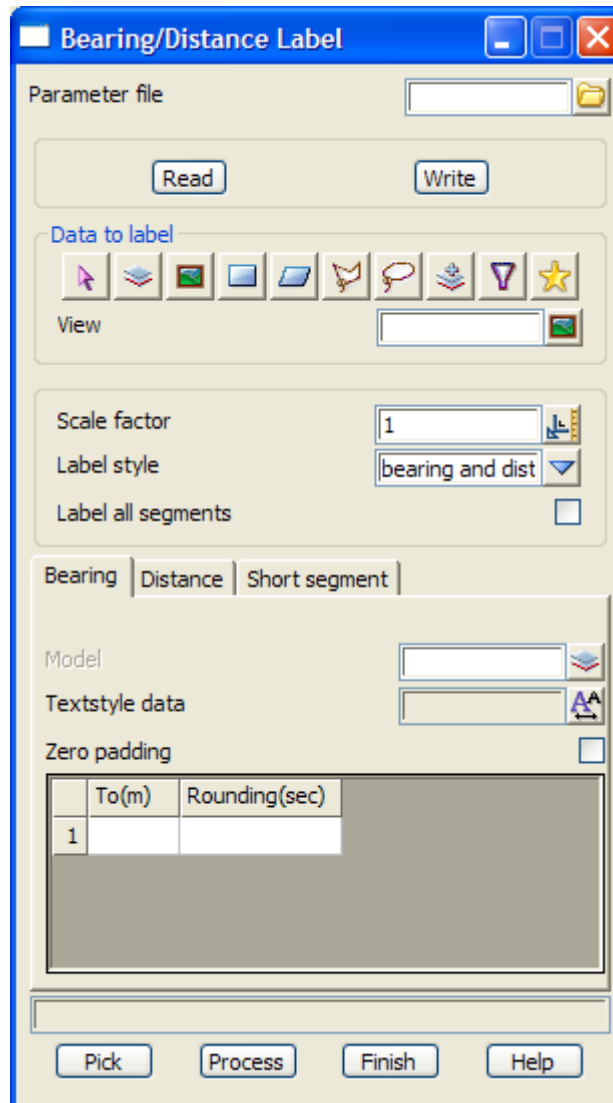

Bearing_Distance_Label

Position of option on menu: Survey =>Geodetics => Bearing/distance label

The Bearing/distance label is for the labelling of a selected string with bearing and distance information. It allows a parameter file to be setup (*.lbf) which can be written and read into the option. This file allows the setting of panel parameters such as rounding, textstyle data etc.

The pick should be with direction. This will effect the bearing that is labelled (+/-180 degrees).

On selecting the Bearing/distance label option, the **Bearing/distance label** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Parameter file	file box		*.lbf files

the parameter file can be read in which will fill in the remaining values within the panel. The user can make changes and save the choices as a different file, thus enabling a library of labelling options to be created.

Read	button
-------------	--------

if a valid parameter file is entered into the parameter file field, the user can press the read button to load

the information in the file into the panel.

Write button

if a valid parameter file name is entered into the parameter file field, the user can press the write button to save the edited panel information into a file so that it can be read in at a later date.

Scale factor input box Current Scale factor at Central meridian if set
 if a scale factor is specified, the distance values labelled will use the scale factor to compute the label distance. This scale factor will be applied to the calculated plane distance from coordinates in the following manner:

$$\text{label distance} = \text{plane distance} / \text{scale factor.}$$

Label style choice box bearing and distance bearing and distance
 bearing distance
 distance bearing

the label style.

Bearing and distance equates to having the bearing and distance justification point at the same point on the midpoint of the segment (the text justification can make the bearing bottom-middle and the distance top-middle for example to show the bearing above the line and the distance below)

Bearing distance equates to having the bearing and distance justification point along side. For example, a label may be a bearing on the left and a distance on the right

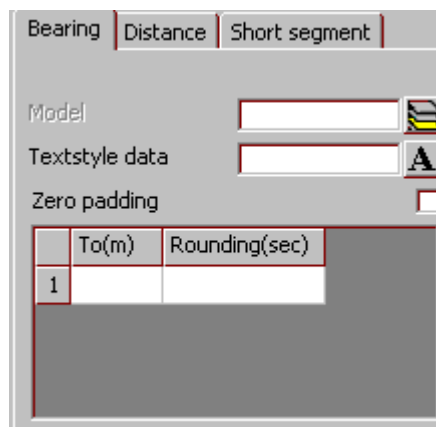

Distance bearing equates to having the distance and bearing justification point along side. For example, a label may be a distance on the left and a bearing on the right

Label all segments tick box unticked

if ticked all the segments of the selected string will be labelled.

Bearing tab

the following fields are located on the bearing tab.

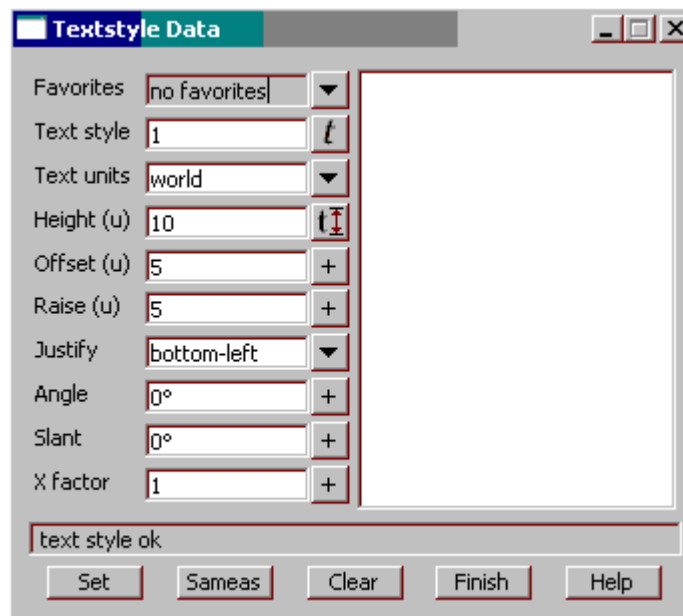

Field Description	Type	Defaults	Pop-Up
Model	model box		current models
if a valid model name is specified, the bearing text will be created in that model.			

Textstyle data textstyle box current textstyle names
on pressing the textstyle data button a list of available textdata predefined names read from the textstyles_name.4d file are displayed.

If no names exist, the user can edit the current settings by selecting the edit button and bring up the textstyle data panel. This allows for definition of textstyle, units, height offset raise etc.

The textstyle data panel enables the user to define multiple text parameters.

Zero padding tick box unticked
if ticked, the labels will have zero's inserted so that at least 2 characters exist for the minutes and second part of the label. For example, A bearing of $10^{\circ} 6' 5''$ would become $10^{\circ} 06' 05''$ with padding.

The values in the grid relate to the rounding of bearings for labelling. Many different ranges can be specified in the grid with each line representing a valid rounding range.

To(m) input box
the rounding upper range limit in meters. This value together with the rounding specified, allow the bearings between certain distance ranges to be rounded to a certain value. The first line in the grid is

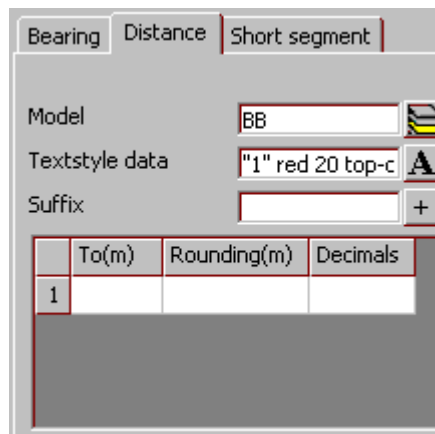

from 0 to the specified distance range. Any following lines in the grid use the **To(m)** value in the previous line for the lower limit to the **To(m)** value in that line.

Rounding(sec) input box

the rounding value given relates to the distance range. Any bearing within the distance range specified will be rounded to the value in seconds. e.g for a rounding value of 60 seconds the bearing will be rounded to the nearest minute.

Distance tab

the following fields are located on the distance tab.

Field Description

Type

Defaults

Pop-Up

Model

model box

current models

if a valid model name is specified, the distance text will be created in that model.

Textstyle data

textstyle box

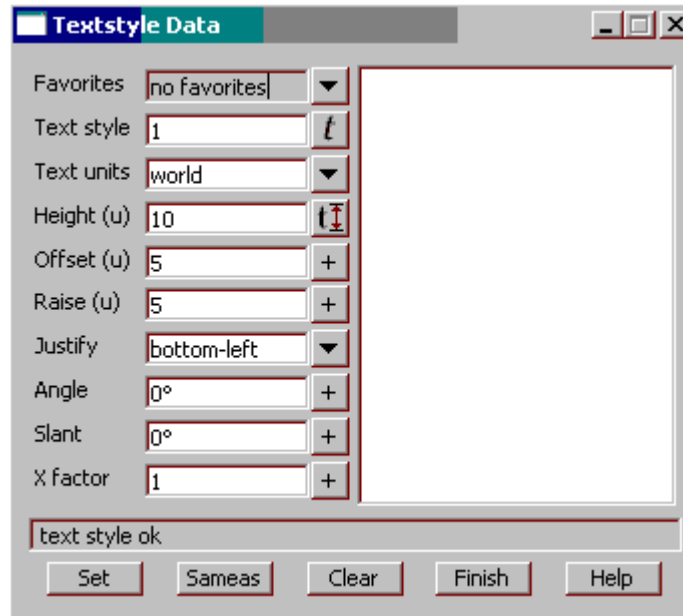

current textstyle names

on pressing the textstyle data button a list of available textdata predefined names read from the `textstyles_name.4d` file are displayed.

If no names exist, the user can edit the current settings by selecting the edit button and bring up the

textstyle data panel. This allows for definition of textstyle, units, height offset raise etc.

The textstyle data panel enables the user to define multiple text parameters.

Suffix input box

if entered, this suffix will be appended to the end of the distance label.

The values in the grid relate to the rounding of distances for labelling. Many different ranges can be specified in the grid with each line representing a valid rounding range.

To(m) input box

*the rounding upper range limit in meters. This value together with the rounding and number of decimals specified, allow the distance to be rounded to a certain value. The first line in the grid is from 0 to the specified distance range. Any following lines in the grid use the **To(m)** value in the previous line for the lower limit to the **To(m)** value in that line.*

Rounding(m) input box

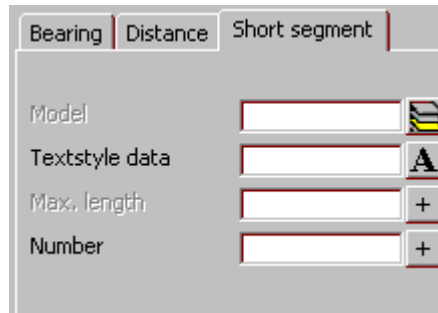

the rounding value given relates to the distance range. Any distance within the distance range specified will be rounded to the value in metres. e.g for a rounding value of 0.05 a distance of 125.261 will be rounded to a value of 125.25

Decimals input box

the number of decimal places can be specified. For a distance of 125.261, rounding of 0.05 and Decimals equal to 3, the label will be 125.250.

Short segment tab

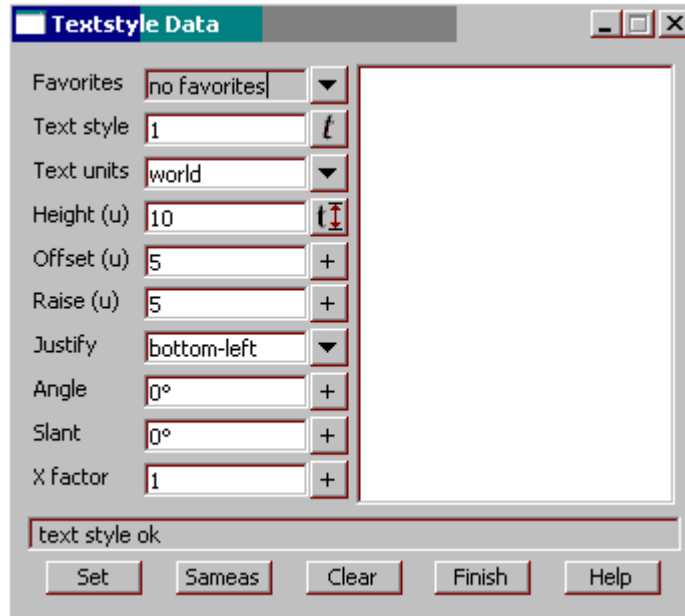

the following fields are located on the short segment tab.

Field Description	Type	Defaults	Pop-Up
Model <i>if a valid model name is specified, the short segment text will be created in that model.</i>	model box		current models
Textstyle data <i>on pressing the textstyle data button a list of available textdata predefined names read from the textstyles_name.4d file are displayed.</i>	textstyle box		current textstyle names

If no names exist, the user can edit the current settings by selecting the edit button and bring up the textstyle data panel. This allows for definition of textstyle, units, height offset raise etc.

The textstyle data panel enables the user to define multiple text parameters.

Max. length input box

if entered, this value will be compared with the selected segment distance. If the selected distance is less than this distance, the short line labelling will override any bearing and distance labelling.

Number input box

if entered, this value will be used for the short segment text.

Pick button

on selection the user can then select a segment/line from a view with direction. The direction will give the bearing direction which is usually +/- 180 degrees different. eg a segment with a bearing of 24 degrees can be labelled with a bearing of 204 by picking in a south west direction.

Projection Bearing/Distance Label

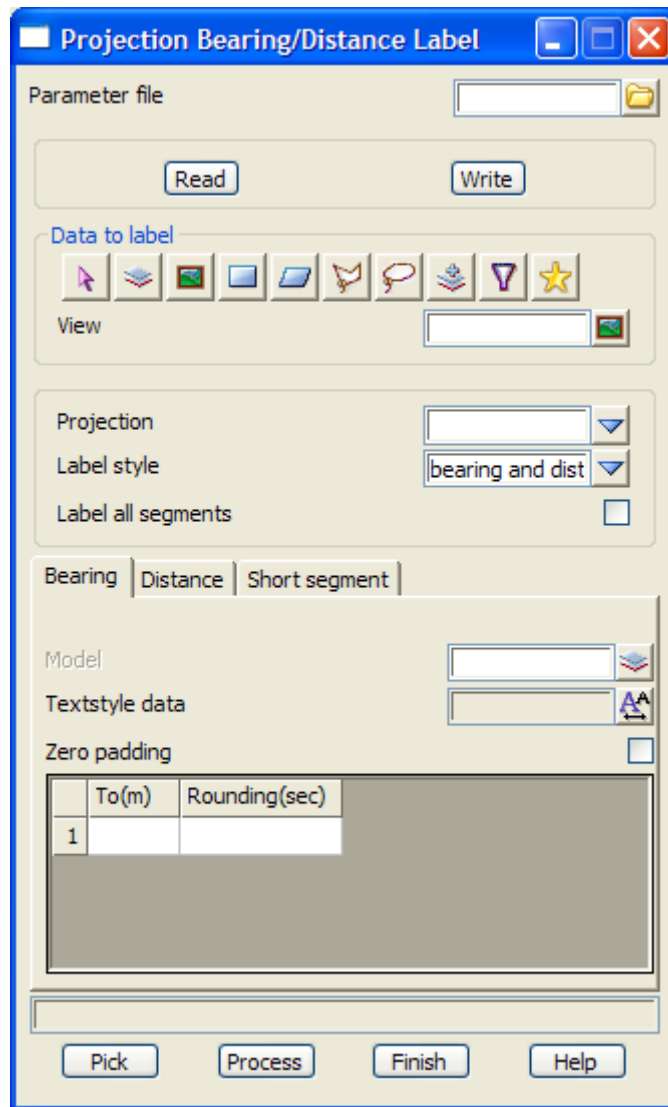

Projection_Bearing_Distance_Label

Position of option on menu: Survey =>Geodetics => Projection bearing/distance label

The Projection bearing/distance label is for the labelling of a selected string with plane bearing and ellipsoid distance information that is in terms of a selected projection. It allows a parameter file to be setup (*.lbf) which can be written and read into the option. This file allows the setting of panel parameters such as rounding, textstyle data etc.

The pick should be with direction. This will effect the bearing that is labelled (+/-180 degrees of actual direction).

On selecting the Projection bearing/distance label option, the **Projection bearing/distance label** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Parameter file	file box		*.lbf files

Geodetic reporting

Geodetic_Reporting

Position of option on menu: Survey =>Geodetics => Geodetic reporting

The Geodetic reporting option is for the reporting of selected data (projection coordinates) in terms of geodetic positions and variables. The user can choose from a number of different reporting options including, point scale factor, Longitude and latitude, point ids etc.

On selecting the Geodetic reporting option, the **Geodetic reporting** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data to report	source box	model	
-----------------------	------------	-------	--

the source of objects to be reported are selected using the data source box. For more information on the data source box see "Data Source" . The selected data must be in terms of the selected map projection.coordinate system.

Projection	choice	current projection	available projections
-------------------	--------	--------------------	-----------------------

the projection of the data to be reported.

N value interpolation method	choice box	currently set method	Available n value methods
-------------------------------------	------------	----------------------	---------------------------

the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are defined in the project n value settings. For more information on the n value settings see the section "N values"

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the reporting only. The original z value for the point will remain unchanged

String name	tick box		
--------------------	----------	--	--

if selected, any valid string names will be shown in the report.

- Point Ids** tick box
if selected, any valid point ids will be shown in the report.
- Vertex Numbers** tick box
if selected, vertex numbers will be shown in the report.
- X,Y coordinates** tick box ticked
if ticked, the coordinates of the selected data will be reported.
- Z coord** tick box
if selected, any valid z values will be shown in the report.
- N values** tick box
if ticked, the N value calculated for the given point will be reported (if valid).
- Ellipsoid heights** tick box
if selected, the calculated ellipsoid height will be reported. If no N values are calculated, this will be the same as the Z value.
- Long, Lat** tick box
if selected, the calculated longitude and latitude will be reported.
- Point scale** tick box
if selected, the point scale for each point will be reported.
- Combined point scale** tick box
if selected, the combined point scale for each point will be reported. This combined scale factor is the product of the point scale factor and a height scale factor. The height scale factor is computed from the ellipsoid height of the point.
- Text** tick box
if selected, any valid text values will be shown in the report.
- Report file** input *.rpt
name of the file to report to.

Solar Reduction

Solar_Observations

Position of option on menu: Survey =>Geodetics => Solar reduction

The Solar reduction option allows the reduction of observations to the sun by the hour angle method. The user can specify either limb or the centre of the sun, and a number of observations can be processed together. **The option does not require almanac details as these are processed internally using algorithms supplied by the US naval observatory.** These algorithms will produce accuracy in the order of 2 arc seconds in azimuth for the period AD1800 - 2050

On selecting the Solar reduction option, the **Solar Observations** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File <i>a filename can be specified for reading or writing a file.</i>	file box		*.ast files
Read <i>if a valid file exists, the file contents can be loaded into the panel.</i>	button		
Write <i>if a valid name is specified and the valid values are entered into all of the fields, the user can write the input data to a file.</i>	button		
Projection <i>a projection can be specified so that a grid convergence value can be computed. This value will be used to compute the grid or projection bearing to the RO. If left blank, only the True azimuth will be reported.</i>	choice	current projection	available projections
Report file	input		*.rpt

name of the file to report to.

Origin station input

name of the origin station

RO station input

name of the reference object station

Origin longitude input

the observation station's longitude should be specified in DMS format.

Origin latitude input

the observation station's latitude should be specified in DMS format.

Date date box current system date

the date of the observations as at the observers position should be entered. This can be by direct entry into the date field or by selecting the day, month, year from a date pop-up panel. The user can scroll through different months by selecting the arrow buttons on the pop-up date panel.

Time zone time zone box major time zones

a valid time zone for the observers position and local time should be selected from the pop-up list.

Timing corr.(hh.mmss) input

the correction to apply for any timing error including stopwatch corrections should be entered. The value should be in a hours, minutes seconds in hp format.

GRID VALUES: input

	Local Time	Horiz obs to RO	Horiz obs to Sun	Limb of sun	Az to Cen. SUN	Az to RO	Conv. angle	Grid brg to RO
1								

Local time input

the local time of the observation specified in 24 hour time in HMS. eg. 18.121002

Horiz obs to RO input

the horizontal angle (bearing) observed to the RO for the set of measurements. A set in this case includes a pointing to the RO and sun (at a certain time) in the same face.

Horiz obs to SUN input

the horizontal angle (bearing) observed to the Sun for the set of measurements.(The observation should not be corrected for the suns semi diameter as this is done internally by the reduction process)

If observation s are made on both faces, a separate line should be entered for each face. e.g Face 1 to RO may be 0.0000 and the face 1 to the sun may be 50.0000 which would be on the same line, then the observer may change face to face 2 and observe to the sun again followed by the RO. The face 2 observations should appear on the next line eg 180.0004 230.0110.

Limb of sun choice box
 Centre
 Left limb
 Right limb

the limb of the sun observed should be specified. This enables the suns semi diameter correction to be applied. This also allows the observations to be read in any order.

Az to cen. SUN output

the true azimuth to the sun will be displayed in this field on successful reduction of the observations.

Az to RO output

the true azimuth to the RO will be displayed in this field on successful reduction of the observations.

Conv. angle output

the convergence angle at the observation point will be displayed in this field if a valid projection is specified and there is a successful reduction of the observations.

Grid brg to RO output

the grid bearing to the RO will be displayed in this field if a valid convergence angle is calculated and there is a successful reduction of the observations. The grid bearing is calculated by:

$$\mathbf{Grid\ brg} = \mathbf{True\ azimuth} + \mathbf{convergence}$$

The fields and buttons used in this panel below the grid have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Average RO azimuth	output		
---------------------------	--------	--	--

if there is as successful reduction, the average RO azimuth value will be reported in this field.

Average RO grid bearing	output		
--------------------------------	--------	--	--

if there is as successful reduction, and the projection given, the average RO grid bearing value will be reported in this field.

Standard deviation in the mean	output		
---------------------------------------	--------	--	--

this is a statistical measure of the reduced observations.

Star Reduction

Star_Observations

Position of option on menu: Survey =>Geodetics => Star reduction

The Star reduction option allows the reduction of observations to the nominated star by the hour angle method. A number of observations can be processed together. **The option does not require almanac details as these are processed internally using algorithms supplied by the US naval observatory.** These algorithms will produce accuracy in the order of 2 arc seconds in azimuth for the period AD1800 - 2050

On selecting the Star reduction option, the **Star Observations** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File <i>a filename can be specified for reading or writing a file.</i>	file box		*.ast files
Read <i>if a valid file exists, the file contents can be loaded into the panel.</i>	button		
Write <i>if a valid name is specified and the valid values are entered into all of the fields, the user can write the input data to a file.</i>	button		
Star id by	button	FK5 number	General name Constellation Bayer/ Flamsteed number FK5 number SAO number

the star can be identified by a number of different means. The stars available are based on the Fifth Fundamental Catalogue(FK5) catalogue. Cross matching of id's are not possible in some instances. e.g A star may have no known general name.

The selection of an id method will force the changing of the id list so the particular star can be selected.

Star id choice 1st star id in list available id's for that type
the star id can be selected from the list.

Report file input *.rpt
name of the file to report to.

Origin station input
name of the origin station

RO station input
name of the reference object station

Origin longitude input
the observation station's longitude should be specified in DMS format.

Origin latitude input
the observation station's latitude should be specified in DMS format.

Date date box current system date
the date of the observations as at the observers position should be entered. This can be by direct entry into the date field or by selecting the day, month, year from a date pop-up panel. The user can scroll through different months by selecting the arrow buttons on the pop-up date panel.

Time zone time zone box major time zones
a valid time zone for the observers position and local time should be selected from the pop-up list.

Timing corr.(hh.mmss) input
the correction to apply for any timing error including stopwatch corrections should be entered. The value should be in a hours, minutes seconds in hp format.

GRID VALUES: input

	Local Time	Horiz obs to RO	Horiz obs to Star	Az to Star	Az to RO	Conv. angle	Grid brg to RO
1							

Local time input
the local time of the observation specified in 24 hour time in HMS. eg. 18.121002

Horiz obs to RO input
the horizontal angle (bearing) observed to the RO for the set of measurements. A set in this case includes a pointing to the RO and star (at a certain time) in the same face.

If observation s are made on both faces, a separate line should be entered for each face. e.g Face 1 to RO may be 0.0000 and the face 1 to the star may be 50.0000 which would be on the same line, then the observer may change face to face 2 and observe to the star again followed by the RO. The face 2 observations should appear on the next line eg 180.0004 230.0110.

Horiz obs to Star input

Az to Star output

the true azimuth to the sun will be displayed in this field on successful reduction of the observations.

Az to RO output

the true azimuth to the RO will be displayed in this field on successful reduction of the observations.

Conv. angle output

the convergence angle at the observation point will be displayed in this field if a valid projection is specified and there is a successful reduction of the observations.

Grid brg to RO output

the grid bearing to the RO will be displayed in this field if a valid convergence angle is calculated and there is a successful reduction of the observations. The grid bearing is calculated by:

$$\mathbf{Grid\ brg} = \mathbf{True\ azimuth} + \mathbf{convergence}$$

The fields and buttons used in this panel below the grid have the following functions.

Field Description	Type	Defaults	Pop-Up
Average RO azimuth	output		
<i>if there is as successful reduction, the average RO azimuth value will be reported in this field.</i>			
Average RO grid bearing	output		
<i>if there is as successful reduction, and the projection given, the average RO grid bearing value will be reported in this field.</i>			
Standard deviation in the mean	output		
<i>this is a statistical measure of the reduced observations.</i>			

Traverse Spreadsheet

traverse_spreadsheet

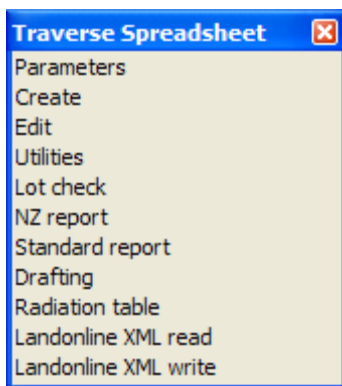

Position of menu: Survey =>Traverse spreadsheet

The **Traverse Spreadsheet** options allow the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop). Traverse Spreadsheet will often be abbreviated as TSS.

There are two types of traverse spreadsheets (TSS) - Plane and Projection.

For the Plane TSS, entered distances are multiplied by the scale factor to give final distances and hence calculate co-ordinates, whereas for the Projection TSS, ellipsoid distances are entered and 12d Model calculates the correct co-ordinate position using full projection calculations.

The Traverse spreadsheet walk-right menu contains the traverse spreadsheet options.

Setting parameters for the traverse spreadsheet option
 Create a TSS - Plane or Projection
 Edit an existing TSS
 Utilities for use with existing TSS's
 Run lot checks on typed bearing/distance data
 NZ traverse spreadsheet report
 Standard traverse spreadsheet report
 Traverse spreadsheet drafting
 Creating radiation tables from a TSS
 Reading LINZ XML data
 Writing LINZ XML data

traverse_spreadsheet_parameters

Position of option on menu: Survey =>Parameters

The Traverse Spreadsheet Parameters sets the parameters for defining the *look and feel* of the TSS create and edit panels, reports and drafting.

Selecting Parameters brings up the **Traverse Spreadsheet Parameters** panel:

TSS Create

create_traverse_spreadsheet

Position of option on menu: Survey =>Traverse spreadsheet =>Create

A traverse spreadsheet (TSS) can either use a constant scale factor or a cartographic projection to define the relationship between bearings/distances and the (x,y) co-ordinates.

The Traverse Spreadsheet Create option allows the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop).

Selecting Traverse Spreadsheet Create brings up the **Create Traverse Spreadsheet** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Projection spreadsheet	radio button		
<i>if selected then the Projection field must be filled in.</i>			

Projection	projection box	first projection	project projections
<i>the cartographic projection used in the TSS. For more information on projections go to "Projections" in the chapter "Projects". This is a Projection TSS.</i>			

Scaled spreadsheet	radio button		
---------------------------	--------------	--	--

if selected then the Scale factor field must be filled in.

Scale factor real box

the constant scale factor used in the TSS. This is a Plane TSS.

Details section

Spreadsheet name text box

the name for the TSS

File name text box

*name of the *.tf file to store all the TSS data in. The TSS can be brought back for editing by giving this filename.*

Create button

*create a new traverse spreadsheet using the parameters entered in the above panel field. The appropriate editor (either for a **Projection Traverse Spreadsheet** or a **Plane Traverse Spreadsheet** panel) is then brought up for the TSS data to be entered and/or edited.*

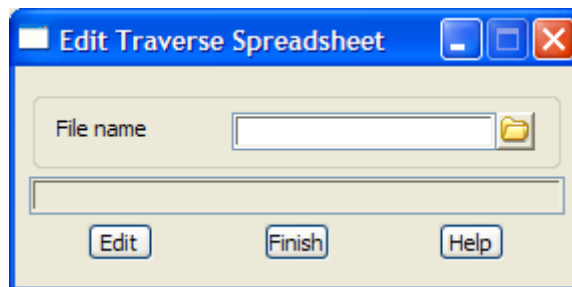

TSS Edit

[edit_traverse_spreadsheet](#)

Position of option on menu: Survey =>Traverse spreadsheet =>Edit

The traverse spreadsheet editor reads in an existing TSS file and loads the information into either the **Projection Traverse Spreadsheet** or the **Plane Traverse Spreadsheet** panel.

Selecting Traverse Spreadsheet Edit brings up the **Edit Traverse Spreadsheet** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File name <i>name of the file containing the traverse spreadsheet information to be edited.</i>	file box		*.ts files

Edit button
*read the information in the traverse spreadsheet file and load it into either a **Projection Traverse Spreadsheet** or a **Plane Traverse Spreadsheet** panel.*

For entering/editing either a Projection TSS or Plane TT, please go to the section "Traverse Spreadsheets"

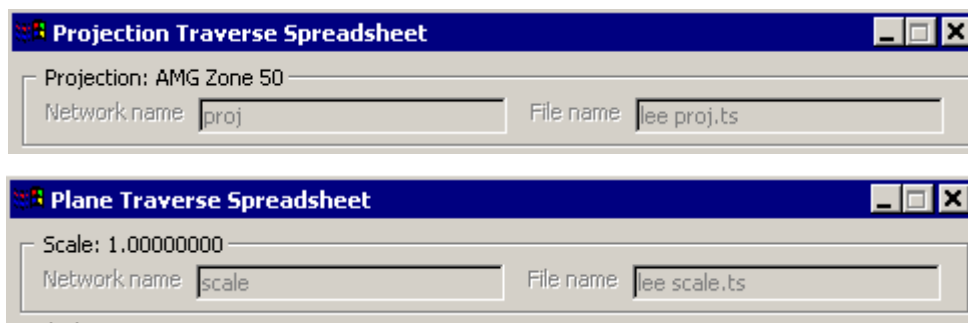

Traverse Spreadsheets

[plane_traverse_spreadsheet](#)

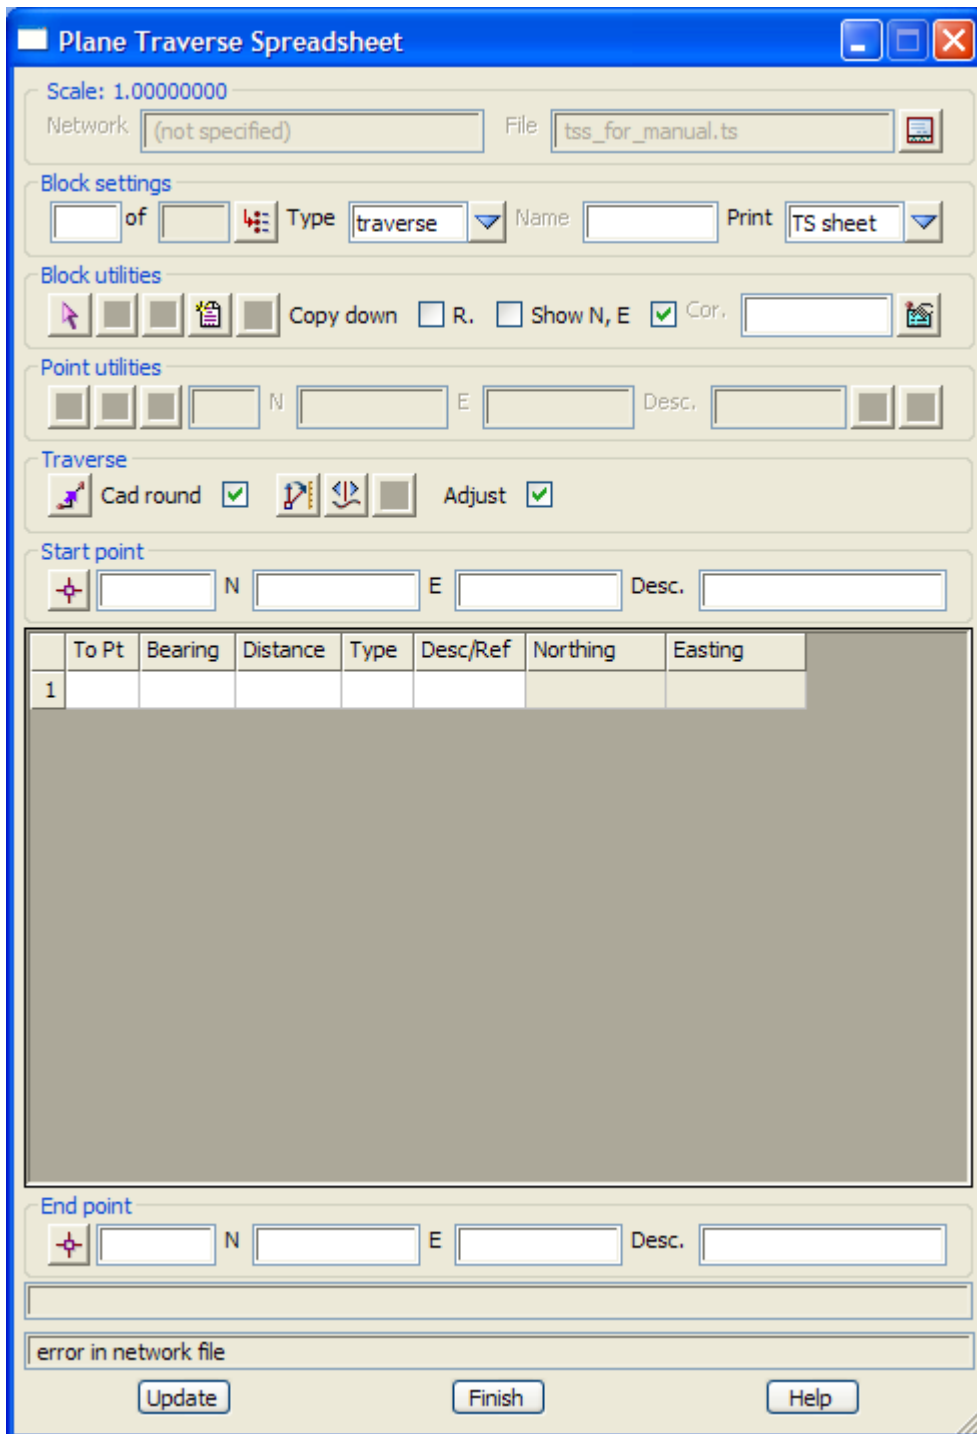

[projection_traverse_spreadsheet](#)

The Projection and Plane TSS panels allows the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop).

The two panels are very similar and only the top section is different. The Projection Traverse Spreadsheet requires a Projection rather than a Scale factor.

For more information about terminology used in the projection option, see the Appendix “Geodetics Summary” .

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Network name display only

the entire spreadsheet can be given a name for identification purposes. This was defined when the TSS was created and can only be changed using the TSS Utilities option.

File name display only

the file name containing the TSS information. This was defined when the TSS was created and can only be changed using the TSS Utilities option.

The only visible difference between the Plane and Projections Traverse Spreadsheet panel is that the Scale or Projection is given at the top of the panel. All the panel fields are the same.

Of course the calculations are different for the two types of spreadsheets. For the Plane TSS, entered distances are multiplied by the scale factor to give final distances and hence calculated co-ordinates, whereas for the Projection TSS, ellipsoid distances are entered and 12d Model calculates the correct co-ordinate position using full projection calculations.

Block Settings

Position input

the order of a block within the spreadsheet can be specified by nominating the block position. Numbering within the list starts at 1. This parameter is used for inserting new blocks into the list. If a user nominates to insert in position 5 and there is only 2 blocks already defined, the block will be placed at the end of the list (i.e. position 3)

Count input

the number of blocks within the spreadsheet.

Type choice traverse traverse, radiation, radiation backsight, parcel, irregular trace, balance

the type of a block within the spreadsheet can be specified by nominating the block type.

*The **traverse** block is for the entry of loop and non-loop traverses starting and ending at points with known coordinate values.*

For a hanging traverse, i.e. a traverse that does not close onto a known point, the data can be entered by entering a 0 (zero) in the point id field of the grid control, as well as the end point - point id field.

*The **radiation** block consists of a number of radiations or **side shots** from a point with known coordinates. This point may be defined in a previous traverse block or it may be from a known point. A valid coordinate must exist for the radiation start point for the radiation block to be used.*

*A **radiation backsight** block is the same as a radiation block except that the value set to the backsight is included. After adjustment of previous blocks, the coordinates of setup and backsight points often change. This will introduce swing errors into calculations if not accounted for. By entering the backsight value as set in the field, a comparison is made between what was set and the adjusted value. The difference is then applied to the radiations in the block to reflect the corrected angle measurements.*

XXXX - need 12d NZ documentation on TSS

Name input

a spreadsheet can consist of a number of different blocks. For each block, a name can be given which can help identify a particular traverse/radiation block within the spreadsheet.

Flag input

the adjustment mode of the current block. The mode is either adjusted or unadjust. All blocks are set to unadjusted on reading of a file, and the user specifies which blocks are to be adjusted.

Prev button

allows the navigation to the previous block in the list.

Next	button		
	<i>allows the navigation to the next block in the list.</i>		
New	button		
	<i>allows for the definition and entry of a new block in the list.</i>		
Update	button		
	<i>allows for the updating of entries when changes have been made. For example, if a distance measurement were to be changed, pushing the update button will ensure the new value will be used in further calculations and adjustments</i>		
Insert	button		
	<i>allows for the insertion of a block into the list in the position defined by the Block position entry.</i>		
Append	button		
	<i>allows for the insertion of a block at the end of the list.</i>		
Delete	button		
	<i>allows for the deletion of the currently displayed block.</i>		
Show EN	tick box	ticked	
	<i>if ticked the easting and northing columns will be shown in the grid. If unticked the columns will not be shown.</i>		
Copy b dsc	tick box	ticked	
	<i>if ticked the bearing and description from the previous line in the grid will automatically be copied down to the next entered line.</i>		
Pick string	button		
	<i>allows for the loading of the current block by selecting a string from the current view.</i>		
Adjustment method	choice		bowditch, compass, transit, least square
	<i>method of adjustment.</i>		
Loop	tick box	unticked	
	<i>For loop traverses the tick box should be checked. This assumes that the start and end points are the same.</i>		

The fields in this panel define the start and end point details. If the **loop** option is chosen the end point details are assumed to be the same as the start point In this case the end point group is disabled.

Least square tab

The fields in this panel define the values to be used for least square adjustments.

Field Description	Type	Defaults	Pop-Up
Angular std (sec).			
	<i>The standard deviation of a single angular measurement in seconds of arc.</i>		
Linear std (mm)			
	<i>this value is defined by the standard deviation of a single distance measurement (e.g. 5 mm)</i>		
ppm			
	<i>this value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)</i>		
Iterations	input box	10	

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

Coords differ input box 0.0001

the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

variance increase tick box ticked

the calculation of the adjustment can stopped when the variance between successive calculations increases

The fields in start point group specify the start point parameters

Start point button/input

the start point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the start point is to be entered manually, the point id should be entered into the field adjacent to the start point button.

N input

the start point's northing value.

E input

the start point's easting value.

Desc input

the start point's description.

the grid control values can be entered using valid inputs into the various fields.

To Point. *The point id of the next traverse station.*

Bearing(dms). *The bearing of the traverse line.*

Distance. *The distance of the traverse line.*

Point Desc. *The description of the traverse point*

Easting *The easting coordinate of the traverse point. NB. This field is only displayed when the calc or adjust buttons are selected.*

Northing *The northing coordinate of the traverse point. NB. This field is only displayed when the calc or adjust buttons are selected.*

The fields in end point group specify the end point parameters

end point button/input

the end point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the end point is to be entered manually, the point id should be entered into the field adjacent to the end point button.

N input

the end point's northing value.

E input

the end point's easting value.

Desc input
the end point's description.

the misclose line near the bottom of the panel have the following functions.

Bearing input box
the closing bearing for the traverses.

Distance input box
the closing distance of the traverse

Delta east input box
the closing vector's delta east component

Delta east input box
the closing vector's delta east component

Misclosure input box
the ratio of the closing distance to the total traverse distance.

the buttons at the bottom of the panel have the following function.

Calc button
*the calc button is used to calculate coordinate values based on the information input into the grid control and the points tab. The block has to be inserted or appended into the list **before** this can be done.*

Adjust button
the adjustment of the current block can be done after the calc stage has been reached. This will use the method of adjustment as stipulated by the user.

Adjust All button
the adjustment of **all** of the blocks in the list can be done after the calc stage has been reached in each of the individual blocks. This will use the method of adjustment as stipulated by the user.

Save button
*saves the current data in the panel to the TSS file (displayed in the **file name** box).*

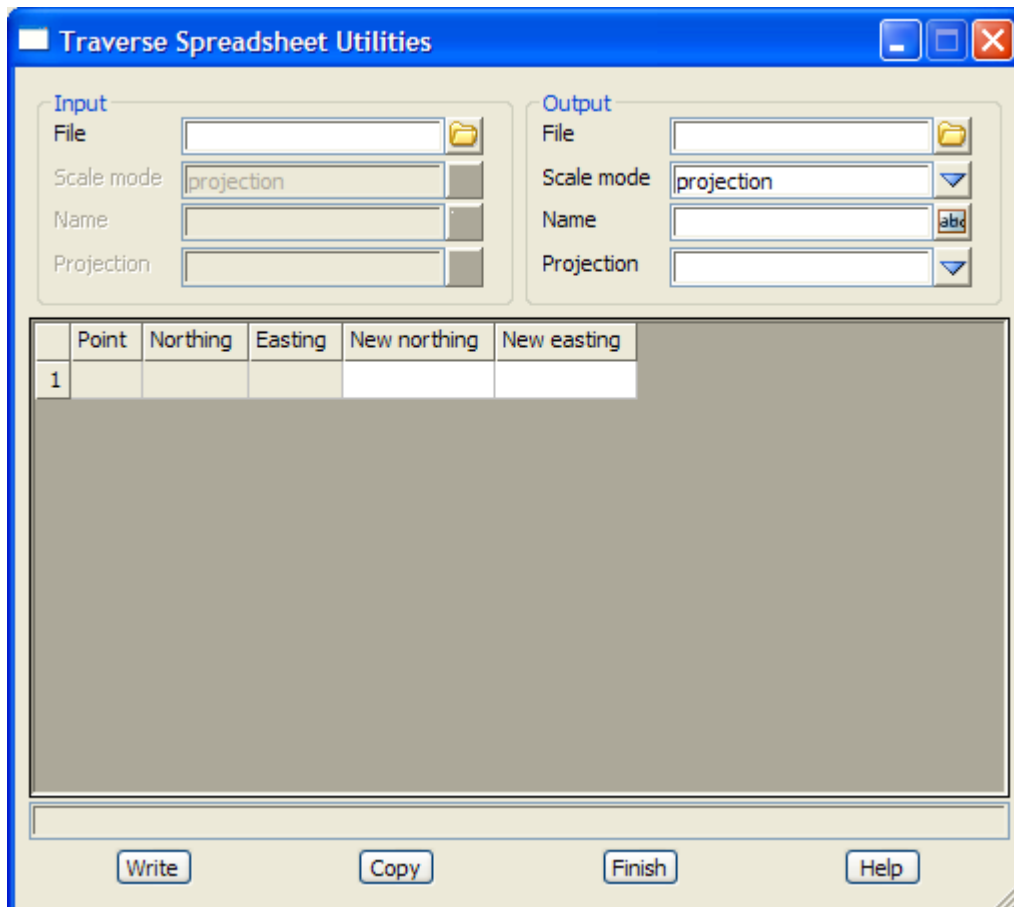

TSS Utilities

traverse_spreadsheet_utilities

Position of option on menu: Survey =>Traverse spreadsheet =>Utilities

The traverse spreadsheet utilities are used to change the file containing a TSS, change the name (TSS), change between Plane (constant scale) or Projection type,

Selecting Traverse Spreadsheet Utilities brings up the **Traverse Spreadsheet Utilities** panel:

Lot Check

lot_check

Position of option on menu: Survey => Traverse spreadsheet => Lot check

The **Lot check** option allows the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. This option can be used to enter existing plan dimensions to check area calculations as well as ensuring lots are closed to prescribed limits.

Selecting Lot check brings up the **Lot Check** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

The scale and datum fields are the only difference between the plane and datum lot check panels.

Scale factor	input	project scale factor
---------------------	-------	----------------------

a scale factor can be defined which will be applied to any entered distances. Final distances used in calculations are derived by multiplying the entered distance by the scale factor.

Block count	input	
	<i>the number of blocks within the spreadsheet.</i>	
Desc.	input	
	<i>a spreadsheet can consist of a number of different blocks. For each block, a block description can be given which can help identify a particular traverse/radiation block within the spreadsheet.</i>	
Block flag	input	
	<i>the adjustment mode of the current block. The mode is either adjusted or unadjust. All blocks are set to unadjusted on reading of a file, and the user specifies which blocks are to be adjusted.</i>	
Prev	button	
	<i>allows the navigation to the previous block in the list.</i>	
Next	button	
	<i>allows the navigation to the next block in the list.</i>	
New	button	
	<i>allows for the definition and entry of a new block in the list.</i>	
Update	button	
	<i>allows for the updating of entries when changes have been made. For example, if a distance measurement were to be changed, pushing the update button will ensure the new value will be used in further calculations and adjustments</i>	
Insert	button	
	<i>allows for the insertion of a block into the list in the position defined by the Block position entry.</i>	
Append	button	
	<i>allows for the insertion of a block at the end of the list.</i>	
Delete	button	
	<i>allows for the deletion of the currently displayed block.</i>	
File name	input box	*.ts
	<i>a file name can be defined which will allow for the reading of an existing file and for defining a new file name for reading in the future.</i>	
Read	button	
	<i>the read button allows for the loading of an existing file as specified by the file name box.</i>	
Write	button	
	<i>the write button allows for the saving of the current file as specified in the file name box.</i>	
Pick string	button	
	<i>allows for the loading of the current block by selecting a string from the current view.</i>	
Adjust method	choice	bowditch, compass, transit, least square, none
	<i>method of adjustment.</i>	
Show EN	checkbox	ticked
	<i>if ticked the easting and northing columns will be shown in the grid. If unticked the columns will not</i>	

be shown.

Copy b dsc

if ticked the bearing and description from the previous line in the grid will automatically be copied down to the next entered line.

The fields in this panel define the start and end point details. If the **loop** option is chosen the end point details are assumed to be the same as the start point In this case the end point group is disabled.

Least square tab

The fields in this panel define the values to be used for least square adjustments.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Angular std (sec).

The standard deviation of a single angular measurement in seconds of arc.

Linear std (mm)

this value is defined by the standard deviation of a single distance measurement (e.g. 5 mm)

ppm

this value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)

Iterations 10

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

Coords differ 0.0001

the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

variance increase

the calculation of the adjustment can stopped when the variance between successive calculations increases

The fields in start point group specify the start point parameters

Start point /input

the start point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the start point is to be entered manually, the point id should be entered into the field adjacent to the start point button.

N

the start point's northing value.

E

the start point's easting value.

Desc

the start point's description.

the grid control values can be entered using valid inputs into the various fields.

To Point. The point id of the next traverse station.

Bearing(dms). The bearing of the traverse line.

Distance. The distance of the traverse line.

Point Desc. The description of the traverse point

Easting The easting coordinate of the traverse point. **NB.** This field is only displayed when the calc or adjust buttons are selected.

Northing The northing coordinate of the traverse point. **NB.** This field is only displayed when the calc or adjust buttons are selected.

The fields in end point group specify the end point parameters

end point button/input

the end point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the end point is to be entered manually, the point id should be entered into the field adjacent to the end point button.

N input

the end point's northing value.

E input

the end point's easting value.

Desc input

the end point's description.

the misclose line near the bottom of the panel have the following functions.

Bearing input box

the closing bearing for the traverses.

Distance input box

the closing distance of the traverse

Delta east input box

the closing vector's delta east component

Delta east input box

the closing vector's delta east component

Misclosure input box

the ratio of the closing distance to the total traverse distance.

the buttons at the bottom of the panel have the following function.

Calc button

the calc button is used to calculate coordinate values based on the information input into the grid control and the points tab. The block has to be inserted or appended into the list **before** this can be done.

Adjust button

the adjustment of the current block can be done after the calc stage has been reached. This will use the method of adjustment as stipulated by the user.

Adjust All button

the adjustment of **all** of the blocks in the list can be done after the calc stage has been reached in each of the individual blocks. This will use the method of adjustment as stipulated by the user.

Report button

on selecting this button the NZ traverse spreadsheet report panel appears.

NZ TSS Report

nz_traverse_spreadsheet_report

Position of option on menu: Survey =>Traverse spreadsheet =>NZ report

The NZ report option allows the user to define the report header etc. so as to produce a spreadsheet report which can be printed to a pre-printed NZ sheet.

Selecting NZ report brings up the NZ Traverse Spreadsheet Report panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input format	choice box	*.ts	*.ts, *.lch

either a TSS file (*.ts) or a lot check file (*.lch) can be reported.

Input file	input box		*.ts
	name of the TSS or lot check file.		
Print	choice box	TS sheet	TS sheet, Calc sheet, Other
	either TS sheet.		
Report parcels	tick box		
	<i>If tick, parcel block types are included in the report.</i>		

Traverse Title section

Traverses of, line 2, line 3, line 4

*The title of the traverses can be entered into the **traverses of** box as well as the following **line 2, line 3** and **line 4** input boxes. Due to the limitation of space on the pre-printed forms supplied by LINZ the number of characters should be limited to 20 characters (inclusive of space characters) for the **traverse of line** and 33 characters (inclusive of space characters) for **lines 2 to 4**.*

*The input into the **traverses for line** is compulsory but for **lines 2 to 4** it is optional.*

Datum Information section

NZ Circuit	choice box	existing NZ circuits
	the circuit in which the current spreadsheet file relates to should be specified.	
Projection	choice box	Geodetic 1949 Geodetic 2000 Old Cadastral

the appropriate NZ geodetic datum should be selected.

Coords in terms of section

these parameters are only required to be entered for the Old cadastral datum case. For other datums, the values are automatically updated.

Point name	input box
	the name of the origin point should be entered.
Northing	input box
	the northing coordinate of the origin point should be entered.
Easting	input box
	the easting coordinate of the origin point should be entered.

Other Details section

Field book	input box	
	the name of the field book used.	
Plan no	input box	
	the plan no to be created if known.	
NZ Land District	choice box	Existing NZ land districts
	the appropriate NZ land district should be selected.	
Report file	files box	*.rpt files
	<i>file name for the report.</i>	

Report file button
a report using the nominated file name is created.

Standard TSS Report

standard_spreadsheet_traverse_report

Position of option on menu: Survey =>Traverse spreadsheet =>Standard report

The **Standard report** allows the user to define the report header etc. so as to produce a standard TSS report which can be printed, saved or edited.

Selecting **Standard report** brings up the **Standard Traverse Spreadsheet Report** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input format	choice box	*.ts	*.ts, *.lch
either a TSS file (*.ts) or a lot check file (*.lch) can be reported.			
Input file	input box		*.ts
name of the TSS or lot check file.			
Print	choice box	TS sheet	TS sheet, Calc sheet, Other
either TS sheet.			
Report parcels	tick box		
<i>If tick, parcel block types are included in the report.</i>			

Traverse Title section

Job id	text input box
text to use as the Job id.	

Traverses of, line 2, line 3, line 4

The title of the traverses can be entered into the **traverses of** box as well as the following **line 2, line 3** and **line 4** input boxes. Due to the limitation of space on the pre-printed forms supplied by LINZ the number of characters should be limited to 20 characters (inclusive of space characters) for the **traverse of line** and 33 characters (inclusive of space characters) for **lines 2 to 4**.

The input into the **traverses for line** is compulsory but for **lines 2 to 4** it is optional.

Surveyor id text input box

text to use as the Surveyor id.

Computer operator text input box

text to use as the Computer operator.

Report file files box *.rpt files
file name for the report.

Report file button
a report using the nominated file name is created.

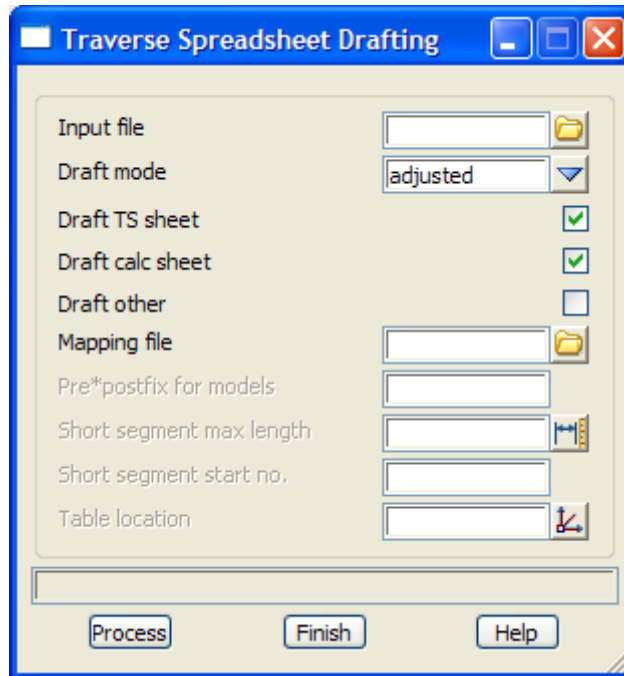

TSS Drafting

traverse_spreadsheet_drafting

Position of option on menu: Survey => Traverse spreadsheet=> Drafting

The Traverse spreadsheet **drafting** produce models, linestyles and colours for data within the TSS.

Selecting **Drafting** brings up the Traverse Spreadsheet Drafting panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file <i>name of the existing spreadsheet file to create drafting for.</i>	file box		*.ts
Draft mode <i>the draft mode will determine if adjusted strings are used for drafting or if the unadjusted values(initial) values are used</i>	choice box	adjusted	adjusted initial
Draft TS sheet <i>if tick,</i>	tick box		
Draft calc sheet <i>if tick,</i>	tick box		
Draft other <i>if tick,</i>	tick box		
Mapping file <i>mapping file to define the drafting</i>	mapping file box		*.mf
Pre*postfix for models <i>pre and post text to add to the model names given in the mapping file</i>	text input box		

Short segment max length real input box

maximum size for a segment to be considered a short segment. Short segments are labelled with a number and the details placed in a table.

Short segment start no. integer input box

start number for any short segments.

Table location xyz box

world position for the short segment table.

Process button

process the traverse spreadsheet and create the drafting and short segment table.

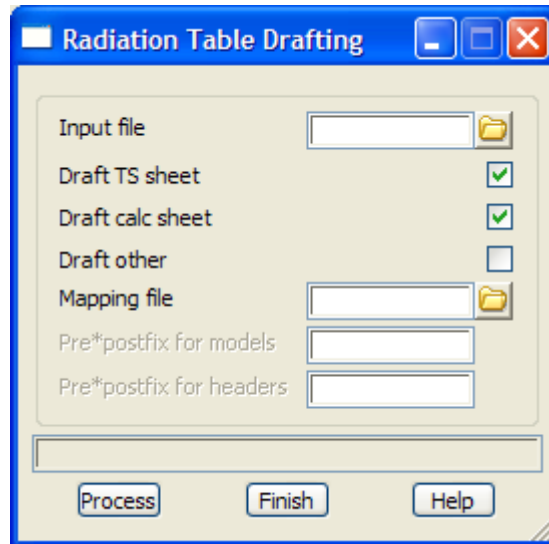

TSS Radiation Table Drafting

radiation_table_drafting

Position of option on menu: Survey => Traverse spreadsheet=> Radiation table

The Traverse spreadsheet radiation table option produces radiation tables for the radiation data in a traverse spreadsheet.

Selecting Radiation table brings up the Radiation Table Drafting panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file name of the existing spreadsheet file to create radiation tables for.	file box		*.ts
Draft TS sheet <i>if tick,</i>	tick box		
Draft calc sheet <i>if tick,</i>	tick box		
Draft other <i>if tick,</i>	tick box		
Mapping file <i>mapping file to define the drafting</i>	mapping file box		*.mf
Pre*postfix for models <i>pre and post text to add to the model names given in the mapping file</i>	text input box		
Pre*postfix for headers <i>pre and post text to add to the header names for the radiation tables.</i>	text input box		
Process <i>process the traverse spreadsheet and create the radiation tables.</i>	button		

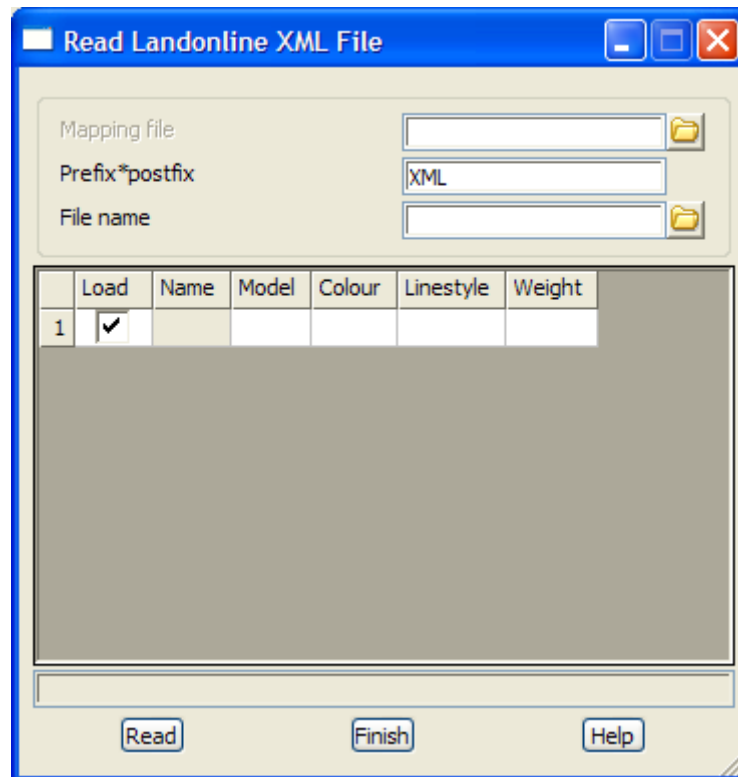

Landonline XML Read

`read_Landonline_xml_file`

Position of menu: Survey => Traverse spreadsheet => Landonline XML read

The Landonline XML Read option reads in data in the XML format for Landonline New Zealand.

Selecting Landonline XML read brings up the Read Landonline XML File panel

Documentation is available from *12d NZ Ltd.*

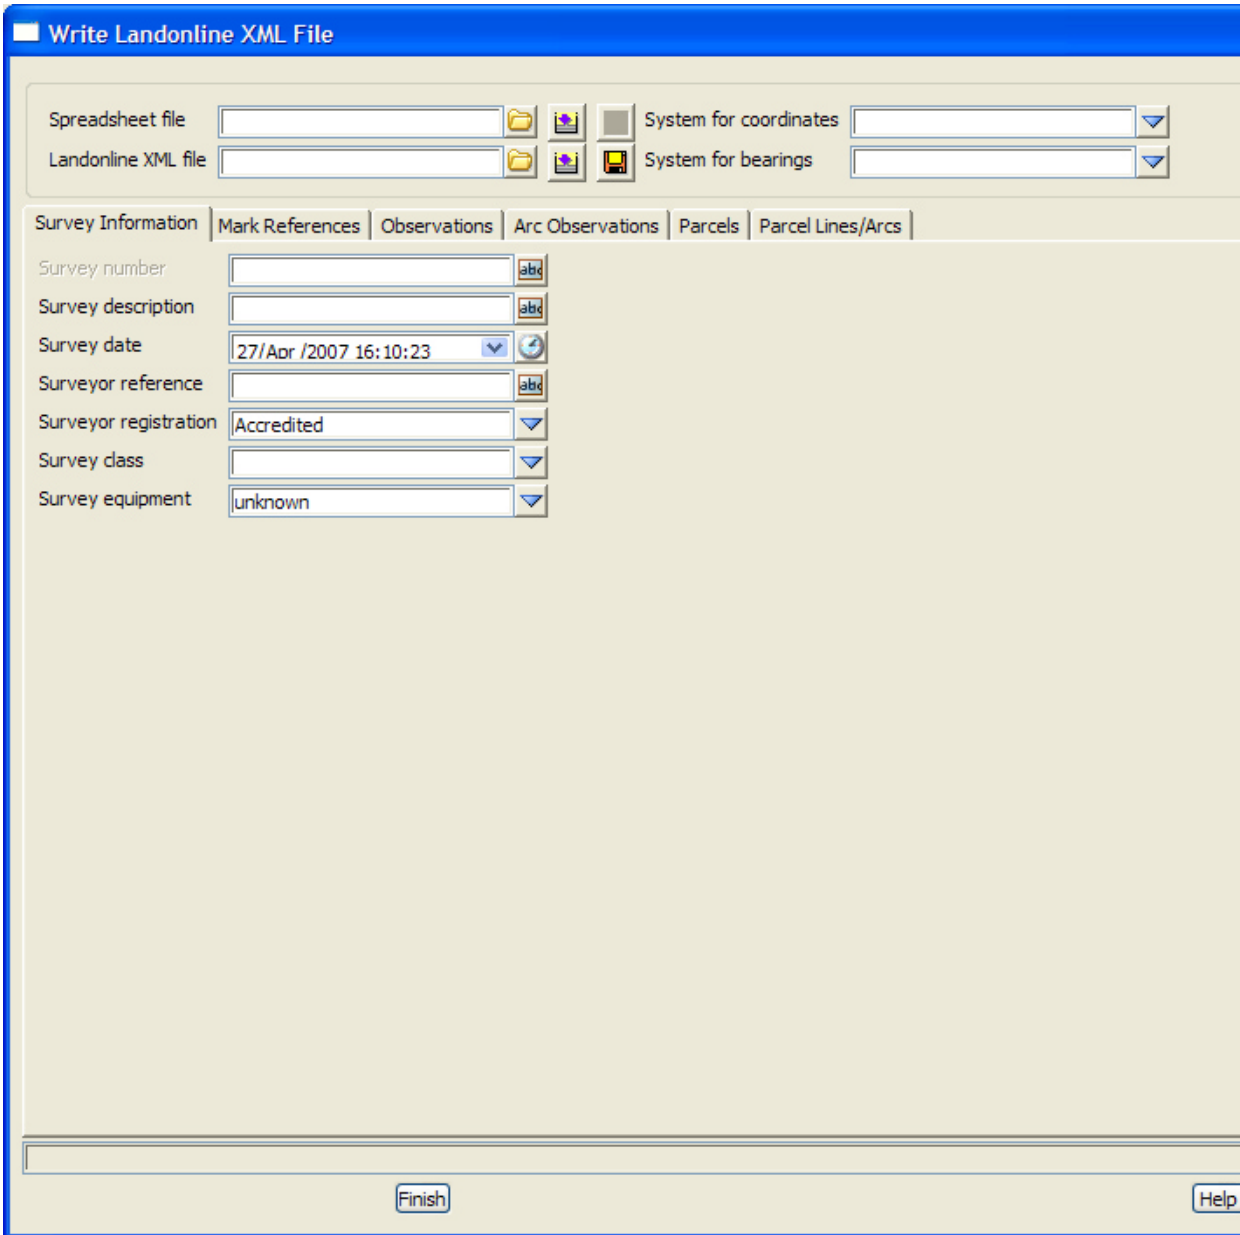

Landonline XML Write

read_Landonline_xml_file

Position of menu: Survey => Traverse spreadsheet => Landonline XML write

The Landonline XML Write option writes out data in the XML format for Landonline New Zealand.

Selecting Landonline XML write brings up the Write Landonline XML File panel

Documentation is available from 12d NZ Ltd.

Conformance

survey_conformance

Position of menu: Survey =>Conformance

The Conformance walk-right menu contains survey options for generating conformance reports and models on surveyed points representing as-built batter slopes and pavements, compared against string data representing designed batter slopes and pavements.

The Conformance walk-right menu is

Generate batter slope conformance report
Generate pavement conformance report

For the option *Batter slope report*,
Pavement report,

go to the section:"Batter slope report"
go to the section:"Pavement report"

Batter slope report

Conformance_Report_Batters_panel

Position of option on menu: Survey =>Conformance =>Batter slope report

The **Batter slope report** option generates a conformance report on surveyed points representing an as-built batter slope, compared against string data representing a designed batter slope.

In addition to the conformance report, an output results model of the surveyed points can be generated, grouping the points by colour into their conformance zones (i.e. *within tolerance*, *above tolerance*, *below tolerance*, and *not tested*). The points in the results model can have z-values and vertex text set to show various combinations of point level, point conformance, and point error.

Note1: the term *point conformance* is used here to refer to a point's distance from design (distance from the conformance line on diagram below), while the term *point error* refers to a point's distance out of tolerance. As such, a point that is within tolerance (i.e. a *conformant point*) will, in general, have a non-zero conformance and a zero error, while a point that is out of tolerance (i.e. a *non-conformant point*) will have both a non-zero conformance and a non-zero error.

Note2: the point conformances and errors can be measured either vertically or perpendicular to the conformance line. It is perhaps worthwhile to note, especially in the case of the *sliding critical zone*, that the perpendicular measurements are determined from the vertical measurements, and **not** vice versa. That is, if the slope of the conformance line, measured from horizontal, is denoted by the angle A , then a surveyed point Q , has a perpendicular conformance Q_{cp} , and error Q_{ep} , determined from the point's vertical conformance Q_{cv} , and error Q_{ev} , via the following relationships:

$$Q_{cp} = Q_{cv} \cdot \cos A$$

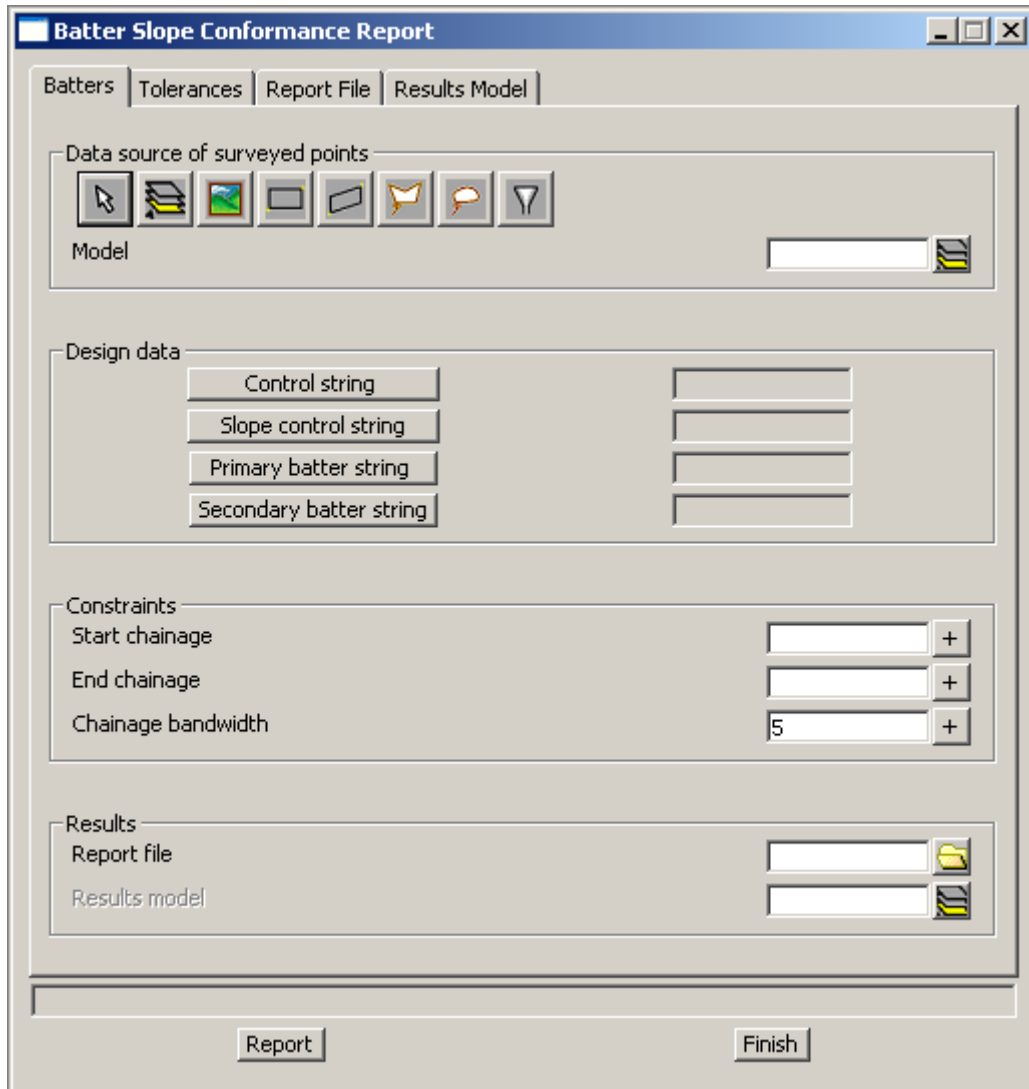

$$Q_{ep} = Q_{ev} \cdot \cos A$$

Note3: the conformance line is the line from which all point conformances and tolerances are measured, and is always parallel to the design batter slope line. When testing a sub-grade survey, the conformance line will normally be below the design batter slope line, but when testing a completed-construction survey, the two lines should normally coincide.

Typical sections through excavation and embankment batters are shown in the diagram below, along with schematics showing how the surveyed points are tested for conformance:

Selecting Batter slope report brings up the Batter Slope Conformance Report panel
 The first tab on this panel is the Batters Tab:

The fields and buttons on the Batters Tab have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Survey data

Data source of points source box

all points selected with this source box (whether they exist in point-string form or line-string form) will be considered as the set of surveyed points to be tested for conformance.

Note: *the data for the Point Description column in the report will be taken from the string names of the selected points. If all the string names are blank, however, the point description data in the report will show point ids representing the sequential order that the points are reported in. The results model (if generated) will always have the string names of each point set to match the reported point description.*

Design data

Control string string box

the string selected with this box should normally represent the road centreline, and will be used to determine the chainage and offset of each surveyed point

Slope control string string box

the Slope control string is optional (and is not shown on the diagram above). If no string is selected, the Primary string, below, will be used as the Slope control string. The line that is formed in plan, from a surveyed point to the nearest point on the Slope control string, defines the vertical plane used to conform that surveyed point. The slope formed between the primary and secondary strings on this vertical plane, is the design slope for that surveyed point.

Primary string string box

the string selected with this box should represent one edge of the designed batter (normally the edge closer to the road - i.e. the toe string of an excavation batter, or the crest string of an embankment batter).

The Primary string represents the start of the Critical Zone, which continues horizontally in the direction of the Secondary string, for a distance specified in the Critical zone range field (on the Tolerances Tab).

Secondary string string box

the string selected with this box should represent the other edge of the designed batter (normally the edge further away from the road - i.e. the interface string)

Constraints**Start chainage** real box

the start chainage of the surveyed points to be conformed. Any point with a chainage less than the start chainage will not be tested. By default, the start chainage is set when the Control string is selected, but a different value can be typed in.

End chainage real box

the end chainage of the surveyed points to be conformed. Any point with a chainage greater than the end chainage will not be tested. By default, the end chainage is set when the Control string is selected, but a different value can be typed in.

Chainage bandwidth real box 5.0

if zero or blank, the surveyed points are simply sorted in ascending chainage order. However, if a value greater than zero is entered, the surveyed points will also be sub-sorted into chainage bands, in ascending offset order. Within each chainage band, the difference between the maximum and minimum chainage will be less than the Chainage bandwidth. This is a useful feature if the surveyed points are set out in rows of roughly equivalent chainage.

Results**Report file** file box *.rpt

the name of the conformance report file to be created. If no extension is given, it will be given an extension of ".rpt".

Results model model box available models

the name of the results model to be created. If blank, the results model is not created.

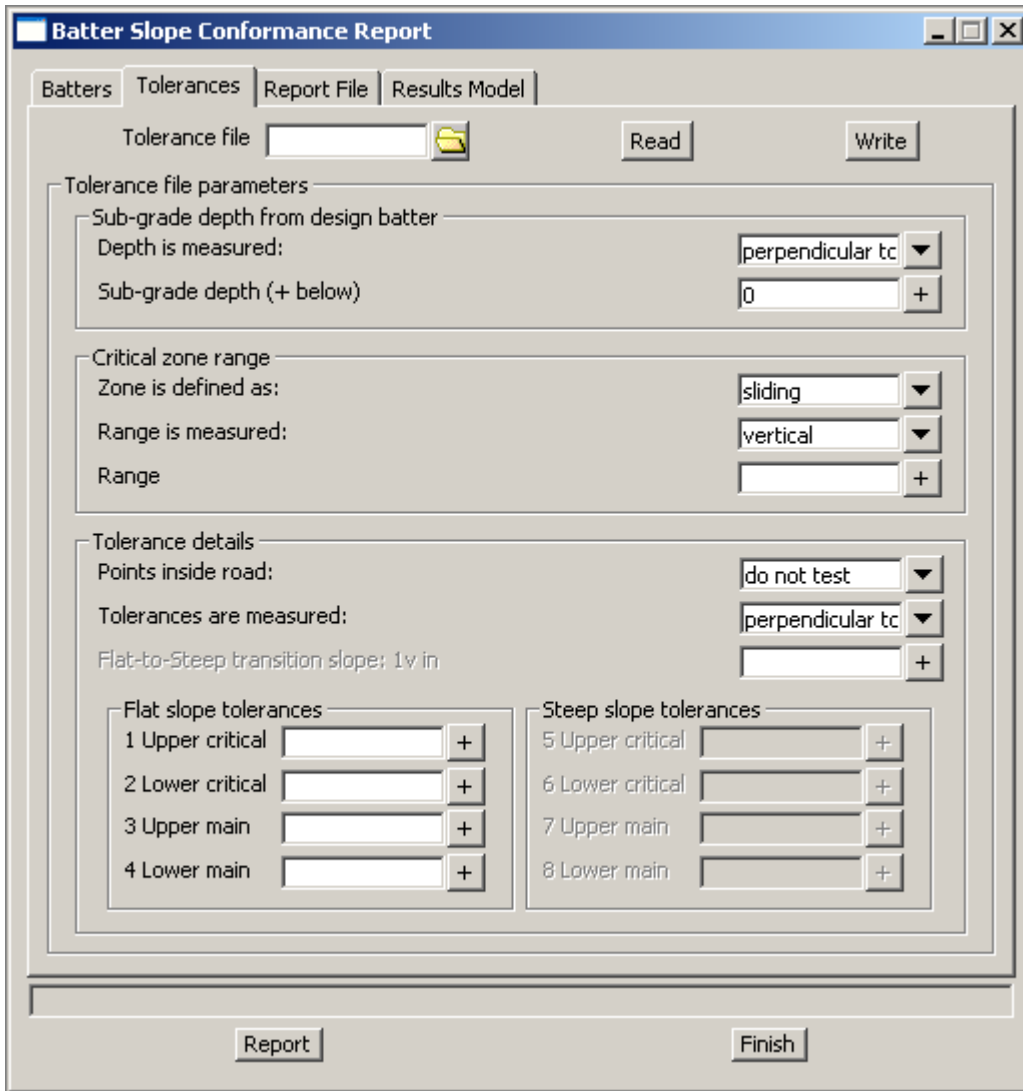

Buttons**Report** button

generates the conformance report file and the results model. This button can be activated regardless of which panel tab is currently active.

Finish button

exits the option and closes the panel. This button can be activated regardless of which panel tab is currently active.

The next tab on the panel is the Tolerances Tab:

The fields and buttons on the Tolerances Tab have the following functions:

Field Description	Type	Defaults	Pop-Up
Tolerance file	file box		*.tol

the name of the tolerance file used to load and/or save the details of the conformance. If no extension is given, it will be given an extension of ".tol". The tolerance file stores the details of every field on the Tolerances Tab, the Report File Tab, and the Results Model Tab. The tolerance file itself is not required to run a conformance test - it is merely provided as a convenience.

Read button

Pressing this button will populate the panel fields on the last three panel tabs, with the data stored in the tolerance file. If data for a particular field is not found, that field remains unaffected.

Write button

Pressing this button will create a new tolerance file or replace an existing one. The contents of all non-blank fields on the last three panel tabs, are written to the file at this time.

Sub-grade depth from design batter

Depth is measured	choice box	perpendicular	perpendicular to batter vertical
-------------------	------------	---------------	-------------------------------------

whether the sub-grade depth is measured perpendicular to the batter or vertically (refer to parameters D_p and D_v on the diagram above)

Sub-grade depth real box 0.0

the depth of the conformance line from the design batter (refer to parameters D_p and D_v on the diagram above). If testing a sub-grade survey, this value will normally be greater than zero. If testing a completed-construction survey, however, this value will normally be zero, and the conformance line will coincide with the design batter slope line.

Critical zone range

Zone is defined as choice box sliding sliding fixed

determines whether the Critical Zone is defined as sliding or fixed (refer to diagram above). For excavation batters, the zone is normally sliding, whilst for embankment batters, it is normally fixed.

Range is measured choice box vertical along batter vertical horizontal

determines how the size of the Critical Zone is measured (refer to parameters C_b , C_v , and C_h on the diagram above)

Range real box

the size of the Critical Zone, measured in the specified direction (refer to parameters C_b , C_v , and C_h on the diagram above). This distance must be zero or greater.

Tolerance details

Points inside road choice box do not test do not test test with zero tolerance test with fixed crit. tolerance

determines what to do with any surveyed points found inside the road. If such points are found, and this field is set to **do not test**, the points will be classified as untested, and in the results model, will have their vertex text set to **INR**.

Note: untested points do not appear in the conformance report.

Tolerances measured choice box perpendicular perpendicular to batter vertical

whether the conformance tolerances are measured perpendicular to the batter or vertically (refer to parameters T^{*p} and T^{*v} on the diagram above). This field also determines whether the reported point conformances and point errors are measured perpendicular or vertically.

Flat-to-Steep transition slope: 1v in real box

It is possible to use two different sets of batter slope tolerances, when producing the conformance report. The Flat slope tolerance set will be used whenever the design slope is equal to the transition slope or flatter, and the Steep slope tolerance set will be used whenever the design slope is steeper than the transition slope. The transition slope must be specified as a positive number, and will be interpreted as a slope in the form

1[v] : transition slope[h]. Leaving this field blank will disable the Steep slope tolerance set, ensuring that only the Flat slope tolerance set will ever be used.

Flat slope tolerances

The following four tolerances are used if the *transition slope* is not specified, or whenever the design slope is equal to the *transition slope* or flatter.

- 1 Upper critical** real box
refer to parameters Tucp and Tucv on the diagram above. This value is normally zero or greater.
- 2 Lower critical** real box
refer to parameters Tlcp and Tlcv on the diagram above. This value is normally zero or less.
- 3 Upper main** real box
the upper allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tump and Tumv on the diagram above). This value is normally zero or greater.
- 4 Lower main** real box
the lower allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tlmp and Tlmv on the diagram above). This value is normally zero or less.

Steep slope tolerances

The following four tolerances are used only if the *transition slope* is specified, and the design slope is steeper than the *transition slope*.

- 5 Upper critical** real box
refer to parameters Tucp and Tucv on the diagram above. This value is normally zero or greater.
- 6 Lower critical** real box
refer to parameters Tlcp and Tlcv on the diagram above. This value is normally zero or less.
- 7 Upper main** real box
the upper allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tump and Tumv on the diagram above). This value is normally zero or greater.
- 8 Lower main** real box
the lower allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tlmp and Tlmv on the diagram above). This value is normally zero or less.

The next tab on the panel is the Report File Tab:

The fields on the Report File Tab have the following functions:

Field Description	Type	Defaults	Pop-Up
Max lines per page	integer box	70	

the maximum number of report lines that can fit on a printed page. This number is needed so that page breaks (form feed characters) can be inserted into the report file at the appropriate places. The number of lines per page will vary depending on the editor/word-processor used for printing, the desired page size and margin widths, the desired page layout (portrait or landscape), and the desired font and font size. As such, the number needs to be tuned for the user's particular report specifications/requirements.

Note1: you may find that MS Notepad is not a good program for printing out the report file (Notepad doesn't seem to interpret form feed characters).

Note2: if Max lines per page is set to a large enough number, there will be no page breaks in the report file.

Header information

Original survey file input box
optional line of text in the report header to identify the original survey data file

Lot number input box
optional line of text in the report header to identify the lot number

Lot location input box
optional line of text in the report header to identify the lot location

Lot description input box
optional line of text in the report header to identify the lot description

Table options

Show design levels tick box off
whether to show the design levels in the column after the point levels

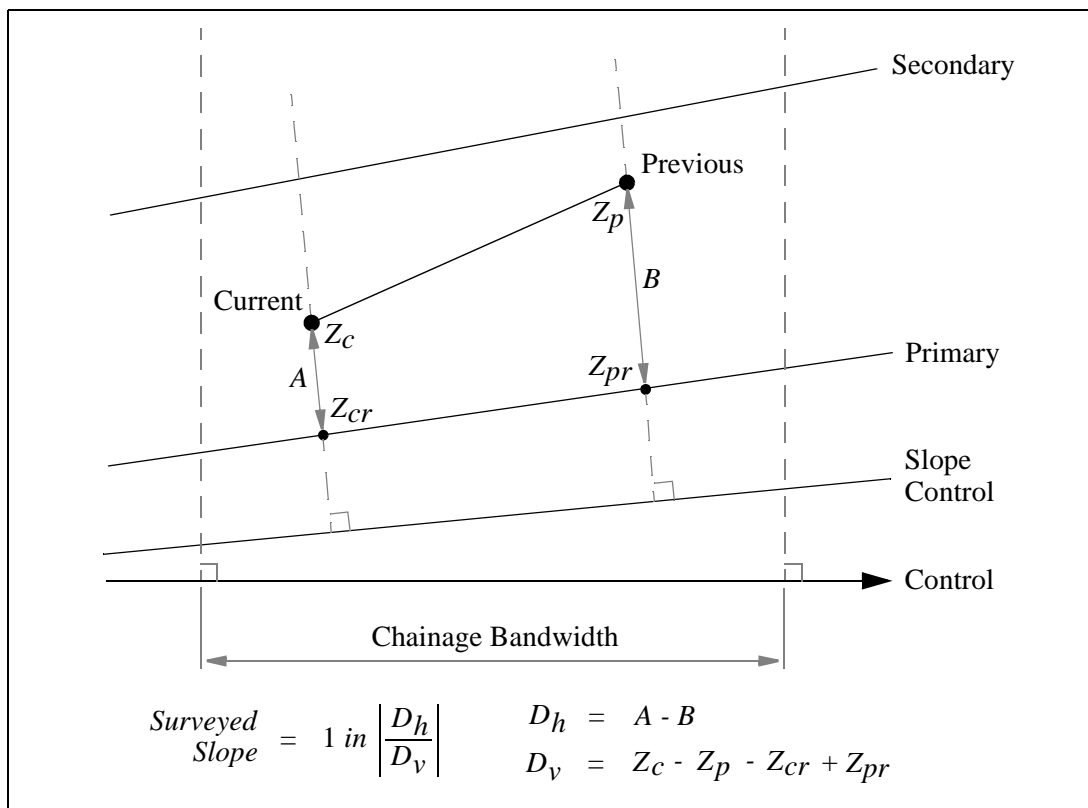

Note: the design levels are always vertically above or below the point levels, even if the tolerances are measured perpendicular to the design slope.

Show non-conformance errors
 tick box off

whether to show the point errors for non-conformant points (i.e. the distances the points are out of tolerance). If turned on, the point errors will appear in parentheses, (=, after the conformance and tolerance details.

Show non-conformance slopes
 tick box off

whether to show the surveyed slopes at non-conformant points. The surveyed slope is the slope between the previous and current point in the report, within a single, offset-sorted chainage band. The slope is calculated as though the previous point lies in the same vertical plane as that of the current point's design slope. As such, the slope is adjusted for any differences in bearing direction between the two design slopes, and for any incline in the road, as shown in the diagram, below:

If turned on, the surveyed slopes will appear in square brackets, [=, after the conformance, tolerance and point error details.

Note: if the Chainage bandwidth on the Batters Tab is zero or blank, then the points will only be sorted by chainage, and not sub-sorted by offset within chainage bands. In this case, surveyed slopes will never be reported.

Footer information

Surveyor name input box
name of the person required to sign the report (optional)

Surveyor title input box
title of the person required to sign the report (optional)

The last tab on the panel is the Results Model Tab:

The screenshot shows a software dialog box titled "Batter Slope Conformance Report". It has four tabs: "Batters", "Tolerances", "Report File", and "Results Model". The "Results Model" tab is selected. The dialog is divided into several sections:

- Results model details:**
 - "Clean results model beforehand": A checkbox that is currently unchecked.
 - "Z values are:": A dropdown menu with "levels" selected.
 - "Vertex text shows:": A dropdown menu with "conformances" selected.
 - "Vertex textstyle data": A text input field with a font icon button.
- Colours:**
 - "Points within tolerance": A color selection box with "green" and a green swatch.
 - "Points above tolerance": A color selection box with "red" and a red swatch.
 - "Points below tolerance": A color selection box with "cyan" and a cyan swatch.
 - "Untested points": A color selection box with "grey" and a grey swatch.
- Create tin of tested results model points:**
 - "Tin name": A text input field with a tin icon button.
 - "Model for tin": A dropdown menu with a model icon button.
 - "Tin colour": A text input field with a color selection icon button.

At the bottom of the dialog, there are two buttons: "Report" and "Finish".

The fields on the Results Model Tab have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Clean results model beforehand

tick box	off
----------	-----

whether to clean the contents of an existing results model before re-running the option

Z values are	choice box	levels	levels conformances errors
---------------------	------------	--------	----------------------------------

determines what z values to give the points generated in the results model

Note: any untested points in the model will have their z values set to their original point levels, regardless.

Vertex text shows	choice box	conformances	levels conformances errors
--------------------------	------------	--------------	----------------------------------

determines what values to show in the vertex text of the points generated in the results model

Note1: any points within tolerance will have a zero error. For these points, if the vertex text is set to errors, no text will be set.

Note2: any untested points in the model will have the vertex text set to show one of four possible error codes, explaining why the point was not tested. The error codes are **NUL** (invalid z-value), **OCR** (outside chainage range), **ERR** (intersection error or similar), and **INR** (inside road).

Vertex textstyle data	textdata box		user textdata favourites
------------------------------	--------------	--	--------------------------

controls the appearance of the vertex text for the points generated in the results model

Colours

Points within tolerance	colour box	green	available colours
--------------------------------	------------	-------	-------------------

colour for points within tolerance

Points above tolerance	colour box	red	available colours
-------------------------------	------------	-----	-------------------

colour for points above tolerance

Points below tolerance	colour box	cyan	available colours
-------------------------------	------------	------	-------------------

colour for points below tolerance

Untested points	colour box	grey	available colours
------------------------	------------	------	-------------------

colour for untested points

Note: untested points do not appear in the conformance report.

Create tin of tested results model points

Tin name	tin box		available tins
-----------------	---------	--	----------------

name of the tin to create. If the tin already exists, a prompt will ask if it should be replaced. If this field is blank, or if the Results model field (on the Batters Tab) is blank, no tin will be created.

Note: the tin will be created only with the set of tested points created in the Results model, and can be used to quickly display contour maps of the results. When creating the tin, an attempt is made to null any triangles outside the "shrink-wrapped" boundary of the tested points. The boundary polygon used for this nulling procedure is determined from the extremity points of each offset-sorted chainage band (see Chainage bandwidth on the Batters Tab).

Model for tin	model box		available models
----------------------	-----------	--	------------------

model for tin to be placed in, for viewing purposes. If blank, the tin is not placed into a model.

Tin colour	colour box		available colours
-------------------	------------	--	-------------------

colour for tin. If blank, the tin will adopt the colour selected for Points within tolerance.

Pavement report

Conformance_Report_Pavement_panel

Position of option on menu: Survey =>Conformance =>Pavement report

The **Pavement report** option generates a conformance report on surveyed points representing the top of an as-built pavement, compared against string data representing the top of a designed pavement (level conformance), and compared against tin data representing the bottom of an as-built pavement (thickness conformance).

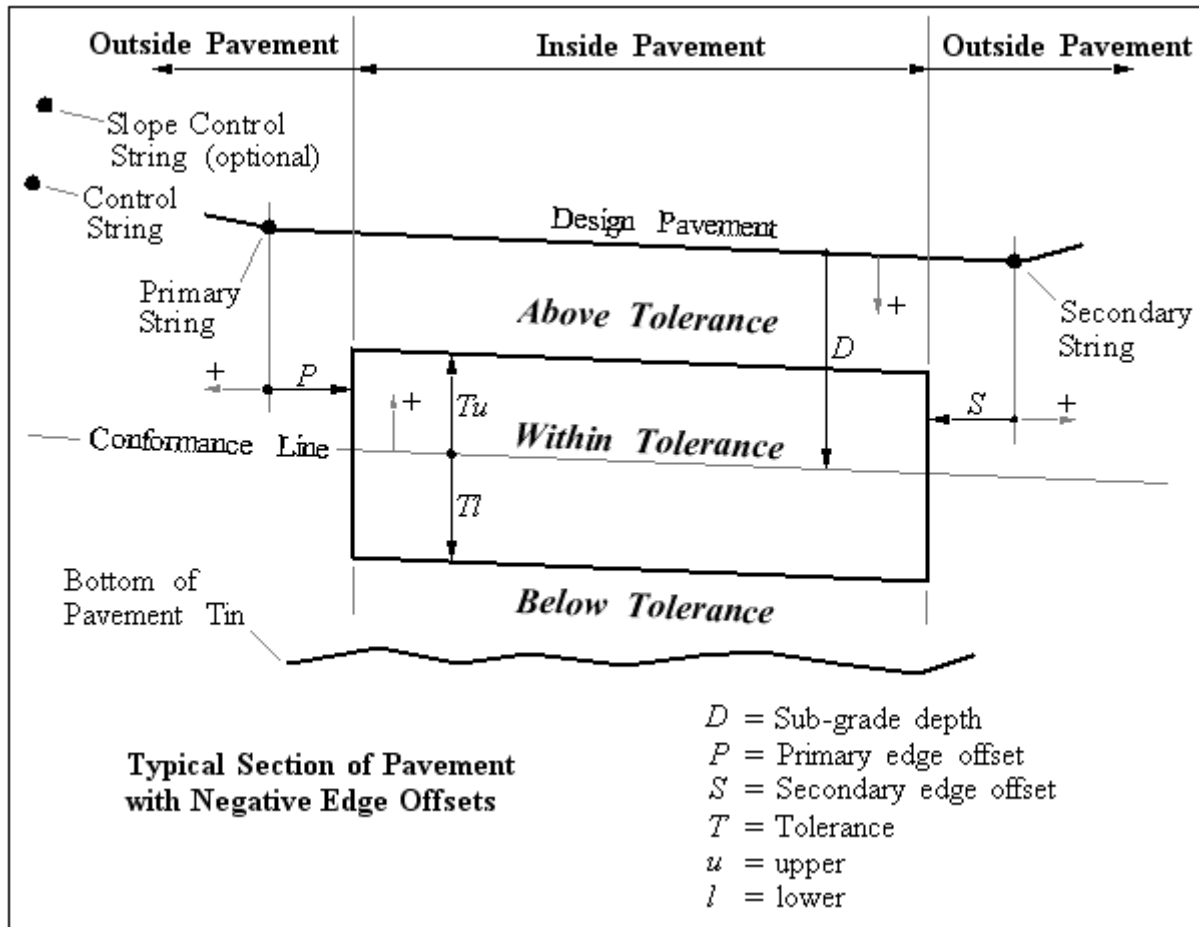

In addition to the conformance report, an output results model of the surveyed points can be generated, grouping the points by colour into their conformance zones (i.e. *within tolerance*, *above tolerance*, *below tolerance*, and *not tested*). The points in the results model can have z-values and vertex text set to show various combinations of point level, point conformance, point error, pavement thickness and pavement thickness error.

Note1: the term *point conformance* is used here to refer to a point's distance from design (distance from the conformance line on diagram below), while the term *point error* refers to a point's distance out of tolerance. As such, a point that is within tolerance (i.e. a *conformant point*) will, in general, have a non-zero conformance and a zero error, while a point that is out of tolerance (i.e. a *non-conformant point*) will have both a non-zero conformance and a non-zero error.

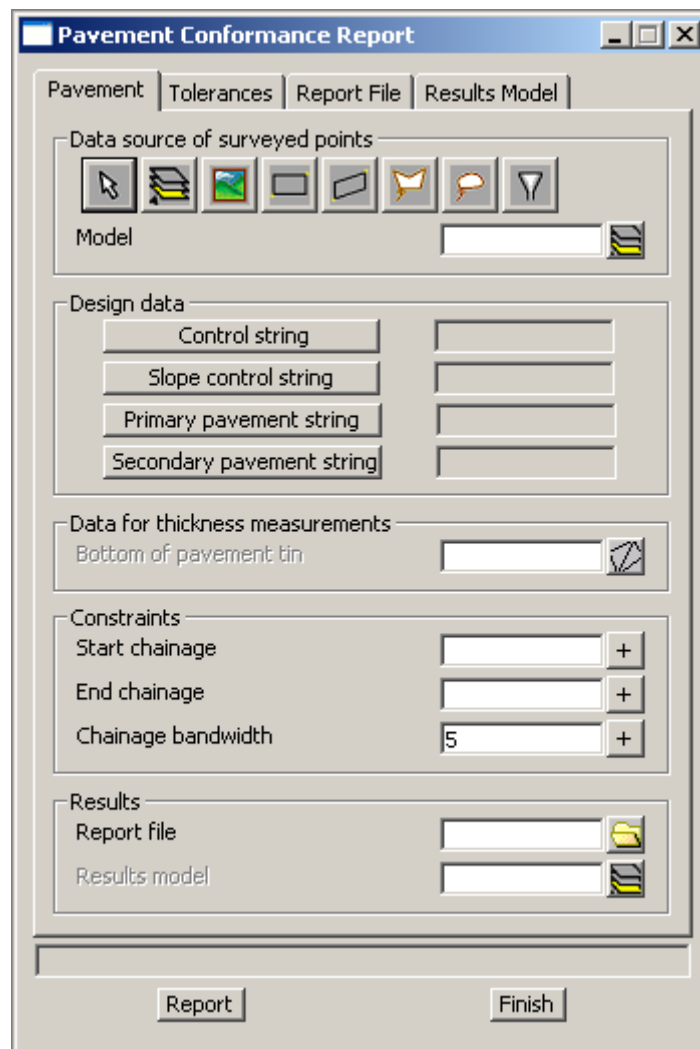

Note2: the point conformances and errors can be measured either vertically or perpendicular to the conformance line. The conformance line is the line from which all point conformances and tolerances are measured, and is always parallel to the design pavement line. When testing a sub-grade survey, the conformance line will normally be below the design pavement line, but when testing a completed-construction survey, the two lines should normally coincide.

Note3: the optional pavement thickness measurements are always made vertically downwards from the surveyed points, to the tin representing the bottom of pavement. Pavement thickness errors will be non-zero wherever the pavement is found to be too thick or too thin. When testing for both level conformance and thickness conformance, both tests must pass for a point to be considered conformant.

A typical section of pavement is shown in the diagram below, along with a schematic showing how the surveyed points are tested for level conformance:

Selecting Pavement report brings up the Pavement Conformance Report panel
The first tab on this panel is the Pavement Tab:

The fields and buttons on the Pavement Tab have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Survey data

Data source of points source box

all points selected with this source box (whether they exist in point-string form or line-string form) will be considered as the set of surveyed points to be tested for conformance.

Note: *the data for the Point Description column in the report will be taken from the string names of the selected points. If all the string names are blank, however, the point description data in the report will show point ids representing the sequential order that the points are reported in. The results model (if generated) will always have the string names of each point set to match the reported point description.*

Design data

Control string string box

the string selected with this box should normally represent the road centreline, and will be used to determine the chainage and offset of each surveyed point

Slope control string string box

the Slope control string is optional. If no string is selected, the Control string, above, will be used as the Slope control string. The line that is formed in plan, from a surveyed point to the nearest point on the Slope control string, defines the vertical plane used to conform that surveyed point. The slope formed between the primary and secondary strings on this vertical plane, is the design slope for that surveyed point.

Primary string string box

the string selected with this box should represent one edge of the designed pavement (normally the edge that is closer to the Control string)

Secondary string string box

the string selected with this box should represent the other edge of the designed pavement (normally the edge that is further away from the Control string).

Note: *If the selected string is the same as the Primary string, or if no string is selected, then the pavement is defined by one string and is considered to be flat (i.e. zero cross-fall), and to have a width defined by the Primary and Secondary edge offsets (on the Tolerances Tab). This feature can be useful for identifying any surveyed points that are close to an edge line.*

Data for thickness measurements**Bottom of pavement tin** tin box available tins

the Bottom of pavement tin is optional. If not selected, the pavement is not tested for thickness conformance. The tin selected with this box should represent the as-built bottom surface of the pavement currently being tested.

Constraints**Start chainage** real box

the start chainage of the surveyed points to be conformed. Any point with a chainage less than the start chainage will not be tested. By default, the start chainage is set when the Control string is selected, but a different value can be typed in.

End chainage real box

the end chainage of the surveyed points to be conformed. Any point with a chainage greater than the end chainage will not be tested. By default, the end chainage is set when the Control string is selected, but a different value can be typed in.

Chainage bandwidth real box 5.0

if zero or blank, the surveyed points are simply sorted in ascending chainage order. However, if a value greater than zero is entered, the surveyed points will also be sub-sorted into chainage bands, in ascending offset order. Within each chainage band, the difference between the maximum and minimum chainage will be less than the Chainage bandwidth. This is a useful feature if the surveyed points are set out in rows of roughly equivalent chainage.

Results**Report file** file box *.rpt

the name of the conformance report file to be created. If no extension is given, it will be given an extension of .rpt.

Results model model box available models

the name of the results model to be created. If blank, the results model is not created.

Buttons

Report button

generates the conformance report file and the results model. This button can be activated regardless of which panel tab is currently active.

Finish button

exits the option and closes the panel. This button can be activated regardless of which panel tab is currently active.

The next tab on the panel is the Tolerances Tab:

The fields and buttons on the Tolerances Tab have the following functions:

Field Description	Type	Defaults	Pop-Up
Tolerance file	file box		*.tol

the name of the tolerance file used to load and/or save the details of the conformance. If no extension is given, it will be given an extension of ".tol". The tolerance file stores the details of every field on the Tolerances Tab, the Report File Tab, and the Results Model Tab. The tolerance file itself is not required to run a conformance test - it is merely provided as a convenience.

Read button

Pressing this button will populate the panel fields on the last three panel tabs, with the data stored in the tolerance file. If data for a particular field is not found, that field remains unaffected.

Write button

Pressing this button will create a new tolerance file or replace an existing one. The contents of all non-blank fields on the last three panel tabs, are written to the file at this time.

Sub-grade depth from design pavement

Depth is measured choice box vertical perpendicular to pavement vertical

whether the sub-grade depth is measured perpendicular to the pavement or vertically (refer to parameter *D* on the diagram above)

Note: since pavements typically have cross-fall slopes of less than 7%, the value of this setting should make very little difference to the results.

Sub-grade depth real box 0.0

the depth of the conformance line from the design pavement (refer to parameter *D* on the diagram above). If testing a sub-grade survey, this value will normally be greater than zero. If testing a completed-construction survey, however, this value will normally be zero, and the conformance line will coincide with the design pavement line.

Pavement edge details

Points outside pavement choice box do not test do not test
test with zero tolerance
test with normal tolerance

determines what to do with any surveyed points found outside the pavement. If such points are found, and this field is set to **do not test**, the points will be classified as untested, and in the results model, will have their vertex text set to **EDG**.

Note: untested points do not appear in the conformance report.

Primary edge offset real box 0.0

the amount to horizontally increase or decrease the width of the design pavement at the Primary string edge (refer to parameter *P* on the diagram above). A negative value decreases the width, which is the more common case, since surveyed points near a pavement edge are normally ignored for the purposes of conformance.

Secondary edge offset real box 0.0

the amount to horizontally increase or decrease the width of the design pavement at the Secondary string edge (refer to parameter *S* on the diagram above). A negative value decreases the width, which is the more common case, since surveyed points near a pavement edge are normally ignored for the purposes of conformance.

Tolerance details

Tolerances measured choice box vertical perpendicular to pavement vertical

whether the conformance tolerances are measured perpendicular to the pavement or vertically (refer to parameters *Tu* and *Tl* on the diagram above). This field also determines whether the reported point conformances and point errors are measured perpendicular or vertically.

Note: since pavements typically have cross-fall slopes of less than 7%, the value of this setting should make very little difference to the results.

Upper tolerance real box

the upper allowable distance that a surveyed point may be from the conformance line, in order to be conformant (refer to parameter *Tu* on the diagram above). This value is normally zero or greater.

Lower tolerance real box

the lower allowable distance that a surveyed point may be from the conformance line, in order to be conformant (refer to parameter T1 on the diagram above). This value is normally zero or less.

Thickness details

Maximum thickness real box

the maximum allowable vertical distance that a surveyed point may be above the Bottom of pavement tin, in order to be conformant. If blank, there will be no upper limit to the pavement thickness.

Minimum thickness real box

the minimum allowable vertical distance that a surveyed point may be above the Bottom of pavement tin, in order to be conformant. If blank, there will be no lower limit to the pavement thickness.

The next tab on the panel is the Report File Tab:

The fields on the Report File Tab have the following functions:

Field Description	Type	Defaults	Pop-Up
Max lines per page	integer box	70	

the maximum number of report lines that can fit on a printed page. This number is needed so that page breaks (form feed characters) can be inserted into the report file at the appropriate places. The number of lines per page will vary depending on the editor/word-processor used for printing, the desired page size and margin widths, the desired page layout (portrait or landscape), and the desired font and font size.

As such, the number needs to be tuned for the user's particular report specifications/requirements.

Note1: you may find that MS Notepad is not a good program for printing out the report file (Notepad doesn't seem to interpret form feed characters).

Note2: if Max lines per page is set to a large enough number, there will be no page breaks in the report file.

Header information

Original survey file input box
optional line of text in the report header to identify the original survey data file

Lot number input box
optional line of text in the report header to identify the lot number

Lot location input box
optional line of text in the report header to identify the lot location

Lot description input box
optional line of text in the report header to identify the lot description

Table options

Show design levels tick box off
whether to show the design levels in the column after the point levels

Note: the design levels are always vertically above or below the point levels, even if the tolerances are measured perpendicular to the design slope.

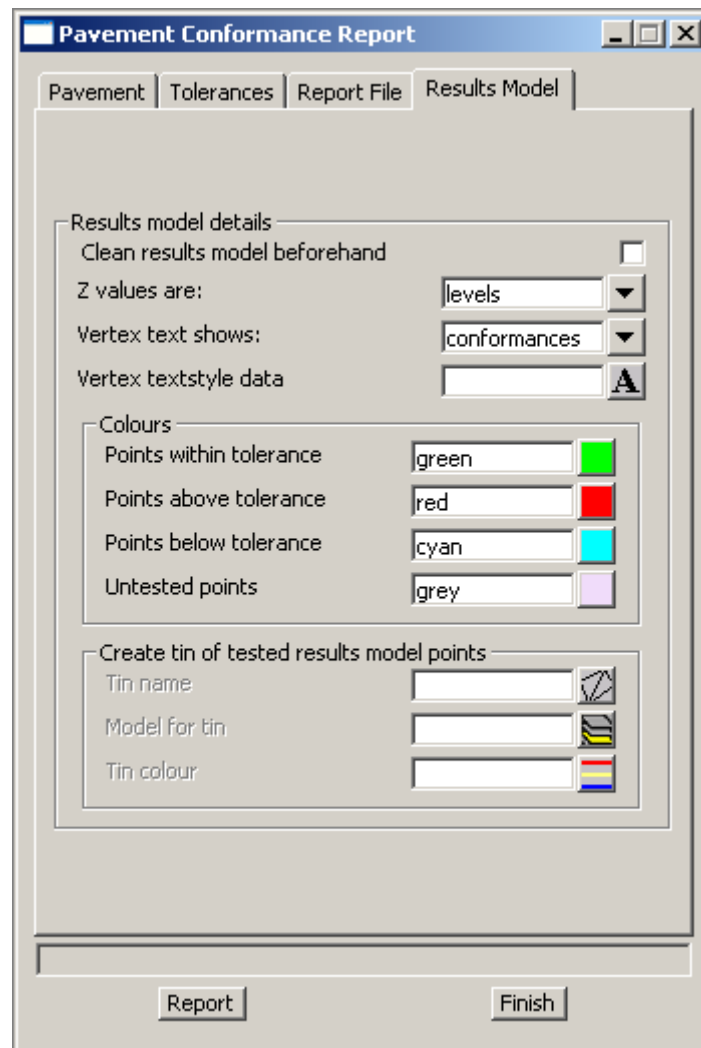

Show non-conformance errors
tick box off
whether to show the point errors and thickness errors for non-conformant points (i.e. the distances the points are out of level and thickness conformance, respectively). If turned on, the point errors will appear in parentheses, (), after the conformance and tolerance details, and the thickness errors will appear in parentheses, (), after the thickness and max/min thickness details.

Footer information

Surveyor name input box
name of the person required to sign the report (optional)

Surveyor title input box
title of the person required to sign the report (optional)

The last tab on the panel is the Results Model Tab:

The fields on the Results Model Tab have the following functions:

Field Description	Type	Defaults	Pop-Up
Clean results model beforehand	tick box	off	
<i>whether to clean the contents of an existing results model before re-running the option</i>			
Z values are	choice box	levels	levels conformances errors thicknesses thickness errors

determines what z values to give the points generated in the results model

Note: any untested points in the model will have their z values set to their original point levels, regardless.

Vertex text shows	choice box	conformances	levels conformances errors thicknesses thickness errors
--------------------------	------------	--------------	---

determines what values to show in the vertex text of the points generated in the results model

Note1: any points that pass the level conformance test will have a zero error. For these points, if the vertex text is set to **errors**, no text will be set. Likewise, any points that pass the thickness conformance test will have a zero thickness error. For these points, if the vertex text is set to **thickness errors**, no text will be set.

Note2: any untested points in the model will have the vertex text set to show one of five possible error codes, explaining why the point was not tested. The error codes are **NUL** (invalid z-value), **OCR** (outside chainage range), **ERR** (intersection error or similar), **EDG** (outside pavement edge), and **NTN** (bottom of pavement tin not defined at point).

Vertex textstyle data textdata box user textdata favorites
controls the appearance of the vertex text for the points generated in the results model

Colours

Points within tolerance colour box green available colours
colour for points within tolerance (i.e. points that pass both the level and thickness conformance tests)

Points above tolerance colour box red available colours
colour for points above tolerance (i.e. points that are above the Upper tolerance or points where the pavement is thicker than the Maximum thickness)

Points below tolerance colour box cyan available colours
colour for points below tolerance (i.e. points that are below the Lower tolerance or points where the pavement is thinner than the Minimum thickness)

Untested points colour box grey available colours
colour for untested points

Note: untested points do not appear in the conformance report.

Create tin of tested results model points

Tin name tin box available tins
name of the tin to create. If the tin already exists, a prompt will ask if it should be replaced. If this field is blank, or if the Results model field (on the Pavement Tab) is blank, no tin will be created.

Note: the tin will be created only with the set of tested points created in the Results model, and (depending on what the points' z-values are set to in the Results model) can be used to quickly display contour maps of the results, or to create a Bottom of pavement tin for the next pavement layer to be tested. When creating the tin, an attempt is made to null any triangles outside the "shrink-wrapped" boundary of the tested points. The boundary polygon used for this nulling procedure is determined from the extremity points of each offset-sorted chainage band (see Chainage bandwidth on the Pavement Tab).

Model for tin model box available models
model for tin to be placed in, for viewing purposes. If blank, the tin is not placed into a model.

Tin colour colour box available colours
colour for tin. If blank, the tin will adopt the colour selected for Points within tolerance.

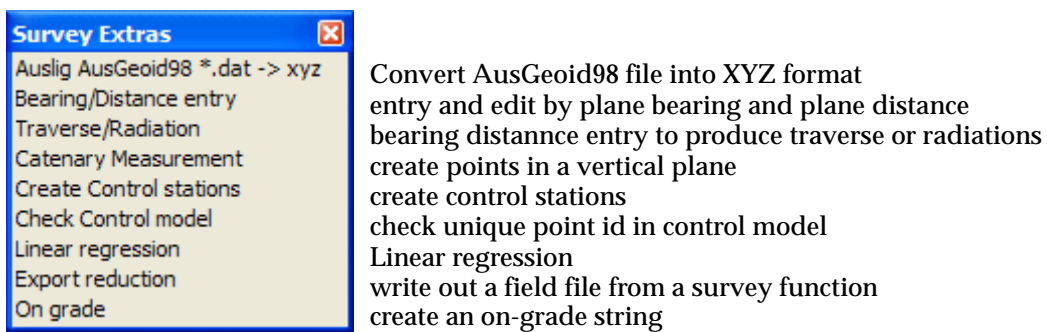

Extras

survey_extras

Position of menu: Survey =>Extras

The extras walk-right menu contains extra survey options. some of which are still being developed.

The extras walk-right menu is

For the option *Auslig AusGeoid98 *.dat ->xyz*, go to the section "AusGeoid98 *.dat -> xyz"

Bearing/Distance entry

"Plane Bearing/Distance Entry"

Traverse/Radiation

"Bearing/Distance Entry for Traverse/Radiation"

Catenary measurement

"Catenary Measurement"

Create Control Station

"Create Control Stations"

Check control model

"Check Control Model"

Linear regression

"Linear Regression"

Reduction to field file

"Survey Function to Field File"

On grade

"On Grade"

AusGeoid98 *.dat -> xyz

auslig_ausgeoid98__dat__xyz

Position of option on menu: Survey =>Extras =>Auslig AusGeoid98 *.dat->xyz

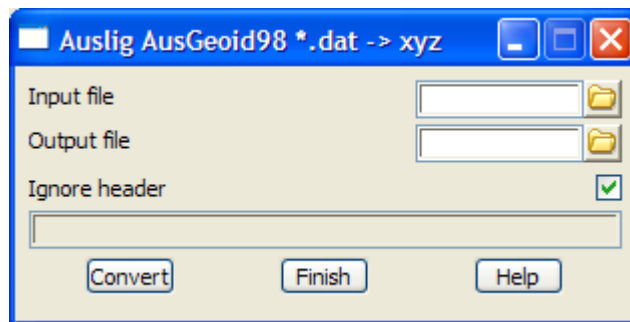

The **Ausgeoid98 *.dat -> xyz** option allows the conversion of a standard AusGeoid98 *.dat file into a XYZ format. This format can then be read into 12d. The values in the XYZ file will have the following meaning

X value will represent the Longitude

Y value will represent the Latitude

Z value will represent the N value

Selecting **Ausgeoid98 *.dat -> xyz** brings up the **Ausgeoid98 *.dat -> xyz** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file <i>this filename of the AusGeoid file. The .dat extension is added by default.</i>	file box		*.dat
Output file <i>this filename of the XYZ file to be produced.</i>	file box		
Ignore header <i>if ticked, the first line in the *.dat file is ignored (usually the header)</i>	checkbox	ticked	
Convert <i>convert the file.</i>	button		

For more information about terminology used in this option, see the Appendix "Geodetics Summary" .

Plane Bearing/Distance Entry

bearing_distance_entry

Position of option on menu: Survey =>Extras =>Bearing/distance entry

The bearing/distance entry option allows the input of a traverse by manual input of plane bearings and plane distances or by selecting an existing string.

Selecting Bearing/distance entry brings up the **Bearing/Distance Entry** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		defined names from names.4d file
<i>this field is optional. If non-blank, the name of the new string.</i>			
Model	model box		available models
<i>if non-blank, the model of the new string. If blank, the original string model is used.</i>			
Colour	colour box	red	available colours
<i>if non-blank, the colour of the new string. If blank, the original string colour is used.</i>			
Linestyle	input	1	available line styles
<i>line style of the string.</i>			
Scale factor	input	projection scale	
<i>This value will be applied to any entered distances. i.e. final distance = entered distance * scale factor</i>			

The scale factor could be a point scale factor, a line scale factor or a combined scale factor.
The final distance will be used for coordinate calculations.

Use z- value tick box transit

if **tick**, the z-values for each point can be entered.
If **no tick** then z-values are not entered.

Point id input typed none, auto increment, typed

if **none**, no point ids are entered and the grid control will not show a column for point ids.

If **auto increment** then the values of point ids will be incremented by a value of 1 starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated. No column for point ids is shown in the grid control.

if **typed** then the values of point ids will be incremented by a value of 1, starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.

VALUES IN GRID grid box

The columns shown in the grid will depend on the selection of the **Use z- value** and **Point id** fields.

	To Pt.	Bearing (dms)	Distance	Height
1				

To Pt. input

if **none** is selected for the **Point id** field, this column will not be displayed.

if **auto increment** is selected for the **Point id** field, this column will not be displayed.

if **typed** is selected for the **Point id** field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. If a new value is typed into the **To Pt.** field, the next line will increment from that number.

Bearing (dms) angle box

The user should enter the bearing for the segment into this field.

Distance input box

the user should enter the distance of the segment.

Height input box

This column will only be visible in the grid if the **Use z- value** tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.

Select button

on pressing the select button, a user is able to pick an existing string from the current view. If a non-traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the relevant information.

Process button

changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

Bearing/Distance Entry for Traverse/Radiation

bearing_distance_traverse_radiation_entry

Position of option on menu: Survey =>Extras =>Traverse/Radiation

The Traverse/radiation option allows the input of a traverse or radiations by manual input of plane bearings and plane distances or by selecting an existing string.

Bearing/Distance Traverse/Radiation Entry

Selecting Traverse/Radiation brings up the **Bearing/Distance Traverse/Radiation Entry** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		defined names from names.4d file
			<i>this field is optional. If non-blank, the name of the new string/strings.</i>
Model	model box		available models
			<i>if non-blank, the model of the new string. If blank, the original string model is used.</i>
Colour	colour box	red	available colours
			<i>if non-blank, the colour of the new string. If blank, the original string colour is used.</i>
Linestyle	input	1	available line styles
			<i>line style of the string.</i>
Scale factor	input	projection scale	

*This value will be applied to any entered distances. i.e. final distance = entered distance * scale factor
The scale factor could be a point scale factor, a line scale factor or a combined scale factor.
The final distance will be used for coordinate calculations.*

Start point coords xyz pick box
coordinates of the first point. The bearing/distances start from this point.

Start point id input
if Point ids is auto increment, point id of the first point.

Point id input typed none, auto increment, typed
if none, no point ids are entered and the grid control will not show a column for point ids.

*If **auto increment** then the values of point ids will be incremented by a value of 1 starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated. No column for point ids is shown in the grid control.*

*if **typed** then the values of point ids will be incremented by a value of 1, starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.*

Use z- value tick box
*if tick, the z-values for each point can be entered.
If no tick then z-values are not entered.*

Radiation tick box
*if tick, the bearing distances are used to create points that are radiations from the start point.
If no tick the bearing/distances are used to create a traerse string beginning at the start point.*

VALUES IN GRID grid box
*The columns shown in the grid will depend on the selection of the **Use z- value** and **Point id** fields.*

	To Pt.	Bearing (dms)	Distance	Height
1				

To Pt. input
*if none is selected for the **Point id** field, this column will not be displayed.*

*if **auto increment** is selected for the **Point id** field, this column will not be displayed.*

*if **typed** is selected for the **Point id** field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. If a new value is typed into the To Pt. field, the next line will increment from that number.*

Bearing (dms) angle box
The user should enter the bearing for the segment into this field.

Distance input box
the user should enter the distance of the segment.

Height input box
*This column will only be visible in the grid if the **Use z- value** tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.*

Select button

on pressing the select button, a user is able to pick an existing string from the current view. If a non-traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the relevant information.

Process button

changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

Catenary Measurement

catenary_measurement

Position of option on menu: Survey =>Extras =>Catenary measurement

The Catenary measurements option allows for the picking up of data in the vertical plane between two known points using only a bearing and a vertical angle. For example, picking up wires between towers where a distance measurement to the cable is not possible.

Selecting Catenary measurements brings up the **Catenary Measurements** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Instrument setup

- | | | | |
|---------------|--|--|--|
| Coords | xyz box | | |
| | <i>the xyz coordinates of the instrument.</i> | | |
| Id | input box | | |
| | <i>the vertex id (point id) of the instrument.</i> | | |

Height input box
the height of the instrument.

1st Attachment

Coords xyz box
the xyz coordinates of the attachment point of the cable on the first tower.

Id input box
the vertex id (point id) of the first tower.

2nd Attachment

Coords xyz box
the xyz coordinates of the attachment point of the cable on the second tower.

Id input box
the vertex id (point id) of the second tower.

Reading

Horizontal angle correction angle box
angle to be subtracted from the Horizontal Angle reading to give true bearing.

Reading No input box
number for the reading.

Horz. Angle angle box
Horizontal Angle reading. The Horizontal angle correction is subtracted from this to give the true bearing.

Vert. Angle angle box
Vertical Angle reading.

Results

Create string tick box ticked
if ticked, a string of the observed points is created.

Name input box
name of the created string.

Model model box available models
name of the model for the created string.

Colour colour box red available colours
the colour of the created string.

Linestyle input 1 available linestyles
linestyle of the created string.

Report file file box *.rpt files
if non-blank, the name of the file to write the report to.

Process button
reduce the angle readings.

Create Control Stations

create_control_stations

Position of option on menu: Survey =>Extras =>Create Control stations

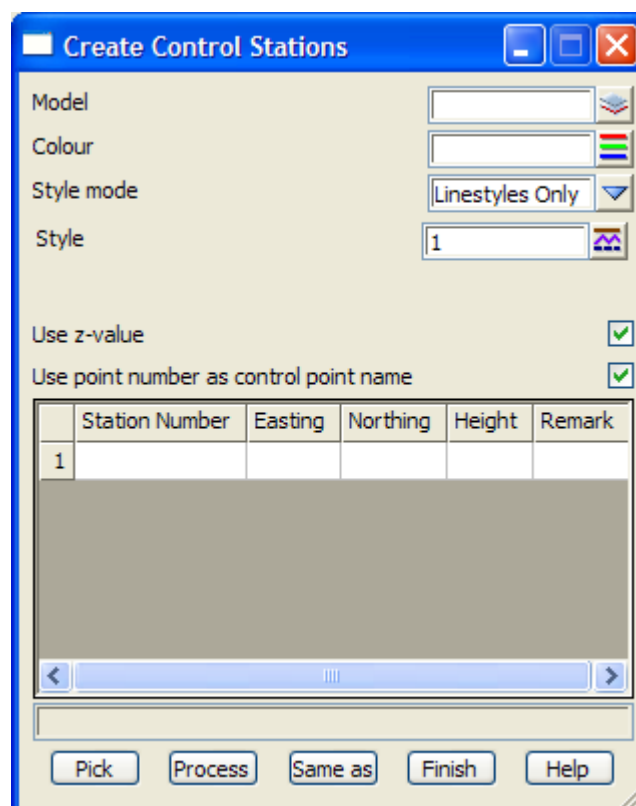

Position of option on menu: Strings =>Create =>Create Control Stations

A *control station* (for surveying) consists of a one point string. For V6, the *point name* is the name of the control station. For V5 and before, the *string name* is used as name of the control station.

Control stations are used when reducing 12d field files in the *Survey Reduction* module.

The Create Control Stations options allows the user to define control stations in a given model. The option checks that the point ids are unique in the control model.

Selecting Create Control Stations brings up the **Create Control Station** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model <i>name of the model for the control stations.</i>	model box		available models
Colour <i>the colour of the new control stations.</i>	colour box	red	available colours
Line style <i>line style of the control station.</i>	input	1	available line styles
Use z-value <i>if ticked, the height value must be specified for all of the stations.</i>	tick box	ticked	
Use point id as control point name	tick box	ticked	

if ticked, the point names are used as the names of the control points and the **point names** are checked for uniqueness.

If not ticked, the name of the string is used as the names of the control points and the **string names** are checked for uniqueness. This is only for compatibility in pre 12d Model V6.0.

Station name Easting Northing Height Remark

the information for stations to be created is entered into the grid. The stations are created by selecting the **Process** button.

If a station name is typed in and the <enter> key pressed then the Model is searched and if a control station already exists of the same name (either point name or string name depending on the **Use point id as control point name flag**), the co-ordinates are displayed in the grid.

The grid control values can be entered/displayed using valid inputs into the various fields.

Station name. The associated text that identifies the control point.

Easting The easting coordinate of the control point.

Northing The northing coordinate of the control point.

Height The height of the station. (Only displayed if the use z-value tickbox is selected.)

Remark The description of the control station.

Process button

After the **Process** button is chosen, the control stations in the grid are created. If a station of the given name already exists in the control Model, the user is asked if the co-ordinates of the station are to be updated by the values given in the grid.

Same as button

After the **Same as** button is chosen, another string is selected and information about it is used for the Model, Colour and Point style fields in this panel.

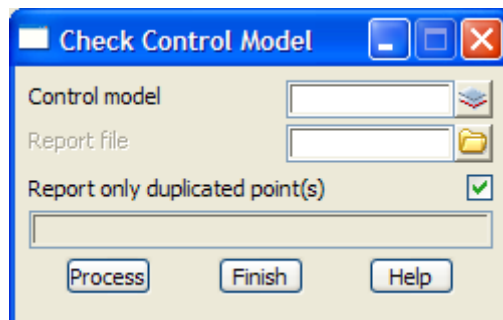

Check Control Model

[check_control_model](#)

Position of option on menu: Survey =>Extras =>Check Control model

The **Check control model** option checks that there are no points in the control model with the same point id. A report of all the points in the control models, or only those with clashing point ids, is created.

Selecting **Check control model** brings up the **Check Control Model** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control model <i>the model the check for unique point ids.</i>	model box		available models

Report file file box *.rpt files
if non-blank, the name of the file to write the report to.

Report only duplicated point(s) tick box ticked
*if ticked, only those points with duplicated point ids are reported.
If not ticked, all points in the control model are written out.*

Process button
check the Control model for duplicated point ids.

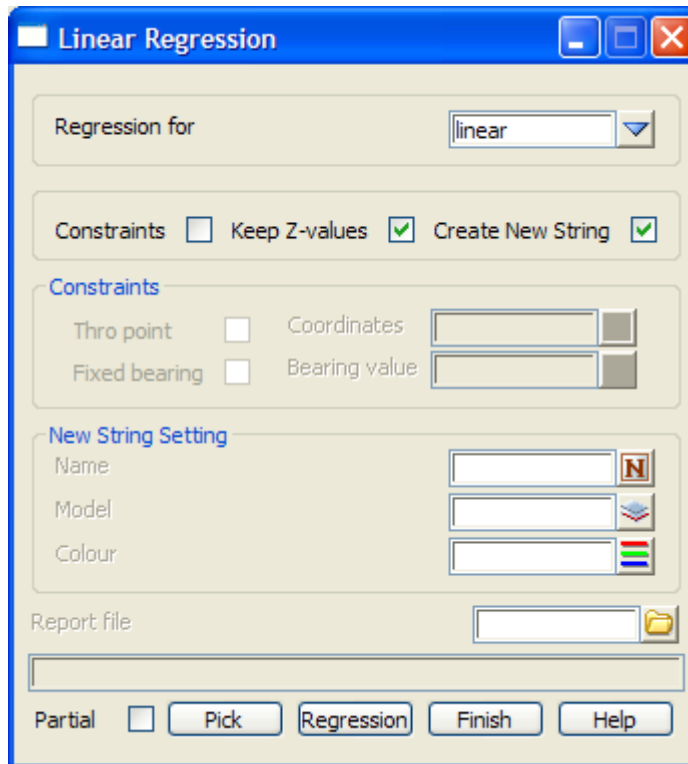

Linear Regression

linear_regression

Position of option on menu: Survey =>Extras =>Linear regression

The linear regression option will create a line, circle or arc of best fit through points on a string. The line can be constrained to go through a selected point or have a given bearing.

Selecting linear regression brings up the **linear regression** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Regression for	choice box	line	line, circle, arc
<i>if line/circle/arc, the line/circle/arc of best fit through the points is created.</i>			

Constraints	tick box		
<i>if tick, the regression line can be restrained to go through a selected point or be given a selected bearing.</i>			

Keep z-values	tick box	tick	
<i>if tick, the z-values of the selected string are used on the regression string.</i>			

Create new string	tick box	tick	
<i>if tick, a new adjusted string is created. If not tick, the selected string is adjusted.</i>			

Constraints

Thro point	tick box	
<i>if tick, the regression line is constrained to go through the point with co-ordinates given in the Coordinates field.</i>		

Coordinates	
<i>if thro point is ticked, the regression line is constrained to go through the point given in this field.</i>	

Fixed bearing tick box

if tick, the regression line is constrained to have the bearing given in the Bearing value field.

Bearing value

*if **thro point** is ticked, the regression line is constrained to have the bearing given in this field.*

Name name box

if non-blank, the name of the new string. If blank, the original string name is used.

Model model box available models

if non-blank, the model of the new string. If blank, the original string model is used.

Colour colour box available colours

if non-blank, the colour of the new string. If blank, the original string colour is used.

Report file *.rpt files

if non-blank, a report for the adjustment is created with this name. If non-blank, no report is created.

Partial tick box

if tick, only part of the string is used in the regression.

Pick button

select the string to create a regression line/circle/arc from.

Regression button

perform the regression.

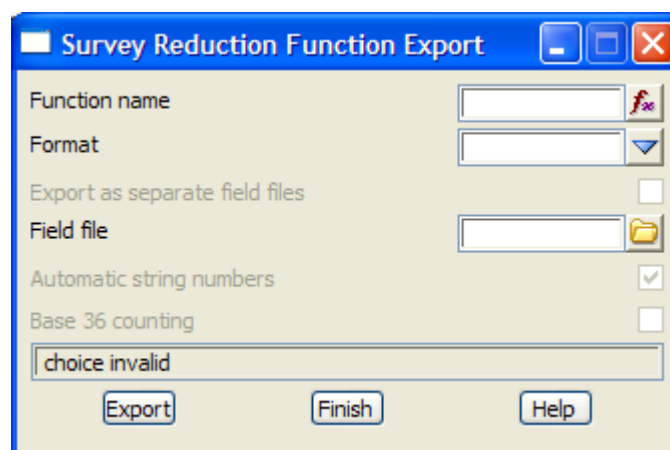

Survey Function to Field File

[survey_reduction_function_export](#)

Position of option on menu: Survey =>Extras =>Reduction to field file

The reduction to field file option writes out the field data from a Survey function to a file in the standard 12d field file format.

Selecting reduction to field file brings up the **survey reduction function export** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	input		available Survey functions

name of the 12d Survey function to write out a 12d field file for.

Field file input *.fld
name of the 12d field file to write out the Survey field data to.

Export button
create the 12d field file.

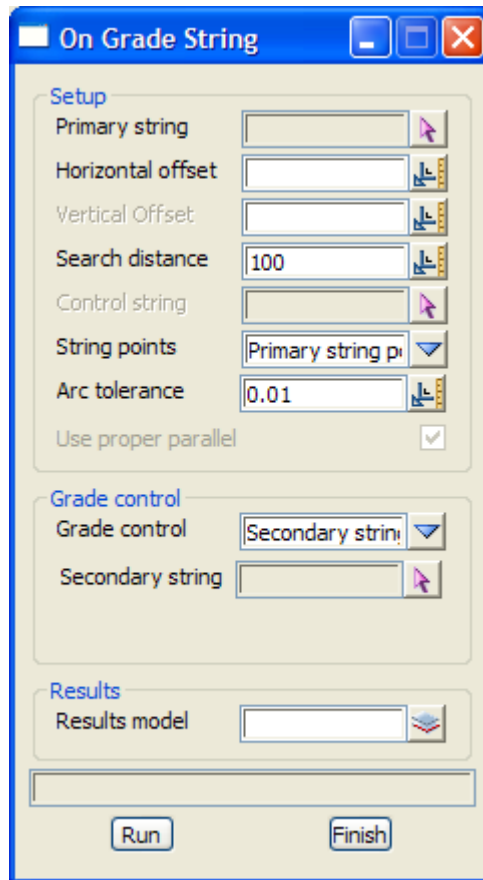

On Grade

on_grade_string

Position of option on menu: Survey =>Extras =>On grade

The on grade option produces a string that is a fixed horizontal distance from a selected string with z-values produced by extrapolating the grade from two strings or from a tin.

Selecting On grade brings up the **On Grade String** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Primary string <i>string to produce the on grade string from</i>	string select		
Horizontal offset <i>horizontal distance to offset the on grade string from the primary string</i>	input		
Vertical offset	input		

vertical distance to offset the on grade string from the primary string

Search distance input

Control string string select

if selected, the horizontal distance is measured at right angles to the control string. In this case, the on-grade may not be parallel to the primary string.

If not selected, the horizontal distance is measured at right angles to the primary string.

String points choice box Primary string points
Chainage interval
Special chainage file

if Primary string points, the on-grade string has vertices on it where ever there is a vertex on the primary string. Extra points will also be include for the given arc tolerance.

Arc tolerance input

if non zero, chord to arc tolerance to use for adding additional vertices

Use proper parallel tick box

if tick, the primary string is paralleled to from the on-grade string

If Chainage interval, vertices are created on the on-grade string corresponding to the given chainage interval along the primary/control string.

Interval input

the chainage interval the use along the primary/control string for creating on-grade vertices.

If Special chainage file, vertices are created on the on-grade string from chainages on the primary or control string, corresponding to the special chainages file.

Special chainages file box .spc files

the chainage interval the use along the primary/control string for creating on-grade vertices.

Grade control choice box Secondary string
Tin

if Secondary string, the grade to use to create z-values on the on-grade string is the grade between the secondary string and the primary string.

Secondary string string select

the grade to use is taken from the secondary to the primary string

If Tin, .

Tin tin box

the tin to use

Offset input

the offset.

Results model model box available models

the model for the created on-grade string

Run button

create the on grade string

Setout

setout

Position of menu: Survey =>Setout

Options still under development.

The setout walk-right menu contains options for creating points numbers and files for uploading to data recorders.

The setout walk-right menu is

setout centres of string curves
create text at centre of HIP's
setout lip line
create setout points
Create setout points using super strings

For *Create centres of string curves*, go to the section "Create Centre Points for Curves of Strings"

Create x,y,z,text of centres of HIPs "Create X Y Text for Centre Points of Alignments" .

Setout lip line "Setout Lip Line" .

Setout points "Create Setout Points" .

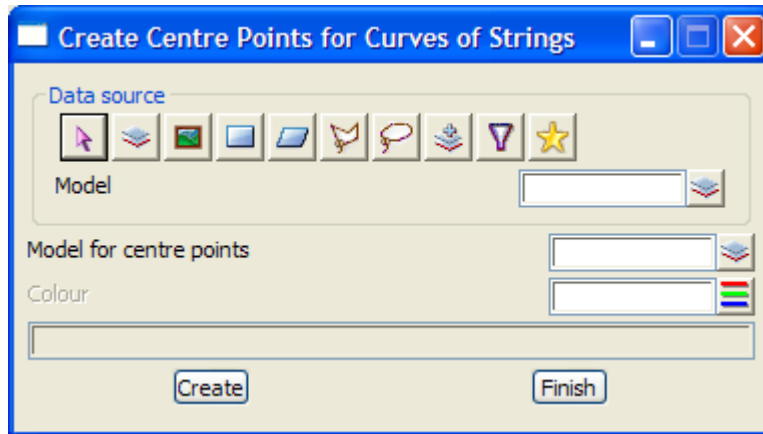

Setout points using super string "Create Setout Points Using Super String" .

Create Centre Points for Curves of Strings

[create_centre_points_for_curves_of_strings](#)

Position of option on menu: Survey =>Setout =>Create centres of string curves

This option is used to create points at the centres of arcs in alignment strings, polylines, arcs or circles.

The fields and buttons used in this panel have the following functions:

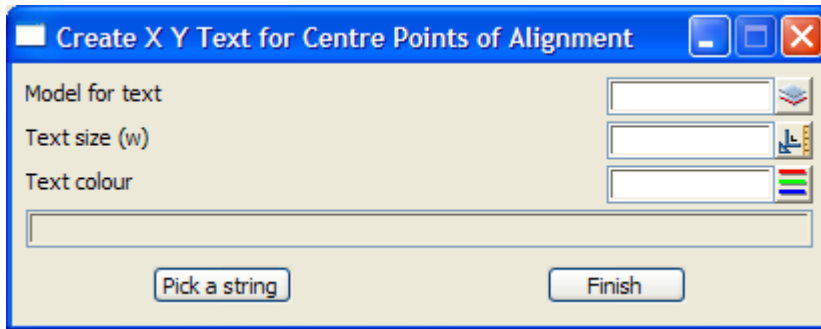

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source			
<i>data source for strings to process</i>			
Model for centre points	input box		
<i>model for the created points</i>			
Colour	colour box		available colours
<i>colour of centre points</i>			
Create	button		
<i>create the points</i>			

Create X Y Text for Centre Points of Alignments

mark_centre_panel

Position of option on menu: Survey =>Setout =>Create x y text of centres of HIPs

This option creates text for the x and y co-ordinates of the horizontal arcs on an alignment string.

The fields and buttons used in this panel have the following functions:

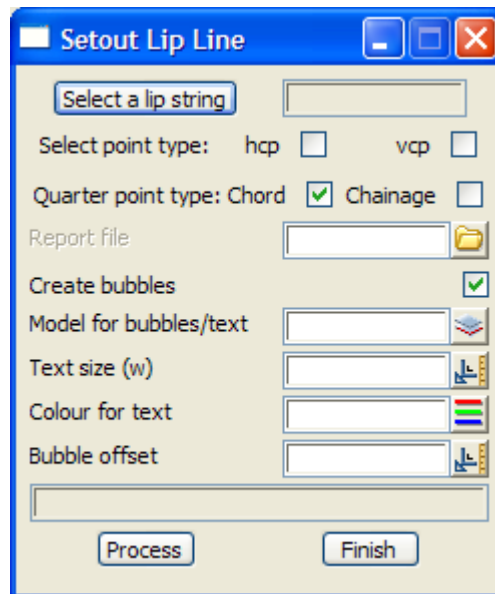

Field Description	Type	Defaults	Pop-Up
Model for text <i>model for the text of the x and y co-ordinates</i>	input box		
Text size (w) <i>size of text in world units.</i>	input box		
Text colour <i>colour of text</i>	input box		
Pick a string <i>select string to create text for.</i>	button		

Setout Lip Line

qtrpts_panel

Position of option on menu: Survey =>Setout =>Setout lip line

This panel is used to create bubbles and/or a report for the critical horizontal and vertical points and quarter points (by chord or by chainage) for any arcs in an alignment string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select a lip string <i>pick the alignment string to have bubbles created for.</i>	string select		

Select point type:

hcp <i>if tick, the horizontal tangent points are included.</i>	tick box	
---	----------	--

vcp <i>if tick, the vertical tangent points are included.</i>	tick box	
---	----------	--

Quarter point type:

Chord <i>if tick, the quarter points by chord distance are included.</i>	tick box	tick
--	----------	------

Chainage <i>if tick, the quarter points by chainage distance are included.</i>	tick box	
--	----------	--

Report file <i>name of the report file.</i>	input box	
---	-----------	--

Create bubbles <i>if tick, bubbles are created with the string name and bubble number inside.</i>	tick box	tick
---	----------	------

Model for bubbles/text input box

model for the bubbles and text.

Text size (w) input box

size (in world units) for the text inside the bubble.

Colour for text input box

Colour for the bubble and bubble text.

Bubble offset input box

offset distance from the alignment string to place the bubble.

Process button

run the option.

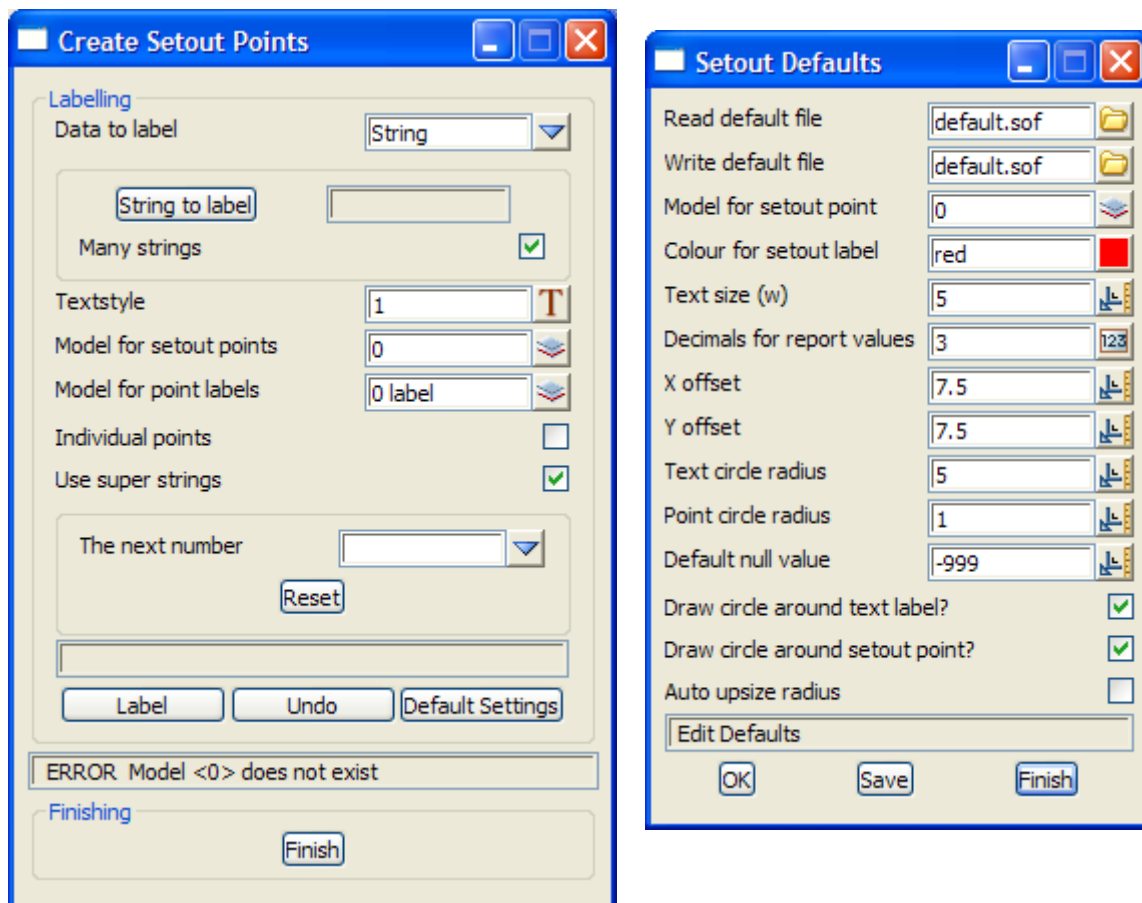

Create Setout Points

setout_panel

Position of option on menu: Survey =>Setout =>Setout points

This panel is used to create points with numbers for use in setting out data. This option is usually run before the option to create an instrument upload file. The setout point is created as a 4d string with the point at the data point and with the point id as the text for the 4d string, with a text size of zero.

Separate text for the numbers and circles surrounding the data points and the text numbers are also created. By default, a file called "defaults.sof" is read in containing settings required for the option.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Textstyle <i>textstyle for the created point ids</i>	input box	1	
Model for setout points <i>model to place the setout points in</i>	input box	0	
Model for points labels <i>model to place the setout point ids and circles in.</i>	input box	0	
Individual points	tick box		

*if tick, the setout points are created as point strings
If not tick, individual one point strings are created.*

Use super strings tick box tick

if not tick, super strings are created for the setout points. The super string point id is set to the setout point id.

If not tick, 4d strings are created for the setout points strings with the 4d text as the setout point id (with text size set to zero).

The next number input box 1 or highest number in model for setout points

*next numeric point id to use for creating point ids. If a **Model for setout points** is given, the model is searched for any super strings or 4d strings with numbers as text and the **The next number** is set to one more than the highest numeric point id in the model.*

Reset button

*reset the **The next number** to the highest point in the model for setout points.*

Data to label input box string string, model, view, point

type of data source.

Model/View/String/Point to output box

data to create point ids for.

Many points/strings tick box tick

*if tick, the each time a string/point is selected, the string/point is processed without having to click on the **Label** button. After a string/point is processed, another string/point can then be selected.*

*If not tick, the **Label** button must be clicked before the selected string/point is processed.*

Label button

create setout points and circles for the selected data.

Undo button

undo the last setout points and s created whilst the panel has been up.

Default settings button

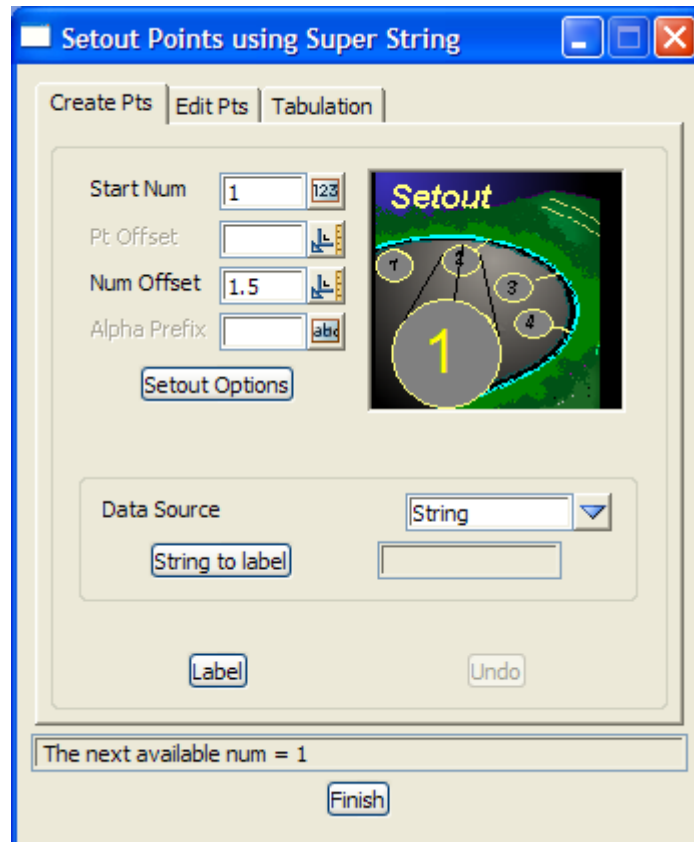

default settings for the s. These can be read in from a file.

Create Setout Points Using Super String

super_setout_panel

Position of option on menu: Survey =>Setout =>Setout points using super string

This panel is used to create points with numbers for use in setting out data. This option is usually run before the option to create an instrument upload file

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Not yet documented.			

Upload

survey_upload

Position of menu: Survey =>Upload

The Survey Upload walk-right menu contains survey options to upload data the most survey instruments. There are options to upload points, triangulations and road geometry.

The Survey Upload walk-right menu is

- Create triangle upload file
- Create points upload file
- Create roads upload file
- Create points upload file (new) - only for *Trimble Link*
- Create roads upload file (new) - only for *Leica XML* and *Trimble Link*
- Upload data to instrument/device

For the option <i>Create triangle upload file</i>	go to	"Create Triangle Upload File"
<i>Create points upload file</i>		"Create Points Upload File"
<i>Create road upload file</i>		"Create Road Upload File"
<i>Create points upload file (new)</i>		"Create Points Upload File (New)"
<i>Create road upload file (new)</i>		"Create Road Upload File (New)"
<i>Upload</i>		"Survey Data Upload"

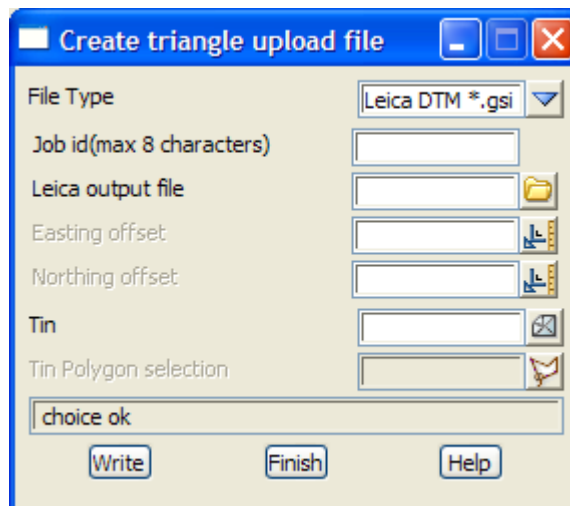

Create Triangle Upload File

create_triangle_upload_file

Position of option on menu: Survey =>Upload => Create triangle upload file

The Create triangle upload file option allows the creation of a triangle file based on a tin. Various file formats can be selected

Selecting Create triangle upload file brings up the Create triangle upload file panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Common parameters at bottom:

Tin input
name of tin from which the triangle file will be based.

Tin polygon selection selection
allows the user to select a specific area of the tin to be exported as a triangle file.

Write button
On clicking the write button, 12d Model will write the specified file.

File type	choice box	Trimble binary *.ttm Leica DTM *.gsi 12d xyzs *.dat Ortho 12d *.T12 Sokkia *.tri TP Setout/Stakeout *.tsa LandXML *.xml
-----------	------------	---

file type to be produced.

For Trimble *.ttm format:

Use Trimble Link tick box
if tick, Trimble Link is used to create the data

Upload directly to Trimble device tick box
if tick, the data is uploaded to the Trimble instrument

Job name input
Trimble job name

TTM output file input
name of file to be produced.

For Leica DTM *.gsi format:

Job id input
job id to be included in file. (max 8 characters)

Leica output file input
name of file to be produced

Easting offset input
easting offset to be applied to data. This is important where large coordinate values are used, such as in map projections.

Northing offset input
northing offset to be applied to data. This is important where large coordinate values are used, such as in map projections.

For 12D xyzs *.dat format:

12d output file input
name of file to be produced

For Ortho 12d *.T12 format:

File Type Ortho 12d *.T12

Ortho 12d output file 

Ortho 12d output file input
name of file to be produced

For Sokkia *.tri format:

File Type Sokkia *.tri

Sokkia output file 

Sokkia output file input
name of file to be produced

For TPSetout/Stakeout *.tsa format:

File Type TP Setout/Stake

TP Setout/Stakeout file 

Tp Setout/Stakeout file input
name of file to be produced

For TPSetout/Stakeout *.tsa format:

File Type LandXML *.xml

LandXML file 

LandXML file input
name of file to be produced

Create Points Upload File

instrument_points_upload_panel

Position of option on menu: Survey =>Upload => Create points upload file

The Create points upload file option allows the creation of a file of point ids, x, y and z, for string data (super strings and 4d strings only). Various file formats can be selected

Selecting Create points upload file brings up the **Create Instrument Points Upload File** panel.

Upload files for points can be created for various Leica, Geodimeter, Sokkia, Topcon, UPL, QuikDraw, Trimble XYZ formats as well as a text file of point id, x,y,z data.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Instrument choices <i>type of output format</i>	choice box	report_xyz	available instruments
Output z values <i>if tick, z-values are output - only used for Geodimeter formats</i>	tick box		
Create new job on SDR 33 <i>if tick, create a new job on SDR33 - only used for Sokkia formats</i>	tick box		
Left justify fields	tick box		

if tick, each field is left justified - only used for Sokkia formats

User definable terminator input box &
terminator to use - only used for Geodimeter formats.

Default char for blank name input box z
character used for blank names - only used for Geodimeter formats.

Data source of setout points Model
data selection type - for a full description go to “Data Source” in the chapter “Tools and Concepts”

Data source
data source of setout points to create the upload file from.

Number of decimal places input box 3
number of decimal places for x, y and z values.

Default for null value input box -9999
value to write for null z-values.

Start point id input box
point id to start creating upload file from.

End point id input box
last point id to write to upload file.

Note: Start and End point ids may be left blank, and all point ids (whether numeric or alpha-numeric) will be written to the upload file.

Origin x/Origin y input box
If non-zero, subtract the value from the x/y value before writing out.

Upload file file box
name of the upload file to create.

Get Point Range button
pressing this button will populate the Start and End point id fields with the minimum and maximum (numeric) point ids found in the selected source data. If the selected source data contains a mix of numeric and alpha-numeric point ids, the alpha-numeric point ids are considered to have a numeric value of zero (0), but are ignored when determining the range. If the selected source data contains alpha-numeric point ids only, then the Start and End point id fields will both be set to zero (0).

Write File button
create the upload file

Create Road Upload File

instrument_roads_upload_panel

Position of option on menu: Survey =>Upload => Create roads upload file

The Create roads upload file option allows the creation of a specific roading file. Files can be created for various Leica (8 & 16 formats), Geodimeter, Sokkia, Topcon and Trimble Roding formats.

Selecting Create road upload file brings up the **Create Roding Upload File** panel

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Instrument choices	choice box		Geodimeter Roadline 3d Leica Road Plus 8 Leica Road Plus 16 LMGS - D45 Sokkia Roding - Alignment Road Sokkia Roding - String Road Topcon MS2000 Topcon GTS-700 Roads Trimble Roding

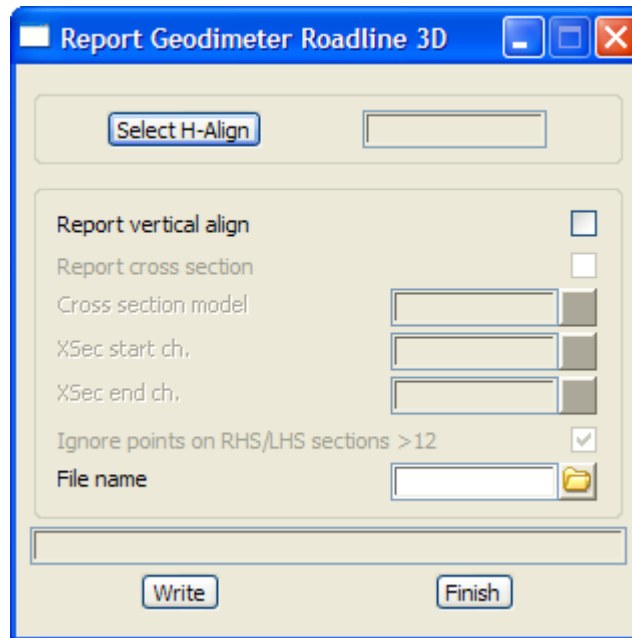

For choice of <i>Geodimeter Roadline 3d</i> , go to the	"Geodimeter Roadline 3D file"
<i>Leica Road Plus 8</i>	"Leica road plus 8 / 16 file" .
<i>Leica Road Plus 16</i>	"Leica road plus 8 / 16 file" .
<i>LMGS - D45 file</i>	"LMGS - D45 file" .
<i>Sokkia Roding - Alignment road</i>	"Sokkia Roding - Alignment Road file" .
<i>Sokkia Roding - String road</i>	"Sokkia Roding - String Road file" .
<i>Topcon MS2000</i>	"Topcon MS2000 Roding file" .
<i>Topcon GTS-700 Roads</i>	"Topcon GT700 Roding File" .
<i>Trimble Roding</i>	"Trimble Roding File" .

Geodimeter Roadline 3D file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Geodimeter Roadline 3d

The Geodimeter Roadline 3d option allows the creation of a specific roading file.

Selecting Geodimeter Roadline 3d brings up the **Report Geodimeter Roadline 3D** panel

The Geodimeter (trimble), has certain limitations and criteria associated with the 3d file. These include:

1. Each section template (i.e. right or left) has a max number of 12 points.
2. The first and last segments of the alignment must be a straight (for both horizontal and vertical).
3. The start and end chainages of the horizontal alignment should be the same for the vertical alignment.
4. The alignment string must exist on the xsec's. This allows the calculation of the "zero pt" so we can split the section into left and right templates.
5. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
6. The alignment string cannot exist above or below the xsection. I.e. it should be on the section as per 4)
7. The number of points on assuasive section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, cannot handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections is the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select H-Align <i>select valid alignment string.</i>	Select box		
Report vertical alignment <i>write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.</i>	tick box	no	
Report cross sections	tick box	no	

if selected, the cross section model box will be enabled.

Cross section model model box

This will ask for the model of cross sections. These sections will be written out to the file.

XSec start ch input box min alignment ch
chainage value to start writing cross sections.

XSec end ch input box max alignment ch
chainage value to end writing cross sections.

Ignore points on RHS/LHS sections >12
 tick box ticked

if ticked, where there are more than 12 points in either the RHS or LHS template (derived from the xsection) the outlying points are ignored. e.g. if there was 14 points on the RHS template, only 12 will be written to the file with 2 pts being ignored.

File name input box
the name to be used for file creation

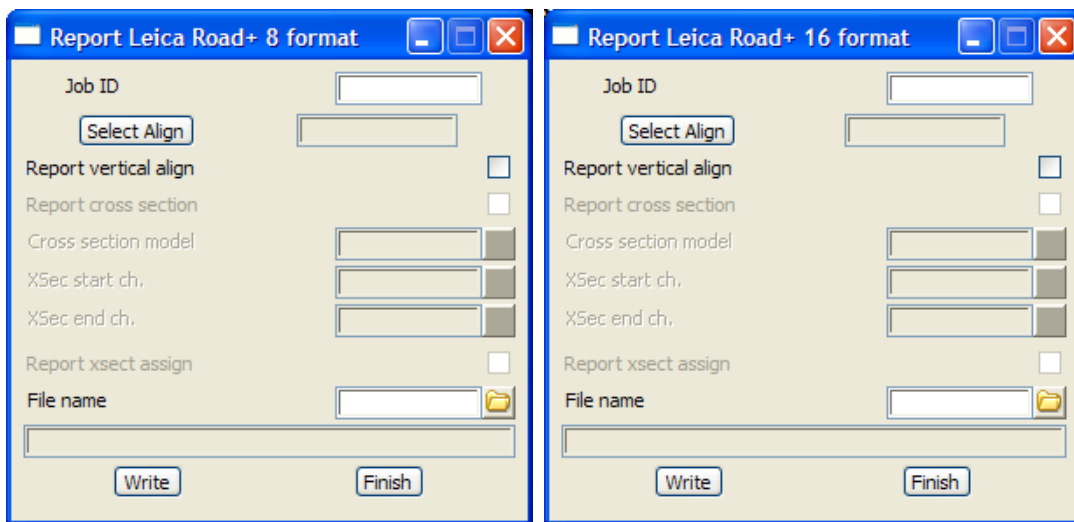

Write button
write appropriate files.

Leica road plus 8 / 16 file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Leica roadplus 8 or Leica roadplus 16

The Leica roadplus 8 and Leica roadplus 16 options allow the creation of specific Leica roading files.

Selecting Leica roadplus 8 brings up the **Report Leica roadplus 8** panel.
 Selecting Leica roadplus 16 brings up the **Report Leica roadplus 16** panel.

The 8 and 16 formats are different file formats for the leica range of instruments. The user should be aware of the required format for the particular instrument. Please refer to the Leica documentation for specifications

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

- Job id** input box
job id (max 8 characters).
- Select alignment** String select box
select valid alignment string.
- Report vertical alignment** tick box no
*write vertical alignment details to file mode. If yes vertical alignment details written to appropriate file. i.e. (PRF*****.gsi)*
- Report cross sections** tick box no
if selected, the cross section model box will be enabled.
- Cross section model** model box
*This will ask for the model of cross sections. These sections will be written out to the appropriate file. i.e. (CRS*****.gsi)*
- XSec start ch** input box min alignment ch
chainage value to start writing cross sections.
- XSec end ch** input box max alignment ch
chainage value to end writing cross sections.
- Report cross section assignment** tick box no
*If ticked, a cross section assignment file (STA*****.gsi) file will be made.*
- File name** input box
the name to be used for file creation. NB depending on what files are specified, the name given will be appended with the correct prefix eg ALN for alignment file. As Leica only takes 8 character file names, the name may be truncated.
- Write** button
write appropriate files.

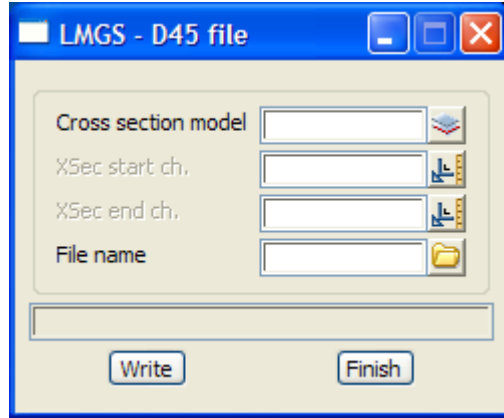

LMGS - D45 file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = LMGS - D45 file

The LMGS - D45 file option allows the creation of a specific file format suitable for upload to Leica's grader and paver control systems. The format has a number of rules that must be satisfied for correct file creation. These include:

1. There must be an equal number of points on each section
2. Points should not be closer than 5cm in both directions
3. Azimuth changes between cross section points should not be greater than 20gon (18 degrees).

Selecting LMGS - D45 file brings up the **LMGS - D45 file** panel

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Cross section model <i>the model of cross sections. These sections will be written out to the file.</i>	model box		
XSec start ch <i>chainage value to start writing cross sections.</i>	input box	min alignment ch	
XSec end ch <i>chainage value to end writing cross sections.</i>	input box	max alignment ch	
File name <i>the name to be used for the file creation. The file will automatically be given a .D45 extension.</i>	input box		
Write <i>write appropriate file.</i>	button		

Sokkia Roding - Alignment Road file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Sokkia Roding - Alignment road

The Sokkia Roding - Alignment road option allows the creation of a specific roding file.

Selecting Sokkia Roding - Alignment road brings up the **SDR Roding - Alignment Road** panel

The sdr33 roading file has certain limitations and criteria. These include:

1. The alignment string must exist on the xsec's. This allows us to calculate the "zero pt" so we can split the template into left and right.
2. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
3. The alignment string cannot exist above or below the xsection. I.e. it should be on the section as per 1).
4. The number of points on adjacent section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections are the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select H-Align <i>select valid alignment string.</i>	Select box		
Road Name <i>input road name. If a valid alignment is selected, the name of that alignment will be the default road name.</i>	input box		Name of selected alignment string
Report vertical alignment <i>write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.</i>	tick box	no	
Assume last XSec segment is sideslope			

tick box ticked

if box is selected, the last segments left and right of 0.0 offset are considered to be side slopes, and the default cut and fill slope fields are enabled.

Default cut slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

*When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a fill sideslope is calculated, the cut sideslope definition in the file will be given the value as entered into the **default cut slope** field. If no value is set for the default, the cut slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Default fill slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

*When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a cut sideslope is calculated, the fill sideslope definition in the file will be given the value as entered into the **default fill slope** field. If no value is set for the default, the fill slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Cross section model model box

This will ask for the model of cross sections. These sections will be written out to the file.

XSec start ch input box min alignment ch

chainage value to start writing cross sections

XSec end ch input box max alignment ch

chainage value to end writing cross sections

File name input box

the name to be used for file creation

Write button

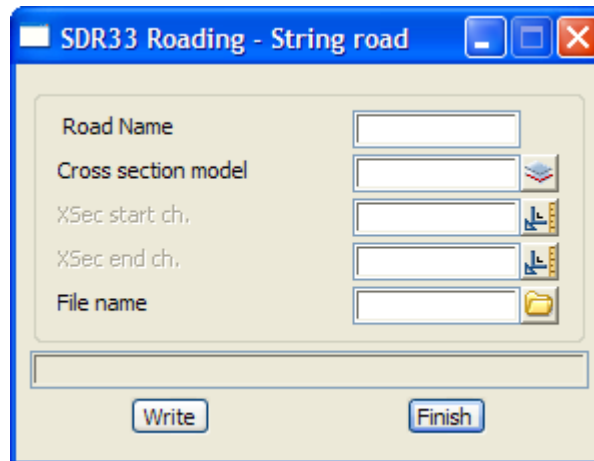

write appropriate file

Sokkia Roding - String Road file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Sokkia Roding - String road

The Sokkia Roding - String road option allows the creation of a specific string roading file.

Selecting Sokkia Roding - String road brings up the **SDR Roding - String Road** panel

The fields and buttons used in this panel have the following functions:

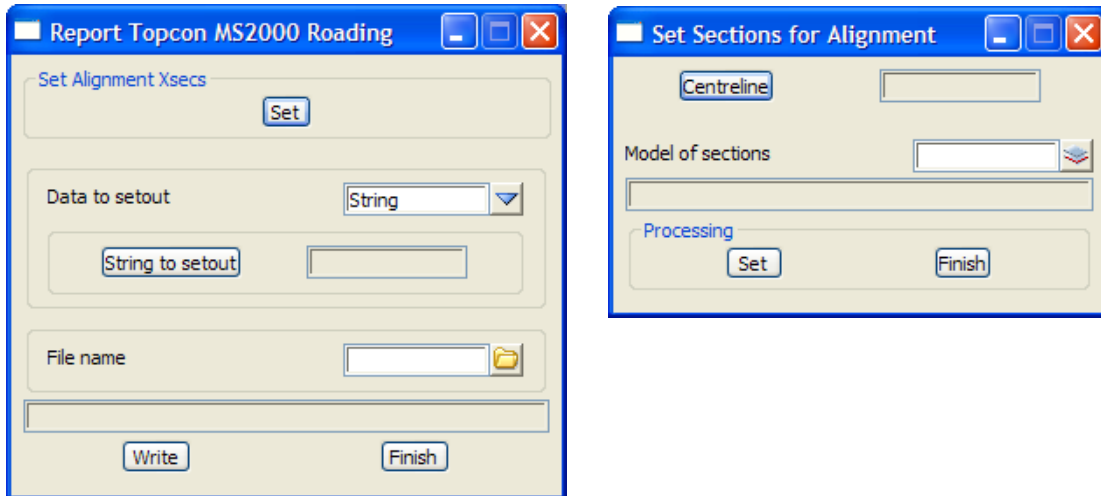

Field Description	Type	Defaults	Pop-Up
Road Name <i>input road name. If a valid alignment is selected, the name of that alignment will be the default road name.</i>	input box	Name of selected alignment string	
Cross section model <i>model of cross sections to write out in SDR33 string format</i>	Model box		available models
XSec start ch. <i>chainage of the first cross sections to write out</i>	input box	min alignment ch	
XSec end ch. <i>chainage of the last cross sections to write out</i>	input box	max alignment ch	
File name <i>the name to be used for file creation</i>	file box		
Write <i>write appropriate file.</i>	button		

Topcon MS2000 Roding file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Topcon MS2000

The Topcon MS2000 option allows the creation of a specific roding file.

Selecting Topcon MS2000 brings up the **Report topcon MS2000 Roding** panel

The fields and buttons used in this panel have the following functions:

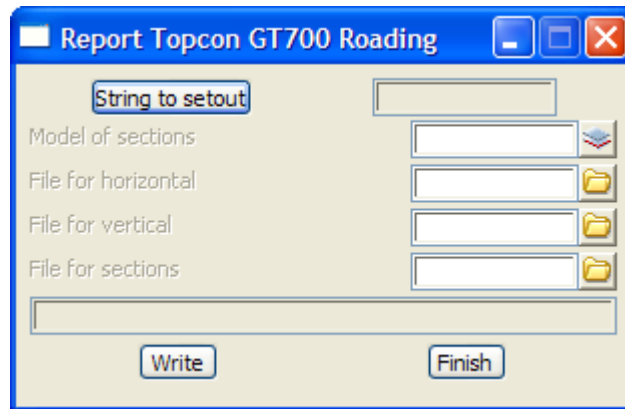

Field Description	Type	Defaults	Pop-Up
Set	button		Set section for alignment panel
<i>the set button will bring up the set sections for alignment panel. This panel allows the user to select multiple alignment/xsection combinations for the one file. The alignment is selected (using the Centreline selection button) followed by the Model of sections for that alignment. The Set button is pressed to accept the selection. This can be repeated for a number of alignments. Finish will close the set sections for alignment panel and return to the original panel</i>			
Data to setout	choice box	string	model view string
<i>the data to be included in the file can be selected by choosing a valid model, view or string. Depending on which data source is selected, the appropriate selection button will appear. The user then selects the button and then the items of interest.</i>			
File name	input box		
<i>the name to be used for file creation</i>			
Write	button		
<i>write appropriate files.</i>			

Topcon GT700 Roding File

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Topcon GTS-700 Roads

The Topcon GTS-700 Roads option allows the creation of a specific roding file.

Selecting Topcon GTS-700 Roads brings up the **Report Topcon GT700 Roding** panel

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

String to setout	select button		
-------------------------	---------------	--	--

after pressing the string to setout button, the user can select a valid string. This string will be used for setting out.

Model of sections	model box		
--------------------------	-----------	--	--

the model of cross sections. These sections will be written out to the file.

File for horizontal	input box		
----------------------------	-----------	--	--

the name to be used for horizontal file creation. The file will automatically be given a .hg extension.

File for vertical	input box		
--------------------------	-----------	--	--

the name to be used for the vertical file creation. The file will automatically be given a .vg extension.

File for sections	input box		
--------------------------	-----------	--	--

the name to be used for the section file creation. The file will automatically be given a .xs extension.

Write	button		
--------------	--------	--	--

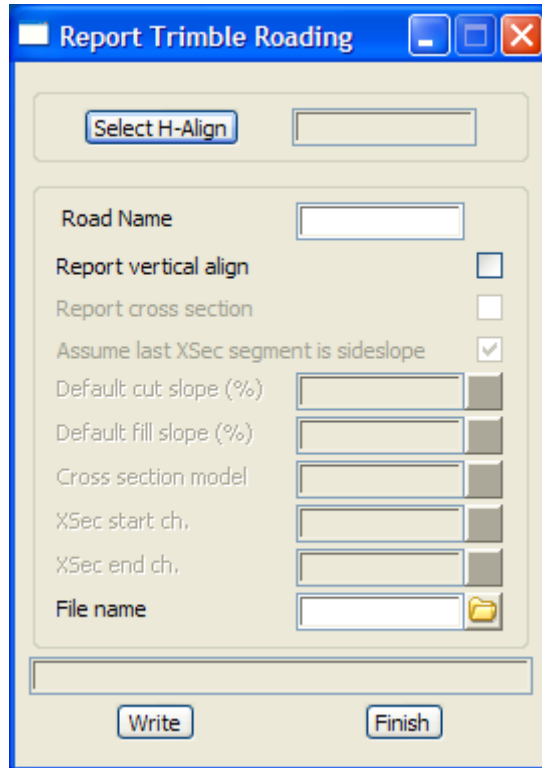

write appropriate files.

Trimble Roding File

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Trimble Roding

The Trimble Roding option allows the creation of a specific roding file.

Selecting Trimble Roding brings up the **Report Trimble Roding** panel

The trimble DC file has certain limitations and criteria. These include:

1. The alignment string must exist on the xsec's. This allows us to calculate the "zero pt" so we can split the template into left and right.
2. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
3. The alignment string cannot exist above or below the xsection. I.e. it should be on the section as per 1).
4. The number of points on assuasive section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections are the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select H-Align <i>select valid alignment string.</i>	Select box		
Road Name <i>input road name. If a valid alignment is selected, the name of that alignment will be the default road name.</i>	input box		Name of selected alignment string
Report vertical alignment <i>write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.</i>	tick box	no	
Assume last XSec segment is sideslope <i>tick box ticked</i>	tick box	ticked	

if box is selected, the last segments left and right of 0.0 offset are considered to be side slopes, and the default cut and fill slope fields are enabled.

Default cut slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

*When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a fill sideslope is calculated, the cut sideslope definition in the file will be given the value as entered into the **default cut slope** field. If no value is set for the default, the cut slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Default fill slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

*When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a cut sideslope is calculated, the fill sideslope definition in the file will be given the value as entered into the **default fill slope** field. If no value is set for the default, the fill slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Cross section model model box

This will ask for the model of cross sections. These sections will be written out to the file.

XSec start ch input box min alignment ch

chainage value to start writing cross sections.

XSec end ch input box max alignment ch

chainage value to end writing cross sections.

File name input box

the name to be used for file creation

Write button

write appropriate files.

Create Points Upload File (New)

create_points_upload_file

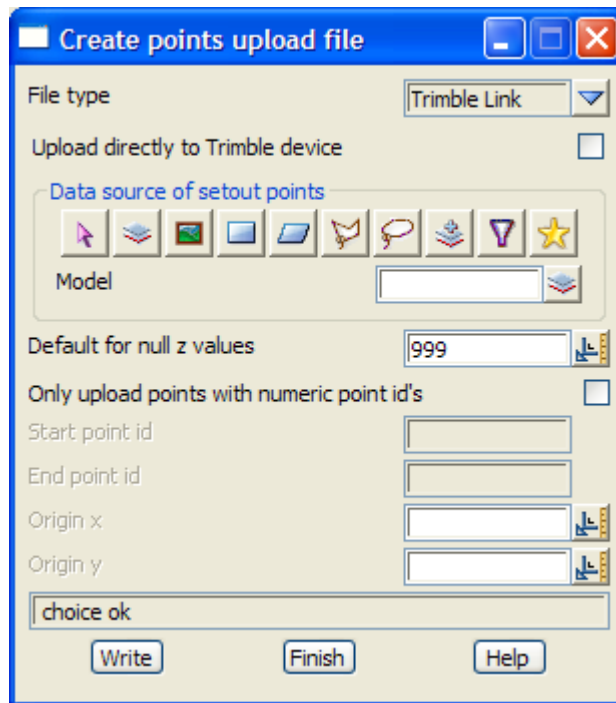

Position of option on menu: Survey =>Upload => Create points upload file (new)

This option is still under development.

The Create points upload file (new) option creates or uploads directly to a Trimble instrument a file of point ids, x, y and z, for string data (super strings and 4d strings only).

Only Trimble file formats is supported as this stage - the option Create points upload file ("Create Points Upload File") is used to create files for most other instruments.

Selecting Create points upload file (new) brings up the **Create Points Upload File** panel.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Upload directly to Trimble device	tick box		
<i>if tick, the points are uploaded to the attached Trimble instrument</i>			
<i>if not tick, a dc file will be created.</i>			

Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			

Data source		Model	
<i>source of data is to be processed.</i>			

Default for null value	input box	999	
<i>value to write for null z-values.</i>			

Only upload points with numeric point names	tick box		
<i>if tick, only points with numeric (integer) point names are used.</i>			
<i>if not tick, alphanumeric point names are used.</i>			

Start point id	input box		
-----------------------	-----------	--	--

point id to start creating upload file from.

End point id input box

last point id to write to upload file.

Note: Start and End point ids may be left blank, and all point ids (whether numeric or alpha-numeric) will be written to the upload file.

Origin x/Origin y input box

If non-zero, subtract the value from the x/y value before writing out.

Upload File button

create the upload file

Create Road Upload File (New)

create_road_upload_file

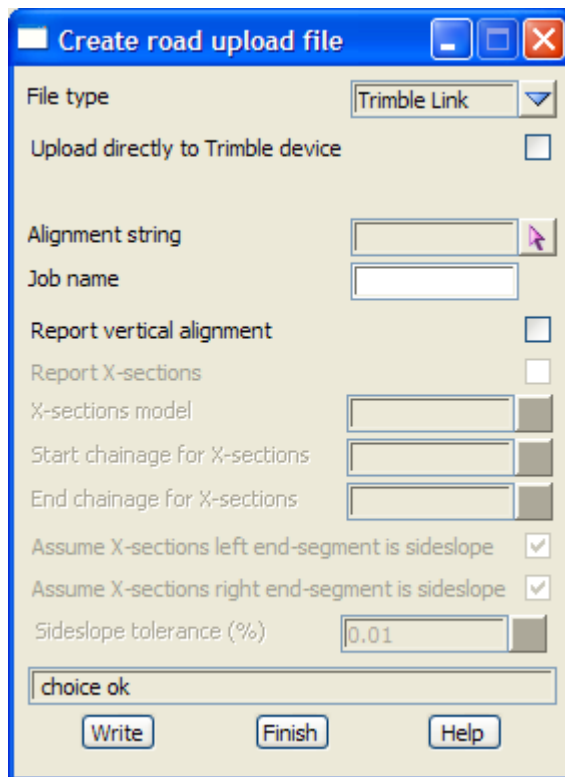

Position of option on menu: Survey =>Upload => Create road upload file (new)

This option is still under development.

The Create road upload file (new) option allows the creation of road files or uploads directly to a Trimble instrument and Leica using *Leica XML* format.

Only *Trimble* and *Leica LandXML* file formats are supported as this stage- the option Create road upload file (“Create Road Upload File”) is used to create files for most other instruments.

Selecting Create road upload file (new) brings up the **Create Road Upload File** panel

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
File type	choice box		Trimble Link Leica X-sections LandXML

For the choice *Trimble Link*, go to "Trimble Link"
Leica X-Sections LandXML "Leica X-Sections LandXML"

Trimble Link

Position of option on menu: Survey =>Upload => Create roads upload file (new), File type = Trimble Link

The Trimble Link options creates a file in Trimble dc format or uploads the date directly to the instrument using *Trimble Link*.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Upload directly to Trimble device tick box

*if tick, the points are uploaded to the attached Trimble instrument
if not tick, a dc file will be created.*

Alignment string String select box

select valid alignment string.

Road Name input box Name of selected alignment string

input road name. If a valid alignment is selected, the name of that alignment will be the default road name.

Report vertical alignment tick box

If tick, vertical alignment details written to file.

Report cross sections tick box

if tick, the cross section model box will be enabled.

X- sections model model box

model of cross sections to be written out.

Start chainage for X-sections

chainage value to start writing cross sections. If blank, start with first x-section.

End chainage for X-sections

chainage value to stop writing cross sections. If blank, end with last x-section.

Assume X-sections left end-segment is sideslope tick box

If tick, left end segments are tagged as sideslopes.

Assume X-sections right end-segment is sideslope tick box

If tick, right end segments are tagged as sideslopes.

Sideslope tolerance (%) input 0.01

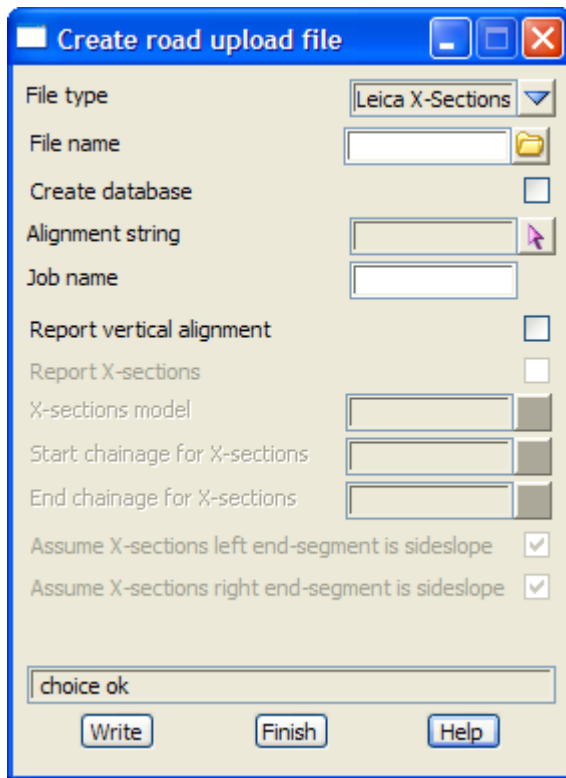

Write button

write out or upload the data.

Leica X-Sections LandXML

Position of option on menu: Survey =>Upload => Create roads upload file (new), File type = Leica X-Sections LandXML

The Leica X-Sections LandXML options creates a file in LandXML format suitable for *Leica* instruments

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
File name <i>the name of the Leica LandXML file.</i>	input box		*.xml
Create database <i>if tick, a DBX file is created</i>	tick box		
Alignment string <i>select valid alignment string.</i>	string select		
Job Name	input box	name of selected alignment string	

input job name. If a valid alignment is selected, the name of that alignment will be the default job name.

Report vertical alignment tick box

if tick, vertical alignment details written to file.

Report cross sections tick box

if tick, the cross section model box will be enabled.

X- sections model model box

available models

model of cross sections to be written out.

Start chainage for X-sections

chainage value to start writing cross sections. If blank, start with first x-section.

End chainage for X-sections

chainage value to stop writing cross sections. If blank, end with last x-section.

Assume X-sections left end-segment is sideslope tick box

If tick, left end segments are tagged as sideslopes.

Assume X-sections right end-segment is sideslope tick box

If tick, right end segments are tagged as sideslopes.

Write button

write out file.

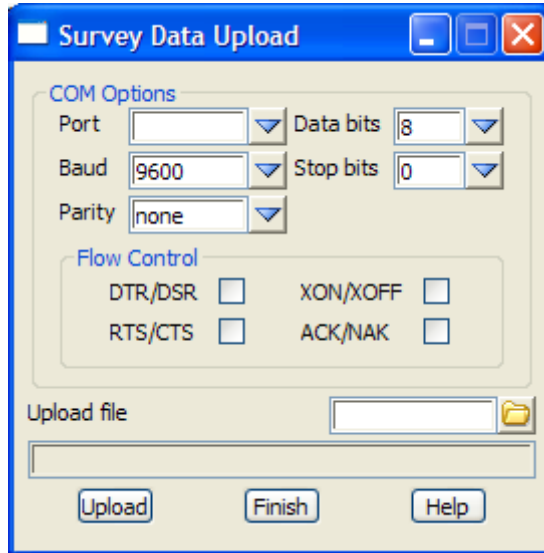

Survey Data Upload

survey_data_upload

Position of option on menu: Survey =>Upload

The **upload** option take data from the computer and sends it to the data collector connected to the computer's serial port.

Selecting **Upload** brings up the **Survey Data Upload** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Port <i>name of the computer serial port that the data collector is connected to. The default port is specified in the data collector configuration file.</i>	input	from configuration file	
Baud rate <i>speed of the serial port</i>	input	from configuration file	
Data bits <i>number of data bits</i>	input	from configuration file	
Stop bits <i>number of stop bits</i>	input	from configuration file	
Parity <i>parity</i>	input	from configuration file	
DTR/DSR <i>if tick, use DTR/DSR flow control</i>	<input type="checkbox"/>	from configuration file	
RTS/CTS <i>if tick, use RTS/CTS flow control</i>	<input type="checkbox"/>	from configuration file	
XON/XOFF <i>if tick, use Xon/Xoff</i>	<input type="checkbox"/>	from configuration file	
ACK/NAK <i>if tick, use ACK/NAK</i>	<input type="checkbox"/>	from configuration file	

Field file input *.fld files

name of the 12d field file that the raw file is to be converted to. The raw file is given the same name but with the extension specified in the configuration file, e.g., ".gre".

Upload button

On clicking the upload button, 12d Model will send the specified file through the serial port and up to the data collector.

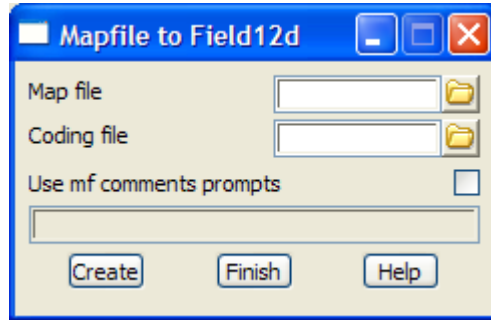

Mapfile to Field 12d

mapfile_to_field12d

Position of option on menu: Survey =>Mapfile to Field 12d

The **Mapfile to Field 12d** option converts a 12d mapfile to an .att file used by Field 12d.

Selecting **Mapfile to Field 12d** brings up the **Mapfile to Field12d** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mapfile <i>name of the 12d mapfile to convert to an .att file.</i>	file box		*.mf
Coding file <i>name of the attribute file to convert the mapfile to.</i>	file box		*.att
Create <i>convert the file.</i>	button		

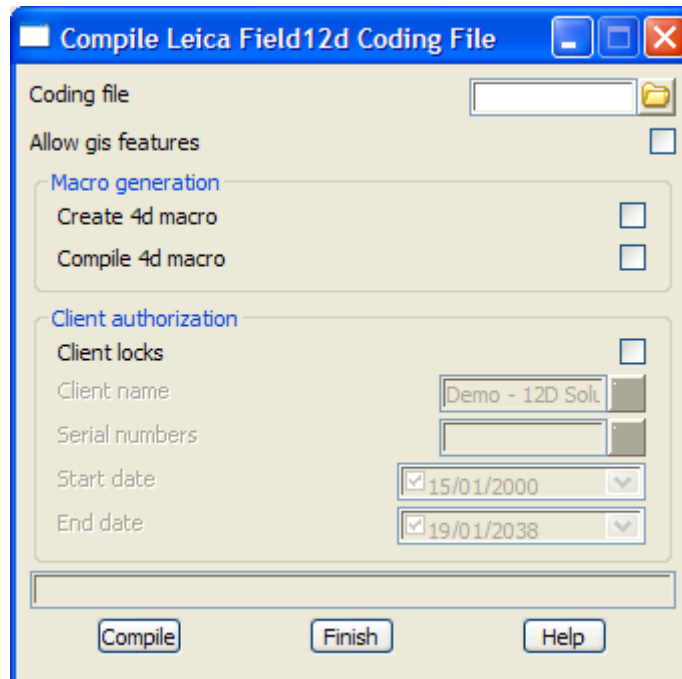

Field 12d

[compile_leica_field12d_coding_file](#)

Position of option on menu: Survey =>Field 12d

The Field 12d option converts a Field 12d .att file to a .bin file for use on the *Leica* (with the Field 12d software).

Selecting Field 12d brings up the **Compile Leica Field 12d Coding File** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Coding file <i>name of the attribute file to create the .bin file for</i>	file box		*.att
Allow gis features <i>if tick, allow gis features in the .bin file</i>	tick box		
Create 12d macro <i>if tick, a 12d Model macro is created</i>	tick box		
Compile 12d macro <i>if tick, the 12d Model macro is compiled</i>	tick box		
Client locks <i>if tick, the 12d Model macro is locked to a particular 12d Solutions client name</i>	tick box		
Client name <i>the 12d Solutions client name that the macro is locked to</i>	input		
Start date <i>start date for running the macro</i>	calendar box		
End date	calendar box		

end date for running the macro

Compile button
create the .bin file and 12d macro (if required).

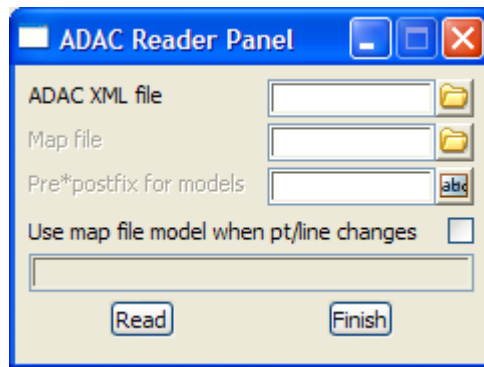

Read Adac XML File

adac_reader_panel

Position of option on menu: Survey =>Adac read

This option is for reading the ADAC XML format. It is under development.

Selecting Adac read brings up the **Adac Reader Panel** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

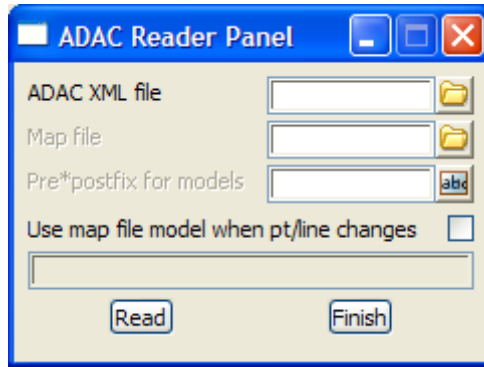

Create Adac XML File

`create_adac_xml_file`

Position of option on menu: Survey =>Adac write

This option is for writing the ADAC XML format. It is under development.

Selecting Adac write brings up the **Write Adac XML File** panel

The fields and buttons used in this panel have the following functions.

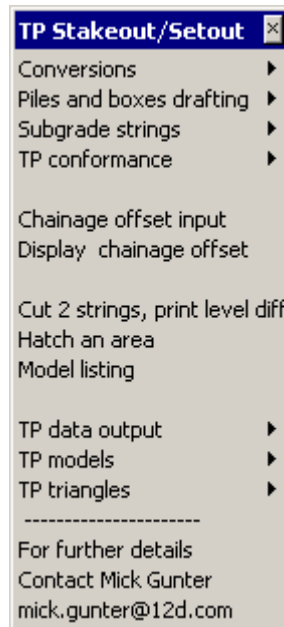

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Templates in 12d Model

In 12d Model, Templates provide a quick and easy method for defining design details along a string for use in conceptual designs and visualizations and even detailed designs.

Any easy way of visualising a template is to look at its affect in a cross section.

A template can be thought of as simply a number of links, which are ultimately defined by width and slope, and are connected sequentially (according to rules for each link type) to form a cross section.

The point defined at the end of each link creates a **string** of the given link name when to template is used to create a design. The default colour of the string is the link colour and polygons created for each link are given the link colour.

For example, a template consisting of just the three links kerb, shoulder, verge could look like:

Cross Section View of a Template

Templates are “applied” to a hinge string at right angles to a user selected reference string to produce a design model. That is, for a given string, specified templates are used as the cross-sectional definition of the geometry at a regular chainage interval down the string.

Both design cross sections and longitudinal strings (created by joining together the same points from each cross section) are created. The longitudinal strings are given the name of the template points used to define them

Plan View of a Template Applied to a String

12d Model supports templates with an unlimited number of fixed links, followed by either

(a) a decisions table

or

(b) an unlimited number of variable cut and fill links and a cut/fill slope to be applied at the end of the last cut or fill template link.

The definition of a template with a fixed link table, a cut and fill tables and the final cut/fill links is discussed under the option **create/edit template**. The definition of the **decision table** is given in the chapter “Advanced Design” .

Fixed Template Links

The **fixed template links** are applied to the selected hinge string and are always used when applying the template regardless of whether the template points are in cut or fill. Each link is defined by two of the three variables, width, height and crossfall, and has a name and colour.

At the end of the fixed links, 12d Model checks to see if a **decisions** table exists.

If a **decisions** table exists, then it is used for the rest of the template.

If **no decision** table exist, then the **cut**, **fill** and **final cut/fill** tables are used.

Template Decisions

The decisions table is used for

- ▲ complicated cut and fill requirements including multiple strata, decisions based on depth below one or more strata or strings, multi-level decisions (i.e. depth decisions followed by fixed links, more depth decision etc.); and
- ▲ extended battering including repetitive battering, fixed width batters, and battering relative to a string or strata.

The **decisions** table is documented in the chapter “Advanced Design” .

Cut and Fill Template Links and Final Cut/Fill

When there is **no** decisions table, the **cut**, **fill**, **final cut/fill** tables are used at the end of the fixed links.

If the end of the last link of the fixed template is in cut, the cut links are used and if the end of the fixed template is in fill, the fill links are used. There can be an unlimited number of cut and fill links and they are used sequentially starting with the first link.

If the surface tin is intersected when using a link, the section is terminated at that intersection point. Otherwise, the entire link is included in the section, and next link is then used. This is repeated until the surface is intersected or all the links have been used.

If there is still no intersection with the surface after using all of the cut or fill links, the final cut/fill slope is used to try and intersect with the tin.

The unlimited cut/fill links are called **variable** template links because at each section, a different number of them may be needed - the number of links used varies from section to section.

Applying Templates

Once templates are defined, they can be “applied” to strings to produce the required design model. That is, for a given string, specified templates are used as the cross-sectional definition of the geometry at a regular chainage interval down the string.

Note

Around any curves, the string is approximated by chords spaced at the string's chainage interval or, if it is different, the section separation interval.

If the chord-to-arc distance is greater than the chord/arc tolerance given in the **apply** options panels, then extra points are inserted around the curve so that the chord/arc tolerance is met.

Templates

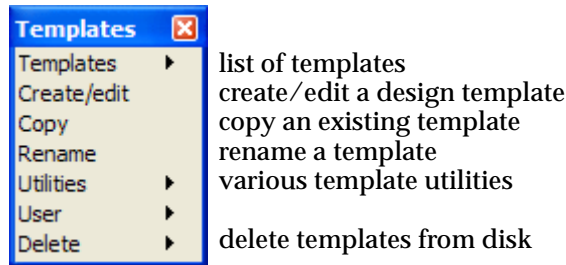

templates

Position of menu: Design =>Templates

The templates walk-right menu provides options create and edit templates, copy, rename and other template utilities.

For a description of the definition of a template in 12d Model, please go to the section “Templates in 12d Model” .

The templates walk- right menu is

For the option *Templates*, go to the section “Templates” .

<i>Create/edit</i>	“Create/Edit” .
<i>Copy</i>	“Copy” .
<i>Rename</i>	“Rename” .
<i>Utilities</i>	“Utilities” .
<i>Delete</i>	“Delete” .

Templates

template_list

Position of option on menu: Design =>Templates =>Templates

The templates walk-right menu provides options to list all the templates added to the project (project templates) and all the templates in the project area but not in the project (removed templates).

The templates walk- right menu is

Project Templates

The project templates walk-right menu provides a list of all the templates in the project.

Removed Templates

The removed templates walk-right menu provides a list of all the templates in the project area that have been removed from the project (using the removed from project option).

Create/Edit

template_create_edit

Position of option on menu: Design =>Templates =>Create/edit

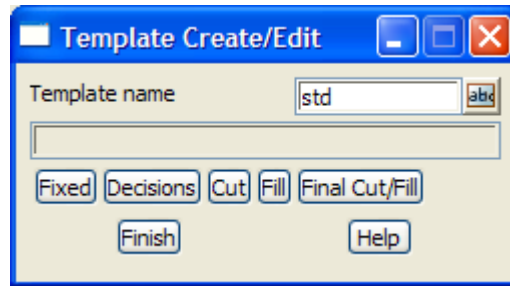

12d Model supports templates with an unlimited number of fixed links, followed by either

- (a) a decisions table
- or
- (b) an unlimited number of cut and fill links and a final cut/fill slope to be applied at the end of the last template link.

To collect the different types of link information needed in the template, the **template create/edit** panel was designed with five buttons **fixed**, **decisions**, **cut**, **fill** and **final cut/fill** used to bring up

and display the panels for creating and editing the fixed, decisions, cut, fill and final cut/fill tables.

On selecting the create/edit option, the **template create/edit** panel is displayed.

The description of the fields and buttons used in the **template create/edit** panel now follows.

The associated panels created by the buttons fixed, cut, fill, final cut/fill will be described in the next four sections and the decisions panel will be described in the chapter “Advanced Design” .

Field Description	Type	Defaults	Pop-Up
Template name	input		available templates
<i>name of the template being created/edited. If the template already exists, then the associated panels will already contain the information for that template. The buttons fixed, decisions, cut, fill and final cut/fill can only be selected after the template name is given.</i>			

Fixed	button		
<i>On selecting this button, the fixed template panel is displayed.</i>			

Decisions	button		
<i>On selecting this button, the Decisions Template panel is displayed. For the complete definition of decisions, please go to the section “Full Definition of Template Decisions” in the Chapter “Advanced Design” .</i>			

Cut or Fill	button		
<i>The variable cut or fill template panel is displayed on selecting this button.</i>			

Final Cut/Fill	button		
<i>The final cut/fill template panel is displayed on selecting this button.</i>			

Note - the buttons can only be selected after the template name has been given in the **template name** panel field.

How to Use the Panel

- A new template is created, or an existing template modified, by first entering the template name into the template field (typed or picked from the pop-up).
- To define or edit the fixed sections of the template, select the **fixed** button and the **fixed template** panel will appear.

Then either:

- use the **decisions** button to define or edit the decisions table
- or
- use the **cut**, **fill** and **final cut/fill** button to define or edit the variable cut, fill or final cut/fill sections of the template respectively.

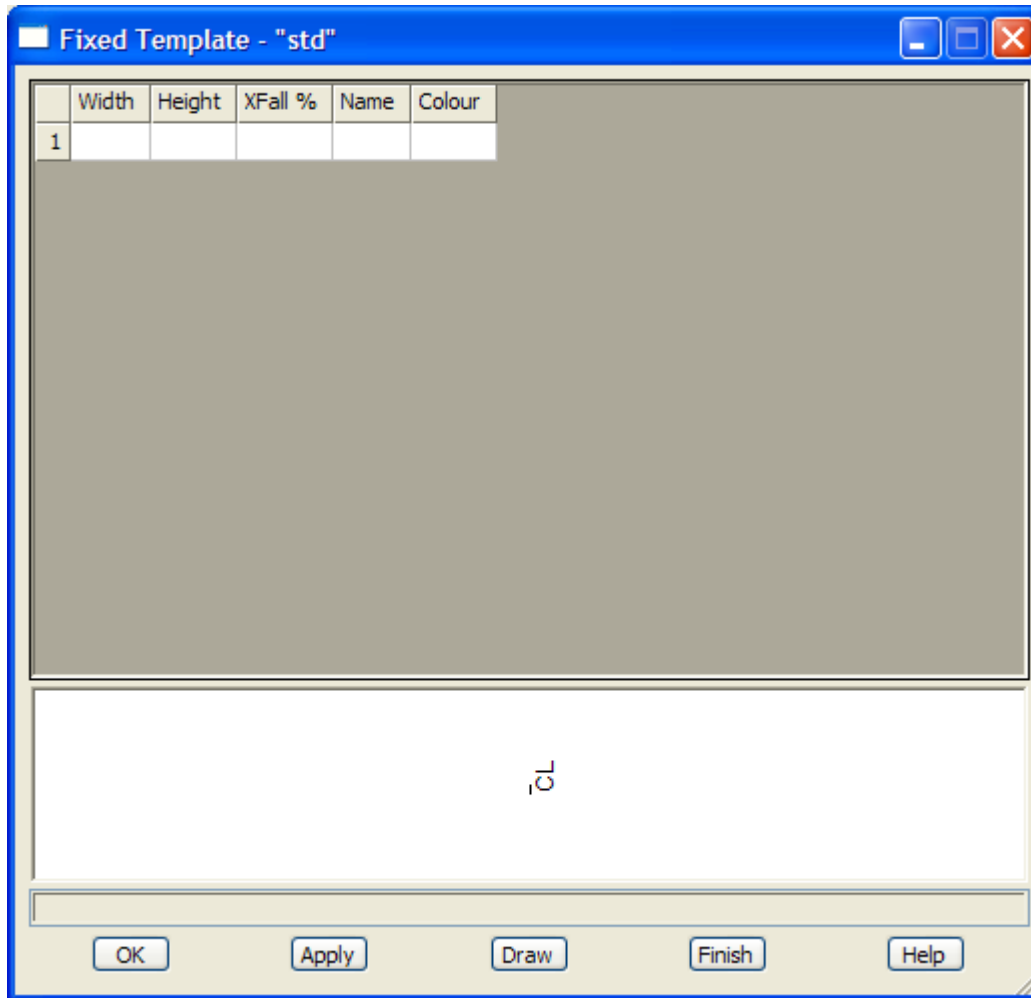

The four panels controlled by the buttons **fixed**, **cut**, **fill** and **final cut/fill** from the **template create/edit** panel will now be described in detail. The **decisions** button will be described in the chapter “Advanced Design” .

Fixed Template

fixed_template

If the template already exists, the current fixed template links will be displayed in the panel. If the template is new, the panel will be empty.

The **fixed template** panel is

An unlimited number of fixed links can be defined in the template. For each link, any two of the three values of width, height and percent crossfall can be used to defined the link. The colour and name are also defined for the link.

The name is given to the sting created by the end of the link and the colour is used as either the string colour, or when a **map file** is used in the **Apply Many** option, is the colour of the created polygon joining the two ends of the link.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Width	input/output
--------------	--------------

width of the link being defined

Height input/output

height of the link being defined

NOTE - if height and cross-fall are being used to go down, then define height to be negative and cross-fall to be negative.

X-fall % input/output

percent cross-fall of the link being defined - units are percent grade. Positive is up and negative down.

NOTE - if height and cross-fall are being used to go down, then define height to be negative and cross-fall to be negative.

Colour input/output available colours

colour of the link being defined. If no colour is supplied, the default colour is used.

Name input/output

name of the link being defined - this is used as the name of the string created by the end point of the link.

OK/Apply button

OK stores the values in the fields and exits the panel. Apply stores the values but doesn't exit the panel.

*Warning - If the OK or Apply button is **not** selected, then **no** new information will be recorded.*

Draw button

draws the fixed template at the bottom of the panel. Automatically does a fit.

NOTE - if height and cross-fall are being used to go down, then define height to be negative and cross-fall to be negative.

Variable Cut or Fill Template

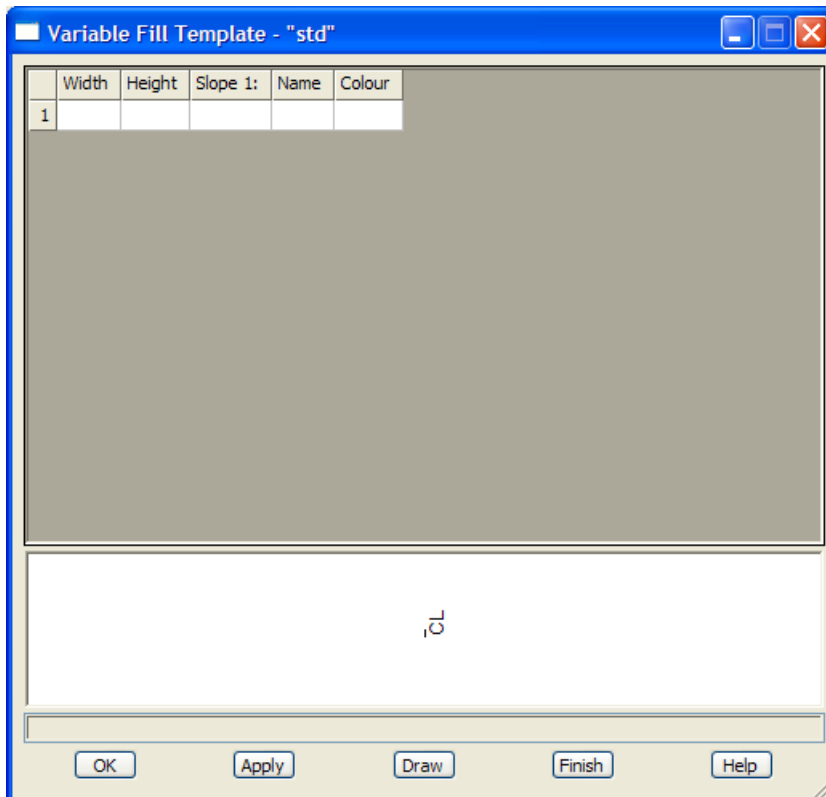

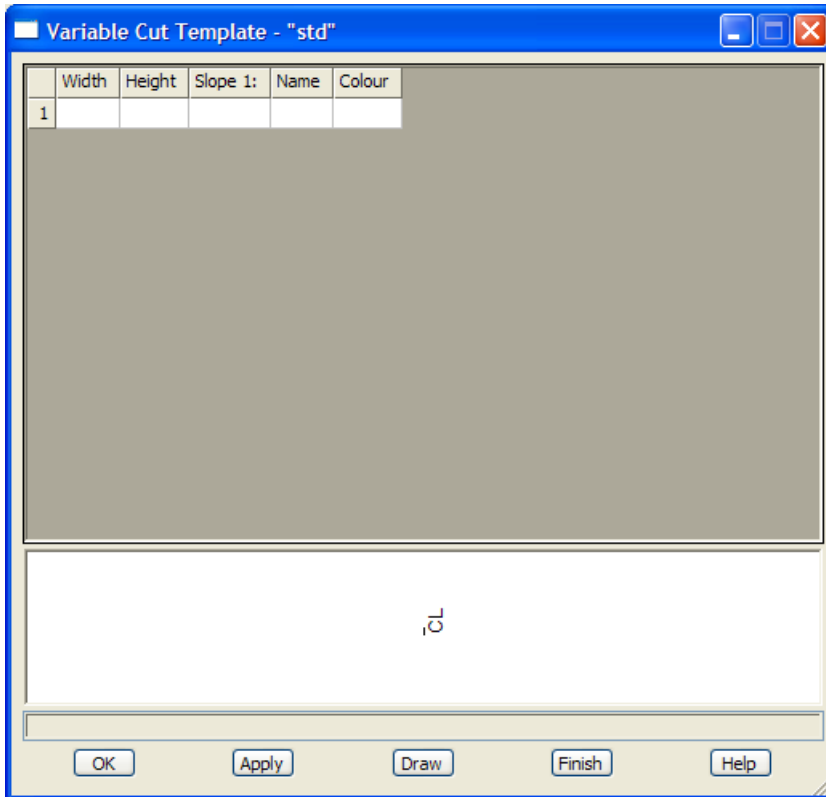

variable_cut_template

variable_fill_template

The definition of the cut or fill template links are similar to the fixed template links except the slope is given as a "one vertical in a user given horizontal value" rather than a percent crossfall.

If the template already exists, the current cut (fill) template links will be displayed in the panel. If the template is new, the panel will be empty.

The **variable cut template** panel and the **variable fill template** panel are similar and look like -

An unlimited number of links can be defined in the variable template. For each link, any two of the three values of width, height and slope can be used to define the link. The colour and name are also defined for the link.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Width <i>width of the link being defined</i>	input/output		
Height <i>height of the link being defined</i>	input/output		
Slope 1v in <i>slope of the cut link being defined. The units are "one vertical in the given horizontal value". The value 0 is used to designate a horizontal slope - a vertical slope is not allowed. For cut, positive is up and negative is down For fill, positive is down and negative is up. NOTE -in cut: if height and slope are being used to go down, then define height to be negative and slope to be negative. In fill: if height and slope are being used to go up, then define height to be negative and slope to be negative.</i>	input/output		
Colour <i>colour of the link being defined. If no colour is supplied, the default colour is used.</i>	input/output		available colours
Name <i>name of the link being defined - this is used as the name of the string created by the end point of the link.</i>	input/output		
OK/Apply <i>OK stores the values in the fields and exits the panel. Apply stores the values but doesn't exit the panel.</i>	button		

Warning - If the **OK** or **Apply** button is **not** selected, then **no** new information will be recorded.

NOTE -in cut: if height and slope are being used to go down, then define height to be negative and slope to be negative.

In fill: if height and slope are being used to go up, then define height to be negative and slope to be negative.

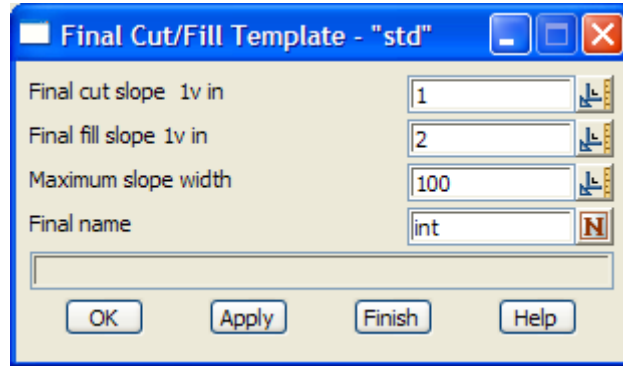

Final Cut/Fill Template

final_cut_fill_template

The final cut/fill template is used if the links in either the cut or fill templates are exhausted without an intersection with the tin being found.

If the template already exists, the current final cut/fill values will be displayed in the panel. If the template is new, the default values are displayed.

The **final cut/fill template** panel is

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Final cut slope 1 v in <i>cut slope for the interface calculation to be done at the end of the last link of the template. A cut slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a horizontal slope - vertical slopes are not allowed. For final cut slope, positive is up and negative down</i>	input/output	0	no slope, 0,1,2,3,4,5,10
Final fill slope 1 v in <i>fill slope for the interface calculation to be done at the end of the last link of the template. A fill slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a horizontal slope - vertical slopes are not allowed. For final fill slope, positive is down and negative is up</i>	input/output	0	no slope, 0,1,2,3,4,5,10
Maximum slope width <i>the maximum width for the final slope.</i>	input/output	100	
Final name <i>name for the string created by this link (normally this string lies on the tin - the interface string).</i>	input/output	int	
OK/Apply <i>OK stores the values in the fields and exists the panel. Apply stores the values but doesn't exit the panel.</i>	button		

Warning - If the **OK** or **Apply** button is **not** selected, then **no** new information will be recorded.

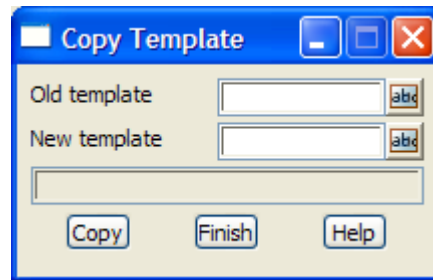

Copy

copy_template

Position of option on menu: Design =>Templates =>Copy

A copy of an existing template can be made using the copy option. This is often useful when a new template that is similar to an existing template is needed. The existing template can be copied and the copy then edited and modified.

On selecting the copy option, the **copy template** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old template <i>name of the template to be copied.</i>	input		available templates
New template <i>name of the template copy.</i>	input		available templates
Copy <i>after selecting this button, the template given in the old template field will be copied and the copy given the name in the new template field.</i>	button		

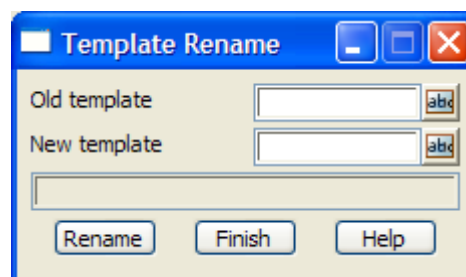

Rename

template_rename

Position of option on menu: Design =>Templates =>Templates =>Rename

On selecting the rename option, the **template rename** panel is displayed.

This panel can be used to change the names of existing templates

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old template <i>name of the template to be renamed.</i>	input		available templates
New template <i>new name for the template</i>	input		
Rename <i>Change the name of the template in the old template field to the name given in the new template field.</i>	button		

Utilities

template_utilities

Position of menu: Design =>Templates =>Utilities

The utilities menu contains miscellaneous options involving templates.

The utilities walk-right menu is

add templates to project
read in template file
write out templates
remove templates from project
save templates to disk

Each option will now be described.

For the option *Add*, go to the section

Input,

Output

Remove

Save

“Add”

“Input”

“Output”

“Remove”

“Save”

Add

template_adds

Position of menu: Design =>Templates =>Utilities =>Add

Removed templates can be added back into the project using the options in the add walk-right menu. The template adds walk-right menu is

Add

add_template_to_the_project

Position of option on menu: Design =>Templates =>Utilities =>Add =>Add to project

Templates in the working project area but not yet in the project can be added to the project using this option.

On selecting the add option, the **add template to the project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Removed template <i>name of the template to be added to the project.</i>	input		available templates

Add button
add the template given in the template field to the working project.

Add All To Project

add_all_templates_to_project

Position of option on menu: Design =>Templates =>Utilities =>Add =>Add all to project

The add all to project option is used to add all the removed templates back into the project.

On selecting the add all to project option, the **add all templates to project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Add	button		
			<i>after selecting this button, all removed templates in the working project will be added to the project.</i>

Input

This input option is used to read in templates from files in this special 12d Model format.

The option has already been described under **file i/o=>layout input**.

Output

The output option writes out one or all templates in the 12d Model template format.

The option has already been described under **file i/o=>layout output**.

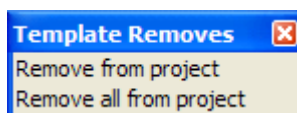

Remove

template_removes

Position of menu: Design =>Templates =>Utilities =>Remove

Templates can be removed from the project using the options in the remove walk-right menu. Removed templates are not deleted but remain in the project area and are no longer accessible in the project.

The template removes walk-right menu is

Remove Template from Project

remove_template_from_project

Position of option on menu: Design =>Templates =>Utilities =>Remove => Remove from project

Individual templates can be removed from the project using the remove from project option and on selecting the option, the **remove template from project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template <i>name of the template to be removed from the working project.</i>	input		available templates

Remove button
after selecting this button, the template given in the template field will be removed from the working project.

Remove All Templates From Project

remove_all_templates_from_project

Position of option on menu: Design =>Templates =>Utilities =>Remove => Remove all from project

All templates can be removed from the project using the remove all option and on selecting the option, the **remove all templates from project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Remove <i>after selecting this button, all templates in the working project will be removed.</i>	button		

Save

template_saves

Position of menu: Design =>Templates =>Utilities =>Save

Templates can be saved on disk. This is done automatically by the **save** option on the **12d Model**

but this option allows the template alone to be saved.

The template saves walk-right menu is

Save Template

save_template

Position of option on menu: Design =>Templates =>Utilities =>Save =>Save a template

On selecting the save a template option, the **save template** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template <i>name of the template to be saved.</i>	input		available templates

Save button
after selecting this button, the template given in the template field will be saved to disk.

Save All Templates

save_all_templates

Position of option on menu: Design =>Templates =>Utilities =>Save =>Save all templates

On selecting the save all templates option, the **save all templates** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Save	button		

after selecting this button, all templates in the working project will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

Delete

template_deletes

Position of menu: Design =>Templates =>Delete

Using the delete option, templates can be deleted from the project and the computer disk so that they can no longer be accessed or take up disk space.

To help protect the user against disasters, when a template is selected for deletion, a **yes-no** pop-up menu is used to confirm that the user did intend deleting the template.

The template deletes walk-right menu is

Delete Template

delete_template

Position of option on menu: Design =>Templates =>Delete =>Delete a template

The delete a template option is used to delete individual template from the project.

On selecting the delete a template option, the **delete template** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template <i>name of the template to be deleted.</i>	input		project templates
Delete	button		

*after selecting this button, the template given in the template field will be deleted from the computer disk. A **yes-no** pop-up is used to confirm that deletion is required.*

Delete All

delete_all_templates

Position of option on menu: Design =>Templates =>Delete =>Delete all templates

The delete all option will delete all templates in the working project. It does not delete templates that are in the working project area but not yet added to the project.

On selecting the delete all option, the **delete all templates** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Delete	button		
---------------	--------	--	--

*after selecting this button, a **yes-no** pop-up is used to confirm that deletion is required. If it is, all templates in the project will be deleted from disk. Unless an error occurs, the panel will be removed.*

Apply

design_functions

Position of menu: Design =>Apply

The **apply** options are for producing design strings using templates and modifiers to create strings along a reference or reference and hinge string - "applying the template to a string". This method can be used to quickly produce roads, canals, trenches, site batters etc.

When applying the templates, design x-sections and strings are automatically produced, plus the cut and fill volumes for the design.

Creating a design in this way is the first job of the **apply** options.

However, after applying a template and examining the results, it is normally necessary to make changes to either the template, the string that the template was applied to or even the tin used for interfacing.

In all cases, the strings, sections and volumes created during the **apply** will no longer be valid and need to be replaced by new information.

Although this can be accomplished by deleting the incorrect models and replacing them with new ones by re-applying the template, this would be a time consuming if repeated over and over again. Hence in **12dModel**, a concept called **Apply functions** was introduced.

Basically, an **apply function** keeps track of all the information involved in applying a template and all the strings and models created during the **apply/apply many**. If either the template, the tin or the string that the template was applied to is subsequently modified, the apply functions can be re-run and all the old information automatically deleted and replaced by the updated information.

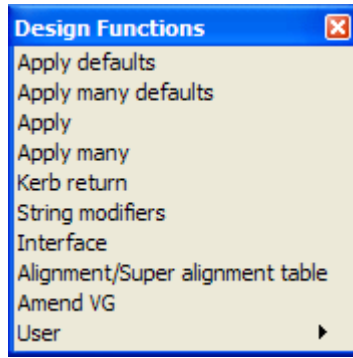

NOTES ABOUT THE STRING CHOSEN TO APPLY TEMPLATES TO

1. If vertical geometry does not exist for the entire length of the string, then the template(s) are only applied to the section of the string where vertical geometry exists.
2. If the horizontal or vertical geometry has overlapping tangent points at any section of the string, then the option terminates without any calculations being made.
3. Any curves will be approximated by chords spaced at chainage interval given by the section separation value. If the chord-to-arc distance for the chords is greater than the chord/arc tolerance given in the **apply/apply many** panel, then extra points are inserted around the curve so that the chord/arc tolerance is met.
4. The **apply** options create sections and strings using a **reference** string to define the chainage and what is perpendicular at each chainage, and a **hinge** string from where the template links are defined. The template defines a point name and colour for each template link.

Cross sections can be created with point names corresponding to the template links, and strings formed by joining the same named points from consecutive cross sections.

The apply walk-right menu is

Each option in this menu will now be described.

For the option *Apply/ Apply many defaults*, go to the section “Apply and Apply Many Defaults” .

<i>Apply,</i>	“Apply”
<i>Apply many,</i>	“Apply Many”
<i>Kerb return</i>	“Kerb Return”
<i>String modifiers</i>	“String Modifiers”
<i>Interface</i>	“Interface”
<i>Alignment/super alignment table</i>	“Alignment & Super Alignment Table” in the chapter “Drafting”
<i>Amend VG</i>	“Amend VG”

Apply and Apply Many Defaults

[apply_template_defaults](#)

[apply_templates_defaults](#)

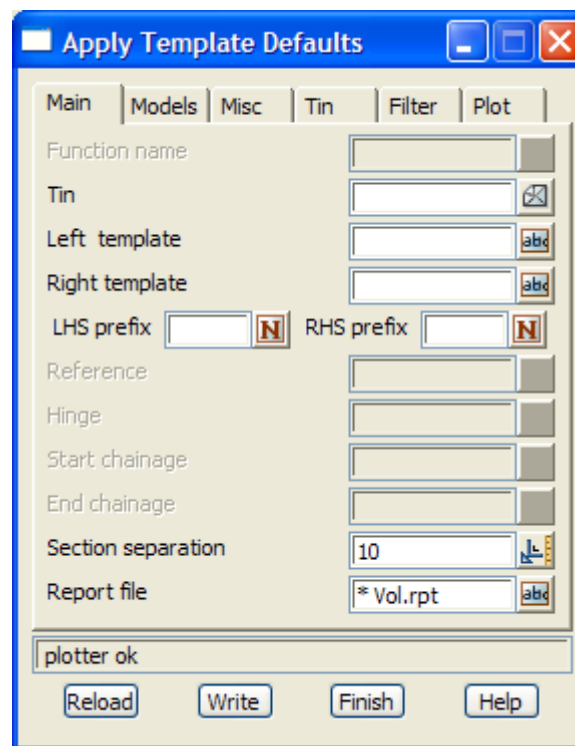

Position of option on menu: Design =>Apply =>Apply defaults

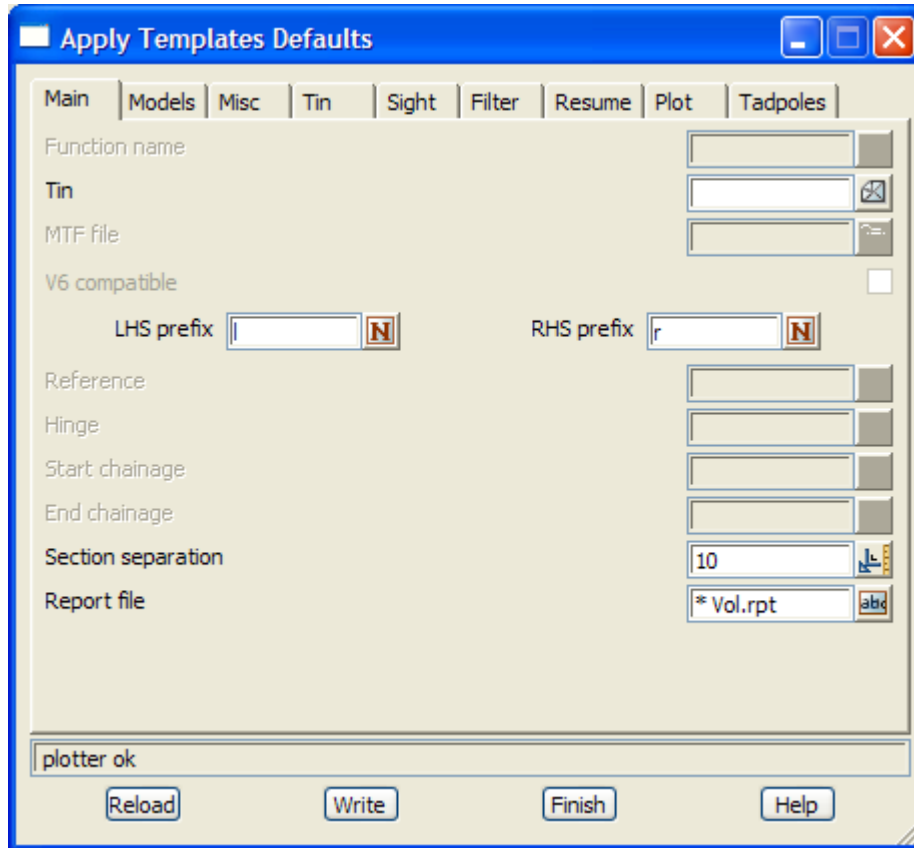

Design =>Apply =>Apply many defaults

There are two files *apply_defaults.4d* and *apply_many_defaults.4d* which contain the **pre** or **post text** to be added to the name of the function to automatically create many entries in the panel fields for *Apply* and *Apply Many* plus default values for all the other panel fields.

After the name of a new function is typed in and an <enter> typed, all the fields mentioned in the default files are automatically filled in using the function name and the defined **pre-post text** as supplied in the file, plus setting any other panel fields from default values supplied in the file. If the files are missing, no panel fields are automatically filled in.

The files can be created and edited using the Apply defaults or Apply many defaults option which brings up the **Apply Template Defaults** or **Apply Templates Defaults** panels respectively.

Apply

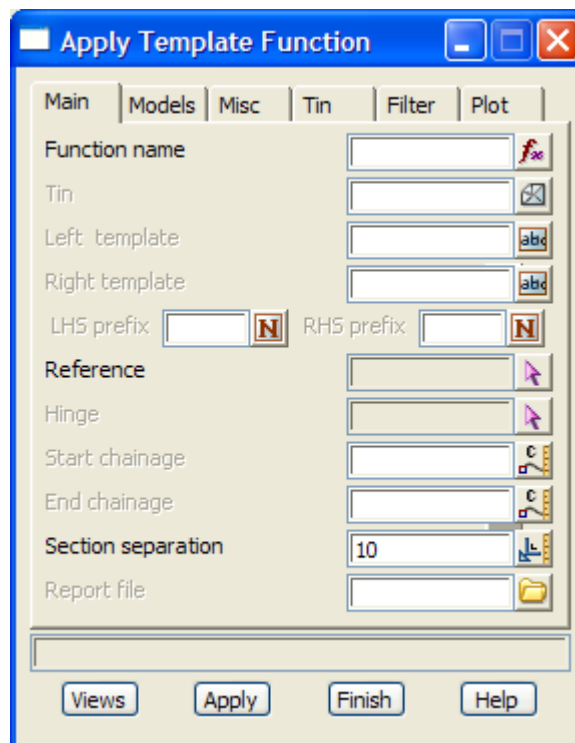

apply_template_function

Position of option on menu: Design =>Apply =>Apply

On selecting the Apply option, the **Apply Template Function** panel is displayed.

This panel is used to create the information for applying a new template function or to modify the information for an existing template function.

The **Apply Template Function** panel is

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Button at bottom			
Views	button		
<i>perspective views can be defined with respect to chainages on the string. This option is described in more detail in the section "Views"</i>			
Apply	button		
<i>apply the template information to the selected reference and hinge strings, between the start and end chainages. The cut, fill and balance volumes are also calculated and written to the message area.</i>			

**Main tab**

Function name	input	available template functions
<i>name of the function to define the apply for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.</i>		
Tin	tin box	available tins
<i>if non-blank, the name of the tin to calculate the cut/fill interfaces against at the end of the fixed part of the templates given in the left and right template fields. If blank, then only the fixed part of the templates are used unless a tin is specified in the decisions section of the templates.</i>		
Left/right template	template box	available templates
<i>name of the template to be applied to the left/right of the string. If a template is used on the left/right, the template definitions go from the hinge string out to the left/right.</i>		
LHS/RHS prefix	input	
<i>prefix/postfix (pre*post) to be applied to the left/right template string names. If pretext only, just give the text. If post text is required, precede it by a *.</i>		
Reference	string-select	
<i>the selected string is used to defined the meaning of chainage and bearing for each point in the apply. Sections are defined at right angles to the reference string at the appropriate chainage points on the reference string.</i>		
Hinge	string-select	
<i>the reference string defines chainage and bearing but the templates are actually applied to the hinge string. For a given chainage, a line is taken at right angles to the point of that chainage on the reference string and extended until it cuts the hinge string. The templates are applied at that point on the hinge string along the direction of the line. If no hinge string is selected, the reference string is also the hinge string.</i>		
Start/End chainage	input	
<i>the reference string start/end chainage for applying the template. If blank, the start/end chainage of the reference string is used.</i>		
Section separation	input	10.0
<i>sections are created at right angles to points on the reference string that are the section separation chainage distance apart.</i>		

Report file file box *.rpt
*if non-blank, the name of the file to contain the volume report for the template calculations. If the file already exists, the report will be appended to the file.
 If blank, no report is produced.*

Models tab

Model for strings model box available models
*if non-blank, the name of the model to contain the template and interface strings. The string colour is the template link colour.
 If blank, the strings will not be stored.*

Model for sections model box available models
*if non-blank, the name of the model to contain the design sections generated by the templates.
 If blank, the sections will not be stored.*

Section colour colour box default colour available colours
the colour for the sections strings

Model for polygons input available models
*if non-blank, the name of the model to contain the polygons created for each link of the template. The polygon is given the colour of the template link.
 If blank, the polygons will not be stored.*

Difference model input available models
if non-blank, the sections which are the difference between the tin sections and the template x-sections are retained and placed in the model given in this field. If blank, the sections are not kept.

Difference colour input available colours
colour for the difference sections strings

Misc tab

Strip depth input 0
the stripping depth to be used on the tin before the apply is done.

Create arcs input super arcs no arcs, alignment arcs,
 polyline arcs, super arcs
*if no arcs, the strings are created as 3d strings with no arcs.
 alignment arcs, the strings are created as alignment strings with arcs
 polyline arcs, the strings are created as polyline strings with arcs.
 super arcs, the strings are created as super strings with arcs.*

Chord/arc tolerance input default chord/arc tolerance
the chord to arc tolerance to use on the reference string for determining how many sections are created around horizontal curves.

Volume correction for curves tick box
if tick, volume corrections are made when going around curves.

Sections as 4d tick tick

if **tick**, the section strings will be created as 4d strings with the appropriate template string names as the text at each point of the section. These are needed for boxing and some options on x-section plots.

Copy hinge tick tick

if **tick**, a string with points at the apply chainages is created on top of the hinge string.

Tin tab

Create road tin tick box

if **tick**, the fields in this tab are used to create a road tin

Road tin tin box available tins

name for the tin created from the design strings and sections

Colour for tin colour box available colours

colour of the road tin

Model for tin model box available models

model for the road tin

Create depth range polygons tick box

if **tick**, depth polygons are created

Depth range file file box *.drf files

depth range file used when creating polygons

Model for polygons model box available models

model for the depth polygons

Filter tab

Filter cross-sections tick box

if **tick**, the fields in this tab are used to filter cross sections

Filter sections model model box available models

model for the filtered cross sections

Filtered sections colour colour box available colours

colour of the filtered cross sections

Regular filtering interval input

regular interval to use for filtering the cross sections

Regular culling tolerance input 0

tolerance to use when selecting a cross section

Include start sections tick box

if **tick**, a section at the start chainage is included even if the start chainage is not a regular interval

Include end sections tick box

if **tick**, a section at the end chainage is included even if the end chainage is not a regular interval

Include H tangent sections tick box

if **tick**, a sections at the horizontal tangent points are included even if they are not a regular interval

Include V create/sag sections tick box

if **tick**, a sections at the crest and sag points are included even if they are not a regular interval

Special chainage file file box *.spc files

if non blank, a file of chainages to include sections at even if they are not a regular interval

Plot tab

Generate long section plots tick box

if tick, long section plots are created

Long section PPF file box

*.lplotppf files

binary ppf file to use for the long section plots

Plotter type plotter box

model

available plotters

type of plotter to use for the long section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model beforehand tick box

*if tick and the **plotter type is model**, the plot models are cleaned before the plots are created*

Generate cross section plots tick box

if tick, cross section plots are created

Cross section PPF file box

*.lplotppf files

binary ppf file to use for the cross section plots

Plotter type plotter box

model

available plotters

type of plotter to use for the cross section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model beforehand tick box

*if tick and the **plotter type is model**, the plot models are cleaned before the plots are created*

Views

template_views

Position of option on menu: Design =>Apply =>Apply

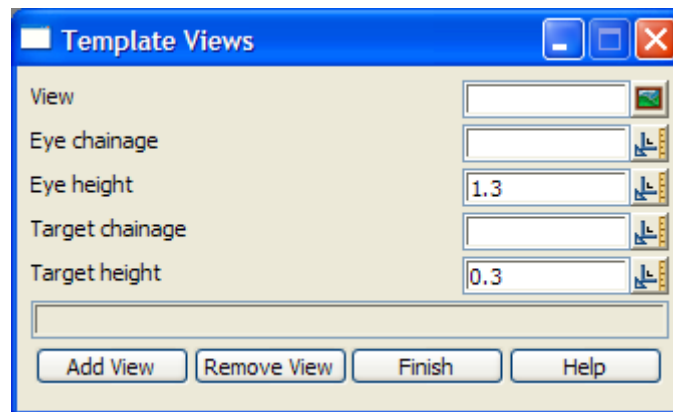

Position of option on menu: Design =>Apply =>Apply many

This option locks perspective views to the reference string of the **Apply/Apply Many** function,

It defines the eye and target co-ordinates for the perspective views in terms of the chainage and height above an existing reference string (as in the perspective view-ops option, string-walk) rather than entering the (x,y,z) eye and target co-ordinates.

If the string is modified, then the perspective eye and target points will also change.

Selecting **Views** fires up the **Template Views** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>the perspective view to define the eye and target points for.</i>	view box		available views
Eye chainage <i>the string chainage of the eye viewing point.</i>	input		
Eye height <i>height of the eye viewing point above the string.</i>	input	1.3	1.3
Target chainage <i>the string chainage the target viewing point.</i>	input		
Target height <i>height of the target viewing point above the string.</i>	input	0.3	0.3
Add View <i>add the view to the template function and then redraw the view using the above eye and target parameters.</i>	button		
Remove View <i>remove the view from the Apply/Apply Many function.</i>	button		

Apply Many

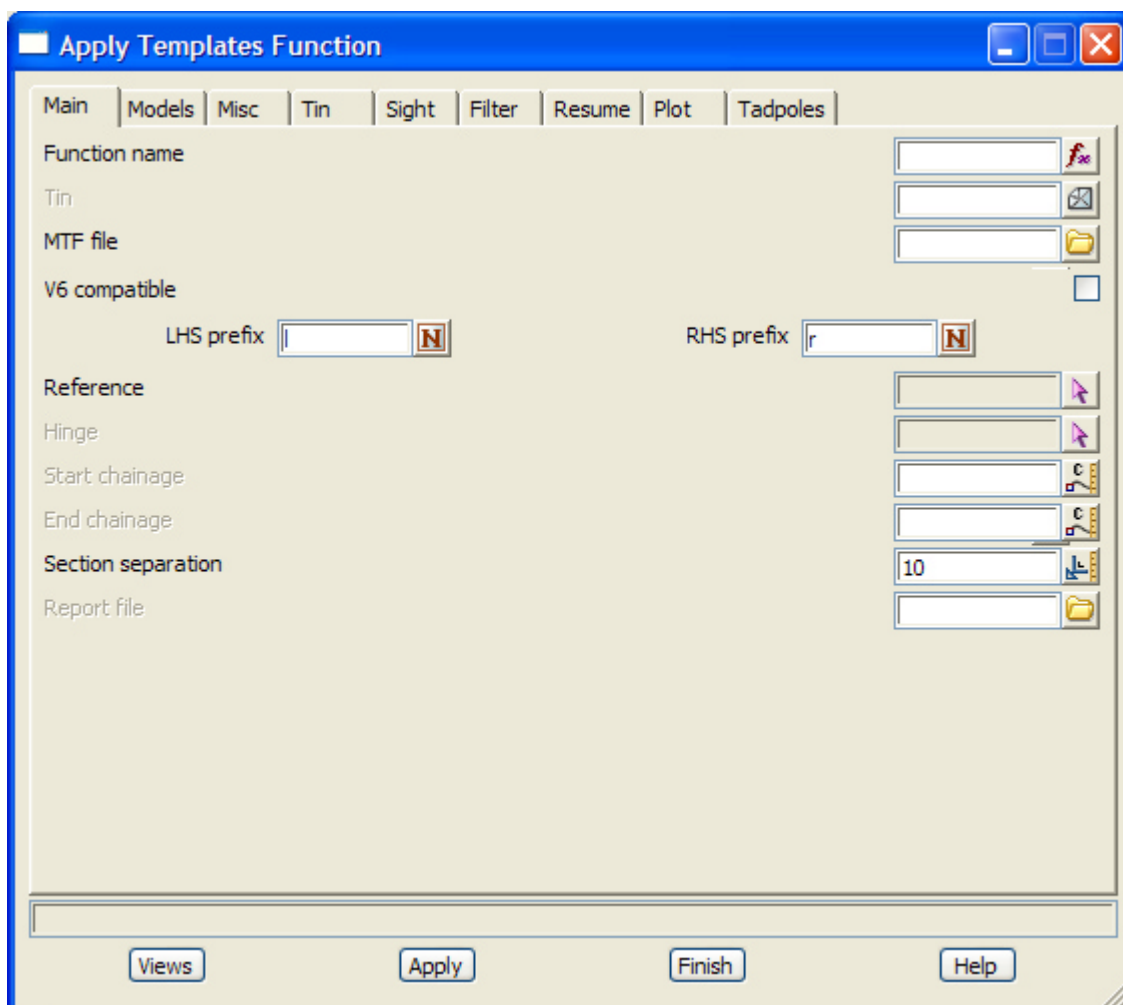

apply_templates_function

Position of option on menu: Design =>Apply =>Apply many

The **apply many** option is used for more complex design work. It includes defining more than one template for defining strings along a string, template modifiers for advanced control of the strings created by the **Apply Many**, stripping depths and boxing, a road tin and depth polygons, sights lines, tadpoles, long section and cross section plots. The **Apply Many** can also create up to eight layers of boxing.

For **Apply Many**, the templates and all the modifiers are supplied in a file called the **Many Templates File** or *mtf* file. The definition of the *mtf* will follow after the description of the **Apply many** option.

Selecting **Apply many** displays the **Apply Templates Function** panel.

This panel can be used to create the information for applying a new template function or to modify the information for an existing template function.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Buttons from bottom

Views	button
--------------	--------

perspective views can be defined with respect to chainages on the string. This option is described in more detail in the next section.

Apply button

apply the template information to the selected reference and hinge strings, between the start and end chainages. The cut, fill and balance volumes are also calculated and written to the message area.

**Main tab**

Function name input available template functions
name of the function to define the apply many for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.

Tin input available tins
*if non-blank, the name of the tin to calculate the cut/fill interfaces against at the end of the fixed part of the templates given in the template file.
 If blank, then only the fixed part of the templates are used unless a tin is specified in the **decisions** section of the templates.*

MTF file file box available mtf's, edit mtf
*name of the file containing the definitions of where and how templates are applied and modified along the string.
 For more information on the MTF file, go to the section "Many Templates File".*

V6 compatible tick box
if tick,

LHS/RHS prefix input
*prefix/postfix (pre*post) to be applied to the left/right template string names. If pretext only, just give the text. If post text is required, precede it by a *.*

Reference string-select
the selected string is used to defined the meaning of chainage and bearing for each point in the apply. Sections are defined at right angles to the reference string at the appropriate chainage points on the reference string.

Hinge string-select
*the reference string defines chainage and bearing but the templates are actually applied to the hinge string. For a given chainage, a line is taken at right angles to the point of that chainage on the reference string and extended until it cuts the hinge string. The templates are applied at that point on the hinge string along the direction of the line.
 If no hinge string is selected, the reference string is also the hinge string.*

Start/End chainage input
the reference string start/end chainage for applying the template. If blank, the start/end chainage of the

reference string is used.

Section separation input 10.0

sections are created at right angles to points on the reference string that are the section separation chainage distance apart.

Report file input *.rpt

if non-blank, the name of the file to contain the volume report for the template calculations. If the file already exists, the report will be automatically over written. If blank, no report is produced.

Also if boxing is included in the MTF file definition, the Volumes in the report reflect the cut and fill volumes to the boxing sections, not the road surface sections. This always happens even if you do not generate boxing sections.

Models tab

the model tab consists of a grid for defining the design strings forming the road surface and design cross section, up to eight layers of boxing and models for the difference sections between the design and the natural surface.

*The last boxing layer is also referred to as the **subgrade** layer.*

Road Surface:

Strings input available models

if non-blank, the name of the model to contain the design and interface strings. The default string colours are the template link colours but that can be overridden by a map file.

If blank, the strings are stored.

Sections input available models

if non-blank, the name of the model to contain the design sections generated by the apply.

If blank, no sections are stored.

Colour input available colours

the colour for the design sections strings

Boxing Layer 1-8:

if non blank, boxing strings and sections will be created for that layer.

*The last boxing layer is also referred to as the **subgrade** layer.*

Strings input available models

if non-blank, the name of the model to contain the boxing strings for this layer.

If blank, the strings will not be stored.

Sections input available models

if non-blank, the name of the model to contain the boxing sections generated by the templates and boxing rules. If blank, the sections will not be stored.

Colour input available colours

colour for the boxing sections for this layer

Difference

Sections input available models

if non-blank, the sections which are the difference between the tin sections and the template x-sections are retained and placed in the model given in this field.

If blank, the sections are not kept.

Colour input available colours
colour for the difference sections strings

Model for polygons input available models
*if non-blank, the name of the model to contain the polygons created for each link of the template. The polygon is given the colour of the template link.
 If blank, the polygons will not be stored.*

Misc tab

Create arcs choice box super arcs no arcs, alignment arcs, polyline arcs, super arcs
*if no arcs, the strings are created as 3d strings with no arcs.
 alignment arcs, the strings are created as alignment strings with arcs
 polyline arcs, the strings are created as polyline strings with arcs.
 super arcs, the strings are created as super strings with arcs.*

Chord/arc tolerance input default chord/arc tolerance
the chord to arc tolerance to use on the reference string for determining how many sections are created around horizontal curves.

Volume correction for curves tick box
if tick, volume corrections are made when going around curves.

Partial interfaces tick box tick
*if tick, an interface string is not produced when no intersection is made with the tin. The interface may then be broken into a number of interface strings.
 If not ticked, a yellow segment is created in the interface string when no intersection is made with the tin. Only one interface string will then be produced.*

Sections as 4d tick box tick
if tick, the section strings will be created as 4d strings with the appropriate template string names as the text at each point of the section. These are needed for boxing and some options on x-section plots.

Copy hinge tick box tick
if tick, a string with points at the apply chainages is created on top of the hinge string.

Use stripping tick box tick
if tick, the stripping depths in the mtf file are used.

Show detailed stripping volumes tick box
if tick, end area stripping volumes are written to the report file

Calculate natural surface to design volumes tick box tick
if tick, end area volumes between the natural surface and the design strings are written to the report file

Calculate natural surface to subgrade volume tick box tick

if tick, end area volumes between the natural surface to the subgrade (the last boxing layer) are written to the report file

Calculate road to subgrade volumes tick box tick

if tick, end area volumes between the design strings and the subgrade (the last boxing layer) are written to the report file.

Calculate inter-boxing layer volumes tick box tick

if tick, end area volumes between each of the boxing layers are written to the report file.

Map file

file box

*.mf files

*if non blank, the given map file is applied to all the design strings created by the **Apply Many**. The map file overrides any default colours from the templates. The map file can colour strings, apply linestyles, apply hatch patterns to polygons, apply extrudes to super strings etc. For more details on the map file, see "Map File" in the chapter "File I/O".*

Tin tab

*the **Tin** tab controls the creation of a design tin and depth polygons*

Create road tin

tick box

if tick, the fields in this tab are used to create a road tin

Road tin

tin box

available tins

name for the tin created from the design strings and sections

Colour for tin

colour box

available colours

colour of the road tin

Model for tin

model box

available models

model for the road tin

Create depth range polygons tick box

if tick, depth polygons are created

Depth range file

file box

*.drf files

depth range file used when creating polygons

Model for polygons

model box

available models

model for the depth polygons

Sight tab

*the **Sight** tab controls the reporting of sight distance lines between the reference line and a super tin formed from the natural surface tin and the design tin, and barrier lines on the reference line if it is a super alignment. For more information on sight distance calculations and for the option that will also create sight lines/no-lines and take bridge tins into consideration, go to the section "Sight Distance".*

Calculate sight distance tick box

if tick, sight distance lines are created and barrier lines calculated and applied to the reference string if it is a super alignment.

Min sight distance

input

100

minimum chainage distance to use for placing the test target point.

Max sight distance

input

3000

maximum chainage distance to use for placing the test target point.

Eye height input 1.3

height of the eye point above the picked string

Eye offset input 1.3

offset of the eye point from the picked string.

Target height input 0.3

height of the test target point above the picked string

Target offset input 1.3

offset of the target point from the picked string.

Calc interval input 20

chainage increment to move the eye point for the next sight distance calculation.

Trial interval input 10

chainage increment to move to test target point.

Report file file box *.rpt files

if non blank, a sight distance report is produced and written out to this file name.

Create separation/barrier lines tick box

if tick, and the reference string is a super alignment, barrier and separation lines are created and defined in the super alignment.

Barrier distance input

Min barrier road length input

Max barrier road length input

Min between barriers input

Filter tab

*the **Tin** tab controls the filtering of cross sections*

Filter cross-sections tick box

if tick, the fields in this tab are used to filter cross sections

Filter sections model model box available models

model for the filtered cross sections

Filtered sections colour colour box available colours

colour of the filtered cross sections

Regular filtering interval input

regular interval to use for filtering the cross sections

Regular culling tolerance input 0

tolerance to use when selecting a cross section

Include start sections tick box

if tick, a section at the start chainage is included even if the start chainage is not a regular interval

Include end sections tick box

if tick, a section at the end chainage is included even if the end chainage is not a regular interval

Include H tangent sections tick box

if tick, a sections at the horizontal tangent points are included even if they are not a regular interval

Include V create/sag sections tick box

if tick, a sections at the crest and sag points are included even if they are not a regular interval

Special chainage file file box *.spc files

if non blank, a file of chainages to include sections at even if they are not a regular interval

Resume tab

still under development

Plot tab

*the **Plot** tab controls the generation of long section and cross section plots*

Generate long section plots tick box

if tick, long section plots are created

Long section PPF file box *.lplotppf files

binary ppf file to use for the long section plots

Plotter type plotter box model available plotters

type of plotter to use for the long section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model beforehand tick box

*if tick and the **plotter type is model**, the plot models are cleaned before the plots are created*

Generate cross section plots tick box

if tick, cross section plots are created

Cross section PPF file box *.lplotppf files

binary ppf file to use for the cross section plots

Plotter type plotter box model available plotters

type of plotter to use for the cross section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model beforehand tick box

*if tick and the **plotter type is model**, the plot models are cleaned before the plots are created*

Tadpoles tab

*the **Tadpole** tab controls the generation of batters ticks and tadpoles (hachure notation). For more information see the section "Create Cut/Fill Symbols" in the chapter "Drafting".*

Create tadpoles tick box

if tick, cut/fill symbols are created between given strings

Tadpole model model box available models

	<i>model for the created cut-fill symbols</i>		
Interval	input	10	
	<i>chainage distance between the symbols</i>		
Search width	input	50	
	<i>maximum distance to search to cut the strings for creating symbols. This is important for cases such as a bend in a road where multiple sets of string may then exist even when only searching out on one side of the road</i>		
Search side	choice box	both	both, left side only right side only
	<i>side of the reference string to search for strings to apply symbols to.</i>		
String 1	input	50	
	<i>name of the point on the template to start symbol.</i>		
String 2	input	50	
	<i>name of the point on the template to stop symbol.</i>		
Start Ch.	input		
	<i>if blank, use the start chainage of the apply many. If non blank, the chainage to start applying this symbol to.</i>		
End Ch.	input		
	<i>if blank, use the end chainage of the apply many. If non blank, the chainage to stop applying this symbol to.</i>		
Symbol 1	symbol data		
	<i>definition of the symbol to create at the given interval, or at twice the given interval if Symbol 2 is defined</i>		
Symbol 1 %	input		
	<i>if non-blank, percentage of the distance between String 1 and String 2 to apply the symbol. If blank, the symbol is applied to the full distance between String 1 and String 2 (i.e. 100%)</i>		
Symbol 2	symbol data		
	<i>definition of a second symbol to create at twice the given interval</i>		
Symbol 2 %	input		
	<i>if non-blank, percentage of the distance between String 1 and String 2 to apply the symbol. If blank, the symbol is applied to the full distance between String 1 and String 2 (i.e. 100%)</i>		

Many Templates File

The many templates file includes the definition of

1. chainage ranges for the use of templates on the left and right side of the hinge
2. interpolation between templates
3. templates at special chainages
4. template modifiers to further change the hinge and template strings
5. stripping depths along the job
6. boxing

The documentation for chainage ranges and template interpolation (1 and 2) will be given now and the documentation for 3-6 will be given in the later chapter “Advanced Design” .

The templates on the left and right hand sides of the centre line are specified separately in the many templates file. Apart from a key word denoting whether the following part of the definition is for the left side or the right side, the set out for the left-side is identical to the right-side. Hence, only the left-side will be described in detail.

The left-side definition begins with the key words

```
left_side =
```

A list of chainages (in ascending order, one per line) with corresponding template names then follows. This list of chainages and templates is enclosed in curly braces { }.

Note if the template name includes spaces, then the name must be enclosed in quotes “. For example, “left 1”.

The chainage-template lists are assembled as follows

- (a) To represent a template starting at a given chainage, the chainage value followed by the template name is given. The chainage and name are separated by one or more spaces. For example, the template **std** starting at chainage 150 is represented by

```
150      std
```

The template is assumed to apply until the chainage given on the next line of the left-side definition.

If the template is to go to the end of the centre-line, add a line with a chainage greater than or equal to the end chainage. For example,

```
150      std
99999
```

- (b) if no template exists from a chainage, simply include the chainage with no template name following it. For example, if there is no template from chainage 250, this is represented by

```
250
```

The non-existence of a template is assumed to apply until the chainage given on the next line of the left-side definition

- (c) the case of a linear change from one template to another template over a specified chainage range is represented by giving the start chainage of the linear change, followed on the same line by the start template, a comma, and the end template. For example, if the template is to vary linearly between the template **std** and the template **left**, beginning at the chainage 350, then the line in the file would be

```
350      std, left
```

The linear change takes place over the interval beginning at the chainage given on the defining line and ending at the chainage given on the next line of the left-side. Distances and percent cross-falls are interpolated linearly and slopes are interpolated on the radian value of

the slope angles.

Combining these rules, the following lines in a template file

```
left_side = {
    100      std
    200      std , "left 1"
    250      "left 1"
    300
    350      std
    99999
}
```

describes the situation

1. the left-hand side of the centre-line has no template from the beginning of the centre-line until chainage 100.
2. at chainage 100, the template **std** begins and continues until chainage 200.
3. there is a linear change from the template **std** to the template **left 1** between chainage 200 and chainage 250.
4. the template **left 1** goes from chainage 250 to chainage 300.
5. there is a gap between chainage 300 and chainage 350.
6. the template **std** goes from chainage 350 to chainage 99999, or if the end chainage is smaller than 99999, to the end of the centre-line.

The right-side template definition begins with the key word `right_side`. The rest of the definition follows the same rules at the left hand side of the centre-line. For example,

```
right_side = {
    100      std
    200      std , right
    250      right
    300      right , std
    350      std
    400
}
```

The left and right sides can vary independently.

Restrictions on the Template File Definitions

1. If one template stops at the same chainage that another template begins, then the two templates must have the same number of fixed and variable links. The templates will be varied linearly from the stopping template to the starting template over one section separation distance.
2. If there is a linear variation between two templates, the two templates must have the same number of fixed and variable links.
3. If two templates do not have the same number of links, they must be separated by a gap, that is, by a region with no template.

Kerb Return

apply_kerb_return_function

Position of option on menu: Design =>Apply =>Kerb return

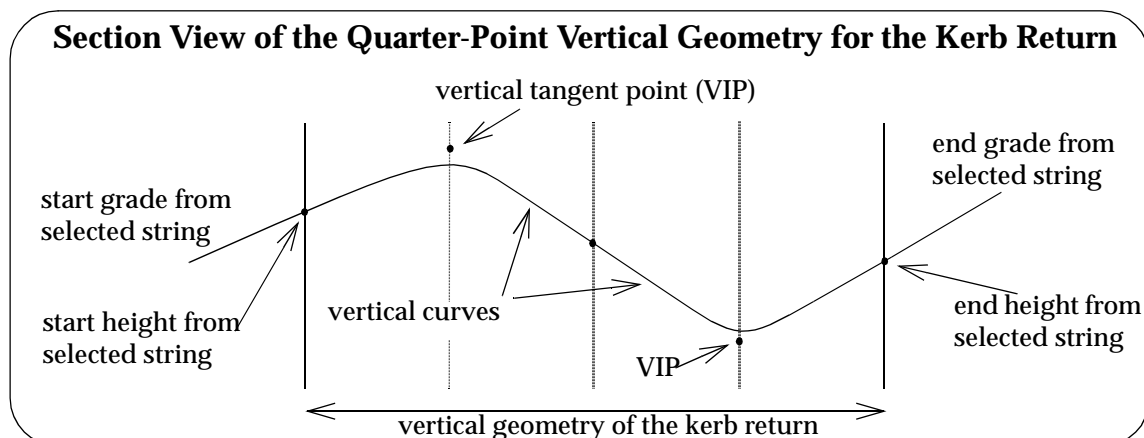

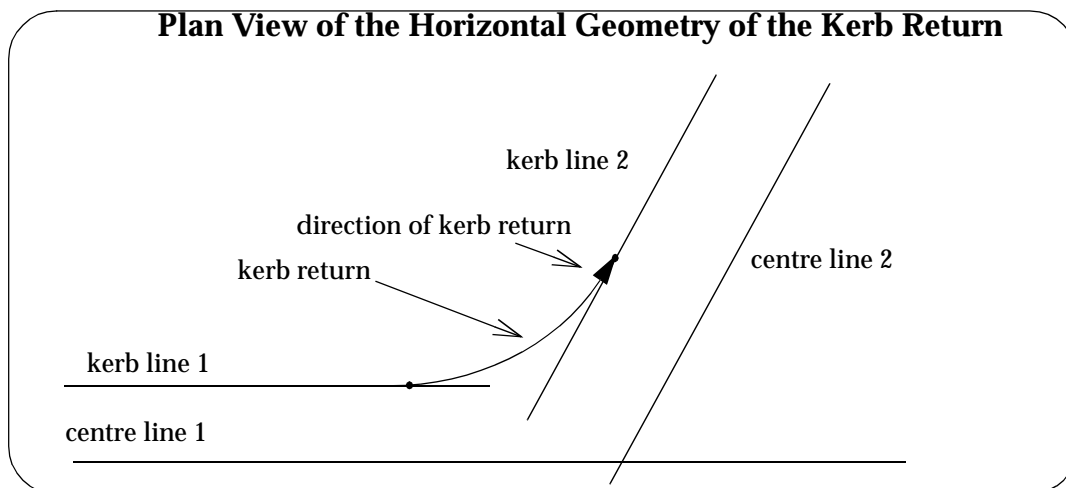

The kerb return option is used to help create the vertical geometry for an alignment string being used as a kerb return.

The standard situation is that in the plan view, the kerb return joins two kerb lines which already have z-values.

It is then necessary to define vertical geometry for the kerb return, usually taking into consideration the z-values and incoming grades from selected strings (often the centre lines and kerb strings).

A standard first guess at the kerb return vertical geometry is known as the quarter point vertical geometry and it is defined by

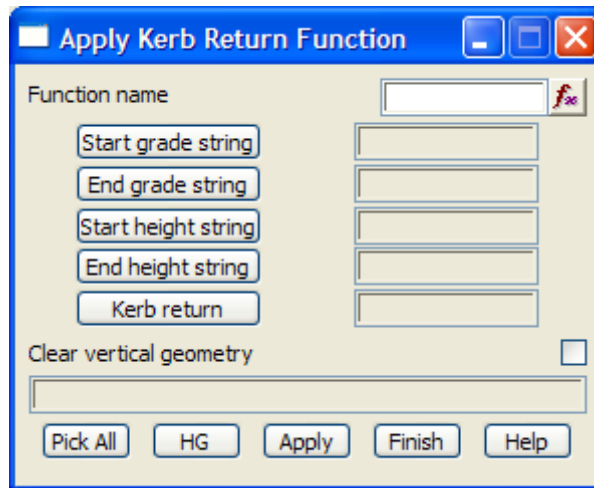

- break the section along the kerb return into four equal pieces
- project the incoming grade from a selected start grade string to intersect the first quarter point line
- project back the outgoing grade from a selected end grade string to intersect the last quarter point line
- join the two projected intersection points
- define vertical intersection points (VIP's) at the intersection points
- create back to back vertical curves for the VIP's

The **kerb return** option creates a function which will automatically create the quarter-point vertical geometry for the kerb return and will recalculate it as required.

Note: the actual **direction** of the kerb is important - start grade and start height apply to the **start** of the kerb and end grade and end height apply to the **end of the kerb** where start and end are determined by the **actual direction** of the kerb (**not the picking direction**).

On selecting the kerb return option, the **apply kerb return function** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the function to define the apply for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.</i>	input		available kerb functions
Start grade string <i>select the string to be used for the in grade at the start of the kerb return.</i>	string-select		
End grade string <i>select the string to be used for the out grade at the end of the kerb return.</i>	string-select		
Start height string <i>select the string to be used for the height at the start of the kerb return - this is used for the z-value at the start of the kerb return.</i>	string-select		
End height string <i>select the string to be used for the height at the end of the kerb return - this is used for the z-value at the end of the kerb return.</i>	string-select		
Kerb return <i>select the alignment string that is the kerb return.</i>	string-select		

Clear vertical geometry tick box

*if **tick**, the vertical geometry of the kerb return string is cleared as soon as the **apply** button is selected, or a recalc done.*

Pick all button

*if **pick all** is selected, the user is asked to sequentially select the four strings: the Start grade string, End grade string, Start height string and End height string. The strings are automatically assigned to the appropriate string-select panel fields.*

HG button

*brings up the kerb return function create **HG** panel. This option is currently under development.*

Apply button

*if the kerb return has no vertical geometry (it will be automatically be deleted if the clear vertical geometry is set to **tick**) or the vertical geometry is the quarter-point geometry for the previous apply, then new quarter-point vertical geometry is created for the kerb return string. Otherwise, nothing happens when the **apply** button is selected. That is, if the kerb return already has vertical geometry which is not the quarter-point geometry for the previous apply, and the clear vertical geometry is set to **no tick**, then **nothing happens** when the **apply** button is selected.*

Note

[kerb_return_function_create_hg](#)

The experimental **kerb return function create HG** panel is

The screenshot shows a dialog box titled "Kerb Return Function Create HG". It contains the following fields and controls:

- Use road widths:
- Use signed widths:
- Road 1 width: [Apply] [Cancel]
- Road 1 X-fall: [Apply] [Cancel]
- Road 2 width: [Apply] [Cancel]
- Road 2 X-fall: [Apply] [Cancel]
- Kerb radius: [Apply] [Cancel]
- Model for kerb: [Apply] [Cancel]
- Colour for kerb: [Color Picker]
- Model for text: [Apply] [Cancel]
- Colour for text: [Color Picker]
- Size for text: [Apply] [Cancel]

At the bottom of the dialog, there is a checkbox for "1/4 pts" and three buttons: "Create HG", "Finish", and "Help".

String Modifiers

string_modifiers_function

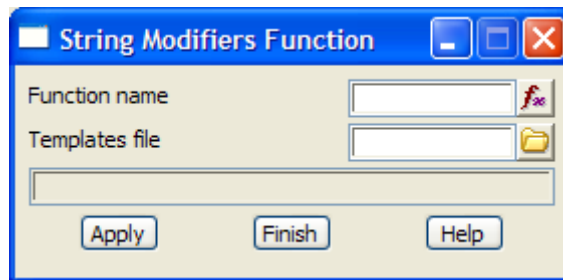

Position of option on menu: Design =>Apply =>String modifiers

The String Modifiers option is used to create vertical intersection points for an alignment string, or heights for a 2d, 3d, 4d, polyline or super string, using projection of heights from a selected string and user given cross-falls or cross-fall between two selected strings.

The **String Modifier** commands are actually part of an mtf file and are documented in “Advanced Design” chapter of this manual.

This option allows the user to run just the **string_modifiers** section of the **mtf** file.

On selecting the String Modifiers option, the **String Modifiers Function** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the function to define the apply for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.</i>	input		available template functions
Template file <i>the name of the many template file to use the string_modifiers section from.</i>	input		available mtf files
Apply <i>apply the string_modifiers section of the many template file.</i>	button		

Interface

interface_function

Position of option on menu: Design =>Apply =>Interface

An **interface** string is where the design meets the natural terrain - it shows the **extent** of the design. The method used for calculating the **interface string** for a given string, tin and cut and fill slopes, is as follows:

For a point on a string, an interface point is calculated by going off at right angles to the string along a line of fixed slope until either the tin is cut or a fixed (plan) distance is travelled. The slope of the line is either the cut or fill slope depending on whether the string point is below the tin (cut point) or above the tin (fill point).

The interface string for a string is constructed by calculating the interface points at regular intervals along the string and then joining the interface points together to form the interface

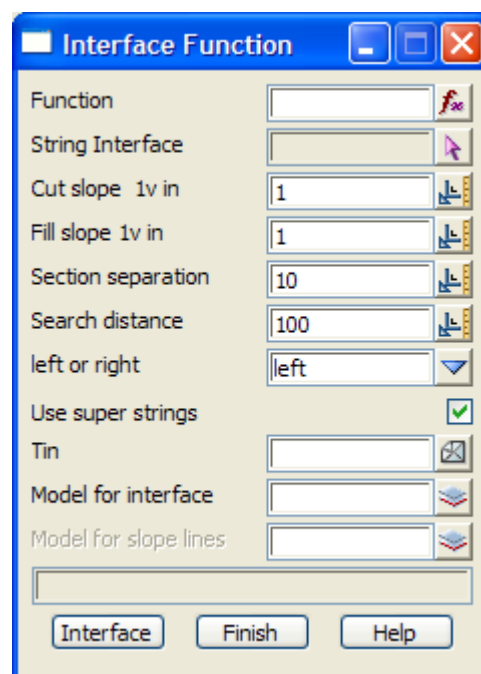

string.

After calculating an interface string and examining the results, it is often necessary to make changes to either the original string, the cut and fill slopes used, or even the tin used for interfacing against. The interface string and slope strings created during the interface would no longer be valid and need to be replaced by new information.

Although this can be accomplished by deleting the incorrect models and replacing them by new ones by re-applying the interface, this is would be time consuming if repeated over and over again. The **interface function** has been introduced to help reduce the work involved when re-calculating an interface string.

Basically, an **interface function** keeps track of all the information involved in creating an interface string and all the strings and models created during the interface. If either the original string, the cut and fill slope or the tin is subsequently modified, the interface functions can be re-run and all the old information automatically deleted and replaced by the updated information.

On selecting interface, the **interface function** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the function to define the interface for. If the function already exists and is picked from a popup or and an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.</i>	function box		available interface functions
String interface <i>select the string to calculate the interface from.</i>	string select box		
Cut slope 1 v in <i>the slope of the interface line if a point is in cut. A cut slope of one vertical to the given value of horizontal units is used. Positive is up for a cut slope. A value 0 is used to designate a horizontal line.</i>	input	1.0	
Fill slope 1 v in <i>the slope of the interface line if the point is in fill. A fill slope of one vertical to the given value of horizontal units is used. Positive is down for a fill slope. A value 0 is used for a horizontal line.</i>	input	1.0	

Section separation	input	10	
	<i>the distance between the points on the selected string that interface points will be calculated from.</i>		
Search distance	input	100	
	<i>the (plan) distance to search along the interface line to see if the tin has been intersected. If the tin has not been intersected then the z-value at the end of the interface line is taken as the interface point z-value.</i>		
Left or right	input	left	left, right
	<i>the interface point is calculated by going out at right angles to the selected string. It is possible to go to either the left or the right depending on the value of this field.</i>		
Tin	tin box		available tins
	<i>name of the tin that the interface points will be calculated against.</i>		
Model for interface	model box		available models
	<i>name of the model to contain the calculated interface string.</i>		
Model for slope lines	model box		available models
	<i>name of the model to contain the lines connecting the string points with the interface points (the slope lines). If the field is blank, no slope lines are recorded.</i>		
Interface	button		
	<i>An interface string is calculated using the selected string and the parameters defined in the panel. The interface string points are coloured red if the original string point was in cut and green if the original string point was in fill.</i>		

<esc> can be used to abort the interface option.

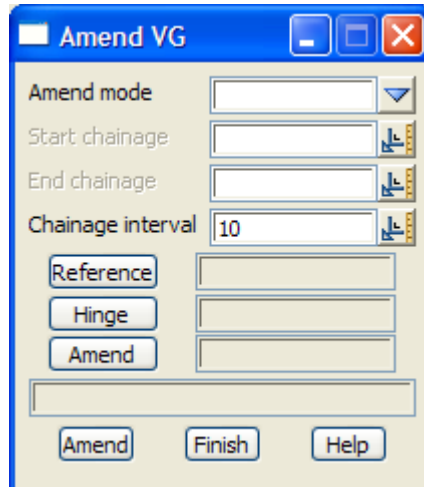

Amend VG

[amend_vg](#)
[amend_linear](#)
[amend_cubic](#)
[amend_vg_linear](#)
[amend_extend_xfall](#)

Position of option on menu: Design =>Apply =>Amend VG

Amend VG is used to modify the vertical geometry of an alignment string using a variety of methods including linear interpolation cubic reverse and circular reverse interpolating or by extending crossfall between two given strings.

Selecting Amend VG, the **Amend VG** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Amend mode	choice box		linear, cubic reverse, circular reverse, VG linear, Extend Xfall

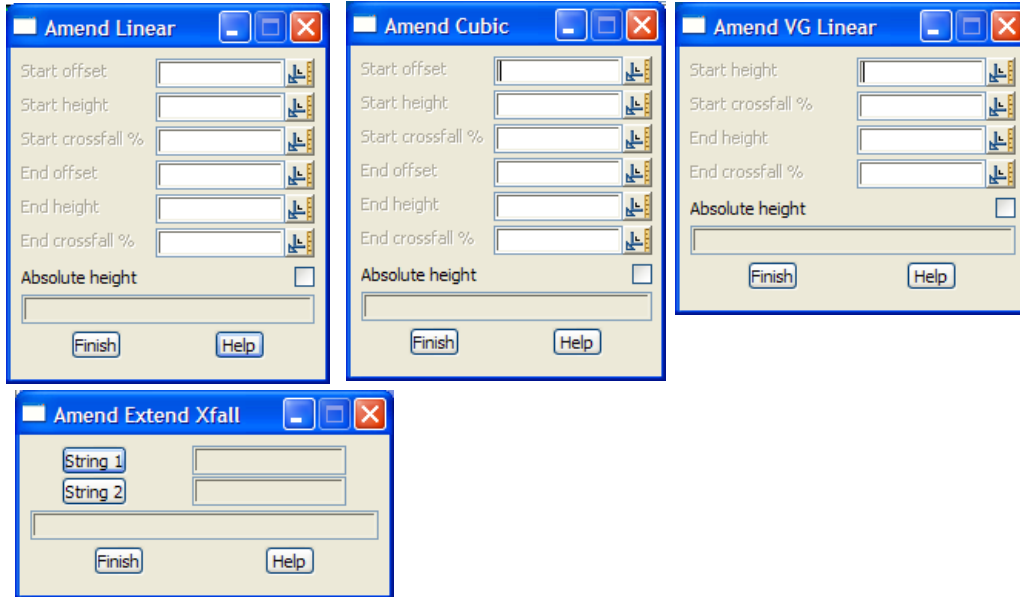

*if linear, a panel to input the values for **Start offset/height/crossfall %**, **End offset/height/crossfall %** and **Absolute height** is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

*If cubic reverse, a panel to input the values for **Start offset/height/crossfall %**, **End offset/height/crossfall %** and **Absolute height** is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

*If circular reverse, no extra information is needed to define how to modifying the vertical geometry of the **Amend** string*

*If VG linear, a panel to input the values for **Start height/crossfall %**, **End height/crossfall %** and **Absolute height** is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

*If Extend Xfall, a panel to select the two strings to extend the crossfall from is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

- Start chainage** input
 chainage to start modifying the vertical geometry of a string
- End chainage** input
 chainage to stop modifying the vertical geometry of a string
- Chainage interval** input 10
 chainage interval to apply the vertical geometry modification
- Reference** string select box
 *select the reference string to define chainage and perpendicular. If there is no **Hinge** string, then z-values are only taken from the Reference string.*
 chainage interval to apply the vertical geometry modification
- Amend** string select box
 *select the reference string to define chainage and perpendicular. If there is no **Hinge** string, then z-values are only taken from the Reference string.*
- Hinge** string select box
 if selected, the string to take z-values from
- Amend** string select box
 the string to have its vertical geometry amended
- Amend** button
 amend the vertical geometry of the Amend string between the start and end chainages

Boxing

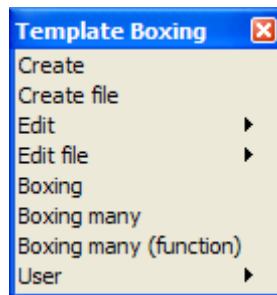

template_boxing

Position of menu: Design =>Boxing

In the Apply many option, **boxing** can be applied at the same time as applying templates by special commands in the many templates file.

However, it is also possible to apply boxing as a post process to a model of x-sections as long as the x-sections were generated in the 4d string format (this can be done by both apply options).

The definition of boxing is given in the chapter “Advanced Design” . The **boxing** walk-right menu is

For the option <i>Create</i> , please continue to the section	“Create”
<i>Create file</i>	“Create File”
<i>Edit</i>	“Edit”
<i>Edit file</i>	“Edit File”
<i>Boxing</i>	“Boxing”
<i>Boxing many</i>	“Boxing Many”
<i>Boxing many (function)</i>	“Boxing Many Function”

Create

create_boxing_file

Position of option on menu: Design =>Boxing =>Create

The **boxing=>create** option is used to create a new boxing file (*.bf) and add new boxing definitions to the file using **12d** Model panels. The created file is written to disk and can be edited using a standard file editor, or using the **boxing=>edit** option.

Selecting Create brings up the **create boxing file** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing file	input		*.bf files

name of the boxing file to create.

Create button

create a boxing file with name given by the boxing file panel fields.

*If the file given in the boxing file field does not exist, then the **edit boxing file** panel is placed on the screen and is used to create and edit the boxing definitions for the boxing file.*

*If the file already exists, then nothing will happen on selecting **create**.*

edit_boxing_definitions

When Create is selected from the **Create Boxing File** panel, it brings up the **Edit Boxing Definitions** panel which is used to create and edit the boxing definitions to be saved in the boxing file.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing definition	input		boxing definitions in file <i>name of the boxing definition (in the current boxing file) to create or edit.</i>

Create button

create a boxing definition with name given by the boxing definition panel field

*If the boxing definition given in the boxing definition field **does not exist**, then the **boxing rules** panel is placed on the screen and is used to create the new boxing definitions for the boxing file.*

*If the boxing definition already exists, then nothing will happen on selecting **create**.*

Edit button

edit an existing boxing definition with name given by the boxing definition panel field

*If the boxing definition given in the boxing definition field **exists**, then the **boxing rules** panel is placed on the screen and is used to edit the existing boxing definitions for the boxing file.*

*If the boxing definition does not exist, then nothing will happen on selecting **edit**.*

Delete button

*delete an existing boxing definition with name given by the boxing definition panel field
A **yes-no** panel confirms the deletion.*

Save file button

save the boxing file with the boxing definitions to disk.

The **Edit Boxing Definitions** panel is described in the section “Edit Boxing File” of chapter “Advanced Design” .

Create File

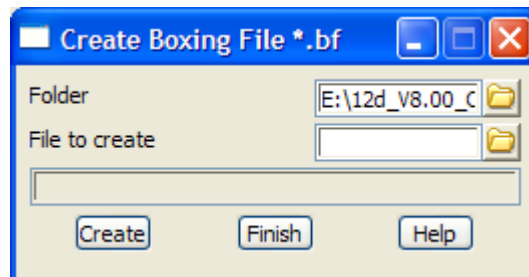

create_boxing_file__bf

Position of option on menu: Design =>Boxing =>Create file

The boxing=>create file option is used to create a new boxing file (*.bf) with the editor pointed to by the EDIT_4D environment variable.

The created file will already have a section header set up for a boxing called "1" (key word and opening and closing brackets).

Selecting create file brings up the **create boxing file *.bf** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder for the .bf file.</i>	input	current folder	
File to create <i>name of the file to create.</i>	input		*.bf files
Create	button		

create a boxing file given by the folder and file to create panel fields. If the file given in the file to edit field does not exist, then a new file is created which already has a section header set up.

The format for the boxing file is described in the chapter "Advanced Design" .

Edit

edit_boxing_file

Position of option on menu: Design =>Boxing =>Edit

The boxing=>edit option is used to edit boxing files (*.bf) using 12d Model panels.

The boxing=>edit option has two modes of operation - selecting the boxing=>edit itself, or by activating the boxing=>edit option's walk-right menu, **folder *.bf**.

Selecting boxing=>edit itself brings up the **edit boxing file** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing file <i>name of the boxing file to edit.</i>	input		*.bf files

Edit button

edit the file given by boxing file panel field.

*If the file given in the boxing file field exists, then the **edit boxing definitions** panel is brought up to create/edit the boxing definitions in the boxing file.*

*The **edit boxing definitions** panel is described in the "Edit Boxing File" from the chapter "Advanced Design".*

The boxing=>edit walk-right menu provides a list all the boxing files (files ending in .bf) in the current folder. When a file is selected from the list, the **edit boxing definitions** panel is brought up to create/edit the boxing definitions in the boxing file. The **edit boxing definitions** panel is described in the "Edit Boxing File" from the chapter "Advanced Design".

Edit File

edit_boxing_file__bf

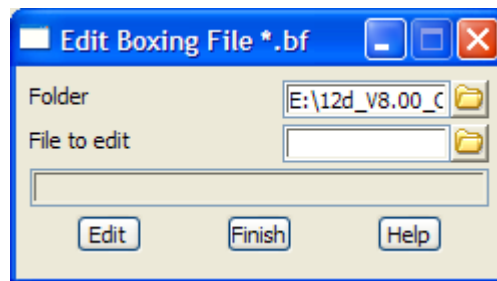

Position of option on menu: Design =>Boxing =>Edit file

The boxing=>edit file option is used to edit boxing files (*.bf) with the editor pointed to by the EDIT_4D environment variable.

The boxing=>edit file option has two modes of operation - selecting the boxing=>edit file itself, or

by activating the boxing=>edit file option's walk-right menu, **folder *.bf**.

Selecting **boxing=>edit file** itself brings up the **edit boxing file *.bf** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder for the .bf file.</i>	input	current folder	
File to edit <i>name of the file, in folder, to edit.</i>	input		*.bf files
Edit	button	<i>edit the file given by the folder and file to edit panel fields. If the file given in the file to edit field does not exist, then a new file is created which already has a section header set up.</i>	

The **boxing=>edit file** walk-right menu provides a list all the boxing files (files ending in .bf) in the current folder. When a file is selected from the list, it is automatically loaded into the editor.

The format for the boxing file is described in the “Boxing File Format” section of the chapter “Advanced Design” .

Boxing

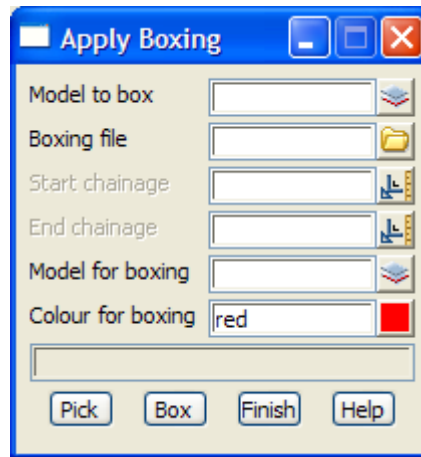

apply_boxing

Position of option on menu: Design =>Boxing =>Boxing

On selecting the boxing option, the **apply boxing** panel is displayed.

This panel can be used to create boxing sections by applying the **boxing definition** to a selected 4d string or model of sections created as 4d strings. Only the one boxing definition is used for all of the sections.

The **apply boxing** panel is

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model to box <i>model of sections (in 4d string format) to apply the boxing definition to.</i>	input		available models
Boxing file <i>name of the file containing the boxing definition to be applied to the sections in the model to box.</i>	input		*.bf files
Start/End chainage <i>the start/end string chainage for applying boxing. If blank, then the start/end chainage is taken to be the chainage at the beginning/end of the picked string.</i>	input		
Model for boxing <i>model for the created boxing x-sections</i>	input		available models
Pick <i>after picking the pick button, any selected strings will have the boxing applied to them.</i>	button		
Box <i>apply the boxing definition given in the boxing file to the sections in the model to box. between the given start chainage and end chainage.</i>	button		

Boxing Many

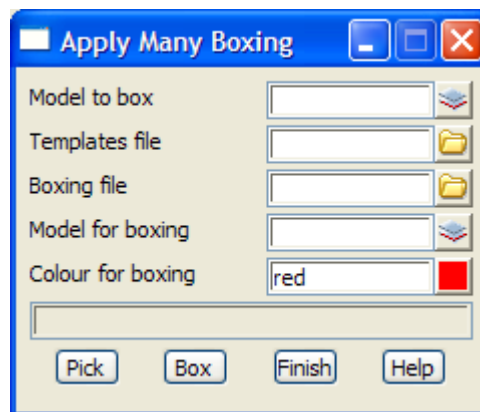

apply_many_boxing

Position of option on menu: Design =>Boxing =>Boxing many

This panel can be used to create boxing sections by applying the **boxing definitions** as specified in a boxing file to a selected 4d string or to a model of sections. If an individual section 4d string is picked, the option uses the boxing defined for the chainage where the section 4d string was created.

The boxing file allows the use of more than one boxing definition.

Selecting boxing many displays the **Apply Many Boxing** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model to box <i>model of sections (in 4d string format) to apply the boxing definition to.</i>	input		available models
Templates file <i>name of the many templates file which contains the application of the boxing definitions to the sections given in the model to box panel field. If Boxing file is non-blank, then all the boxing definitions referred to in the template file are taken from the Boxing file. If Boxing file is blank, use the boxing file given in the template file. The format of the templates file is the same as the left_boxing and the right_boxing sections in the apply many templates file.</i>	input		*.mtf files
Boxing file <i>The file of boxing definition to be applied to the sections in the model given by the model to box panel field if non-blank, the name of the file containing all the boxing definitions referred to in file given in the template file panel field. The format of the template file is the same as the boxing in the apply many template file. If blank, use the boxing file given in the template file.</i>	input		*.bf files
Model for boxing <i>model for the created boxing x-sections</i>	input		available models
Pick	button		

after picking the **pick** button, any selected strings will have the boxing applied to them.

Box button

apply the boxing as given by the template file, using the boxing definitions in the boxing file, to the 4d sections in the model for boxing field. The new boxing sections are added to the model for boxing.

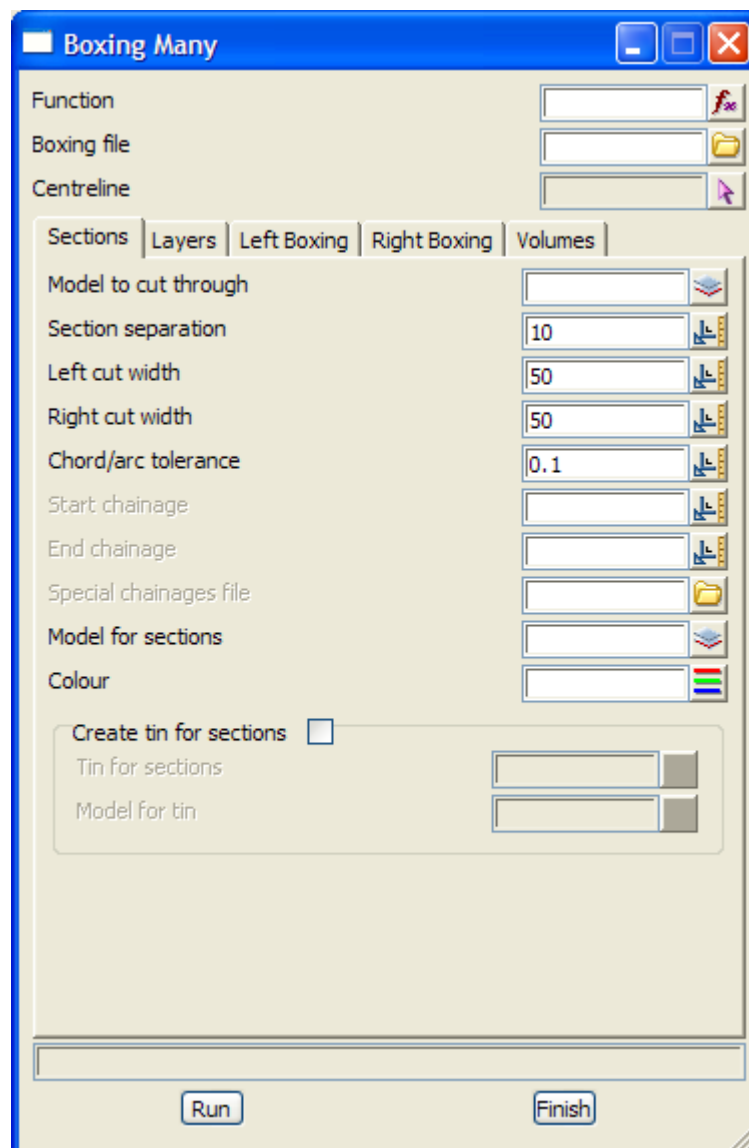

Boxing Many Function

boxing_many

Position of option on menu: Design =>Boxing =>Boxing many (function)

This option is used to cut strings to create sections and then apply up to eight layers of boxing to the cut sections.

Selecting Boxing many (function), the **Boxing Many** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the boxing function</i>	function box		available boxing functions
Boxing file <i>The file of boxing definition that may be applied to the cut sections</i>	input		*.bf files

Centreline string select

string to use for chainage and perpendicular for cutting crass sections to apply boxing to

Sections tab

Model to cut through model box available models

model of strings to cut sections through

Section separation input 10

the distance along the selected centre line to generate plan section lines to be used to cut through the model or view.

Left/Right cut width input 50

the left/right distance to go out from the centre line for creating a section to cut through the strings.

Chord/arc tolerance input default chord/arc tolerance

the chord to arc tolerance to use on the selected string for determining how many plan sections are created around horizontal curves.

Start/End chainage input

if non-blank then sections for the cuts are restricted to between the given start and end chainage of the selected centreline string

Special chainages file file box *.spf files

a file containing chainages, one per line, that are also used as extra chainages to create cross sections at

Model for sections model box available models

model for the cut cross sections

Colour colour box available colours

colour for the cut cross sections

Create tin for sections tick box

if tick, then a tin of the cross sections is created

Tin for sections tin box available tins

name of the tin of cross sections

Model for tin model box available models

model for the cross sections tin

Layers tab

*the layers tab consists of a grid for defining up to eight layers of boxing strings and sections. The last boxing layer is also referred to as the **subgrade** layer.*

Boxing Layer 1-8:

if non blank, boxing strings and sections will be created for that layer.

Strings input

*if non-blank, pre*post text to use with the function name to create the name of the model for the boxing strings for this layer.*

If blank, the boxing strings will not be stored for this layer.

Sections input available models

*if non-blank, pre*post text to use with the function name to create the name of the model for the boxing sections for this layer.*

If blank, the boxing sections will not be stored for this layer.

Colour input available colours

colour for the boxing sections for this layer

Create subgrade tin tick box

if tick, then a tin of the subgrade strings and sections is created. Note - the subgrade is the last boxing layer.

Subgrade tin tin box available tins

name for the subgrade tin

Subgrade tin model model box available models

model for the subgrade tin

Left Boxing tab

tab for applying left boxing - gives the chainage range and boxing definitions to use for each of the eight layers of boxing

Layer choice box Layer 1, Layer 2 ... Layer 8

as each layer is selected, a grid for defining the chainages and boxing definition that applies to that chainage are given in the grid

For each selected layer:

Chainage input available models

for the selected boxing layer, the chainage range to apply the boxing definition to

Boxing boxing definition box boxing definitions

*the boxing definition to use with the given chainage range. The pop-up lists all the boxing definitions in the **Boxing file***

Comment

Right Boxing tab

tab for applying right boxing - gives the chainage range and boxing definitions to use for each of the eight layers of boxing

Layer choice box Layer 1, Layer 2 ... Layer 8

as each layer is selected, a grid for defining the chainages and boxing definition that applies to that chainage are given in the grid

For each selected layer:

Chainage input available models

for the selected boxing layer, the chainage range to apply the boxing definition to

Boxing boxing definition box boxing definitions

*the boxing definition to use with the given chainage range. The pop-up lists all the boxing definitions in the **Boxing file***

Comment

record a comment

Volumes tab

Calculate volumes tick box
*if **tick**, then end area volumes are created*

Tin tin box available tins
name of the natural surface tin - required if volumes to the natural surface are calculated

Model for tin sections model box available models
if non blank, model to put the natural surface sections into

Report file file box *.rpt
*if non-blank, the name of the file to contain the volume report. If the file already exists, the report will be appended to the file.
 If blank, no report is produced.*

Report model choice box Summary, Full
*if **Summary**, the report only contains the final volumes.
 If **Full**, the report contains sections by section areas and volumes as well as the summary of volumes.*

Calculate natural surface to design volumes tick box tick
*if **tick**, end area volumes between the natural surface and the design strings are written to the report file*

Calculate natural surface to subgrade volume tick box tick
*if **tick**, end area volumes between the natural surface to the subgrade (the last boxing layer) are written to the report file*

Calculate design to subgrade volumes tick box tick
*if **tick**, end area volumes between the design strings and the subgrade (the last boxing layer) are written to the report file.*

Calculate inter-boxing layer volumes tick box tick
*if **tick**, end area volumes between each of the boxing layers are written to the report file.*

Run button
run the option

MTF

mtf

Position of menu: Design =>MTF

In the apply many option, a **many template file** is used to control the application of templates to the hinge string.

The full definition for the mtf file is given in the chapter “Advanced Design” .

The mtf walk-right menu is

Each option in this menu will now be described.

For the option <i>Create</i> ,	go to the section	“Create MTF”
<i>Create file</i>		“Create File”
<i>Edit</i>		“Edit”
<i>Edit file</i>		“Edit File”
<i>Rename</i>		“Rename MTF”
<i>Apply many</i>		“Apply Many”
<i>Edit by string</i>		“Edit by String”
<i>Copy MTF</i>		“Copy MTF”
<i>Delete MTF</i>		“Delete MTF”

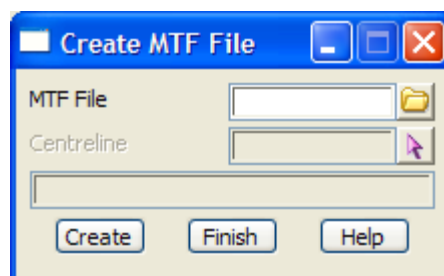

Create MTF

create_mtf_file

Position of option on menu: Design =>MTF =>Create

The mtf=>create option is used to create a new mtf file (*.mtf) using 12d Model panels. The created file is written to disk and can be edited using a standard file editor, or using the MTF=>Edit option.

Selecting Create brings up the **Create MTF File** panel.

The fields and buttons used in this panel have the following functions.

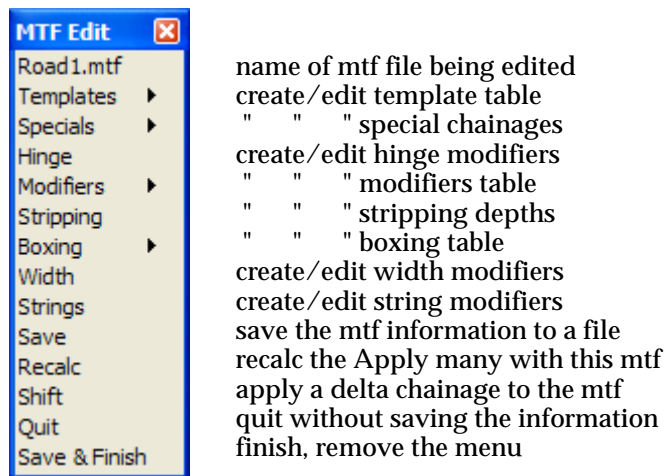

Field Description	Type	Defaults	Pop-Up
MTF file <i>name of the mtf file to create.</i>	file box		*.mtf files

Create button
create an mtf file with name given by the mtf file panel fields.
If the file given in the mtf file field does not exist, then the mtf edit menu is placed on the screen and is used to created and edit the mtf sections in the mtf file.
*If the file already exists, then nothing will happen on selecting **Create**.*

MTF Edit

mtf_edit

When Create is selected from the **Create MTF File** panel, it brings up the **MTF Edit** menu which is used to create and edit the mtf sections to be saved in the mtf file.

The MTF Edit menu is described in the chapter “Advanced Design” .

Create File

create_mtf_file__mtf

Position of option on menu: Design =>MTF =>Create file

The mtf=>create file option is used to create a new many templates files (*.mtf) with the editor pointed to by the EDIT_4D environment variable.

The created file will already have all the section headers (key words and opening and closing brackets) in it.

Selecting create file brings up the **create mtf file *.mtf** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder for the .mtf file.</i>	input	current folder	

File to create input *.mtf files
name of the file to create.

Create button
create an mtf file given by the folder and file to create panel fields. If the file given in the file to edit field does not exist, then a new file is created which already has each of the section headers set up.
 The format for the mtf file is described in the chapter "Advanced Design" .

Edit

edit_mtf_file

Position of option on menu: Design =>MTF =>Edit

The mtf=>edit option is used to edit mtf files (*.mtf) using 12d Model panels.

The mtf=>edit option has two modes of operation - selecting the mtf=>edit itself, or by activating the mtf=>edit option's walk-right menu, **folder *.mtf**.

Selecting mtf=>edit itself brings up the **edit mtf file** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF file	input		*.mtf files
<i>name of the mtf file to edit.</i>			

Edit button
edit the file given by mtf file panel field.
If the file given in the mtf file field exists, then the mtf edit menu is brought up to create/edit the mtf sections in the mtf file.

name of mtf file being edited
 create/edit template table
 " " " special chainages
 create/edit hinge modifiers
 " " " modifiers table
 " " " stripping depths
 " " " boxing table
 create/edit width modifiers
 create/edit string modifiers
 save the mtf information to a file
 recalc the Apply many with this mtf
 apply a delta chainage to the mtf
 quit without saving the information
 finish, remove the menu

The MTF edit menu is described in the chapter "Advanced Design".

The mtf=>edit walk-right menu provides a list all the mtf files (files ending in .mtf) in the current folder. When a file is selected from the list, the edit mtf file panel is brought up to create/edit the mtf sections in the mtf file.

The MTF edit menu is described in the chapter "Advanced Design".

Edit File

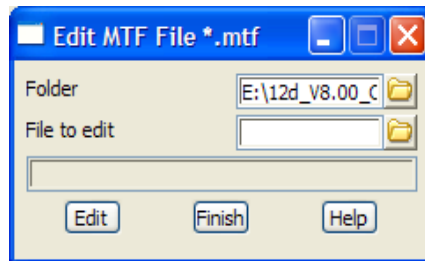

edit_mtf_file__mtf

Position of option on menu: Design =>MTF =>Edit file

The mtf=>edit file option is used to edit many templates files (*.mtf) with the editor pointed to by the EDIT_4D environment variable.

The mtf=>edit file option has two modes of operation - selecting the mtf=>edit file itself, or by activating the mtf=>edit file option's walk-right menu, **folder *.mtf**.

Selecting mtf=>edit file itself brings up the **edit a file *.mtf** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder for the .mtf file.</i>	input	current folder	
File to edit <i>name of the file, in folder, to edit.</i>	input		*.mtf files
Edit	button		

*edit the file given by the folder and file to edit panel fields. If the file given in the file to edit field does not exist, then a new file is created which already has each of the section headers set up.
The format for the mtf file is described in the chapter “Advanced Design” .*

The mtf=>edit file walk-right menu provides a list all the many template files (files ending in .mtf) in the current folder. When a file is selected from the list, it is automatically loaded into the editor.

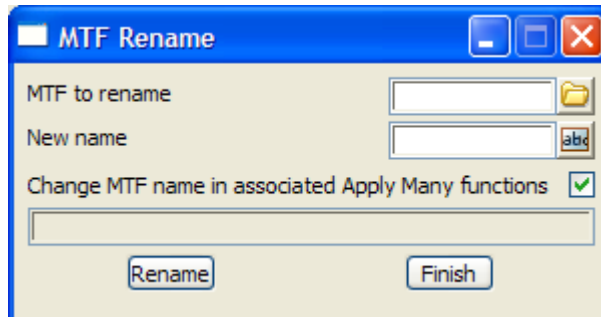

The format for the mtf file is described in the chapter “Advanced Design” .

Rename MTF

mtf_rename

Position of option on menu: Design =>MTF =>Rename

Selecting Rename brings up the **MTF Rename** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF to rename <i>name of the mtf file to rename</i>	file box		*.mtf files
New name <i>new name for the mtf file</i>			
Change MTF name is associated Apply Many functions <i>if tick, rename the mtf in all functions that include it</i>	tick box		
Rename <i>rename the mtf file with the new name</i>	button		

Apply Many

Position of option on menu: Design =>MTF =>Apply many

The **Apply many** option is used to apply a mtf file to a selected hinge string.

The option has already been described under **Design=>Apply=>Apply many**.

For the option *Apply many*, please go to the section “Apply Many” .

Edit by String

Position of option on menu: Design =>MTF =>Edit by string

The **Edit by string** option is used to edit the *MTF* by selecting a string created from using the *MTF* in an *Apply Many*.

Selecting **Edit by string** brings up the **Edit MTF/Survey Function Data** panel:

After selecting the **Pick Edit** button, a string created by MTF function is selected and the MTF editor is started for the MTF.

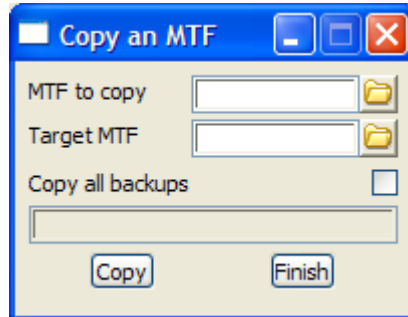

For information on the *MTF Editor*, go to the section “MTF Edit” .

Copy MTF

copy_an_mtf

Position of option on menu: Design =>MTF =>Copy

Selecting Copy brings up the **Copy an MTF** panel.

The fields and buttons used in this panel have the following functions.

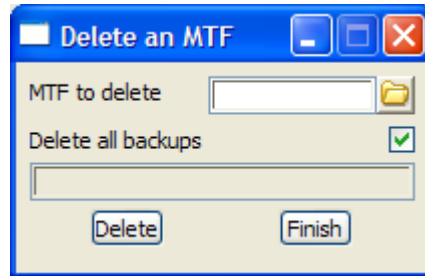

Field Description	Type	Defaults	Pop-Up
MTF to copy <i>name of the mtf file to rename</i>	file box		*.mtf files
Target MTF <i>new name for the mtf file</i>			
Copy all backups <i>if tick, copy all the backup files of the mtf as well</i>	tick box		
Copy <i>copy the mtf file to the new name</i>	button		

Delete MTF

delete_an_mtf

Position of option on menu: Design =>MTF =>Delete

Selecting Delete brings up the **Delete an MTF** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF to delete <i>name of the mtf file to delete</i>	file box		*.mtf files
Delete all backups <i>if tick, delete all the backup files of the mtf as well</i>	tick box		
Delete <i>delete the mtf file</i>	button		

Barwon Sewer

This is a separate chargeable module.

Documentation will be provided when the module is purchased.

The Barwon sewer option is used to place waste water reticulation networks within a subdivision and produce plots and reports to Barwon Water format. The network is placed in three dimensions including manholes and house connections.

If used in conjunction with the services on a section view, interference with neighbouring pipe strings can be taken into consideration when placing the network.

The waste water process consists of a number of steps.

- ▲ creating the sewer network
- ▲ checking that residential blocks are controlled by the network
- ▲ creating the house connections for the sewer
- ▲ producing plots and reports

Note

The "barwon sewer" string can only have straights between manholes. The drainage string described in the chapter, Drainage and Sewer, is a generalization of the sewer string and can have arcs between manholes.

Estate Lots

Position of menu: Design =>Estate/Lots

estate_lots

This module is currently under development.

The Estate Lots module is for creating house lots for an Estate (Subdivision).

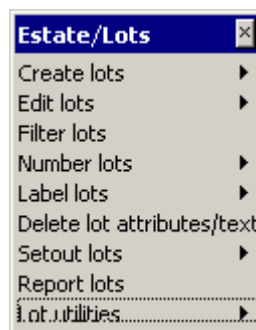

There are options to create and edit lots by a variety of methods. Once the lots are created they can be numbered, given a lot type (see “Lot types”) and labelled.

The labelling includes labelling the side of lots with bearing and distances, lots with areas and lot numbers.

Reports of lot areas and types can be created and lots coloured according to areas.

Finally options exist to create point numbers and reports for setting out the lots.

The Estate/Lots walk-right menu is:

For the option *Create lots*, please continue to the section “Create Lots” .

<i>Edit lots</i>	“Edit Lots”
<i>Filter lots</i>	“Filter Lots”
<i>Number lots</i>	“Number Lots”
<i>Label lots</i>	“Label Lots”
<i>Delete lot attributes/text</i>	“Delete Lot Attributes and Text”
<i>Setout lots</i>	“Setout Lots” .
<i>Report lots</i>	“Report Lots” .
<i>Lot utilities</i>	“Lot Utilities” .

Lot types

Lots can have a **type** which is used in reports. The lot types are defined in a text file called *lottypes.4d* which is searched for in the standard library areas (see “Library, User Library”).

For example of *lottypes.4d* is

```
park
road
other
surround
McDonalds
```

Create Lots

create_lots

Position of menu: Design =>Estate/Lots => Create lots

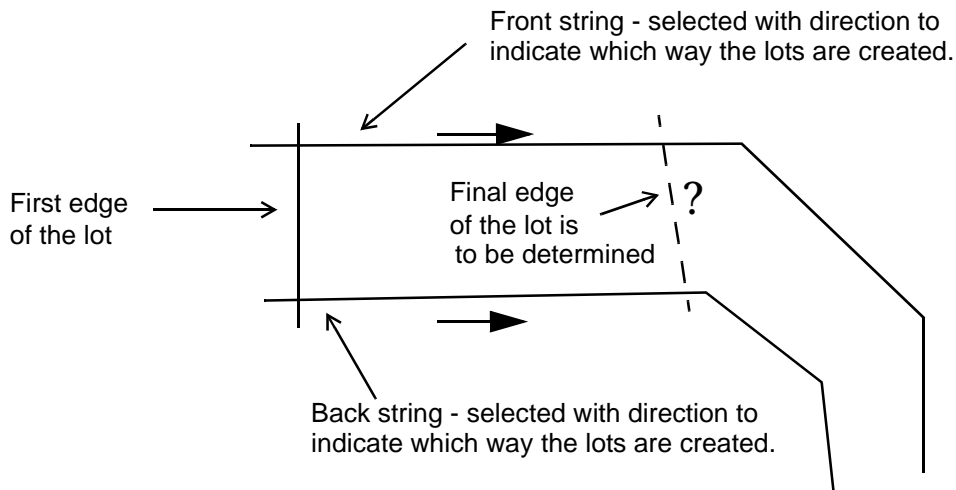

For the option *Create lot*, please continue to the section “Create Lot” .

<i>Create lot from boundaries</i>	“Create Lot from Picking” .
<i>Create lot by picking segments</i>	“Create Lot from Picking Segments” .
<i>Create lot from polygon</i>	“Create Lot from Polygon” .
<i>Read geocomp lots file</i>	“Read Geocomp Lots File” .

Create Lot**lot_creation_panel**

Position of option on menu: Design =>Estate/Lots => Create lots =>Create lot

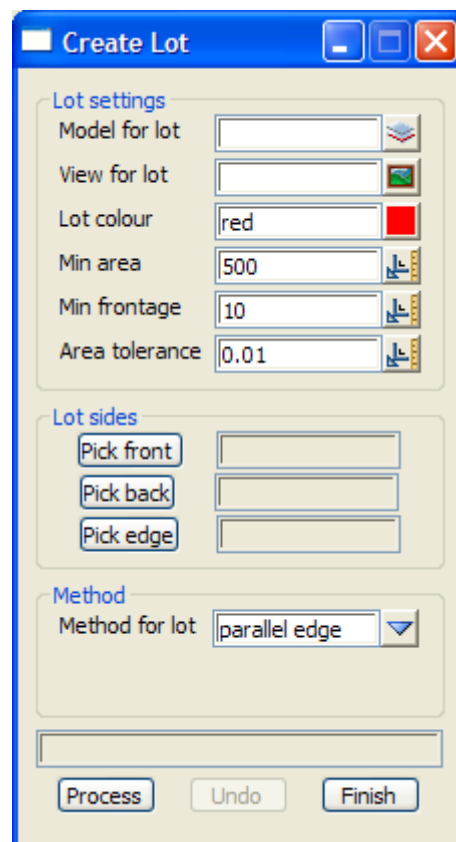

This option creates lots of a user given area using the front and back strings for a number of lots and an initial **straight line edge** of a lot. The final edge of the lot then needs to be determined.

The methods of creating the final edge of lot are:

- parallel the existing side - *parallel edge*. See “Parallel Edge”
- having the same bearing as a selected line - *parallel pick*. See “Parallel Pick”
- having a given bearing - *parallel bear*. See “Parallel Bearing”
- perpendicular to either the front string or the back string - *perpendicular*. See “Perpendicular and Perpendicular Pick”
- perpendicular to either the front string or the back string but starting from a user selected point - *perpen start pt*. See “Perpendicular and Perpendicular Pick” See “Perpendicular and Perpendicular Pick”
- pivoting about a selected point - *pivot pick*. See “Pivot Pick and Pivot Frontage”

- (g) pivoting about the point at minimum frontage - *pivot frontage*. See “Pivot Pick and Pivot Frontage”
- (h) closing a selected string - *close string*. See “Close String”

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for lot <i>model for the created lot.</i>	model box		available models
View for lot <i>view to add model of created lot to.</i>	view box		available views
Lot colour <i>colour for the created lot.</i>	colour box		available colours
Min area <i>required area of the created lot.</i>	double box		
Min frontage <i>required minimum frontage of the created lot.</i>	input box		
Area tolerance <i>lot to be created can be within this tolerance of the minimum area.required area of the created lot.</i>	double box		

- Pick front** string select
pick the string to form the front of the created lot.
- Pick back** string select
pick the string to form the back of the created lot.
- Pick edge** string select
*pick the **straight** line to form the edge of the created lot.
 The front, back and edge form three sides of the lot to be created.*
- Method** choice box parallel edge parallel edge, parallel pick
*parallel bear, perpendicular
 pivot pick, pivot frontage
 close string*
pick the string to form the back of the created lot.
- Process** button
use the selected front, back and edged and then create the final side of the lot by the selected method.

Continue to the next section “Creating Lots from a Front and Back String and an Edge” for a full description of each method of creating the lots.

Creating Lots from a Front and Back String and an Edge

Parallel Edge

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

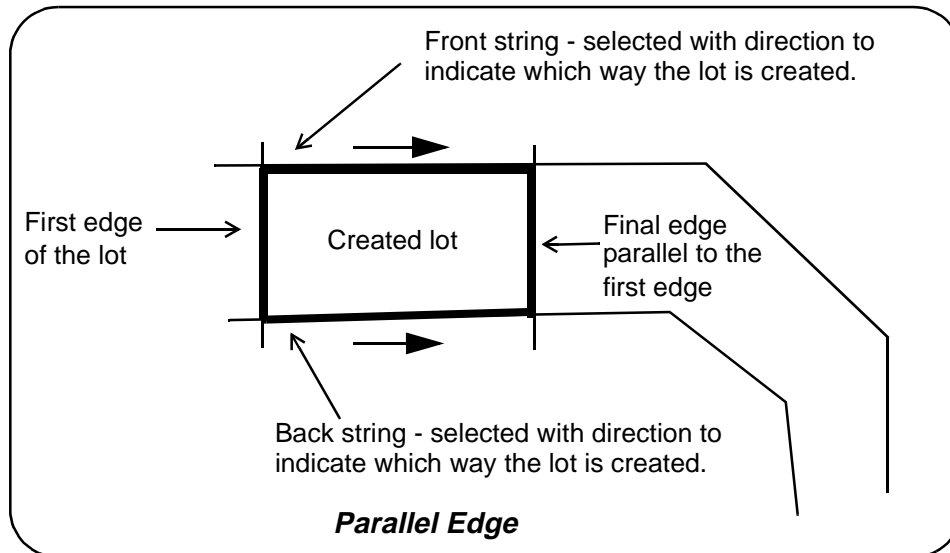

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For *Parallel Edge*, the **final edge** is created parallel to the initial edge and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

Parallel Bearing

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For *Parallel Bear*, the **final edge** is created with a user specified bearing and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

Parallel Pick

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

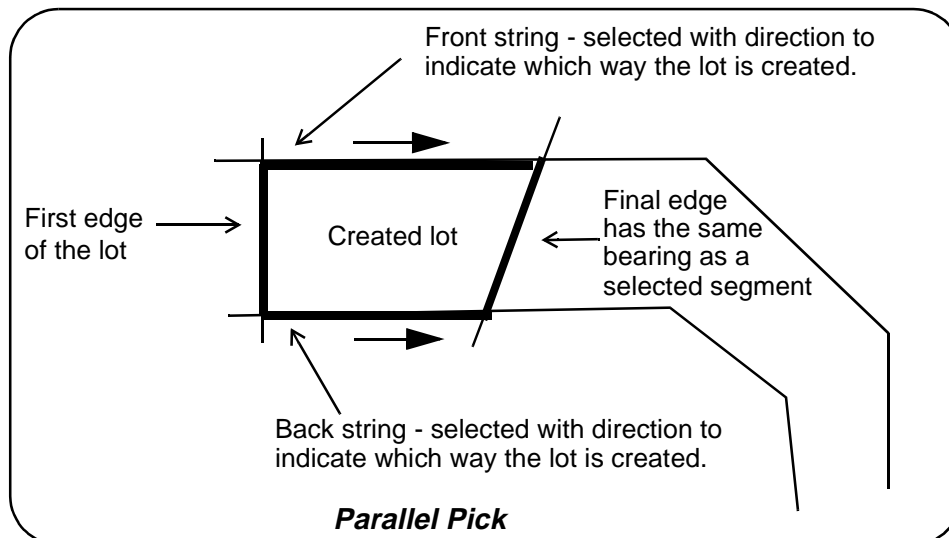

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For *Parallel Pick*, the **final edge** is created with the bearing of a user selected segment and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

Perpendicular and Perpendicular Pick

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

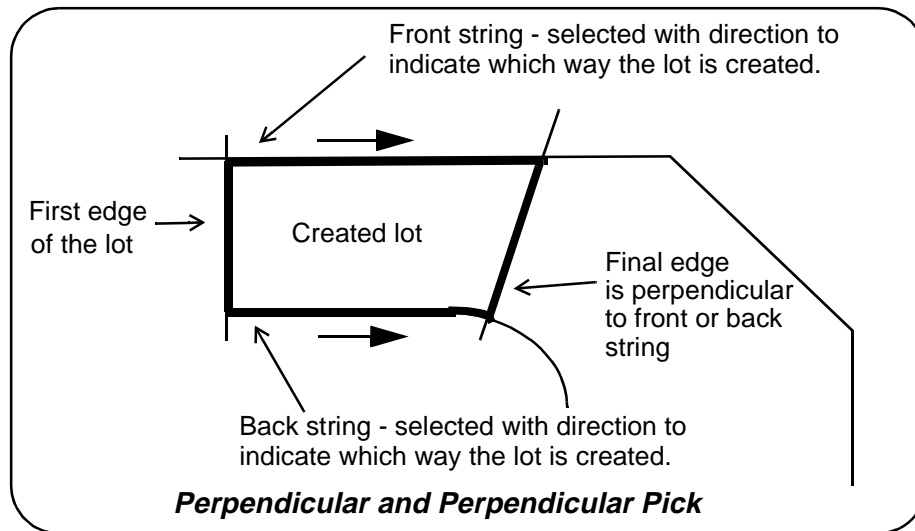

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For *Perpendicular*, the **final edge** is constrained to be perpendicular to either the front or the back string and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

For *Perpendicular Pick*, a start point is selected on the front/back string and the **final edge** is created past the start point. This option only needs to be used when *Perpendicular* has problems finding a solution due to sharp changes of bearing along the front/back string.

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

Pivot Pick and Pivot Frontage

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

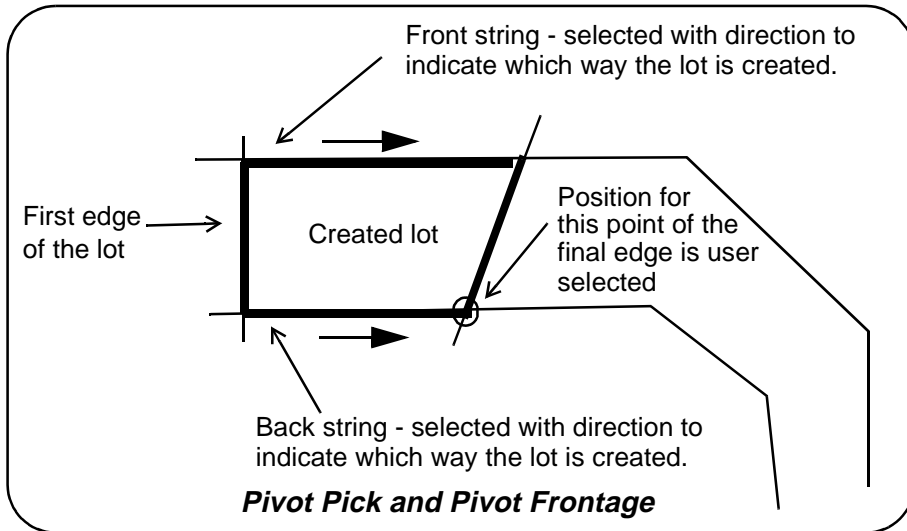

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For *Pivot Pick*, a position is selected on either the front or back string to be one point of the **final edge**. The other point of the final edge is determined so that the lot has the required given area (to within the area tolerance).

For *Pivot Frontage*, the pivot point is taken to be the position on the front string that is the minimum frontage distance along the front string from the initial edge.

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

Close String

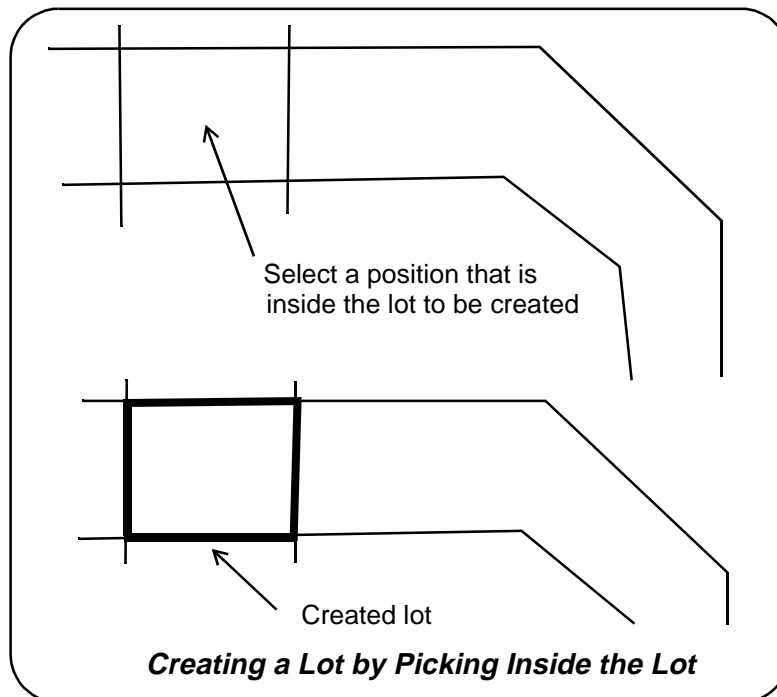

This method simply closes the string that is selected by the user.

Create Lot from Picking

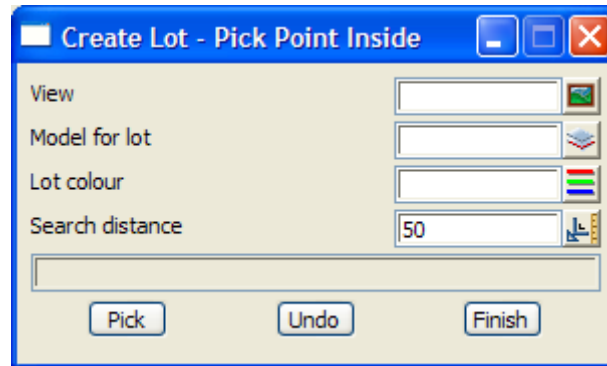

boundary_polyline_panel

Position of option on menu: Design =>Estate/Lots => Create lots =>Picking point inside

This option creates a lot by a picking inside a collection of strings and the lot is created from the closest strings to the picked position. The picked position must be selected so that all sides of the lot can be "seen" from the picked position. That is, a straight line can be drawn from the picked position to the lot side without cutting any other segment.

On selecting the Create lot by picking point inside option, the **Create Lot - Pick Point Inside** panel is displayed.

The fields and buttons used in this panel have the following functions.

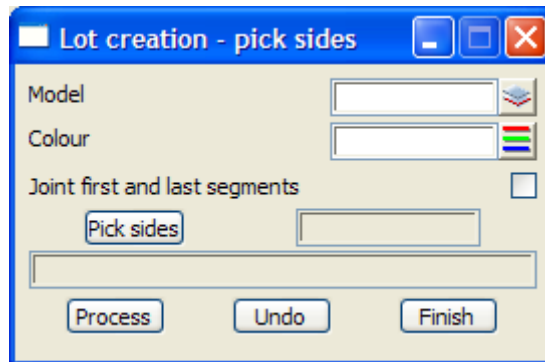

Field Description	Type	Defaults	Pop-Up
View for lot <i>view to add model of created lot to.</i>	view box		available views
Model for lot <i>model for the created lot.</i>	model box		available models
Lot colour/colour for polygon <i>colour for the created lot.</i>	colour box		available colours
Search distance <i>maximum distance to search from the selected point for sides of the lot</i>	double box	20	
Pick <i>pick the position to try and form a lot around.</i>	string select		

Create Lot from Picking Segments

[lot_creation_pick_panel](#)

Position of option on menu: Design =>Estate/Lots => Create lots =>by picking segments

This option creates a lot by a picking each segment in its order (and with direction) around the lot. Segments will be automatically extended or clipped to form the lot.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for lot <i>model for the created lot.</i>	model box		available models
Lot colour <i>colour for the created lot.</i>	colour box		available colours
Join first and last segment	tick box		
<i>if tick, join the end of the last selected segment to the start of the first selected segment to form the final side of the lot.</i>			
Pick sides	string select		
<i>pick, with direction, the segments to be joined together to form the sides of the lot.</i>			

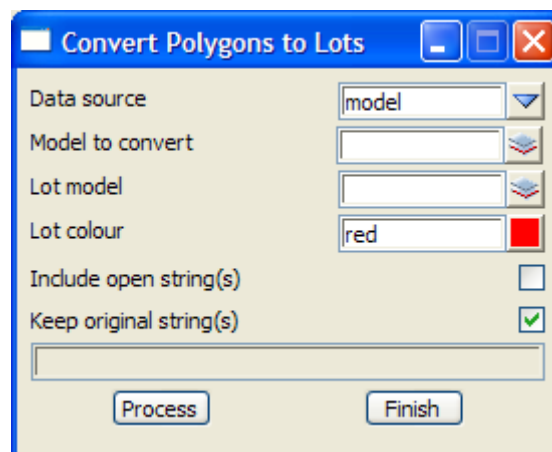

Process button
create the lot from the selected segments.

Create Lot from Polygon

lot_polygon_panel

Position of option on menu: Design =>Estate/Lots => Create lots =>Lots from polygons

This option converts strings to a lot. The strings can be open.

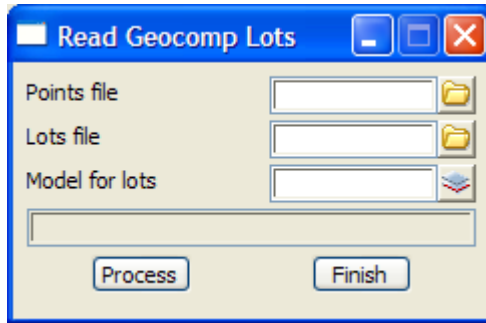

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>			
Data source <i>data source for strings to convert to lots.</i>			
Model for lot <i>model for the created lot.</i>	model box		available models
Lot model <i>model for the created lots.</i>	model box		available models
Lot colour <i>colour for the created lots.</i>	colour box		available colours
Include open strings <i>if tick, open strings are used to from lots by making then closed strings. If not tick, open strings are ignored.</i>	tick box		
Process <i>create lots from the selected strings.</i>	button		

Read Geocomp Lots File

lot_geocomp_panel

Position of option on menu: Design =>Estate/Lots => Create lots =>Read geocomp lots file
 This option reads a Geocomp lots file and creates 12d Model lots.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Points file <i>name of the Geocomp points file.</i>			*.pts files
Lots file <i>name of the Geocomp lots file - is uses points from the given Geocomp points file.</i>			*.pts files
Model for lot <i>model for the created lot.</i>	model box		available models
Process <i>read in the given Geocomp points and lots file and created 12d Model lots.</i>	button		

Edit Lots

edit_lots

Position of menu: Design =>Estate/Lots =>Edit lots

For the menu *Adjust area*, please continue to the section "Adjust Area".
 For the menu *Subdivide area*, please continue to the section "Subdivide Area".

Adjust Area

adjust_area

Position of menu: Design =>Estate/Lots =>Edit lots =>Adjust area

For the option *Pivot*, please continue to the section “Adjust Lot by Pivot” .

Parallel edge

“Adjust Lot by Parallel Edge”

Parallel bearing

“Adjust Lot by Parallel Bearing” .

Perpendicular

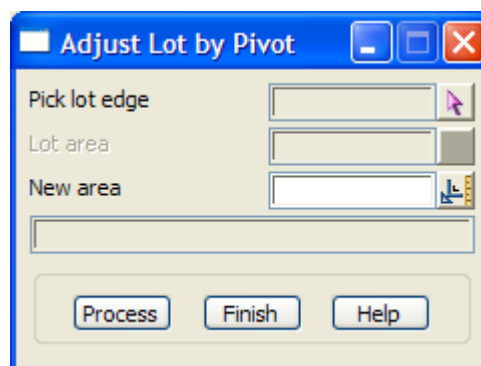

“Adjust Lot by Perpendicular” .

adjust_lot_by_pivot

Adjust Lot by Pivot

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Adjust area =>Pivot

This option adjusts the size of a lot by pivoting one side about one of its end points until the lot area has a new given area.

The fields and buttons used in this panel have the following functions.

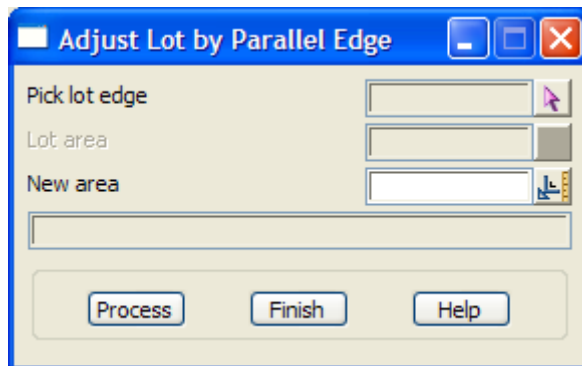

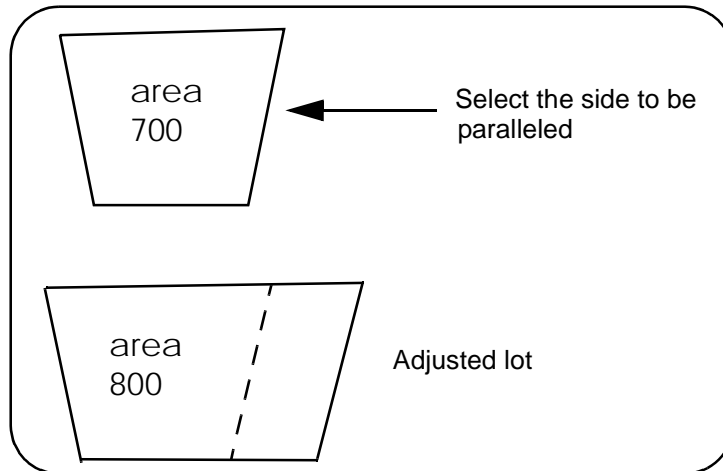

Field Description	Type	Defaults	Pop-Up
Pick lot edge	string select		
<i>pick the lot to adjust by picking a side of the lot with direction. The start of the selected side will be the pivot point.</i>			
Lot area	output box		
<i>area of the selected lot.</i>			
New area	input box		
<i>required area of the adjusted lot. The area can be larger or smaller than the existing lot area.</i>			
Process	button		
<i>adjust the lot by pivoting the side.</i>			

adjust_lot_by_parallel_edge

Adjust Lot by Parallel Edge

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Adjust area =>Parallel edge

This option adjusts the size of a lot by moving a side parallel to itself until the lot area has a new given area.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick lot edge string select
pick the lot to adjust by picking the edge of the lot that is to be paralleled.

Lot area output box
area of the selected lot.

New area input box
required area of the adjusted lot. The area can be larger or smaller than the existing lot area.

Process button
adjust the lot by paralleling the selected edge.

adjust_lot_by_parallel_bearing

Adjust Lot by Parallel Bearing

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Adjust area =>Parallel bearing

This option adjusts the size of a lot by moving a side parallel to a given bearing until the lot area has a new given area.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot corner	string select		
<i>pick the lot to adjust by picking the corner of the lot that the side goes through and has the given bearing.</i>			
Lot area	output box		
<i>area of the selected lot.</i>			
New area	input box		
<i>required area of the adjusted lot. The area can be larger or smaller than the existing lot area.</i>			
Bearing	bearing box		
<i>the bearing used for the selected edge.</i>			
Process	button		
<i>adjust the lot by paralleling the selected edge with the given bearing.</i>			

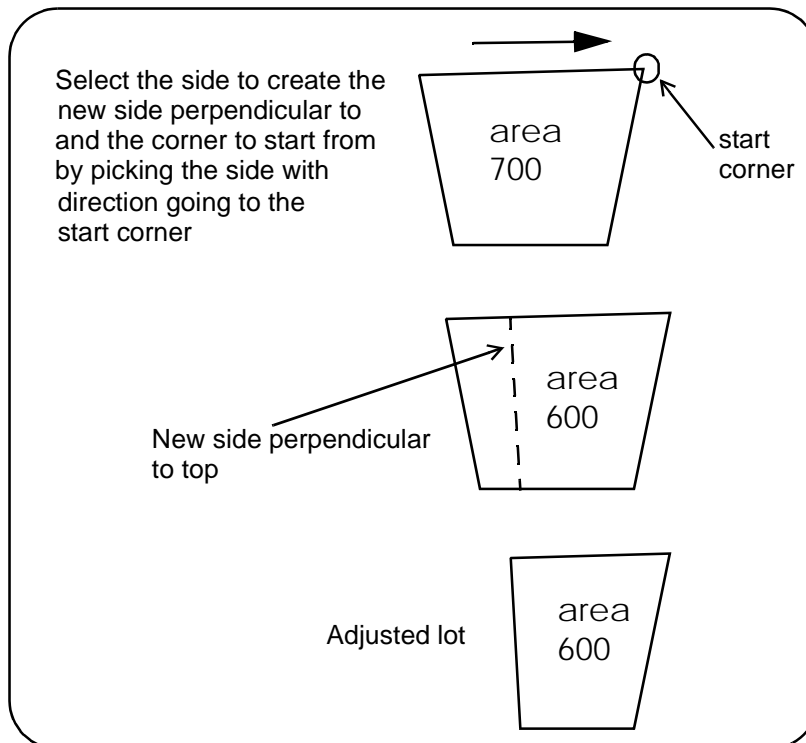

adjust_lot_by_perpendicular

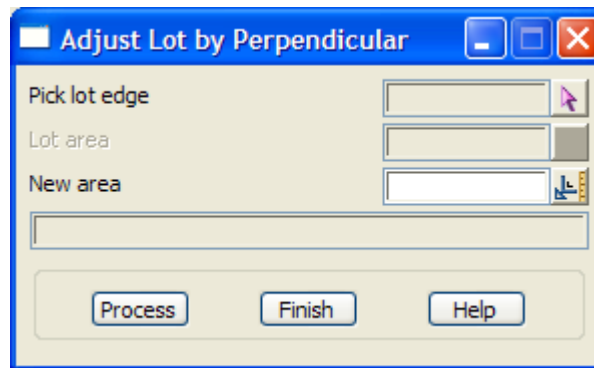

Adjust Lot by Perpendicular

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Adjust area =>Perpendicular

This option adjusts the size of a lot by creating a new side perpendicular to a selected side and then moving the new side until the created lot area has a given area.

Note -the new area must be less than the original area.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge	string select		
<i>pick the side of the lot that a new side will created perpendicular to</i>			
Lot area	output box		
<i>area of the selected lot.</i>			
New area	input box		
<i>required area of the adjusted lot. The area must be smaller than the existing lot area.</i>			
Process	button		
<i>adjust the lot by moving the side whilst keeping it perpendicular to another side.</i>			

[subdivide_area](#)

Subdivide Area

Position of menu: Design =>Estate/Lots =>Edit lots =>Subdivide area

For the option *Pivot*, please continue to the section “Subdivide Lot by Pivot” .

Parallel edge

“Subdivide Lot by Parallel Edge”

Parallel bearing

“Subdivide Lot by Parallel Bearing” .

Perpendicular

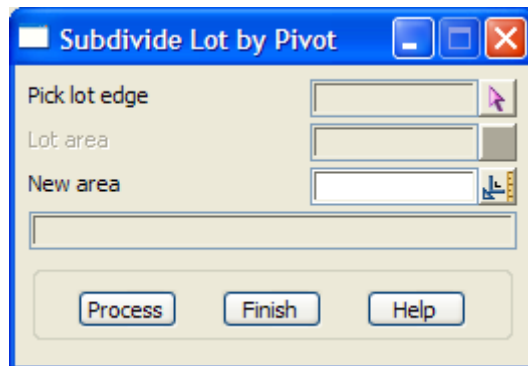

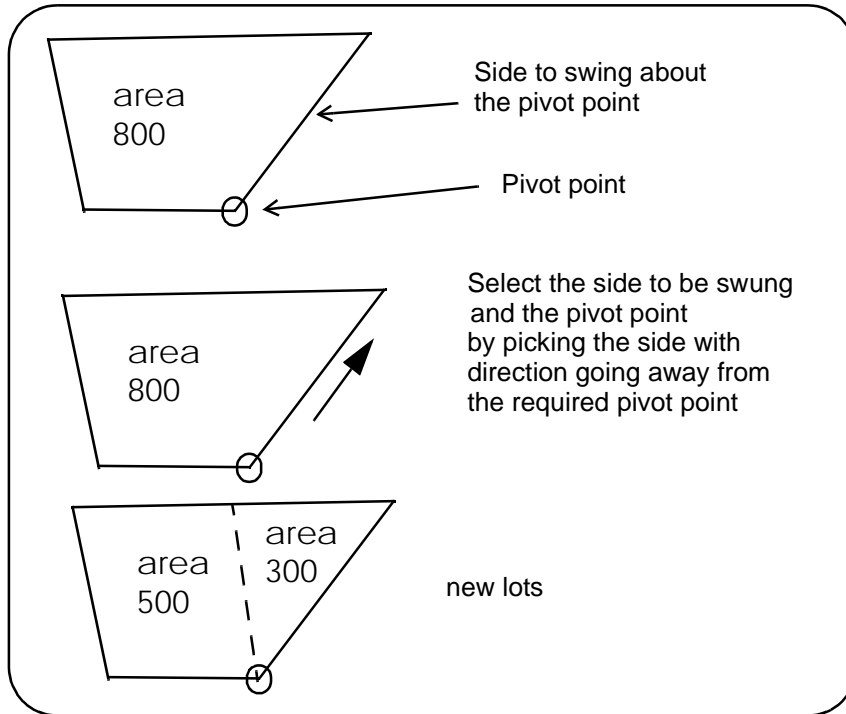

“Subdivide Lot by Perpendicular” .

[subdivide_lot_by_pivot](#)

Subdivide Lot by Pivot

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Subdivide area =>Pivot

This option reduces the size of a lot by pivoting one side about one of its end points until the lot area has a new smaller area. A second lot is created from the remainder of the original lot.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot <i>pick the lot to adjust by picking a side of the lot with direction. The start of the selected side will be the pivot point.</i>	string select		
Lot area <i>area of the selected lot.</i>	output box		
New area <i>required area of the adjusted lot. The area must be smaller than the existing lot area.</i>	input box		
Process	button		

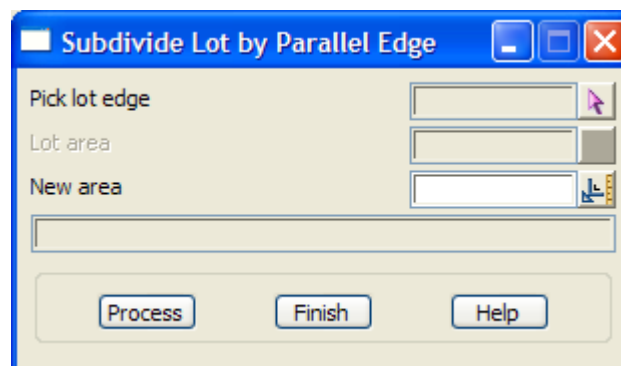

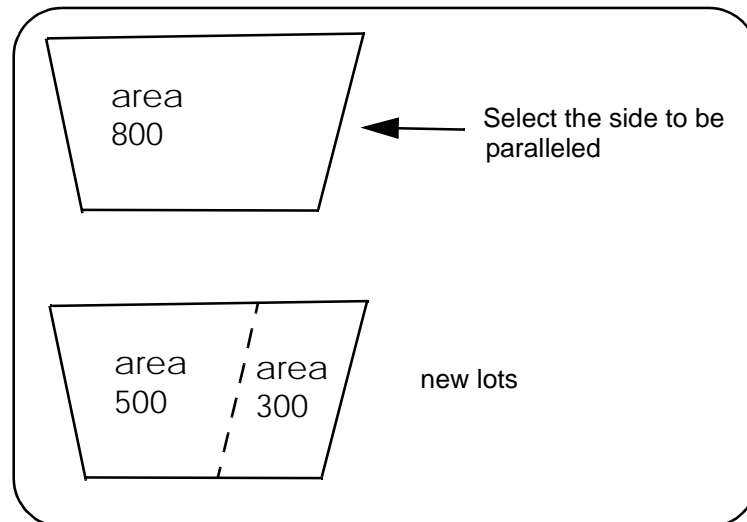

adjust the lot by pivoting the side. A second lot is created from the remainder of the original lot.

subdivide_lot_by_parallel_edge

Subdivide Lot by Parallel Edge

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Subdivide area =>Parallel edge

This option adjusts the size of a lot by moving a side parallel to itself until the lot area has a new smaller area. A second lot is created from the remainder of the original lot.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge	string select		
<i>pick the lot to adjust by picking the edge of the lot that is to be paralleled.</i>			
Lot area	output box		
<i>area of the selected lot.</i>			
New area	input box		
<i>required area of the adjusted lot. The area must be than the existing lot area.</i>			
Process	button		

adjust the lot by paralleling the selected edge. A second lot is created from the remainder of the original lot.

subdivide_lot_by_parallel_bearing

Subdivide Lot by Parallel Bearing

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Subdivide area =>Parallel bearing

This option adjusts the size of a lot by moving a side parallel to a given bearing until the lot area has a new smaller area. A second lot is created from the remainder of the original lot.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick lot corner	string select		
<i>pick the lot to adjust by picking the edge of the lot that is to be paralleled.</i>			

Lot area	output box		
<i>area of the selected lot.</i>			

New area	input box		
<i>required area of the adjusted lot. The area must be smaller than the existing lot area.</i>			

Bearing bearing box

the bearing used for the selected edge.

Process button

adjust the lot by paralleling the selected edge with the given bearing. A second lot is created from the remainder of the original lot.

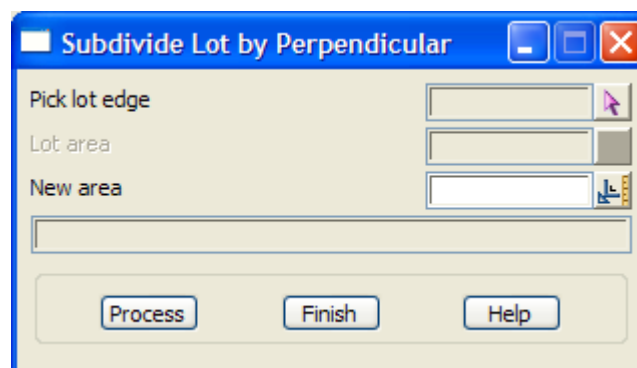

subdivide_lot_by_perpendicular

Subdivide Lot by Perpendicular

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Subdivide area =>Perpendicular

This option adjusts the size of a lot by creating a new side perpendicular to a selected side and then moving the new side until the created lot area has a given smaller area. A second lot is created from the remainder of the original lot.

Note -the new area must be less than the original area.

The fields and buttons used in this panel have the following functions.

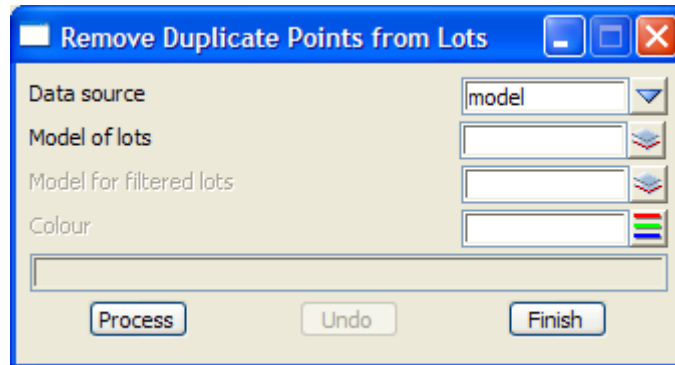

Field Description	Type	Defaults	Pop-Up
Pick lot edge <i>pick the side of the lot that a new side will created perpendicular to</i>	string select		
Lot area <i>area of the selected lot.</i>	output box		
New area <i>required area of the adjusted lot. The area must be smaller than the existing lot area.</i>	input box		
Process <i>adjust the lot by moving a side whilst keeping it perpendicular to another side. A second lot is created from the remainder of the original lot.</i>	button		

Filter Lots

polyline_filter_panel

Position of option on menu: Design =>Estate/Lots => Filter lots

This option is used to remove adjacent duplicate points from lots.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>			
Data source <i>data source for strings to convert to lots.</i>			
Model for filtered lots <i>model for the filtered lots.</i>	model box		available models
Colour <i>if non-blank, the filtered lots are given this colour. Otherwise a filtered lot has the same colour as the non-filtered lot.</i>	colour box		available colours
Process <i>filter the selected lots.</i>	button		

Number Lots

number_lots

After lots are created, they are then numbered. The lot numbers are stored with the lot

Position of menu: Design =>Estate/Lots => Number lots

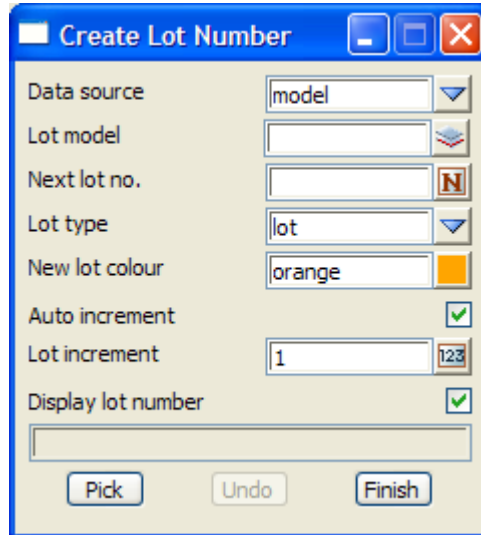

For the option *Create lot numbers*, please continue to the section “Create Lot Numbers” .
Change lot numbers “Change Lot Numbers”

Create Lot Numbers

lot_numbering_panel

Position of option on menu: Design =>Estate/Lots => Number lots =>Create lot numbers

This option creates lot numbers.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type			
<i>data source type.</i>			

Data source

data source for lots that have been numbered. A new lot number cannot be the same as an existing one in the data source.

Next lot no.

the number to give the next lot that is numbered.

Lot type	choice box	user defined	user defined
-----------------	------------	--------------	--------------

type of the lot. The choices are defined by the user in the file. See "Lot types"

New lot colour	colour box		available colours
-----------------------	------------	--	-------------------

colour to created the numbered lot. This is done so that numbered and non-numbered lots can be easily distinguished.

Auto increment	tick box	tick	
-----------------------	----------	------	--

if tick, the Next lot no. is incremented after the lot is numbered.

Lot increment	integer box	1	
----------------------	-------------	---	--

amount to increment the Next lot no if the Auto increment flag is tick.

Display lot numbers	tick box	tick	
----------------------------	----------	------	--

if tick, the lot number is temporarily displayed. Permanent lot numbers are created using the Label Lots options.

Pick string select

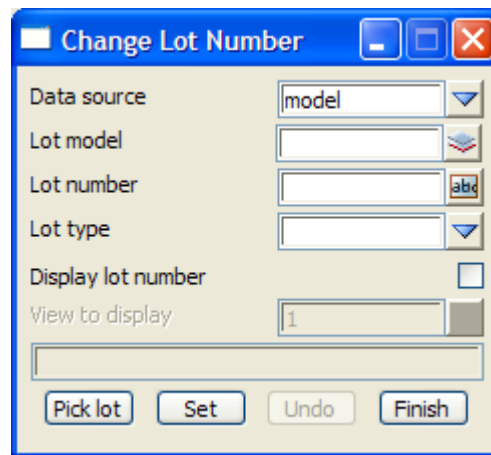

pick the lot the be numbered. After accepting the lot, it is given the Next lot no.

Change Lot Numbers

lot_change_number_panel

Position of option on menu: Design =>Estate/Lots => Number lots =>Change lot numbers

This option changes the lot numbers stored with the lot.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Lot number	text box	number of selected lot	
-------------------	----------	------------------------	--

*when a lot is selected, its lot number is displayed in this field. This can be changed and the selected lot will get the new Lot number when the **Set** button is selected.*

Lot type	choice box	type of selected lot	
-----------------	------------	----------------------	--

*when a lot is selected, its lot type is displayed in this field. This can be changed and the selected lot will get the new Lot type when the **Set** button is selected. See "Lot types"*

Display lot numbers	tick box		
----------------------------	----------	--	--

if tick, the lot numbers are displayed for the selected lots.

View to display	view box		available views
------------------------	----------	--	-----------------

view to temporarily display the lot numbers.

Pick lot	button		
-----------------	--------	--	--

select the lot to change either the lot number or the lot type.

Set	button		
------------	--------	--	--

set the lot number and the lot type of the selected lot to the values given in the Lot number and Lot type fields.

Label Lots

label_lots

After lots are numbers, text for the lot numbers and areas can be displayed.

Position of menu: Design =>Estate/Lots => Label lots

For the option *Lot labelling*, please continue to the section “Create Lot Annotation” .

String b/d labelling

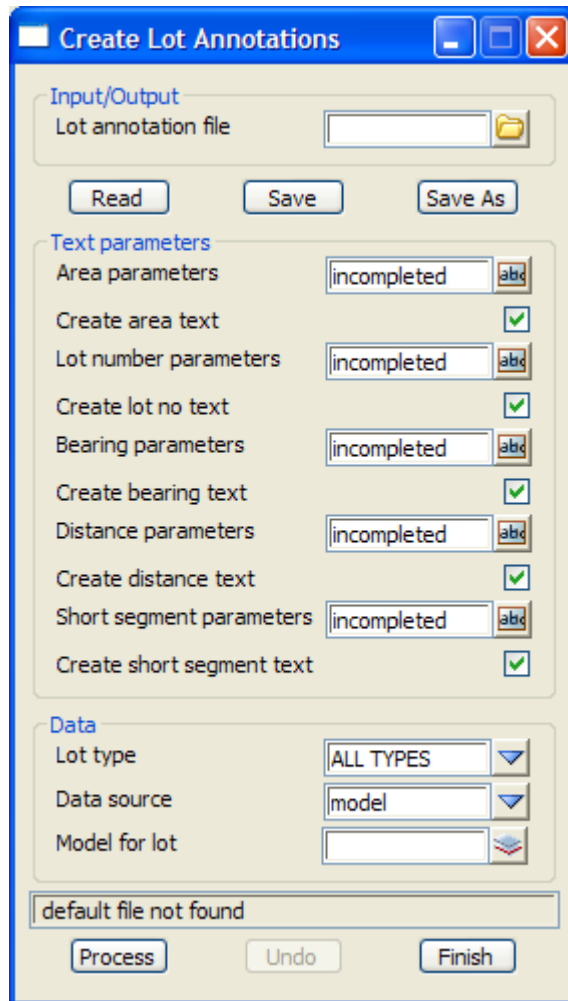

“String Bearing Distance Labelling”

Create Lot Annotation

lot_labelling_panel

Position of option on menu: Design =>Estate/Lots => Number lots =>Lot labelling

This option creates annotation of the lot numbers, lot areas, bearings of the sides and lengths of the sides.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Input/Output parameters

Lot annotation file *.laf files

file of defaults for labelling the lots.

Read button

read in a given lot annotation file.

Save button

write out the current parameters to the given lot annotation file.

Save as button

write out the current parameters to a different lot annotation file.

Text parameters

Area parameters

parameters for labelling the area of a lot.

Create area text tick box tick

if tick, annotation for the areas is created using the Area parameters.

Lot number parameters

parameters for labelling the lot numbers.

Create lot no. text tick box tick

if tick, annotation for the lot numbers is created using the Lot number parameters.

Bearing parameters

parameters for labelling the bearings of the sides of the lots.

Create bearing text tick box tick

if tick, annotation for the lot bearings is created using the Bearing parameters.

Distance parameters

parameters for labelling the lengths of the sides of the lots.

Create distance text tick box tick

if tick, annotation for the lengths of the sides is created using the Distance parameters.

Short segment parameters

parameters for specifying what is a "short Segment" and the parameters for labelling sides of the lots that are short segments.

Create short segment text tick box tick

if tick, annotation for short segments is created using the Short segment parameters.

Data

Data source type

data source type.

Data source

data source for lots to be annotated.

Lot type choice box user defined user defined
of the lots selected by the data source, only lots of this type are labelled. See “Lot types” .

Process button
select all the lots given by the Data source and Lot type and create annotations according the Text parameters.

String Bearing Distance Labelling

Position of option on menu: Design =>Estate/Lots => Label lots =>String b/d labelling

Option to label the bearing and lengths of segments of strings.

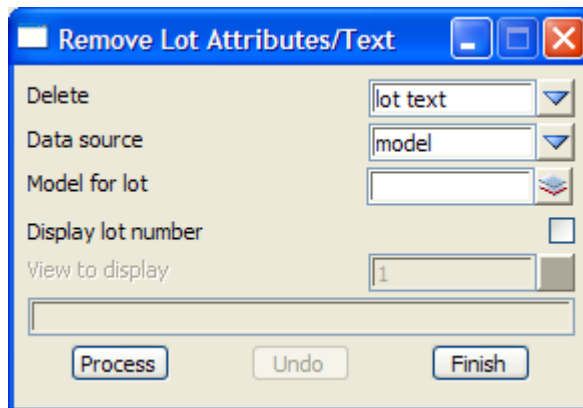

This option is described in the section “Bearing/Distance Labelling” in the chapter “Drafting”

Delete Lot Attributes and Text

lot_delete_number_panel

Position of option on menu: Design =>Estate/Lots => Delete lot attributes/text

This option is used to remove the attributes for a lot which store the lot number, area etc. It can also delete the annotation text that has been created for the lot.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Delete <i>when a lot is selected, its lot type is displayed in this field. This can be changed and the selected lot will get the new Lot type when the Set button is selected.</i>	choice box	lot text	lot text, lot attributes
Data source type <i>data source type.</i>			
Data source <i>data source for lot to delete either the lot text or lot attributes.</i>			
Display lot numbers <i>if tick, the lot numbers are displayed for the selected lots.</i>	tick box		
View to display <i>view to temporarily display the lot numbers.</i>	view box		available views

Process button

delete the selected attributes from the selected lots.

Setout Lots

setout_lots

Options to create unique point numbers for the vertices at the ends of each segment of the lots, and to create z-values from a given tin for the vertices of the lots.

Position of menu: Design =>Estate/Lots => Setout lots

For the option *Create lot point numbers*, please continue to the section “Create Lot Point Numbers”

Drape points

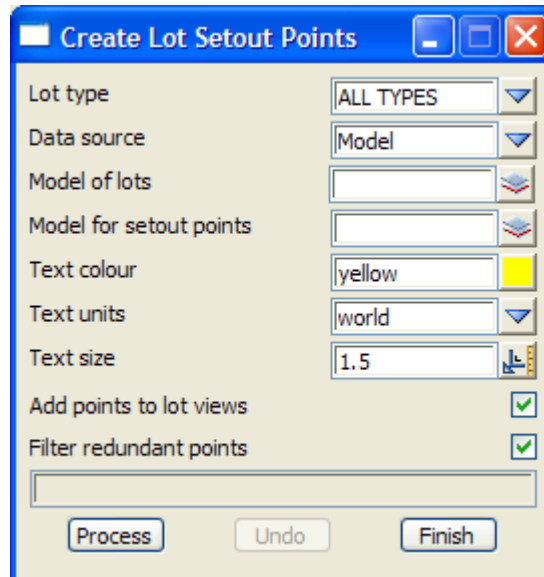

“Drape Points”

Create Lot Point Numbers

lot_setout_panel

Position of option on menu: Design =>Estate/Lots => Setout lots =>Create lot points numbers

This option creates unique point numbers for the vertices at the ends of each segment of the lots. Duplicate vertices are only given one point number.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Lot type	choice box	user defined	user defined
-----------------	------------	--------------	--------------

of the lots selected by the data source, only lots of this type have point numbers created. See “Lot types”

Data source type

data source type.

Data source

data source for lots to have point numbers created.

Model for setout points model box

available models

model for the set out points.

Text colour colour box

available colours

colour of the point numbers.

Text units choice box world

screen, paper, world

units for text size.

Text size double box

Size of the text for the point numbers.

Add points to lot views tick box tick

if tick, add the model of point numbers to the views that the lots are displayed on.

Create short segment text tick box tick

if tick, annotation for short segments is created using the Short segment parameters.

Filter redundant points tick box tick

if tick, then if two adjacent line have the same bearing then the two segments are replaced by one segment. And if two adjacent arc segments could be the one arc, then they are replaced by one arc.

Process button

select all the lots given by the Data source and Lot type and create annotations according the Text parameters.

Drape Points

Position of option on menu: Design =>Estate/Lots => Setout lots =>Drape points

Position of option on menu: Tins =>Drape =>String heights from tin

Option for setting the z-value of points to the z-value from a specified tin.

This option is described in the section “Update Z-values from Tin” in the chapter “Triangles”

Report Lots

lot_report_panel

Position of option on menu: Design =>Estate/Lots => Report lots

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>			
Data source <i>data source for lots to be reported.</i>			
Include point numbers <i>if tick, include the point number for each vertex around the lot.</i>	tick box		
Model of point numbers <i>model of the point numbers for the vertices of the lots.</i>	model box		available models
Report type <i>type of report for the selected lots.</i>	choice box		sort by type, sort by number sort by area, setout
Boundary <i>if selected, the boundary string for the lots.If selected then the area of the boundary string is calculated and the total area of the lots compared to the area of the boundary string.</i>	string select	optional	
No. decimals <i>Number of decimal places for co-ordinates and lengths in the report.</i>	integer box		
No. dec for bearings <i>Number of decimal places for bearings in the report.</i>	integer box		
Report file <i>Name of the file for the report.</i>	file box		

Process button

Create the report.

Lot Utilities

lot_utilities

Various lot options.

Position of menu: Design =>Estate/Lots => Lot utilities

For the option *Colour lots by range file*, please continue to the section “Colour Lots by Range File”

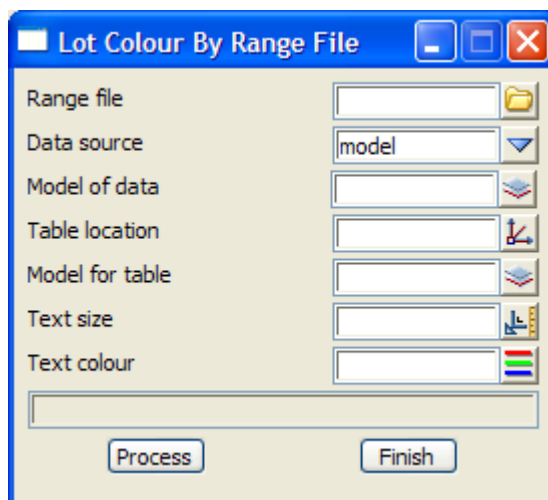

<i>Remove lot colour</i>	“Remove Lot Colour”
<i>Reverse bearing</i>	“Reverse Bearing”
<i>Short line/arc table</i>	“Short Line/Arc Table”
<i>Short line/arc report</i>	“Short Line/Arc Report”
<i>Table utilities</i>	“Short Segment Utilities”

Colour Lots by Range File

colour_lot_by_range_file_panel

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Colour lots by range file

The option colours lots by area using a lot range file (.lrf) to define the colour for each minimum and maximum area. It also creates a table of the statistics for the area ranges.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

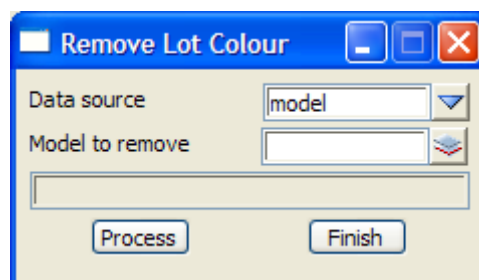

Range file	file box	*.lrf
<i>range file for colouring lots.</i>		
Data source type		
<i>data source type.</i>		
Data source		
<i>data source for lots to be coloured.</i>		
Table location	position select box	
<i>position of the table.</i>		
Model for table	model box	available models
<i>model for the table of statistics on the lot areas.</i>		
Text colour	colour box	available colours
<i>colour of the text.</i>		
Text size (w)	double box	
<i>size of the text for the table.</i>		
Process	button	
<i>select all the lots given by the Data source and Lot type and colour them according to the lot range file.</i>		

Remove Lot Colour

remove_lot_colour_panel

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Remove lot colour

The option removes the colour of all the selected lots.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type			
<i>data source type.</i>			
Data source			
<i>data source for lots to have their colour removed.</i>			
Process	button		
<i>select all the lots given by the Data source and remove the lot colour.</i>			

Reverse Bearing

reverse_bearing

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Reverse bearing

Option to change the value of the bearing text created by the lot labelling option by adding 180 degrees to the bearing. This is then the bearing of a line in the reversed direction to that represented by the original bearing text. The rounding for the reversed bearing is done according to the lot parameters.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Zero padding	tick box	tick	
<i>if tick, if the minutes and/or seconds are zero then two zeros are written out. If not tick, if the minutes and/or seconds are zero then they are left out.</i>			
Pick	button		
<i>pick the bearing text that is to be modified.</i>			

Short Line/Arc Table

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Short line/arc table

Position of option on menu: Drafting =>Text and Tables =>Short segment table

Option to create a table of all the short segments and/or short arcs.

This option is described in the section "Short Segments Table" of the chapter "Drafting"

Short Line/Arc Report

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Short line/arc report

Position of option on menu: Drafting =>Text and Tables =>Short segment report

Option to create a report of all the short segments and/or short arcs.

This option is described in the section "Short Segment Report" of the chapter "Drafting"

Short Segment Utilities

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Table utilities

Position of option on menu: Drafting =>Text and Tables =>Short segment table utilities

This panel is used modify an existing short segments table.

This option is described in the section "Short Segments Table Utilities" of the chapter "Drafting"

Pads

pads

Position of menu: Design =>Pads

The Pads walk-right menu is

For the option *Balance a pad*, go to the section

Dynamic pad

Edit/grade pad

"Balance a Pad"

"Dynamic Pad Interface"

"Allotment Pad Create"

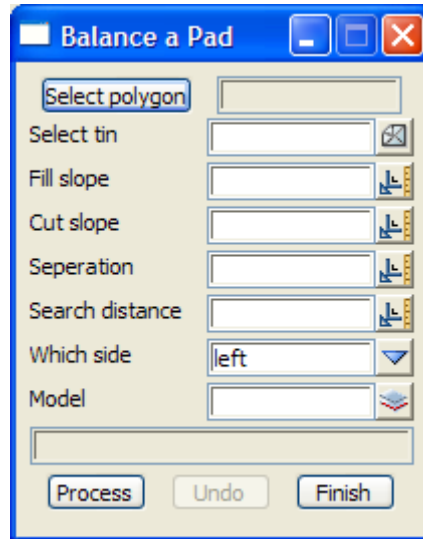

"Allotment Pad Edit"

Balance a Pad

balance_panel

Position of option on menu: Design =>Pads =>Balance a pad

This option takes a pad formed by a string and user given slopes and batters from the pad to a given tin. The pad is moved up or down until a balance is found.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Select polygon <i>select the string to batter from</i>	string select		
Tin to interface <i>tin to batter to.</i>	tin box		
Fill slope 1v in <i>fill slope for interfacing.</i>			
Cut slope 1v in <i>cut slope for interfacing.</i>			
Section separation <i>interval to calculate cut and fill batters.</i>			
Search distance <i>distance for the batter to search to find intersection with the triangles.</i>			
Which side <i>batter to the left or right of the selected string.</i>	choice box	left	left, right
Model <i>model to add the batter strings to.</i>	model box		available models
Process <i>run the option</i>	button		
Undo <i>undo the last set of batter strings created whilst the panel has been up.</i>			

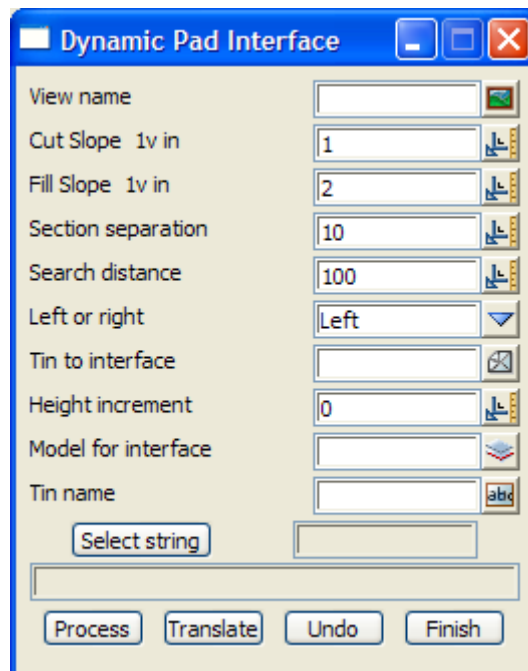

Dynamic Pad Interface

dynamic_pad_panel

Position of option on menu: Design =>Pads =>Dynamic pad

This option is to create a pad by interfacing from a selected string and calculated the volume for the pad. The pad can be moved up or down and the new volumes are calculated.

The pad can also be moved in plan and the new interface and volumes are dynamically calculated.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View name <i>name of the view to display the pad interface strings.</i>	view box		
Cut slope 1v in <i>cut slope for interfacing.</i>		1	
Fill slope 1v in <i>fill slope for interfacing.</i>		2	
Section separation <i>interval to calculate cut and fill batters.</i>		10	
Search distance <i>distance for the batter to search to find intersection with the triangles.</i>		100	
Left or right <i>batter to the left or right of the selected string.</i>	choice box	left	left, right
Tin to interface <i>tin to batter to.</i>	tin box		
Height increment <i>when process is selected, the pad height is adjusted by the value in this panel field and the new interface and volumes are calculated.</i>		0	

Select string select

select string to batter from

Process button

adjust the height of the pad by the Height increment and recalculate the new interface and volumes.

Translate

when selected the pad will move to the cursor position and dynamically calculate the interface and volumes.

Reset button

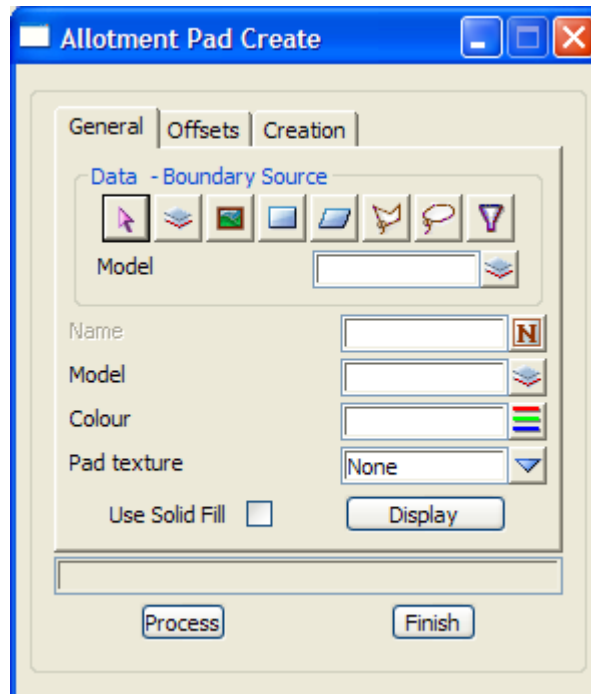

reset the pad height to its original value.

Allotment Pad Create

super_allot_create_panel

Position of option on menu: Design =>Pads =>Create/grade pad

This option and the next *Design =>Pads =>Edit/grade pad* are used to create a pad from surrounding lines, grade the created pad and edit pads already created with this option.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

General tab

Field Description	Type	Defaults	Pop-Up

Roads

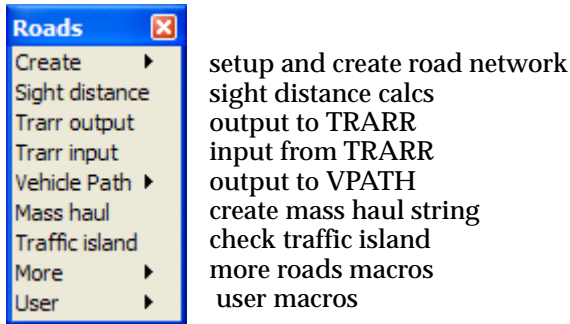

roads

Position of menu: Design =>Roads

The road options include road network creation options and a number of other options for creating road details.

Some of the options are currently under development.

The roads walk-right menu is

Each option in this menu will now be described.

For the option *Create*, please continue to the section "Create Roads"

<i>Sight distance</i>	"Sight Distance"
<i>Trarr output</i>	"Trarr Output"
<i>Trarr input</i>	"Trarr input"
<i>Vehicle path</i>	"Vehicle Path"
<i>Mass haul</i>	"Mass Haul String and Report"
<i>Traffic island</i>	"Create Combined Traffic Island"
<i>More</i>	"More Roads"

Create Roads

create_roads

Position of menu: Design =>Roads =>Create

The Create roads function allow the user to start with a model of road centrelines with vertical geometry, and unique string name.

The centrelines can then be tagged with the width of the roads, left and right turn radii for any intersections and the definitions of any culdesacs at the end of a centreline.

The Create option will then create the left and right edges of the roads, create kerb returns and any intersections and the appropriate culdesacs.

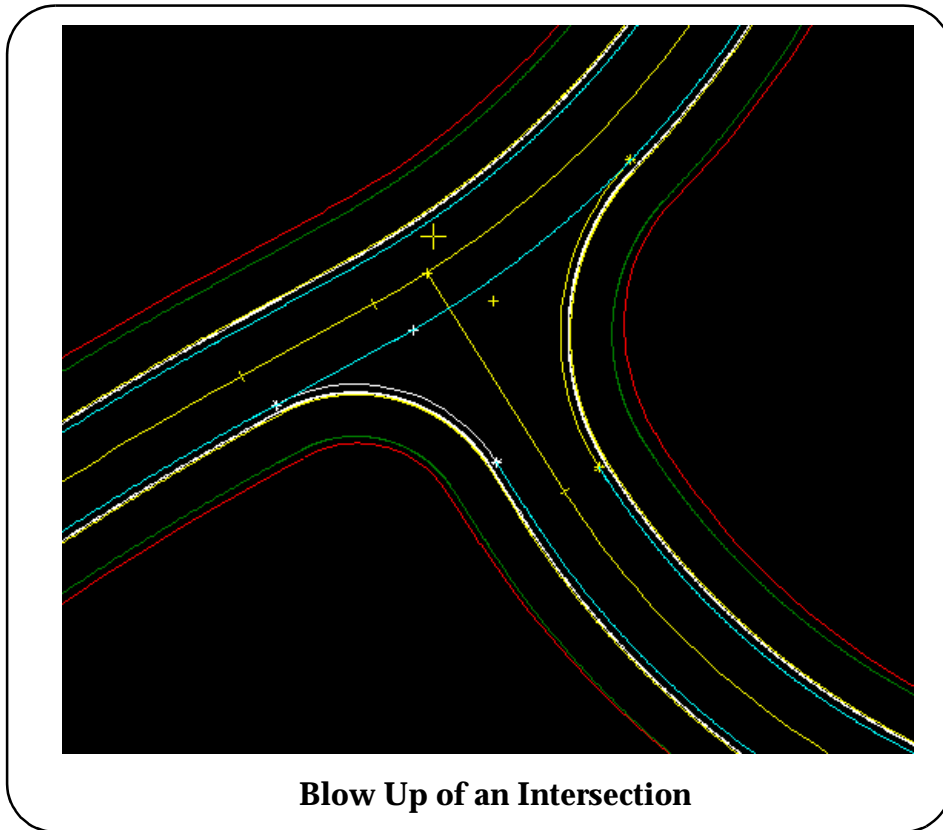

For example

Initial Network of Centrelines

Road Network After Running the Roads Option

Blow Up of an Intersection

The Roads walk-right menu is

construct the roads network
 setups for road network

Each option in this menu will now be described.

For the option *Create Roads - Manager*, go to the section “Create Roads - Manager” .
Create Roads - Setup “Create Roads - Setup” .

Create Roads - Setup

`create_roads_setup`

In the **Create Roads - Manager** panel there are default values for the road width and road crossfall and turn radius.

If a different road width or crossfall, or a different left turn radius or right hand radius is required, the **Create Roads - Setup** option is used to define the different information for any centreline. **Create Roads - Setup** is also used to define culdesacs.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Road Setup tab			
Centreline	string select		
<i>used to set the left and right turn radii, and the width of the road. This option is used twice to set the different radii for each end of a road by picking the centreline close to the end that is to have the left and right turn radii defined. The left and right turn radii can be different for each end of an alignment.</i>			
Road width			
<i>width of one side of the road for the selected centreline.</i>			
LHS turn radius			
<i>radius to use for filleting between any centrelines on the left.</i>			
RHS turn radius			
<i>radius to use for filleting between any centrelines on the right.</i>			
Set	button		
<i>store the given values in the panel with the selected centreline.</i>			

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Culdesac Setup tab			
Left fillet <i>radius of the fillet between the road and the bulb on the left hand side</i>	input		
Bulb radius <i>radius of the culdesac bulb</i>	input		
Bulb offset <i>offset of the culdesac bulb</i>	input		
Right fillet <i>radius of the fillet between the bulb and the right had side of the road</i>	input		
Left straight <i>distance between the left fillet and the bulb</i>	input		

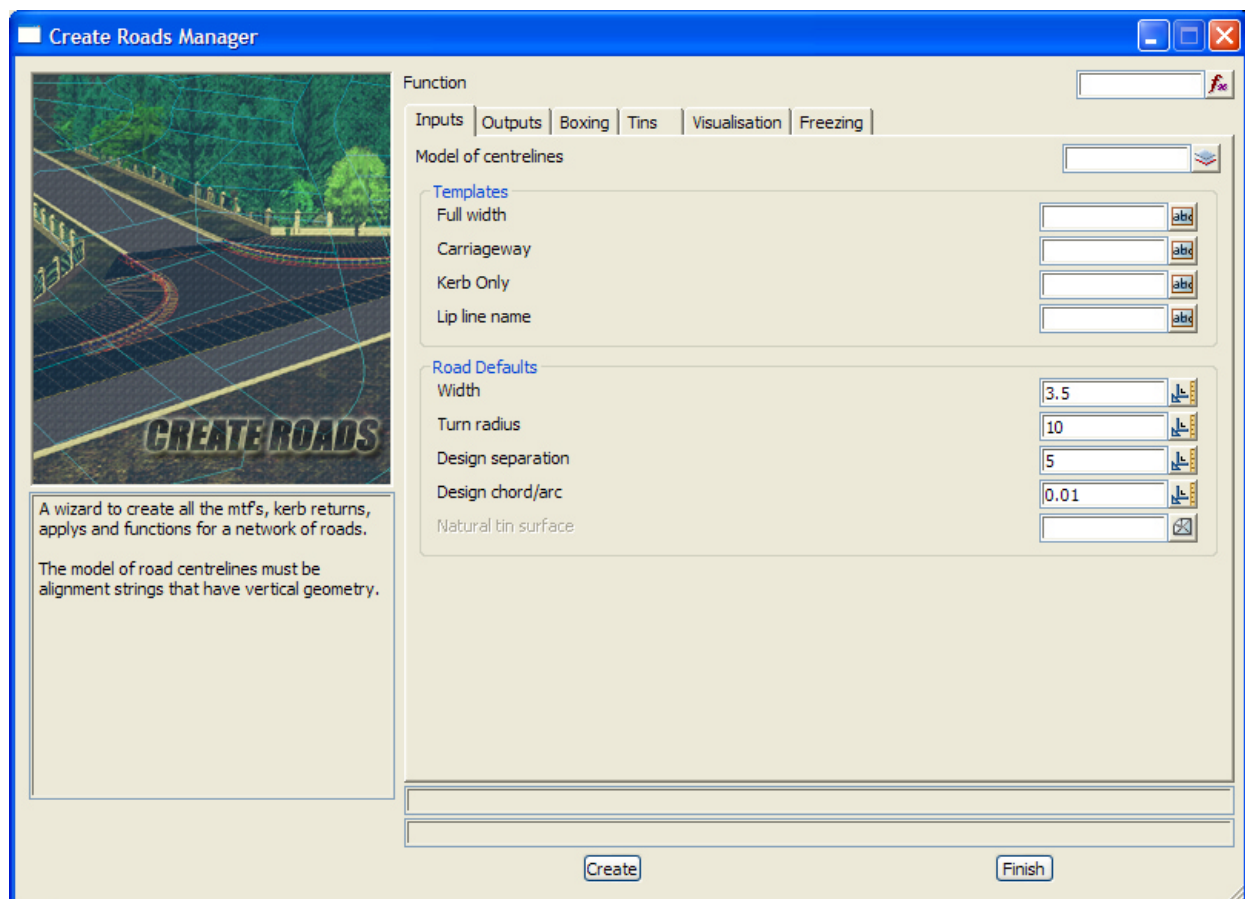

Right straight input
distance between the right fillet and the bulb

Set button
store the panel values the selected centreline.

Create Roads - Manager

create_roads_manager

This option takes all the centrelines in a model and uses road widths and left and right turn radii to form roads on each centreline.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function	function box		available roads functions
<i>name of the create roads function</i>			

Input tab

Model of centrelines	model box	available models
<i>model of the centreline lines that are to processed to create roads, intersections and culdesac. Each centreline must have a unique name and vertical geometry</i>		

Templates

Full width template box available templates
template with one fixed link and then cut and fill definitions to use for creating the roads. If a centreline has a road width defined, then the template is modified to use those values. The cut/fill section of the template are used to batter as normal.

Carriageway template box available templates
a template with only a fixed part to the end of the carriageway which is applied across any intersections - going from the chainage of the start of the kerb return on one side of the intersection to the chainage at the end of kerb return on the other side of the intersection.

Kerb only template box available templates
a template with no carriageway part. It is applied to any kerb returns

Lip line name

name of the lip line that must exist in each of the full width template and the road template. The kerb returns are created from the lip line on each road and the start height and grades are taken from the lip lines.

Road Defaults**Width**

width of the road to be used if one hasn't been defined for any centrelines

Turn radius

radius to use for filleting between any centrelines that don't have a left or right radius defined

Design separation

chainage distance to use in the Applies for creating the roads along the centrelines

Default chord/arc

chord to arc tolerance to use on curves

Natural surface tin tin box available tins

*if non blank, the tin to use as the natural surface for battering in the Applies.
 If blank, no battering is done.*

Output tab**Model stems**

Road strings input

*pre*post text to use with the function name in the created Applies for the design string models for each centreline*

Road sections input

*pre*post text to use with the function name and the created Applies for the design cross section models for each centreline*

Polygons choice box One model One model, No Polygons
 Model for Centreline

*if **One model**, all the polygons created by the applies are place in one model.
 If **Model for Centreline**, different models are created for the polygons in each apply.
 If **No Polygons**, no polygons are created by the applies.*

Model model box available models

*when **One model**, model for all the polygons created by the Applies.*

Road polygons input

*pre*post text to use with the function name in the created Applies for polygon models for each centreline*

Kerb Returns**Turn separation**

chord/arc tolerance for use in the kerb return Applies

Turn chord/arc

chord to arc tolerance to use on kerb return

Model for kerb returns model box

available models

model for all the kerb returns

Naming choice box

Follow Road Names - LHS driving
 Follow Road Names - RHS driving
 Use Numbers
 Use Letters

method of naming the kerb returns

Just create kerb returns tick box

if tick, only create the kerb returns. Usually only run at the beginning to see if the kerbs look correct.

Just create kerb returns tick box

if tick, only create the kerb returns. Usually only run at the beginning to see if the kerbs look correct.

Kerb return strings and sections in one model tick box

if tick, then all the kerb return strings and sections are place in the one model. The model names are given in the next two fields.

Model for kerb return strings model box

available models

model for all the kerb return strings

Model for kerb return sections model box

available models

model for all the kerb return sections

Delete frozen apply many functions tick box

if tick, the apply many functions are deleted for all the frozen roads. Normally not used

View for models view box

available views

if non blank, view to add all the created models onto.

Error report file box

*.rpt files

file for error messages

Boxing tab

boxing can be created for all the road and kerb return strings. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road/kerb return centrelines.

Create boxing tick box

if tick, boxing is applied for all the road and kerb returns. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road centrelines or kerb returns.

Default boxing file file box

*.blf files

file of boxing file definitions

Default boxing CL delimiter input

common name in each boxing definition which will be replaced by the name of each road/kerb return centreline

Model stem for boxing strings input

*pre*post text to use with the road/kerb return function name for boxing string models*

Boxing sections input

*pre*post text to use with the road/kerb return function name for boxing section models*

Boxing kerb return sections and strings in one model tick box

*if **tick**, the strings for all the kerb return Applies are place in one model rather than one model for each kerb return. Similarly, the sections for all the kerb return Applies are placed in the one model.*

*If **not tick**, the model names are created in the same way as for the road centrelines. That is, the Model stem for boxing strings and sections are used with the kerb return function name and the layer stems to produce the kerb return boxing strings and sections models.*

Model name for boxing kerb strings input

*when only one model (per layer) for the box kerb strings is used - the base name for the model of kerb strings created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.*

Model name for boxing kerb sections input

*when only one model (per layer) for the box kerb sections is used - the base name for the model of kerb sections created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.*

Boxing Layer 1-8 in the grid:

if non blank, boxing strings and sections will be created for that layer.

*The last boxing layer is also referred to as the **subgrade** layer.*

Layer stem input

*for this boxing layer, the pre*post text used when naming models for boxing sections and strings.*

Road - LHS input

for this boxing layer, the boxing definition to use on the left hand side of road centrelines

Road - RHS input

for this boxing layer, the boxing definition to use on the right hand side of road centrelines

Kerb return input

for this boxing layer, the boxing definition to use on the kerb returns

Intersection - LHS input

for this boxing layer, the boxing definition to use on the left hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

Intersection - RHS input

for this boxing layer, the boxing definition to use on the right hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

Tins tab**Create tin** tick box

*if **tick**, create a tin for all the roads, kerb returns and culdesacs*

Road tin tin box

available tins

name for the tin created from the all the strings and sections

Road tin colour colour box

available colours

colour of the road tin

Subgrade tin	tin box	available tins
<i>if non blank, a subgrade tin of this name is created</i>		
Subgrade tin colour	colour box	available colours
<i>colour of the subgrade tin</i>		
Nulling angle	input	
<i>angle for nulling the triangles</i>		
Nulling length	input	
<i>length for nulling the triangles</i>		
Null Seed points:		
Seed X/Y	input	
<i>X/Y coordinate of a nulling seed point</i>		
Seed Point	button	
<i>select a seed point for nulling the tins. The X and Y coordinates are written to the Seed X/Y grid</i>		

Visualisation tab

Create visualisation	tick box	
<i>if tick, the road tin is processed for visualisation</i>		
Apply texture map to tin	tick box	
<i>if tick, the texture map is applied to the road tin</i>		
Draw road tin as solid on view	tick box	
<i>if tick,</i>		
Tin colour to use for cut polygons	colour box	available colours
<i>colour to use for all the cut polygons</i>		
Tin colour to use for fill polygons	colour box	available colours
<i>colour to use for all the fill polygons</i>		
Tin colour to use for transition polygons	colour box	available colours
<i>colour to use for all the polygons in neither cut nor fill</i>		

Freezing tab

Colour for the frozen sections	colour box	available colours
<i>colour to use for the sections of frozen strings. In any view, this gives a quick way of identifying frozen roads.</i>		
Road grid - list of all the centrelines		
Element		available colours
<i>centreline name</i>		
Frozen	tick box	
<i>if tick, the centreline is frozen out of the automatic Create Roads process.</i>		

*For a frozen centreline, when the **Create Roads** function is run, the Apply Many for that centreline is deleted and re-created. However any existing Apply Many for that centreline will be run. Kerb returns are still calculated using the lip line create by running the existing Apply Many for the frozen centreline. Hence the mtf for a frozen centreline can be modified and the changes will **not** be deleted when the Create Roads function is recalced.*

Note - if the two roads used to define a kerb return are both frozen, then the kerb return is automatically frozen and the kerb return is not deleted and recreated when the Create Roads function is recalced. However the existing Apply Many for the frozen kerb return is run on each recalc.

Buttons at bottom

Create button
run the option and create the road network.

Sight Distance

sight_distance

Position of option on menu: Design =>Roads =>Sight distance

The sight distance option calculates the maximum distance that can be seen from an eye point, along a string, against a tin (including a supertin).

In the option, a string and a tin are selected and then an eye point is positioned at the given eye height, at the given start chainage on the selected string.

From the eye point, a target point is placed at a chainage distance equal to the given minimum sight distance along the string, at the given target height above the string.

The target point is then tested for visibility from the eye point, against the given tin. That is, a test is made to see if the target point can be seen from the eye point, against the surface given by the tin.

If the target point is visible, it is moved the given chainage distance, trial interval, further along the string and the visibility test redone.

The process is repeated until either the target point is invisible, or the target point is the given maximum sight distance (in chainage) away from the eye point.

A line joining the eye and final target point position is created and placed in the model for sight lines. The chainage distance between the eye and the final target point is placed as a text string in the model for sight text, positioned at the eye point.

The eye point is then moved the given chainage distance interval along the string, and the process repeated until the eye point is past the given end chainage.

The eye point is then placed at the end chainage and the negative of the trial interval and interval values used to calculate sight distance for the reverse direction along the string.

On selecting the **sight distance** option, the **sight distance** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to use as the surface for testing visibility.</i>	input		available tins
Report file <i>if non blank, a report is produced and written out to this file name.</i>	file box		*.rpt files

Centreline tab

Centreline <i>A string to be used for placing the eye and target points, is selected from a view.</i>	string-select		
Interval <i>chainage increment to move to eye point for the next sight distance calculation.</i>	input	100	
Start/end chainage <i>the sight distance is calculated for points on the selected string covering the chainage range given by the start and end chainage fields. If the start/end chainage is blank, the star/end chainage of the selected string is used.</i>	input		
Trial interval <i>chainage increment to move to test target point.</i>	input	10	
Minimum sight distance <i>minimum chainage distance to use for placing the test target point.</i>	input	100	
Maximum sight distance <i>maximum chainage distance to use for placing the test target point.</i>	input	3000	

Eye tab

Height input 1.3
height of the eye point above the picked string

Offset input 1.3
offset of the eye point from the picked string.

Target tab

Height input 0.3
height of the test target point above the picked string

Offset input 1.3
offset of the target point from the picked string.

Bridge Tins tab

Tin grid available tins
name of the tins to use as vertical obstructions when testing visibility.

Forward Direction tab

Sight lines model box available models
*if non-blank, the name of the model to contain the sight lines.
If blank, the sight lines are not created.*

Good colour colour box default colour available colours
when the minimum sight distance is achieved, sight lines are created in the good colour

Bad colour colour box default colour available colours
when the minimum sight distance is not achieved, sight lines are created in the Bad colour

Sight text model box available models
*if non-blank, the name of the model to contain the sight distance text.
If blank, the sight distance text is not created.*

Sight text info text info
definition of the sight text.

Backward Direction tab

Sight lines model box available models
*if non-blank, the name of the model to contain the sight lines when going down the string in the reverse direction Note that the eye and target offsets are then applied in the reverse direction of the string.
If blank, the sight lines are not created.*

	<i>colour of the sight lines</i>	
Trarr file	file box	*.rpt files
	<i>if non blank, a Trarr file of this name is produced</i>	
Centreline	string-select	
	<i>string to be used for placing the eye and target points and calculating sight distance, is selected from a view.</i>	
Polygon	string-select	
	<i>boundary polygon for the road tin</i>	
Sight	button	
	<i>calculate sight lines and write out a Trarr file</i>	

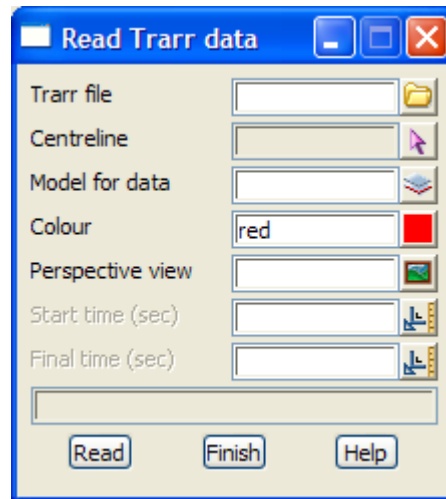

Trarr input

read_trarr_data

Position of option on menu: Design =>Roads =>Trarr input

Options to read in a TRARR file.

Note - this option is under development.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Trarr file <i>the Trarr file to read in</i>	file box		*.traffic files
Centreline <i>string that the Trarr file is for</i>	string-select		
Model for data <i>model to read the Trarr data into</i>	model box		available models
Colour <i>colour for the Trarr data strings</i>	colour box		available colours
Start time (sec) <i>start time in seconds for replaying the data in the Trarr file</i>	input		
Final time (sec) <i>end time in seconds for replaying the data in the Trarr file</i>	input		
Sight <i>calculate sight lines and write out a Trarr file</i>	button		

Vehicle Path

vehicle_path

Position of menu: Design =>Roads =>Vehicle Path

The vehicle path option is used to interface with the vehicle path program, vpath, written by Queensland Department of Main Roads.

The **Vpath** program is a separate chargeable program and is fully described in its own Manual.

To run vpath from within **12d Model**, either the environment variable VEHICLE_PATH_4D must be set to point to the folder where the DOS vpath executable is located or WINDOWS_VEHICLE_PATH_4D is set to point to the folder where the Windows vpath executable is located.

VEHICLE_PATH_4D *folder-path*

or

WINDOWS_VEHICLE_PATH_4D *folder-path*

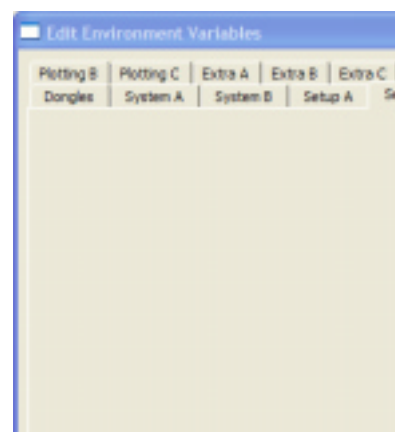

Vpath is the Vehicle Turning Path program written by Main Roads Queensland and is a separate chargeable program.

The vehicle path menu currently contains just one option, steering path.

steering_path **steering_path_windows_version_**

On selecting the steering path option, the **steering path** panel is displayed

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vehicle type	input	Design Semi	available vehicles in the vehicles.std file

the vehicle type used for generating the swept path.

Friction coefficient	input	0.3	
<i>the coefficient of friction to be used for the vehicle.</i>			
Vehicle on side	input	Left	Left, Right
<i>the side of the vehicle that the selecting steering path represents.</i>			
Draw interval (=none)	input	20	
<i>if non-zero, the position of the vehicle on the steering path is draw the position at this interval.</i>			
Steering path model	input		available models
<i>if non-blank, the steering path including the marking of the tangent points and centres of each circular curve are created and placed in this model.</i>			
Vehicle position model	input		available models
<i>if non-blank, the strings tracing out the vehicle position are placed in this model.</i>

Mass Haul String and Report

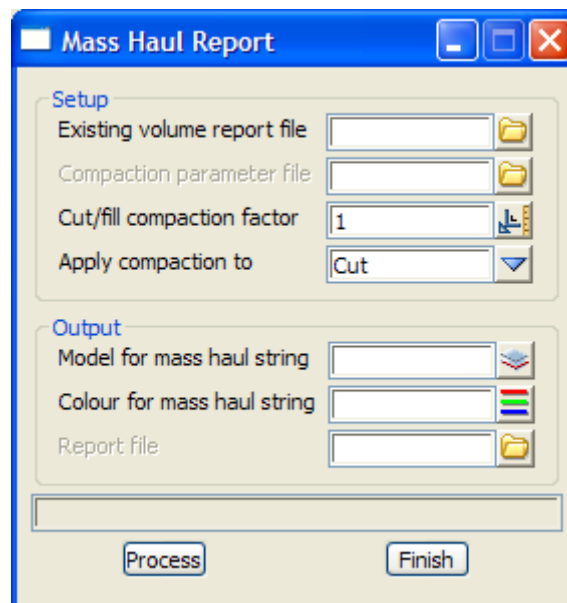

`mass_haul_reportl`

Position of option on menu: Design =>Roads =>Mass haul

This panel is used to read in a volumes report and optionally a cut/fill compaction parameter file and creates a mass haul string and a new volumes report with the compaction volumes.

The compaction parameter file simply contains the compaction factor for given chainage ranges. Either the cut volumes are multiplied by the compaction factor or the fill volumes are divided by the compaction factor, to give the compacted volumes in the new volumes report.

If the existing volume report contains an alignment string and that string can be found in the project then a new alignment string is created with the same horizontal geometry but with the accumulated volumes as the z-values.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Existing volume report file <i>name of the existing volumes report.</i>	file box		*.rpt files
Compaction parameter file <i>file containing compaction factors to be used. See "Format of the Compaction Parameter File".</i>	input		*.mhf files
Cut/fill compaction factor <i>cut/fill compaction factor for any chainages not in the compaction parameter file or if there is no file.</i>	input	1	
Apply compaction factor to <i>if cut, the cut volumes are multiplied by the compaction factors. If fill, the fill volumes are divided by the compaction factors.</i>	choice box	cut	cut, fill
Model for mass haul string <i>model for the created mass haul string.</i>	model box		available models

- Colour for mass haul string** colour box available colours
colour of the created mass haul string.
- Report file** input box
if non-blank, a mass haul volumes file is created.
- Process** button
run the option.

Format of the Compaction Parameter File

```
Format of the
// Sample cut/fill compaction parameter file - the file ending
is .mhf
// All lines starting with // are comments and blank lines are
ignored
//
// A range is specified by a start and end chainage and a compaction
factor.
// A compaction factor of 1.0 means there is no compaction.
// A compaction factor of 0.9 means that 1.0 cubic metres of cut is
equivalent
// to 0.9 cubic metres of fill due to compaction.

// format is
// Start_ch      End_ch      Compaction_factor
           0           100           0.9
          100           500           1.0
          500           2000          1.1
```

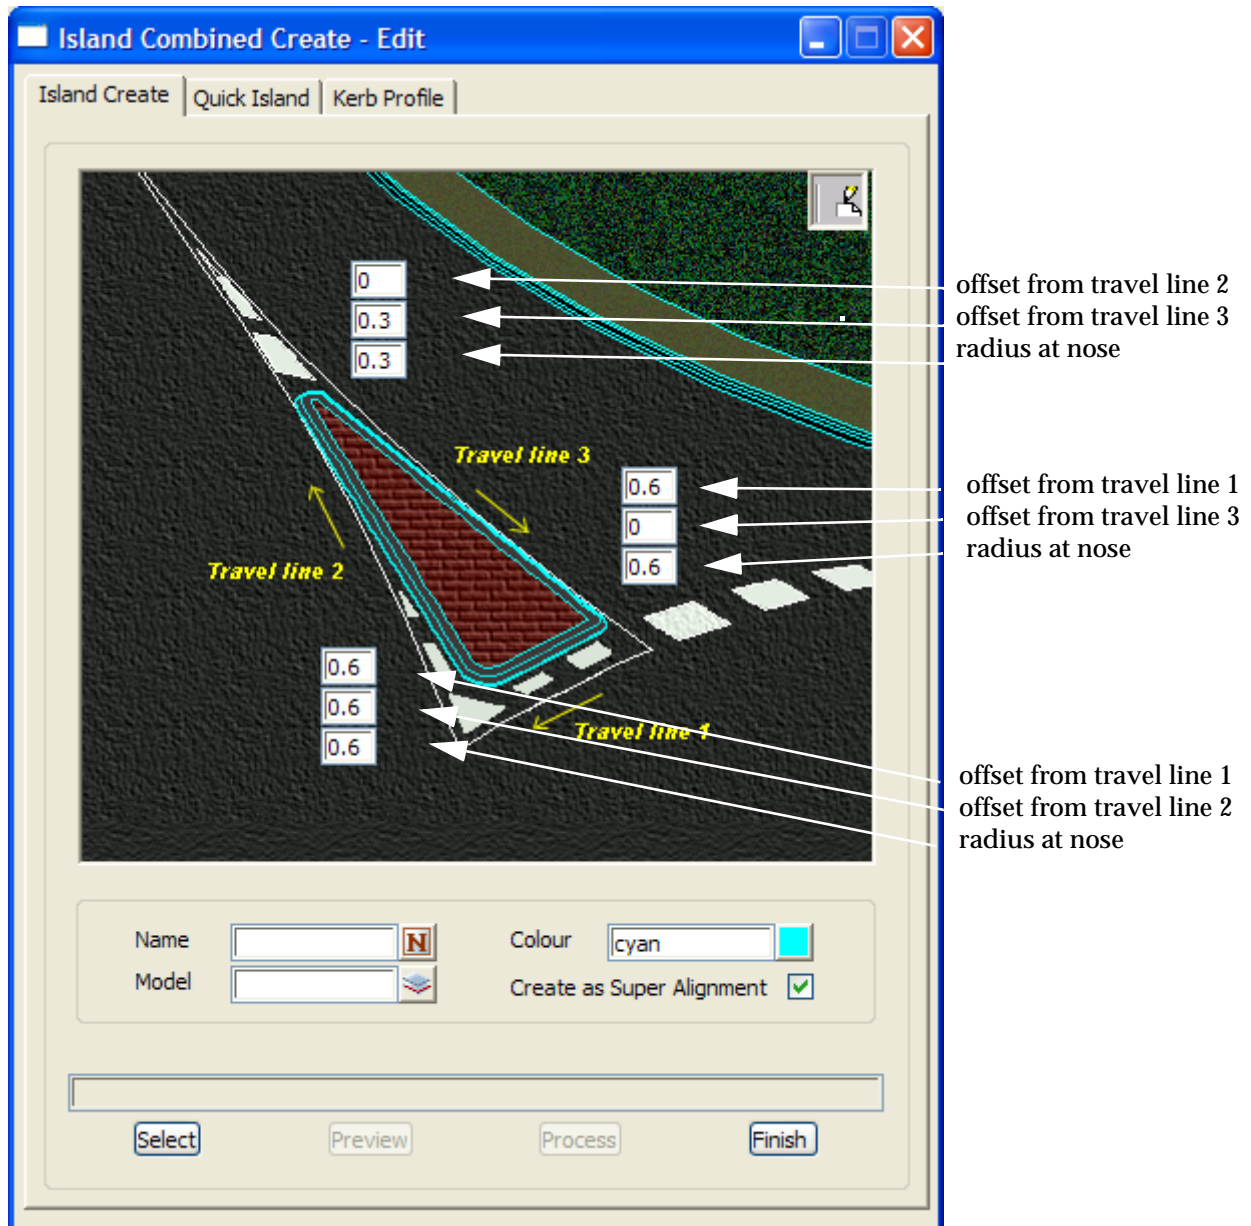

Create Combined Traffic Island

island_combined_panel

Position of option on menu: Design =>Roads =>Traffic Island

Create an alignment string for a traffic island between user selected strings and with user defined offsets from the strings and nose radii. Drape the island onto a tin to give it z-values and then apply a kerb profile to complete the island.

On selecting the traffic island option, the **traffic island alignment creation** panel is displayed.

The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Buttons at bottom

- Select** strings select
select in order and with direction, the three strings to use in creating the traffic island. Terminate by clicking RB and selecting cancel from the pick ops menu.
- Preview** string select
draw the traffic island with the given parameters in the panel draw box.
- Process** button
create the alignment string

Island Create tab

- Offset from travel lines** input box
offset distance from the selected travel lines.
- Radius at nose** input box
radius of the corner of the traffic island between the selected travel lines
- Name** name box available names
name of the created alignment string.
- Model** model box available models
model for the created alignment string.
- Colour** colour box available colours
colour of the created alignment string.
- Create as super alignment** tick box
*if tick, create the string as a super alignment.
 If not tick, create the string as an alignment.*

Quick Island tab

the quick island tab produces a traffic island of fixed sides but with the given nose radii. The traffic island can be created as a super alignment that can then be easily moved around and modified.

- Radius at nose** input box
radius of the corner of the traffic island
- Name** name box available names
name of the created alignment string
- Model** model box available models
model for the created alignment string
- Colour** colour box available colours
colour of the created alignment string
- Create as super alignment** tick box
*if tick, create the string as a super alignment.
 If not tick, create the string as an alignment.*
- Position** xyz select box
pick two points to indicate the direction that the island will be created.

*Then click on **Process** to create the Traffic Island.*

Kerb Profile tab

- Use island alignment levels instead of Tin** tick box

if **tick**, use the alignments own z-value instead of draping the alignment onto the tin.
If **not tick**, drape the alignment onto the tin to get z-values.

Offset kerb face/top/back input box
offset for kerb face/top/back for the selected kerb type.

Height kerb face/top/back input box
height for kerb face/top/back.

Tin tin box available tins
triangulation to drape the traffic island strings onto.

Kerb type input box
type of kerb to apply to the reference string of the traffic island. If type User is selected from the pop-up list, a file which defines the kerb profile can be selected and used.

File file box *.ukt files
file to read/write the user defined kerb type to.

Read button
read the given File to define a kerb type.

Save button
save the kerb parameters to the given File.

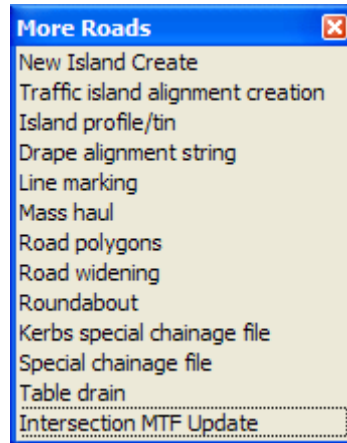

More Roads

more_roads

Position of menu: Design =>Roads =>More

The more roads menu contains macros to create road details such as traffic islands, line marking, mass haul strings.

The more roads walk-right menu is

For *New island create*, go to the section “Create Combined Traffic Island”

For *Traffic island alignment creation*, go to “Alignments” in the chapter “Strings”

<i>Island profile/tin</i>	“Traffic Island Profile and Triangulation Creation”
<i>Drape alignment string</i>	“Drape Alignment (Macro)” in the chapter “Triangles”
<i>Line marking</i>	“Line Marking” in the chapter “Drafting”
<i>Mass haul</i>	“Mass Haul String and Report”
<i>Road polygons</i>	“Polygons from Sections”
<i>Road widening</i>	“Road Widening with Minimum and Maximum Crossfall”
<i>Roundabout</i>	“Create Roundabout”
<i>Kerbs special chainage file</i>	“Kerb Special Chainages File”
<i>Special chainage file</i>	“Special Chainages File”
<i>Table drain</i>	“Table Drain - Intersection of Slopes from Two Strings”

Traffic Island Alignment Creation

Position of option on menu: Design =>Roads =>More =>Traffic island alignment creation

This option creates an alignment string for a traffic island and has already been documented as
Strings => Create => Alignment => Traffic island

For the option *Traffic island*, please continue to the section “Create - Traffic Island” in the chapter “Design” .

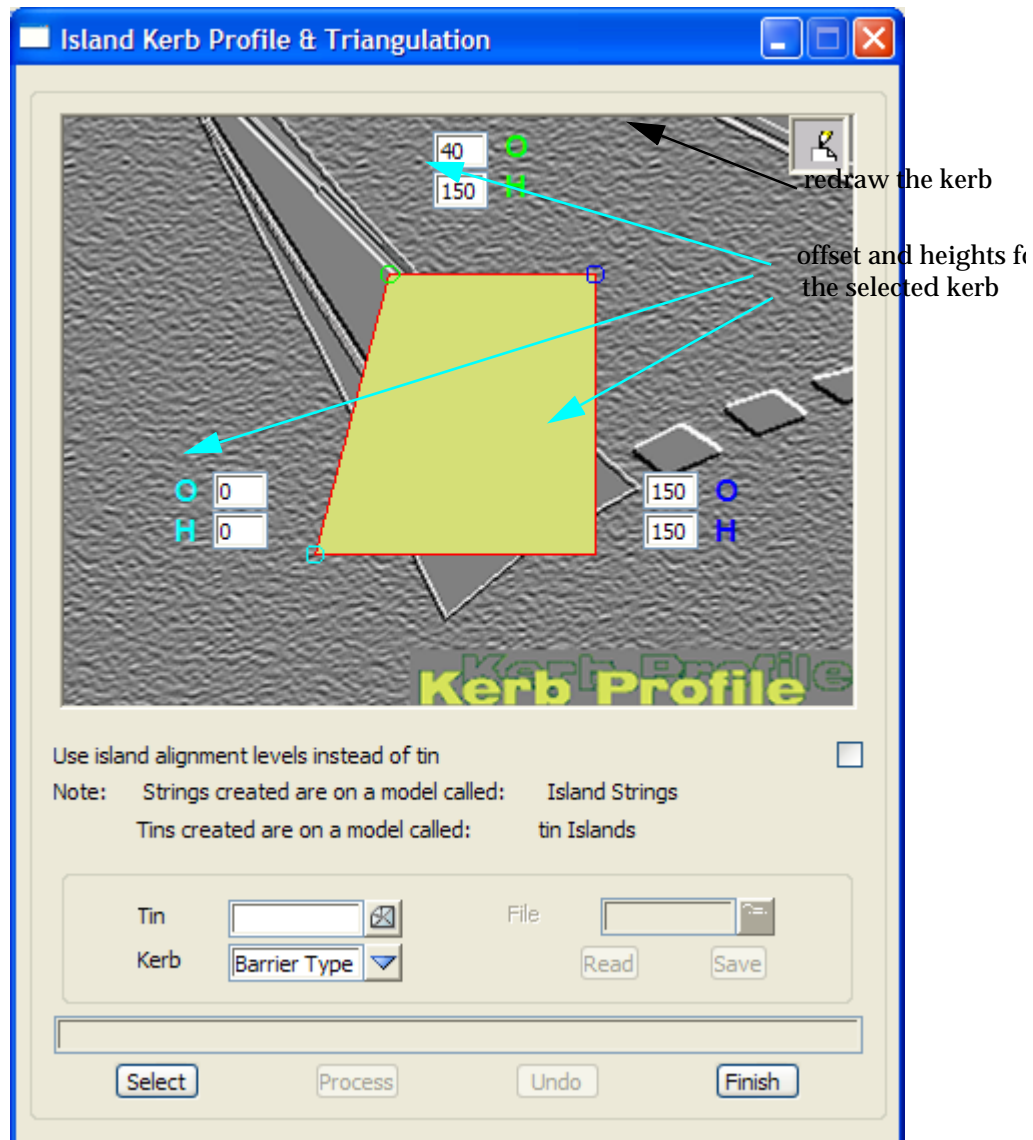

Traffic Island Profile and Triangulation Creation

island_panel

Position of option on menu: Design =>Roads =>More =>Island profile/tin

This option creates strings by offsetting from a selected string using a kerb profile. The resultant

strings are draped onto a given tin and then triangulated to form a traffic island.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Offset kerb face/top/back	input box		
<i>offset for kerb face/top/back for the selected kerb type.</i>			
Height kerb face/top/back	input box		
<i>height for kerb face/top/back.</i>			
Tin	tin box		available tins
<i>triangulation to drape the traffic island strings onto.</i>			
Kerb type	input box		
<i>type of kerb to apply to the reference string of the traffic island. If type User is selected from the pop-up</i>			

list, a file which defines the kerb profile can be selected and used.

File	file box	*.ukt files
	<i>file to read/write the user defined kerb type to.</i>	
Read	button	
	<i>read the given File to define a kerb type.</i>	
Save	button	
	<i>save the kerb parameters to the given File.</i>	
Select	button	
	<i>select the string representing the traffic island.</i>	
Process	button	
	<i>create the traffic island strings and tin.</i>	
Undo	button	
	<i>undo the last traffic island created whilst the option was running.</i>	

Drape Alignment

Position of option on menu: Design =>Roads =>More =>Drape alignment string

This option has already been documented in Tins => Drape=> Drape align.

For the option *Drape align*, please continue to the section "Drape Alignment (Macro)" in the chapter "Triangles".

Line Marking

Position of option on menu: Design =>Roads =>More =>Line marking

This option creates an alignment string for a traffic island and has already been documented as
Drafting => Line marking

For more information on the option *Line marking*, please continue to the section "Line Marking" in the chapter "Drafting".

Create Mass Haul String and Report

masshaul_panel

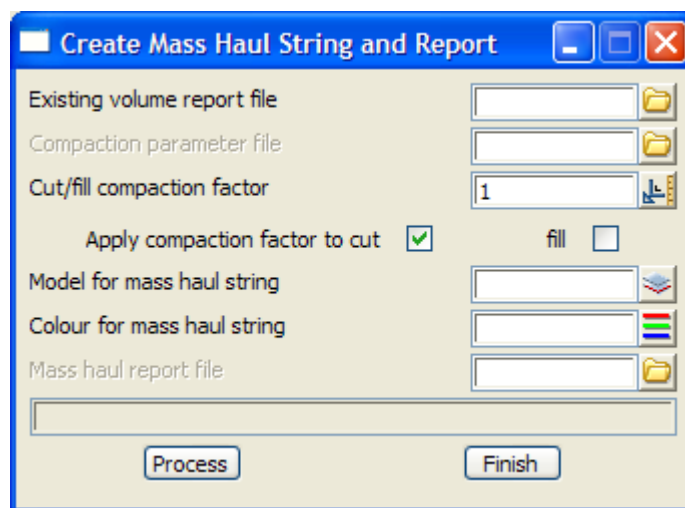

Position of option on menu: Design =>Roads =>More =>Mass haul

This options has been replaced by "Mass Haul String and Report" .

This panel is used to read in a volumes report and optionally a cut/fill compaction parameter file and creates a mass haul string and a new volumes report with the compaction volumes.

The compaction parameter file simply contains the compaction factor for given chainage ranges. Either the cut volumes are multiplied by the compaction factor or the fill volumes are divided by the compaction factor, to give the compacted volumes in the new volumes report.

If the existing volume report contains an alignment string and that string can be found in the project then a new alignment string is created with the same horizontal geometry but with the accumulated volumes as the z-values.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Existing volume report file <i>name of the existing volumes report.</i>	file box		*.rpt files
Cut/fill compaction factor <i>cut/fill compaction factor for any chainages not in the compaction parameter file or if there is no file.</i>	input	1.0	
Compaction parameter file <i>file containing compaction factors to be used.</i>	input		*.mhf files
Apply compaction factor to <i>if cut, the cut volumes are multiplied by the compaction factors. If fill, the fill volumes are divided by the compaction factors.</i>	cut <input checked="" type="checkbox"/> fill <input type="checkbox"/>		
Model for mass haul string <i>model for the created mass haul string.</i>	input		

Colour for mass haul string

colour of the created mass haul string.

Mass haul report file input box

if non-blank, a mass haul volumes file is created.

Process button

run the option.

```
// Sample cut/fill compaction parameter file - the file ending
is .mhf
// All lines starting with // are comments and blank lines are
ignored
//
// A range is specified by a start and end chainage and a compaction
factor.
// A compaction factor of 1.0 means there is no compaction.
// A compaction factor of 0.9 means that 1.0 cubic metres of cut is
equivalent
// to 0.9 cubic metres of fill due to compaction.

// format is
// Start_ch      End_ch      Compaction_factor

           0           100           0.9
          100           500           1.0
          500          2000           1.1
```

Road Polygons

Position of option on menu: Design =>Roads =>More =>Road polygons

This option takes a model of cross-sections and create polygons between specified points on the cross-sections. This option is already documented under

Design => X-Sections =>Polygons from sections

For more information on the option *Polygons from sections*, please continue to the section "Polygons from Sections" in the this chapter

Road Widening with Minimum and Maximum Crossfall**widen_panel**

Position of option on menu: Design =>Roads =>More =>Road widening

This option creates cross sections using the minimum and maximum cross-fall when going out from a selected reference string (usually and alignment string).

Adding these cross sections to a section view when designing the vertical geometry gives an envelope of maximum and minimum crossfall points.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model name min/max xfall <i>model for minimum/maximum cross fall cross sections.</i>	model box		
Min xfall <i>minimum cross-fall (in %)</i>	input box	-2	
Max xfall <i>maximum cross-fall (in %)</i>	input box	-5	
Max width <i>maximum width to go out at the minimum and maximum cross falls.</i>	input box	10	
Chg interval <i>chainage interval for calculating the minimum and maximum cross fall cross sections.</i>	input box	20	
View to add <i>view to add the created cross sections to.</i>	view box		

Reference string select

pick the reference string with direction for the x-sections to go out from. The cross sections are created to the right of the reference string as defined by the direction that the Reference string is picked. To get the sections on the other side, pick the reference string in the opposite direction.

Process button

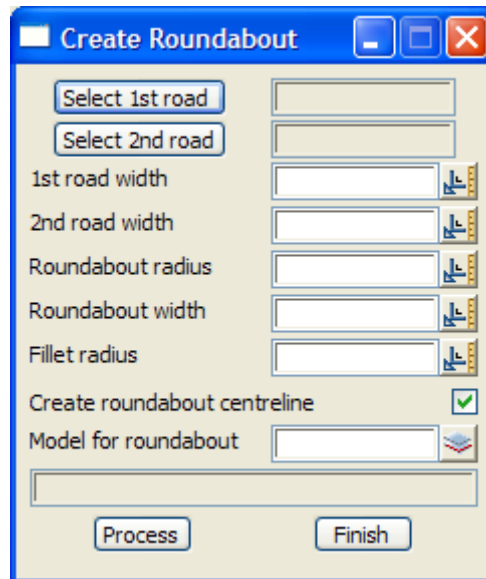

create the minimum and maximum cross fall cross sections.

Create Roundabout

roundabout_panel

Position of option on menu: Design =>Roads =>More =>Roundabout

This option creates a roundabout between two alignment strings. The road widths for the two roads (the distance from the road centre line to the edge of the road) plus the roundabout radius (the distance from the centre of the roundabout to the centreline of the roundabout road), the roundabout width (added and subtracted from the roundabout width to give the inner and outer edges of the roundabout roadway - the inner and outer roundabout radii) and the fillet radius for the turning lanes.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select 1st road <i>first alignment string for the roundabout.</i>	string select		
Select 2nd road <i>second alignment string for the roundabout.</i>	string select		
1st road width <i>distance from the first alignment string to the edge of the road.</i>	input box		
2nd road width	input box		

distance from the second alignment string to the edge of the road.

Roundabout radius input box

distance from the centre of the roundabout to the centreline of the roundabout road.

Roundabout width input box

distance to add and subtract from the roundabout width to give the inner and outer edges of the roundabout roadway (the roundabout radii).

Fillet radius input box

fillet radius of the turning lanes.

Create roundabout centreline tick box

if tick, an alignment string is created for the centreline of the roundabout.

Model for roundabout input box

model for the created roundabout.

Process button

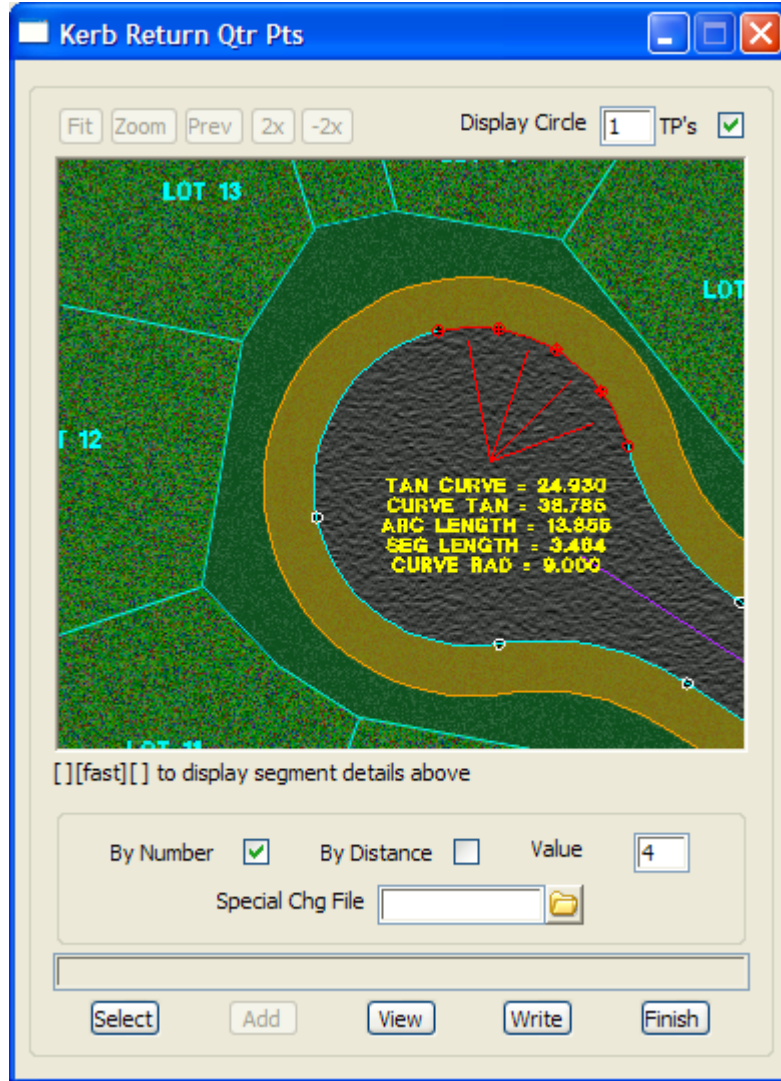

run the option.

Kerb Special Chainages File

[qtr_spec_panel](#)

Position of option on menu: Design =>Roads =>More =>Kerb special chainage file

This option is used to create a special chainage file for an alignment string. The method of creating the chainages is defined differently for each segment of the alignment string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
By number	tick box	tick	
<i>if tick, break the selected segment of the selected string into the number of pieces given by the Value field.</i>			
By distance	tick box		
<i>if tick, break the selected segment of the selected string into pieces of length given by the Value field.</i>			
Value	tick box	tick	
<i>the number of pieces or the chainage length to break the selected segment into.</i>			
Special chg file	file box		
<i>file to write chainages to</i>			
Select	button		

pick the alignment string to create chainages for. The alignment string is then drawn in the panel draw box. Each segment of the alignment string is selected by clicking MB over it in the panel draw box. The special chainages are then defined for that segment.

- Add** button
add the chainages given by number of length to the special chainages list
- View** button
view the special chainages list. The special chainages list can be edited
- Write** button
write the special chainages list to the special chainages file

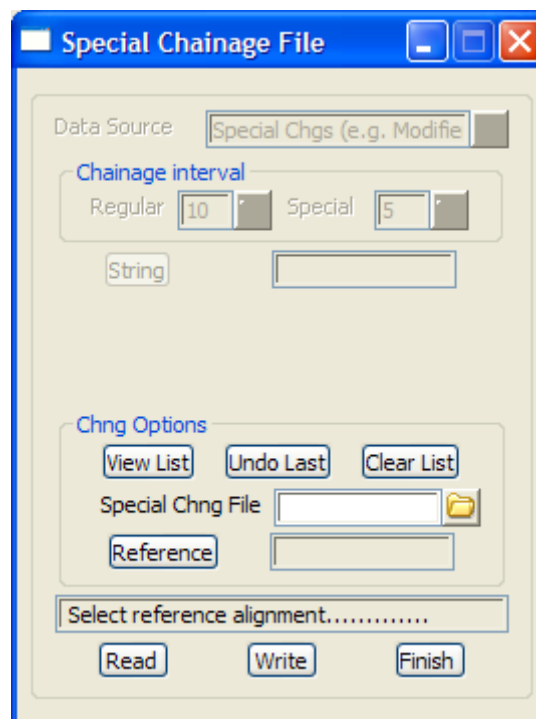

Special Chainages File

special_chg_panel

Position of option on menu: Design =>Roads =>More =>Special chainage file

This option is used to create a special chainage file for an alignment string.

The chainages are created for a selected reference string but can then be defined by dropping strings and/or individual points onto the reference string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source	choice box	Special chainages	Special chainages String Points

Regular

Special

String string select

Reference string select
select the string to create special chainages for.

View list button
view the special chainage list.

Undo last button
undo the last set of created chainages.

Clear list button
clear the chainages list.

Special chng file file box
file to read chainages from or write chainages to

read button
read in a file of special chainages.

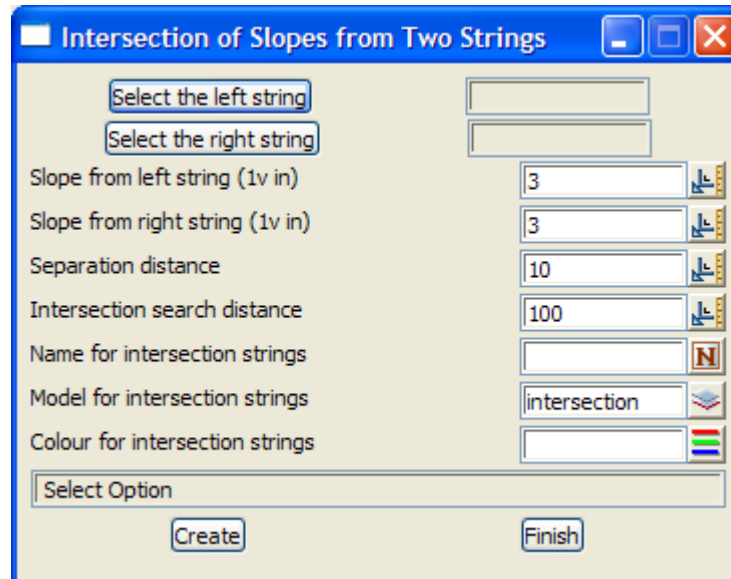

Write button
write the chainages list to the special chainages file.

Table Drain - Intersection of Slopes from Two Strings

[slopes_intersect_panel](#)

Position of option on menu: Design =>Roads =>More =>Table drain

This option is used to create a string which is the intersection of slopes from a left and right string.

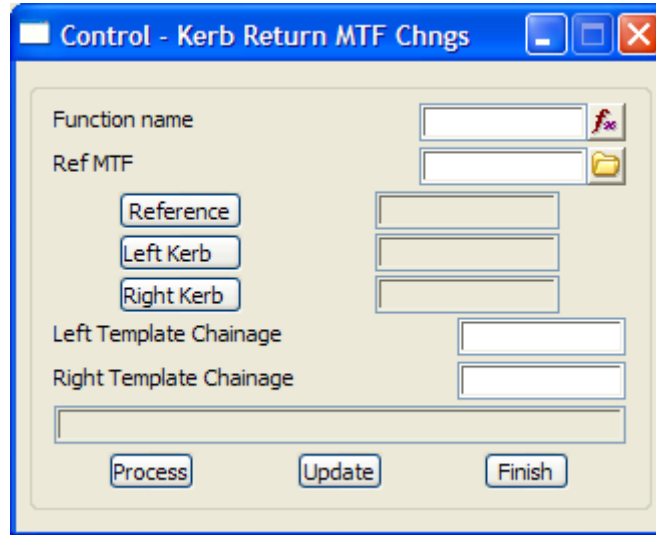

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Select the left string <i>select the left hand side string</i>	string select		
Select the right string <i>select the right hand side string</i>	string select		
Cross fall (1 in..) from left/right string <i>batter slope to go from left/right string</i>	input box	3	
Separation distance <i>distance to create batter lines and find intersection</i>	input box	10	
Intersection search distance <i>distance to search to find an intersection of the batter slopes</i>	input box	100	
Name for intersection strings <i>name for the strings created by the intersection of the batters</i>	input box		
Model/Colour for intersection strings <i>model/colour for the intersection strings</i>		intersection	available models/colours
Create <i>Create the intersection strings by battering of the left and right strings</i>	button		

Intersection MTF Update

kret_control_chgs_panel

Position of option on menu: Design =>Roads =>More =>Intersection MTF updates

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name for the function</i>	function box		available functions
Ref MTF	file box		*.mtf files
Reference <i>select the reference string</i>	string select		
Left kerb <i>select the left kerb string</i>	string select		
Right kerb <i>select the right kerb string</i>	string select		
Left template chainage	input		
Right template chainage	input		
Process	button		
Update	button		

Overlay

overlay

Position of menu: Design =>Overlay

The overlay options are for the design and optimisation of pavement overlay design.

The Overlay options is available to all users with the **Detailed Alignment Design** and **Volumes** modules.

The **Optimal Overlay** is under development and has not been released.

The Overlay walk-right menu is

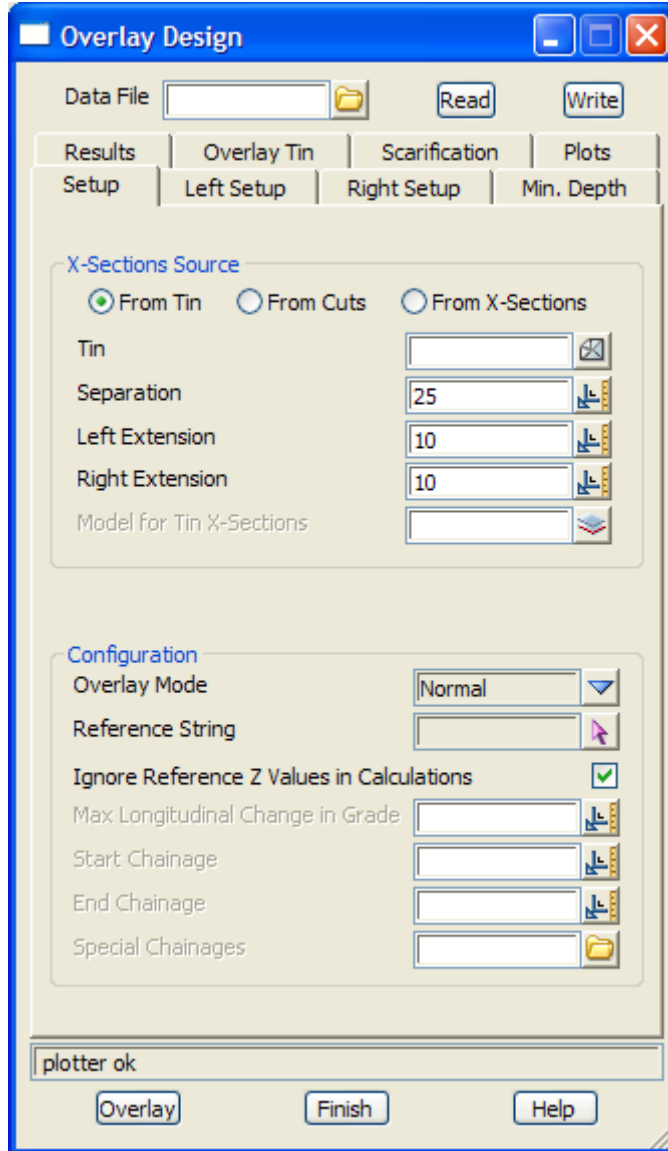

For the option *Overlay*, please continue to the section "Overlay Design" .

Overlay Design

overlay_design

Position of option on menu: Design =>Overlay =>Overlay design

Selecting **Overlay** brings up the **Overlay Design** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data file	file box		*.ovd files
<i>file with all the settings used in the Overlay panel. Used for storing information between runs.</i>			
Read	button		
<i>read in a data file of settings for the panel</i>			
Write	button		
<i>write out a data file of the settings in the panel</i>			
Buttons at bottom of panel			
Overlay	button		
<i>run the overlay.</i>			

Setup**Radio buttons**

radio buttons to define how cross sections for existing road are produced

From Tin radio button

*if **selected**, the road x-sections are created by taking sections through a tin. The following fields are displayed*

Tin tin box available tins

sections are created through this tin to represent the existing road

Separation input

chainage distance between cross sections

Left/Right extension input

Left/Right distance to define the limits of the cross sections

Model for tin x-sections model box available models

model for the created cross sections

From Cuts radio button

*if **selected**, the road x-sections are created by taking cuts through strings. The following fields are displayed*

Strings model model box available models

sections are created by taking cuts through the strings in this model

Separation input

chainage distance between cross sections

Model for cuts model box available models

model for the created cross sections

From X-sections radio button

*if **selected**, the road x-sections already exist. The following fields are displayed*

X-sections model model box available models

existing model of x-sections to use for the road

Overlay mode choice box Normal Normal, Use Crossfalls Only
Use Reference Z Values and Crossfalls only

*if **Normal**, at each section the left/right z-value is calculated so that the left/right crossfall and minimum overlay is obeyed. The z-value for the section is the maximum of the calculated z-values for the left and right.*

*If **User Crossfalls only**, the crossfalls from the Left and Right Setups tabs are used and no minimum overlay applied.*

*If **Reference Z values and Crossfalls only**, no overlay calculations are performed and the crossfalls in the Left and Rights Setups tabs are applied to the actual z-values on the reference string.*

Reference string string select box

select the string for the centreline of the road

Ignore reference z values in calculations tick box

if not tick, when the z-value is calculated at each section obeying just the minimum overlay criteria then use the maximum of the and the calculated z-value and the reference z-value at that section. If tick, use the calculated z-value at each section.

Start chainage input

chainage to start the overlay calculations

End chainage input

chainage to end the overlay calculations

Special chainages file box

special chainage file to define additional cross sections for overlay processing

Left/Right Setup tab

setup for the left/right side sections

Radio buttons

radio buttons to define how cross sections for existing road are produced

By offset radio button

*if selected, the width of the left/right cross sections is given in the **Offset** field*

Offset input

left/right offset distance to define the edge of the left/right section

By String radio button

*if selected, the width of the left/right cross section is defined by a selected **Edge** string minus the **Cut Back/Extension** value. The following fields are displayed*

Edge string string select

select the left/right edge string

Cut Back/Extension input

value to subtract from the distance to the edge string to define the left/right section

*When **By String** is selected, the Chainage-Minimum X-Fall grid can also be automatically filled in by using the crossfall between the **Road Crown** and the **Edge String**.*

Road crown string select

*select the road crown the use for calculating the cross fall to the **Edge string***

Only critical points tick box

*if tick, the crossfall between the **Road crown** and the **Edge string** is only calculated at the tangent points of the Reference string.*

*If not tick, the crossfall between the **Road crown** and the **Edge string** is calculated at the regular interval given by **Xfall Load Interval** and also at the tangent points of the Reference string.*

Xfall load interval input

regular interval to calculate crossfall

Load Xfalls from Strings button

*when selected, the **Chainage-Minimum X-Fall** grid is automatically filled in by using the crossfall between the **Road Crown** and the **Edge String***

By name radio button

*if **selected**, the width of the left/right cross section is defined by the name of a given string minus the **Cut Back/Extension** value. The following fields are displayed*

Name

name of the string to select as the left/right edge string

Cut Back/Extension input

value to subtract from the distance to the edge string to define the left/right section

Default Xfall input

*if **non blank**, the default crossfall to use for the left/right cross section. If **blank**, the **Chainage-Minimum X-fall** grid is used.*

Chainage- Minimum Xfall grid

*this grid is only used if the **Default Xfall** is **blank***

Chainage input

*chainage to use the **Min xfall***

Min X-fall input

minimum X-fall to use at that chainage

Min. Depth tab

there can be one minimum depth value for the entire job or the minimum depth can vary between chainages

Default depth input

*if **non blank**, the default minimum depth to use for the left and right cross section. If **blank**, the **Chainage-Minimum Depth** grid is used.*

Chainage- Minimum Depth grid

*this grid is only used if the **Default depth** is **blank***

Chainage input

chainage to start the minimum depth

Min Depth input

*minimum depth to start at this chainage and either go to the next chainage **or** if there is a **Min Depth 2**, interpolate to **Min Depth 2** from this chainage to the next chainage*

Min Depth 2 input

minimum depth to end with at the next chainage

Results tab

Transfer Z-values to reference string tick box

*if **tick**, the calculated z-values are used to update the z-values on the reference string*

Clean models before overlay	tick box	
<i>if tick, the models of results are cleaned before the overlay option is run</i>		
Model for overlay x-sections	model box	available models
<i>model for the created overlay x-sections</i>		
Model for overlay strings	model box	available models
<i>model for the created overlay strings</i>		
Colour	colour box	available colours
<i>colour for the created overlay strings</i>		
Model for xfall strings	model box	available models
<i>if non blank, left and right strings with z-value equal to the left/right crossfall are created and placed in this model</i>		
Model for min/max points	model box	available models
<i>if non blank, points for the minimum and the maximum of the calculated z-values for the left and right sections are created and placed in this model</i>		
X-sections depth range file	file box	available depth range files
<i>a depth range file used for colouring x-sections by the depth between the overlay and the road tin</i>		
Overlay report	file box	*.rpt files
<i>report on the overlay</i>		
Volumes report	file box	*.rpt files
<i>volumes of overlay report</i>		
Write volumes as CSV	tick box	
<i>if tick, the volume report is written as a CSV file (for Excel)</i>		

Overlay Tin tab

*the **Overlay Tin** tab controls the creation of an overlay tin and depth polygons*

Create overlay tin	tick box	
<i>if tick, the fields in this tab are used to create an overlay tin</i>		
Tin name	tin box	available tins
<i>name for the tin created from the overlay strings and sections</i>		
Tin colour	colour box	available colours
<i>colour of the overlay tin</i>		
Model for tin	model box	available models
<i>model for the overlay tin</i>		
Create depth polygons	tick box	
<i>if tick, depth polygons are created between the road tin and the overlay tin</i>		
Depth range file	file box	*.drf files
<i>depth range file used when creating polygons</i>		
Model for depth polygons	model box	available models
<i>model for the depth polygons</i>		

Scarification tab

*the **Scarification** tab controls any scarification to be applied to the road sections before calculating overlays*

Perform scarification tick box
if tick, scarification is performed on the road sections before overlay is calculated

Model for scarified x-sections model box available models
if non blank, road x-sections after scarification are created and placed in this model

Colour colour box available colours
colour of the scarified sections

Clean scarification x-sections model tick box
if tick, the clean the model of scarified sections before running calculations

Default scarification depth input
*if non blank, the default scarification depth to use for road cross section.
 If blank, the **Overlay-Depth** grid is used.*

Chainage- Minimum Depth grid
*this grid is only used if the **Default scarification depth** is blank*

Chainage input
chainage to start the scarification depth

Depth input
*scarification depth to start at this chainage and either go to the next chainage **or** if there is a **Depth 2**, interpolate to Min Depth 2 from this chainage to the next chainage*

Depth 2 input
scarification depth to end with at the next chainage

Plots tab

Generate long section plots tick box
if tick, long section plots are created

Long section PPF file box *.lplotppf files
binary ppf file to use for the long section plots

Plotter type plotter box model available plotters
type of plotter to use for the long section plots

Plot stem
the name to use for the plots - a number will be added when more than one page is produced

Clean plot model beforehand tick box
*if tick and the **plotter type is model**, the plot models are cleaned before the plots are created*

Generate cross section plots tick box
if tick, cross section plots are created

Cross section PPF file box *.lplotppf files
binary ppf file to use for the cross section plots

Plotter type plotter box model available plotters
type of plotter to use for the cross section plots

Plot stem
the name to use for the plots - a number will be added when more than one page is produced

Clean plot model beforehand tick box
*if tick and the **plotter type is model**, the plot models are cleaned before the plots are created*

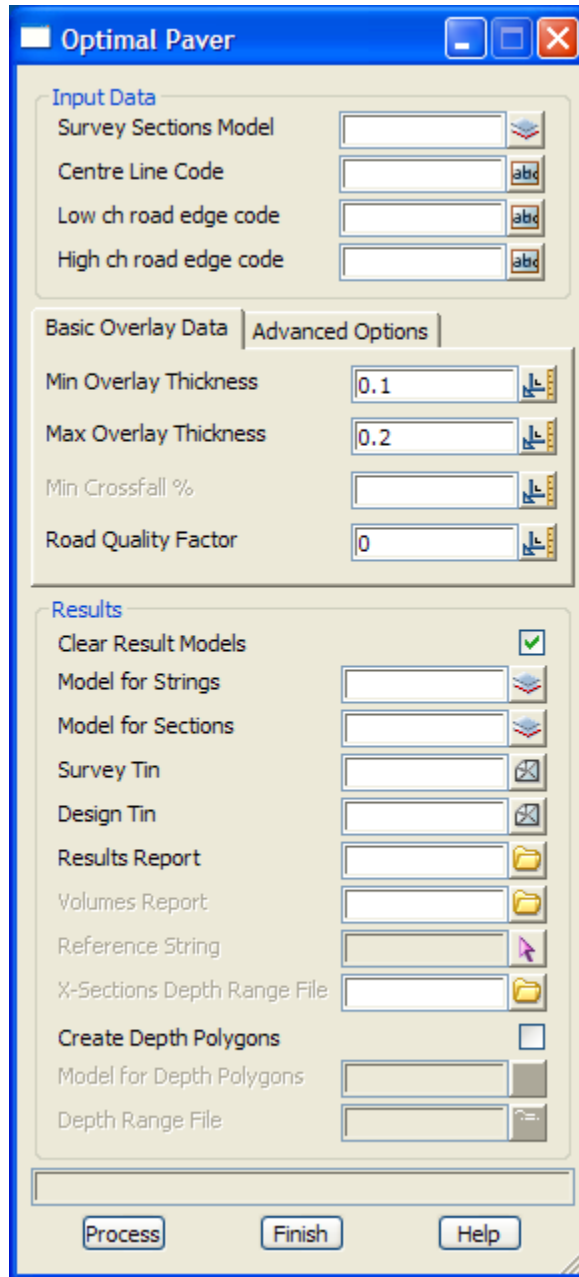

Optimal Overlay

optimal_paver

Position of option on menu: Design =>Overlay =>Optimal overlay

This option is under development and has not been released.

Selecting **Optimal overlay** brings up the **Optimal Paver** panel.

X-Sections

x_sections

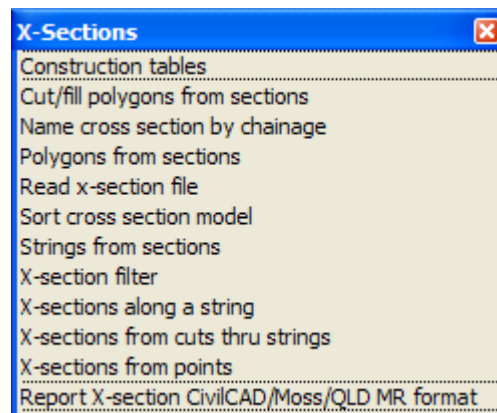

Position of menu: Design =>X-Sections

Cross sections can be created in a variety of ways including

- sections through triangulations created with the options in the menu *Tins =>Sections*.
- sections generated by cutting through strings with the options *Utilities =>A-G =>Cuts*.
- design sections generated from options on the menu *Design =>Apply*
- sections generated by the end area volumes options *Design =>Volumes =>End area*

The x-sections menu contains options to read cross-sections in from a file and for working with cross sections in a variety of way.

Walking right on X-Sections bring up the X-Sections menu:

For the option *Cut/fill polygons from sections*, go to the section "ICut/Fill Polygons from Sections"

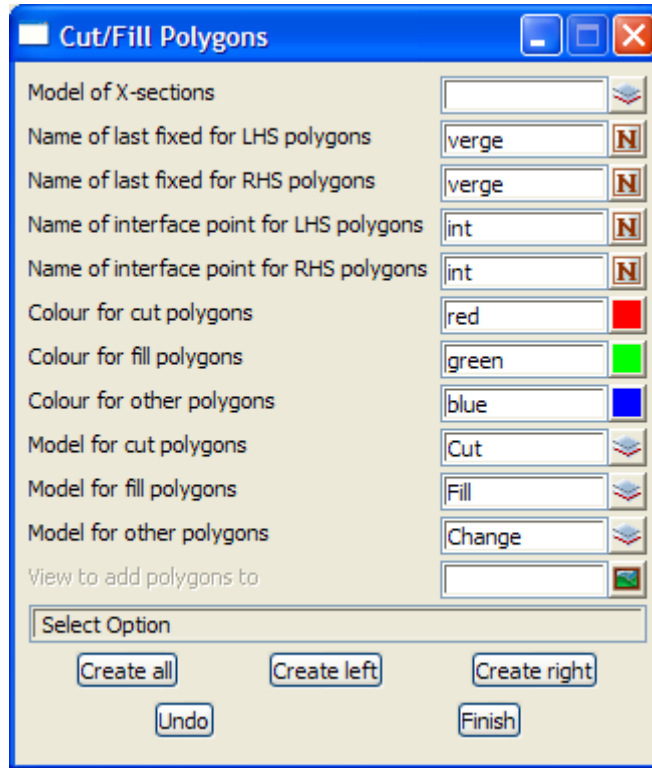

<i>Name cross sections by chainage</i>	"Name Cross Sections by Chainage"
<i>Polygons from sections</i>	"Polygons from Sections"
<i>Read x-section file</i>	"Read X-Section Data"
<i>Sort cross-section mode</i>	"Sort X-Sections in a Model"
<i>Strings from sections,</i>	"Strings from Sections"

ICut/Fill Polygons from Sections

cutfill_polygons_panel

Position of option on menu: Design =>X-Sections =>Cut/fill polygons from sections

This option takes cross sections and by using the user-supplied names of points on the cross section, cut and fill polygons for the strings joining the named points in successive cross sections.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model of x-sections <i>model containing the cross sections used to define the cut and fill polygons.</i>	model box		available models
Name of last fixed for LHS polygons <i>Name of the cross section point to be the inner point of the left hand side polygons.</i>	input	verge	
Name of last fixed for RHS polygons <i>name of the cross section point to be the inner point of the right hand side polygons.</i>	input	verge	
Name of interface point for LHS polygons <i>name of the cross section point to be the outer point of the left hand side polygons.</i>	input	int	
Name of interface point for RHS polygons <i>name of the cross section point to be the outer point of the right hand side polygons.</i>	input	int	
Colour for cut polygons <i>colour for the cut polygons.</i>	input	red	available colours
Colour for fill polygons <i>colour for the fill polygons.</i>	input	green	available colours
Colour for other polygons <i>colour for the polygons that are neither cut or fill – they are either flat or change from cut to fill.</i>	input	blue	available colours
Model for cut polygons <i>model for the cut polygons.</i>	input	cut	available models
Model for fill polygons <i>model for the fill polygons.</i>	input	fill	available models
Model for other polygons <i>model for the polygons that are neither cut or fill – they are either flat or change from cut to fill.</i>	input	other	available models

View to add polygons	input	available views
<i>if non-blank, the models of polygons are added to the view.</i>		
Create all	button	
<i>run the option and create left and right polygons.</i>		
Create left	button	
<i>run the option and only create the left polygons.</i>		
Create right	button	
<i>run the option and only create the right polygons.</i>		
Undo	button	
<i>undo the last set of polygons created whilst the panel has been up.</i>		
Finish	button	
<i>end the option and remove the panel. The undo capability for the polygons is terminated.</i>		

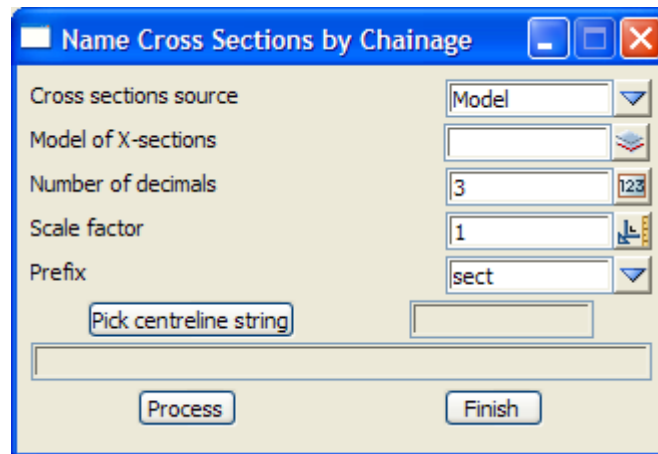

Name Cross Sections by Chainage

xs_name_by_chainage_panel

Position of option on menu: Design =>X-Sections =>Name cross sections by chainage

This option names cross-sections with the chainage from a selected string.

Note that the chainage from the string that the cross section comes from is in the name of the cross section so this option effectively gives the chainage to the cross section.

The fields and buttons used in this panel have the following functions:

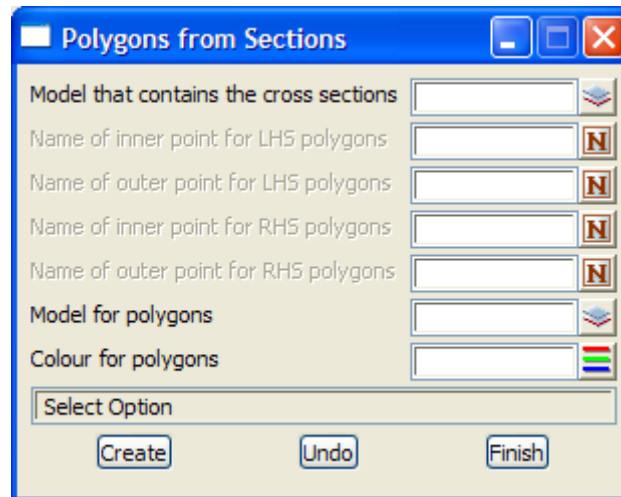

Field Description	Type	Defaults	Pop-Up
Cross sections source <i>type of data source.</i>	choice box	model	string, model, view
Model/String/View of x-sections <i>source of the cross section data.</i>	source box		
Number of decimals <i>number of decimal places to use in the chainage label.</i>	input box	3	
Scale factor <i>factor to multiply the chainage by before creating the label.</i>	input box	1	
Prefix <i>prefix for the chainage value - for cross-section options to work, this should be sect or design.</i>	choice box	sect	sect, design, none
Pick centreline string <i>select the string that is used to find a chainage for the cross sections.</i>	output box		
Process <i>run the option.</i>	button		

Polygons from Sections

road_polygons_panel

Position of option on menu: Design =>X-Sections =>Polygons from sections

Option to take a model of cross-sections and create polygons between specified points on the cross-sections.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model that contains the cross sections	model box		
<i>model of cross sections</i>			
Name of first/last point for lhs polygons	input box		
<i>name of the first/last point on left hand side of the cross-section to creating polygon for.</i>			
Name of first/last point for rhs polygons	input box		
<i>name of the first/last point on right hand side of the cross-section to creating polygon for.</i>			
Model/colour for polygons	input box		
<i>model/colour of the created polygons.</i>			
Create	button		
<i>create polygons between the first and last points on the left and right side of the cross-sections.</i>			
Undo	button		
<i>undo the last set of polygons created whilst the panel was up.</i>			

Read X-Section Data

read_xsc_panel

Position of option on menu: Design =>X-Sections =>Read x-section file

This option is used to read in cross section data from a file and convert it to x-section strings (4d strings).

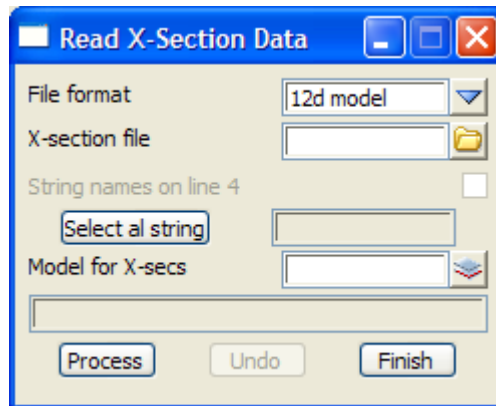

The data in the file is only centre-line chainage values, offset, heights and text (Code) so an alignment string needs to be selected to give an (x,y) position for the centre-line chainage and a direction (at right angles to the alignment string at the chainage) to convert the (offset, height) values into (x,y,z) points on a string.

NOTE - after reading in the x-section data and hence creating 4d strings, the

Design =>X-Sections =>Strings from sections

option can be run to create 3d strings by joining points with the same Code from adjacent x-sections. The created 3d strings are given the string name of the Code that they joined.

Selecting Read x-section file brings up the **Read X-Section Data** panel:

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
File format	input box	12d Model	12d Model, Alg, Moss, Chainage/Offset/Height/Text

format of the x-section data in the file.

12d Model Format

The 12d Model format is a simple text file format with the text CH followed by one or more spaces and then the alignment chainage (centre line chainage) of the x-section, and then on the following lines, the Offset value followed by one or more spaces, the height at that offset followed by one or more spaces, and then the text (Code) for that point on the x-section. The x-section continues until the next Ch line. For example, the following defines two x-sections at chainage 10 and 20 respectively.

```
ch 10
-3 5 A
0 6 "Second label"
4 7 C
ch 20
-3.5 5.5 A
0 6 D
4.5 7.5 ""
```

Note that if the Code includes a space, then it must be enclosed in quotes. For example "Second label". Also the Code is not optional - if there is no code, put "".

Chainage/Offset/Height/Text Format

The Chainage/Offset/Height/Text format is a very simple text file format with each line containing the alignment chainage (centre line chainage) for the x-section followed by one or more spaces and then on the same line the Offset value followed by one or more spaces, the height at that offset followed by one or more spaces, and then optionally, the text (Code) for that point on the x-section. The x-section continues until the alignment chainage changes. For example, the following defines two x-sections at chainage 10 and 20 respectively.

```
10  -3  5  A
10   0  6  "Second label"
10   4  7  C
20  -3.5 5.5 A
20   0  6  D
20  4.5  7.5 E
```

Note that if the Code includes a space, then it must be enclosed in quotes. For example "Second label". Also the Code is optional (whereas it was compulsory for the 12d Model format).

Moss (MX) Format

Please refer to Moss (MX) documentation or ask the group who supplied the data.

Alg Format

Not documented.

X-section file input box

file of x-section data.

String names on line 4 tick box

ONLY used for the ALG format which is not documented

Select al string string select

select the string that is used to define the (x,y) position of the zero offset of the x-section and also the bearing for the x-section.

Model for x-secs model box

available models

model for the created x-sections

Process button

read the file and create the x-sections

Undo button

undo the last set of x-sections created since the panel has been active

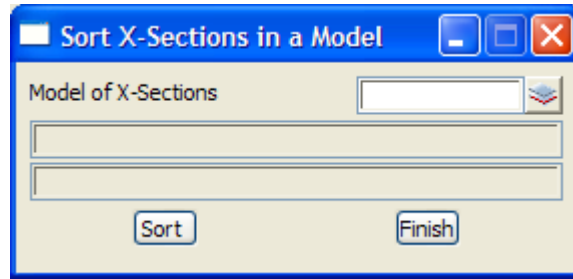

Sort X-Sections in a Model

xs_sort_panel

Position of option on menu: Design =>X-Sections =>Sort cross section model

This option is used to sort cross sections in a model so that they are in the order of the chainages embedded in the cross section name.

Selecting Sort cross section model brings up the **Sort X-Sections in a Model** panel:

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of x-sections <i>model containing the cross sections to be sorted into chainage order.</i>	model box		available models
Sort <i>run the option.</i>	button		

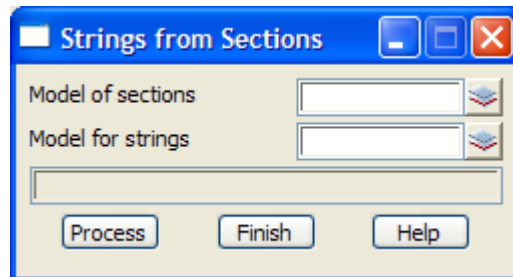

Strings from Sections

[strings_from_sections](#)

Position of option on menu: Design =>X-Sections =>Strings from sections

The strings from sections option creates strings by joining the common named points on successive 4d strings (usually generated as sections).

Selecting strings from sections fires up the **strings from sections** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model of sections <i>model of the 4d strings (sections) to try and join common points from to form strings.</i>	input		available models
Model for string <i>model for the created strings to go to.</i>	input		available models
Process <i>try and join points with the same name from successive sections to form strings.</i>	button		

Sections from Points

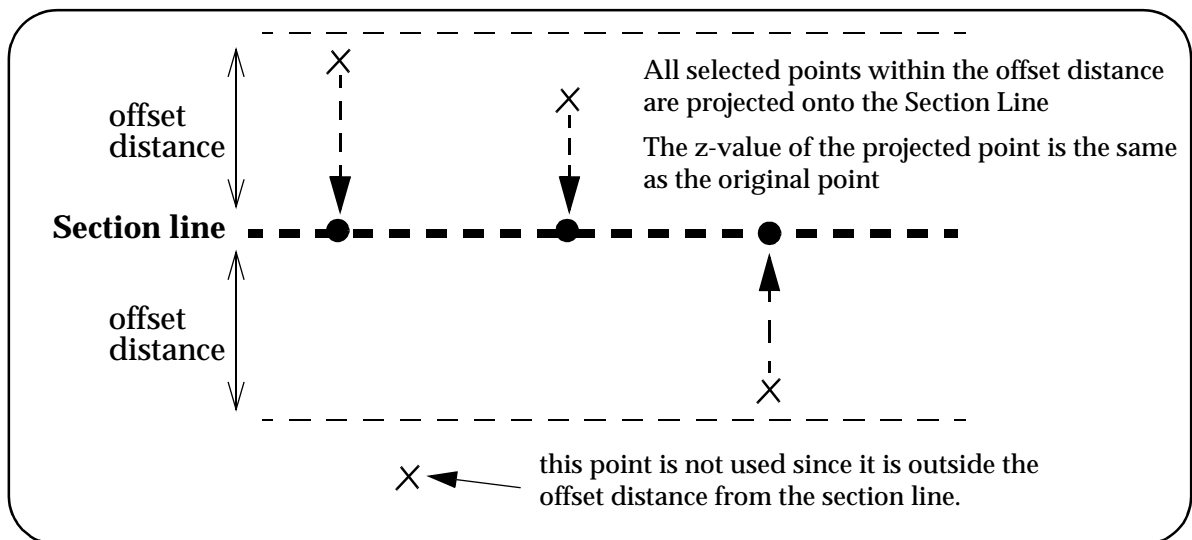

sections_from_points

Position of option on menu: Design =>X-Sections =>X-sections from points

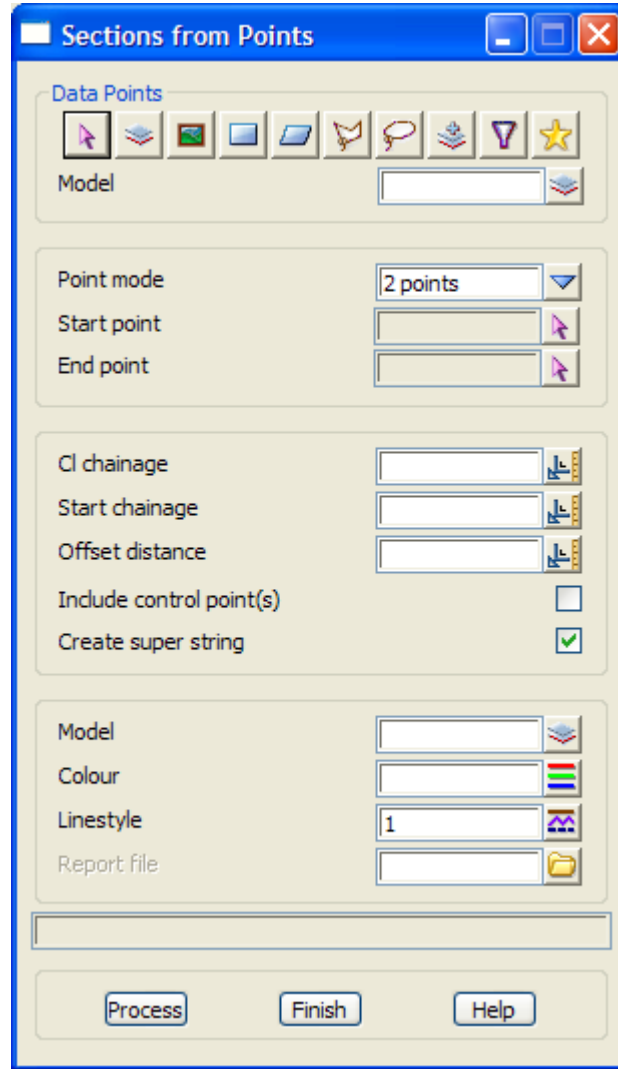

The X-sections from points option creates a cross section by first defining a section line and then dropping all selected points in a user defined offset distance from the section line, onto the section line.

- (a) The z-value for the dropped point is the same as for the original point.
- (b) The Point number (Vertex id) of the dropped point is the Point number (Vertex id) of the original point.
- (c) The Vertex text of the dropped point is the code (string name) of the original point.

The user specifies the start chainage for the created section and the value for the "centreline chainage" of the section.

Selecting Sections from points fires up the **Sections from points** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type			
<i>data source type.</i>			

Data source

data source for points to create sections from.

Point mode	choice box	2 points	2 points, 1 point and bearing point on centreline
-------------------	------------	----------	---

if 2 points, then the Start point and End point are selected. The section goes through the two points. If 1 point and bearing, then the Start point is selected and a Bearing given. The section goes through the start point with the given bearing.

If point on centreline, then a Centreline is selected and a point on the centreline selected. The section goes through the selected point on the centreline and is perpendicular to the selected centreline at the selected point.

If Point mode is **2 points**:

Start point string select

End point string select

If Point mode is **1 point and bearing**:

Start point string select

Bearing angle box

If Point mode is **point on centreline**

Centreline string select

depends on Point mode.

Point on cl string select

depends on Point mode.

CI chainage input

the chainage to give to the created section

Start chainage input

the start chainage to give to the created section.

Offset distance input

distance to search either side of the section for points to project onto the section

Include contrl points(s) tick box

if tick, the selected start and end points are included as part of the section.

Create super string tick box

if tick, then the created section is a super string.

Model model box

available models

model for created sections.

Colour colour box

available colours

colour for the created sections.

Linestyle linestyle box

available linestyles

linestyle for the created sections.

Report file file box

a report.

Process button

create a cross section from the selected points.

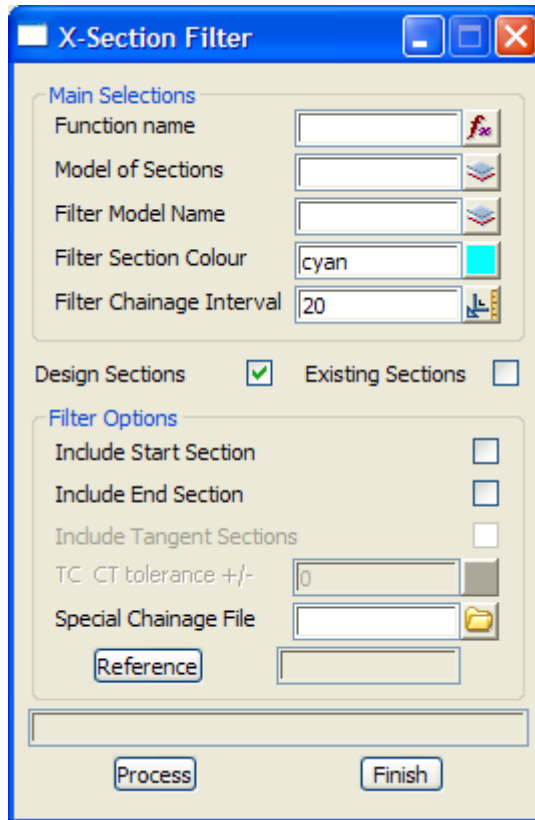

X Section Filter (Sections at Even Chainages)

xs_filter_func_panel

Position of option on menu: Design =>X-Sections =>X-section filter

This panel selects user specified cross-sections from a model of cross-sections and copies them into another model. The cross sections must already exist - no new cross-sections are created.

It is a function so can be recalced when the cross-section model is changed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Function name

name of the function.

Model of sections string select

model of existing cross sections to select some cross sections from.

Filter model name model box

model for the selected cross sections

Filter section colour colour box cyan

colour for the filtered cross sections

Filter chainage interval input 20

*chainage interval to select cross sections. Sections are selected which are multiples of the **filter chainage interval**.*

Design/Existing sections radio button design sections

cross sections are 3d strings with the name

***Design** and the chainage of the cross-section (usually created by an Apply),
or **Sect** and the chainage of the cross-section (usually created by Tins =>Section =>X section)*

*If **Design sections** is selected, then sections starting with the name **Design** are selected.*

*If **Existing sections** is selected, then sections starting with the name **Sect** are selected.*

Include TC_CT sections tick box

*if **tick**, include cross sections at tangent points from the reference string.*

Include start/end section tick box

include a cross section at the start/end chainage of the reference string

TC_CT tolerance +/- input box

*if **non-zero**, then regular cross sections (i.e. those selected by the filter chainage interval) are **not** included if they are closer than the given tolerance distance to a tangent point.*

Special chainage file input box

include cross sections with chainages given in the given special chainage file.

Reference output box

select reference string to use for the filter options requiring tangent points and start/end chainages.

Process button

copy the specified cross-sections to the Filtered Model.

X-Sections Along a String

Position of option on menu: Design =>X-Sections =>X-Sections along a string

This option has already been documented in Tins => Sections=> X-Sections

For the option *X-Sections along a string*, please continue to the section "X-Sections" in the Chapter "Triangles" .

X-Sections from Cuts Through Strings

Position of option on menu: Design =>X-Sections =>X-Sections from cuts thru strings

This option has already been documented in Utilities =>A-G =>Cuts =>by centreline

For the option *X-Sections along a string*, please continue to the section "Cuts by Centreline" in the Chapter "Utilities" .

More Design

more_design

Position of menu: Design =>More

The more design menu contains extra design options.

The more design walk-right menu is

For the option *Culverts from file*, please continue to the section "Culverts from File".

Settlement

"Settlement"

Culverts from File

12d_culvert_panel

Position of option on menu: Design =>More =>Culverts from file

This option is currently under development.

The screenshot shows a dialog box titled "Create Culverts from File". The dialog is organized into several sections:

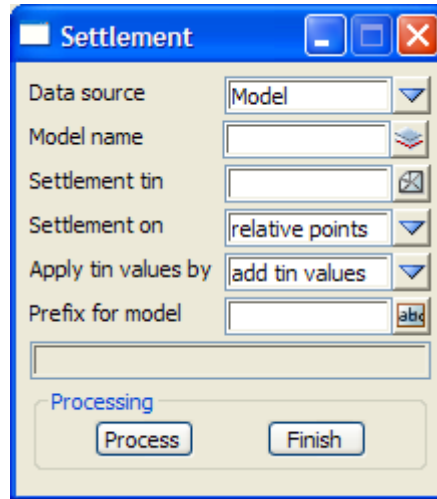

- Culvert Details:** Contains input fields for Alignment, Chainage, Type, Size, and Skew.
- Inlet:** Contains input fields for Level, Side, and Offset.
- Outlet:** Contains input fields for Level, Side, and Offset.
- Input File:** A text field with a folder icon to its right.
- Process all:** A checkbox that is currently checked.
- Buttons:** A row of buttons labeled "Read", "Prev", "Next", "Process", and "Finish".

Settlement

settlement_panel

Position of option on menu: Design =>More =>Settlement

This option uses a tin of settlement values to adjust the z-values of strings.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source <i>type of data source.</i>	choice box		model/view
Model/View name <i>source of the data to process. Only 2d, 3d, 4d and super strings from the data source are processed.</i>			
Settlement tin <i>tin of values (settlement values) to be used to reduce/increase the z-values of strings by.</i>			available tins
Settlement on	choice box	relative points	relative points relative strings absolute points absolute strings

if Settlement on is "relative points" then for each point of a string, the value of the settlement string at that (x,y) position is added/subtracted from the z value at the point.

is "relative string" then for each point of a string, the value of the settlement string at that (x,y) position is added/subtracted from the z value at the point plus for each visible segment joining points of the strings then if the segment crosses any edges of triangles from the settlement tin, a new point is inserted into the string which then has the settlement value applied to it (the initial z-value for the inserted point is interpolated from its adjacent points in the string).

is "absolute points" then for each point of a string, the value of the settlement string at that (x,y) position is taken to be the z value at the point.

is "absolute string" then for each point of a string, the value of the settlement string at that (x,y) position is taken to be the z value at the point plus for each visible segment joining points of the strings then if the segment crosses any edges of triangles from the settlement tin, a new point is inserted into the string which is given the settlement value at that point.

Apply tin values by	choice box	add tin values	add tin values subtract tin values
----------------------------	------------	----------------	---------------------------------------

if "add tin values", then the tin values are added to the string values.

If "subtract tin values", then the tin values are subtracted from the string values.

Prefix for models

prefix to apply to the name of each model in the data source to create new models for the processed data.

Process button

adjust the heights of the selected data.

Ortho 12d

ortho_12d

Position of menu: Design =>Ortho 12d

The Ortho 12d menu contains the option to write out tins in a format suitable for the *Ortho 32* rectification software.

The Ortho 12d walk-right menu is

For the option *Create triangles*, please continue to the section “Create Triangles”

Create Triangles

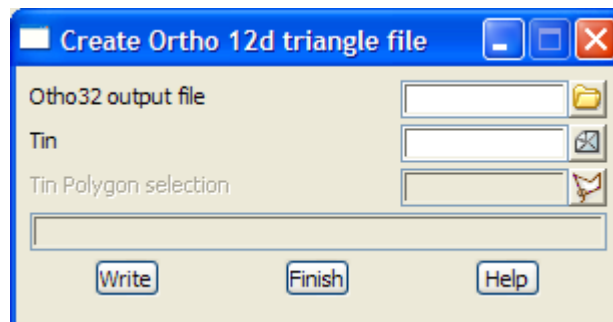

create_ortho_12d_triangle_file

Position of option on menu: Design =>Ortho 12d =>Create triangles

This option writes out a 12d Model tin in a format suitable for the software **Ortho12d** software from Digital Mapping Systems (www.digmapsys.com).

Ortho12d is an image rectification package which can be used for ortho-rectifying photographs.

For more information on *Ortho12d*, please contact Ian Hall from Digital Mapping Systems on ian.hall@digmapsys.com

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>tin to write out in Ortho12d format</i>	tin box		available tins
Tin polygon selection <i>if used, only triangles whose centroid is inside the polygon are written out.</i>	Polygon select box		
Ortho12d output file <i>file to write the tin out to</i>	file box		*.T12 files
Write <i>write the tin out in the Ortho12d format</i>	button		

18 Drainage and Sewer

drainage

Position of menu: Design =>Drainage-Sewer

The **Drainage-Sewer** option is used to place drainage and sewer networks within a subdivision. The network is placed in three dimensions including manholes (maintenance holes), and for sewer work, lot controls and house connections can be defined.

If used in conjunction with the services on a section view, interference with neighbouring pipe strings can be taken into consideration when placing the network.

Note that the drainage string and plots is only available with the drainage and sewer options and the sewer extensions (property control, house controls and Melbourne Water plots) are only available with the sewer option.

The **drainage string** is based on a **polyline** string so that **arcs** can exist between manholes (maintenance holes).

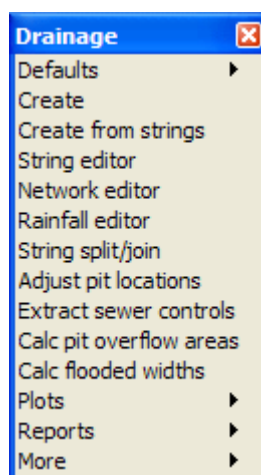

The use of the drainage string for drainage is only a subset of its use for sewer so the steps for the sewer will be given since they cover drainage as well.

The sewer process consists of a number of steps (the drainage process does not use steps 2 and 3):

1. creating the drainage or sewer network
2. checking that residential blocks are controlled by the sewer network
3. creating the house connections for the sewer
4. network design using custom routines, spread sheets or advanced network analysis packages
5. producing plots (plan and long section), material quantity reports, excavation volumes and manhole construction reports

These steps are described in the rest of this chapter.

The **Drainage** walk-right menu is laid out to reflect the standard sequence of placing drainage and wastewater pipes, i.e., creating, editing and plotting.

For a description of the drainage string in 12d Model, please go to the section “Drainage Strings”

For a definition of a drainage network and a junction in 12d Model, please go to the section “Networks and

Junctions” .

For a description of the drainage defaults in 12d Model, please go to the section “Drainage Definitions”

For a description of the drainage design import/export interface, please go to the section "**Drainage import/export**"

For the option *Defaults*, please continue to the section “Defaults” .

Create, please continue to the section “Create” .

Editor, please continue to the section “Editor” .

Plots, please continue to the section “Drainage Plots” .

Reports, please continue to the section “Reports” .

More, please continue to the section "**More Drainage**".

Drainage Strings

A **drainage string** consists of a series of manholes (maintenance holes) at user selected (x,y,z) positions. The manholes can be joined by either straight or curve pipes.

Like all 12d Model strings, the drainage string has an implied direction, starting at the first manhole and going in the direction towards the next manhole in the drainage string. This order is normally determined by the creation order of the manholes.

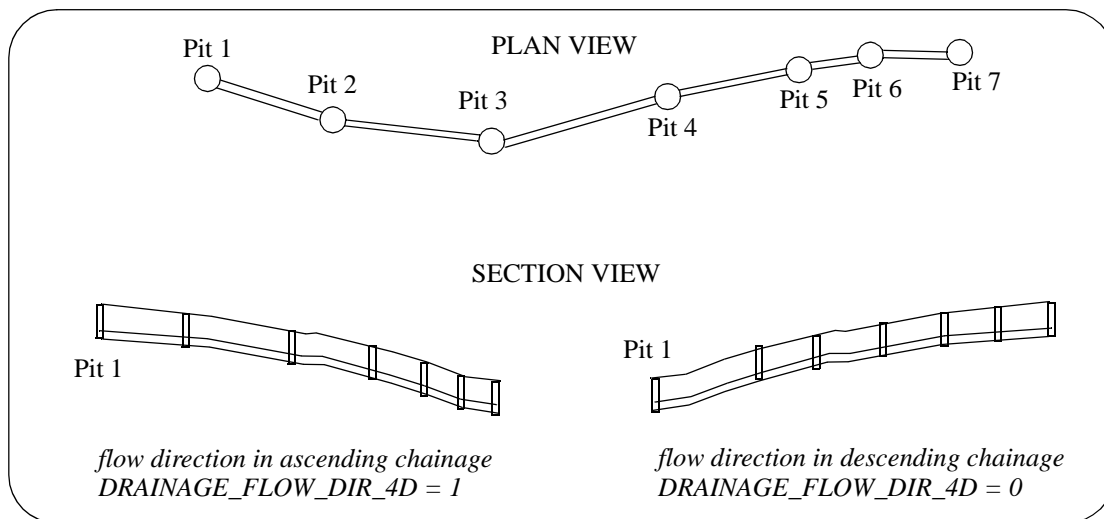

The chainage of the drainage string starts at the **first** manhole and then increases along the direction of the drainage string.

In 12d Model, drainage strings can be entered such that

- (a) the most upstream manhole is entered as the first point of the string and hence the water flows in the direction of ascending string chainage. The flow direction is said to be in ascending chainage.

or

- (b) the most downstream manhole is entered as the first point of the string and hence the water flows in the direction of descending chainage. The flow direction is said to be in descending chainage)

When a drainage string with flow direction in ascending order is profiled in a section view, the left hand side of a manhole is normally upstream and the right hand side of a manhole downstream.

It is recommended that drainage strings are entered with the flow direction in ascending chainage so that the minimum grade and cover can be satisfied as the drainage string is being placed.

That is, if the drainage string flow is in ascending chainage direction, then as manholes are appended, minimum *cover* and minimum *grade* can be automatically maintained.

Please continue to the next section “Networks and Junctions” .

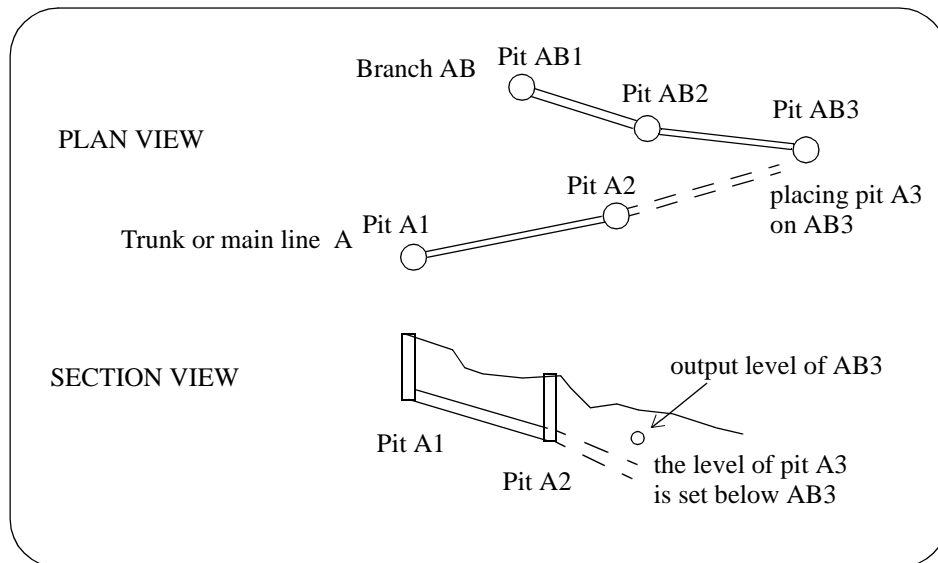

Networks and Junctions

In 12d Model, a **drainage network** consists of one or more drainage strings in the *same* model. Consequently, all the drainage strings in the same model are considered to be part of the same drainage network.

WARNING - All drainage strings in a network **must** be entered with the same flow direction.

If two drainage strings from the same model have a manhole at exactly the same (x,y) location, then 12d Model assumes that the co-incident manholes **are** the same manhole and that the situation represents a **junction**.

Also for a network, if all the drainage strings are entered with the flow direction in ascending chainage, not only can minimum cover and minimum grade be maintained as manholes are appended, but if the branches are laid down before the trunk, then as you connect each branch to the trunk, the invert level for the trunk will be set to below the invert level of the branch line (less the default drop for the manholes).

Please continue to the next section "Drainage Definitions" .

Drainage Definitions

A file of definitions of pipe and manhole (maintenance hole) types can be given to allow tailoring for a particular project.

When 12d Model starts up, it checks to see if an environment variable called DRAINAGE_4D exists and if it does, then the file it points to is used to provide the available types of manholes (maintenance holes) and pits.

If the environment variable is not set, then 12d Model searches for a file called **drainage.4d** in the standard 12d Model search sequence for set up files.

The drainage definitions file format is a simple ascii format and consists of one or more pipe and manhole definitions. Each definition in the file begins with the key word **Pipe** or **Manhole**, followed by the pipe or manhole type and then curly braces { }.

Note

In future versions of 12d Model, this definition will be extended to include special Pipe and Manhole commands within the curly braces.

An example of a typical drainage definitions file is:

```
// -----
// drainage.4d                1/6/96
// Used to define the types of Pipes and Manholes
// -----
Pipe "PVC" {
}

Pipe "VC" {
}
Pipe "PVC Extra Heavy" {
}
Pipe "Plastic" {
}

Manhole "CONC COVER" {
}
Manhole "Gatic" {
}
Manhole "Rubber" {
}
```

Notes

1. spaces in text - any text string that includes spaces or only numbers, must be enclosed in double quotes "".
2. comments - anything after // until the end of the line is ignored.
3. blank lines - blank lines are ignored

Please continue to the next section "Defaults".

Defaults

drainage_defaults

Position of menu: Design =>Drainage-Sewer =>Defaults

The **defaults** menu sets default tin, manhole (maintenance hole) information, drainage pipe information, property control (sewer module only) and house connection (sewer module only) defaults which are all used when defining drainage networks.

The **Defaults** walk-right menu is

For the option *Tins (fs)*, please continue to the section “Tin (fs)” .

Manholes, please continue to the section “Manholes (Maintenance Holes)” .

Pipes, please continue to the section “Pipes” .

Property controls, please continue to the section “Property Controls” .

House connections, please continue to the chapter “House Connections” .

Tin (fs)

drainage_tin_defaults

Position of option on menu: Design =>Drainage-Sewer =>Defaults =>Tin (fs)

On selecting the **Tin (fs)** option, the **Drainage Tin Defaults** panel is displayed.

This panel is for setting the default finished surface tin in the **Create Drainage Strings** panel which is used for creating a new drainage string.

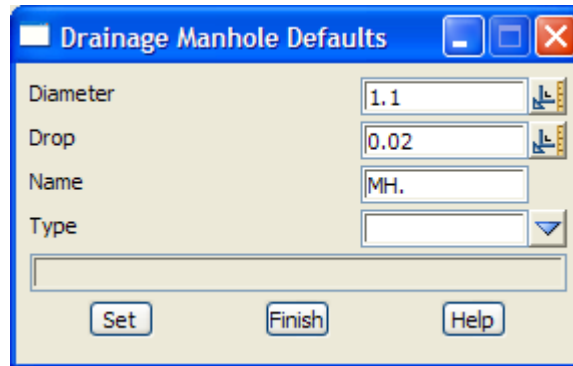

For the drainage string, the finished surface tin is used as the surface that manholes automatically sit on when z float is set on, and for defining cover when placing controls and connections.

Manholes (Maintenance Holes)

drainage_manhole_defaults

Position of option on menu: Design =>Drainage-Sewer =>Defaults =>Manholes

On selecting the **Manholes** option, the **Drainage Manhole Defaults** panel is displayed.

These defaults are used when creating a manhole in a drainage string. The fields and buttons used in this panel have the following functions.

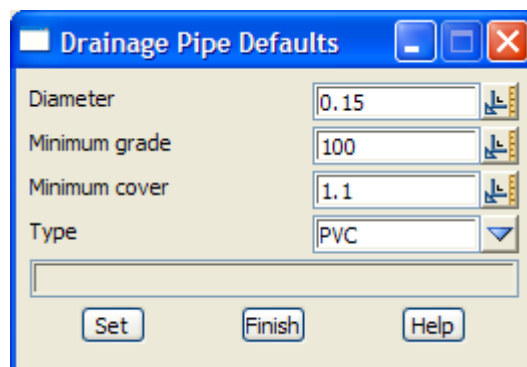

Field Description	Type	Defaults	Pop-Up
Diameter <i>default diameter of a drainage manhole</i>	input	1.1	
Drop <i>drop (metres) through the manhole</i>	input	0.02	
Name <i>default name for the manhole Note that if a manhole name is EOL or eol, then the diameter of the manhole is forced to be zero.</i>	input	MH.	
Type <i>the default cover or lid type of the manholes</i>	input	CONC COVER	CONC COVER, GATIC
Set <i>set the drainage manhole defaults to the values in the above fields.</i>	button		

Pipes

[drainage_pipe_defaults](#)

Position of option on menu: Design =>Drainage-Sewer =>Defaults =>Pipes

On selecting the **Pipes** option, the **Drainage Pipes Defaults** panel is displayed.

This panel is for setting the default drainage pipe diameter, grade, cover and type. These defaults are used when creating a pipe in a drainage string.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Diameter <i>default diameter of the pipe.</i>	input	0.1	
Minimum grade <i>the minimum grade (measured as 1: value) used when laying down the pipe.</i>	input	1.0	
Minimum cover <i>the minimum cover, measured in world units from the surface to the top of the pipe (obvert); used when laying down the pipe.</i>	input	1.0	
Type <i>the default type of the pipe</i>	input	PVC	PVC, VC, PVC X/HEAVY
Set <i>set the drainage pipe defaults to the values in the above fields.</i>	button		

IMPORTANT NOTE.

If the drainage string is laid down in the direction of flow (and hence the flow direction is in ascending chainage), then the minimum grade and minimum cover along the pipe are maintained as the drainage string is created. Otherwise the minimum grade and cover cannot be maintained.

Cover for the pipe segment can also be calculated and/or set afterwards by the **pipe=>cover** option in the drainage string editor.

Minimum cover and minimum grade for the pipe segment to the end of the line can be set afterwards by the **pipe=>default grading** option in the drainage string editor.

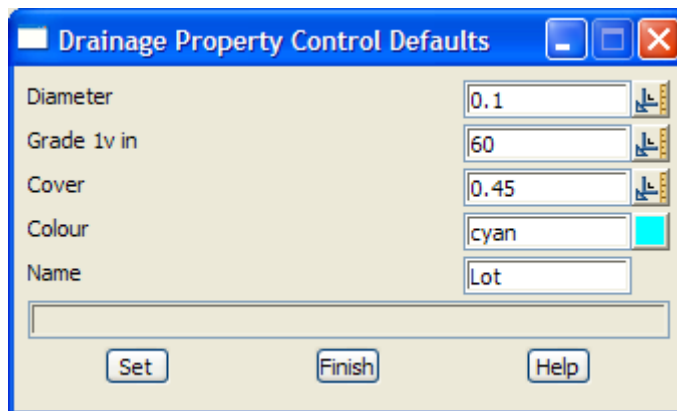

Property Controls

[drainage_property_control_defaults](#)

Position of option on menu: Design =>Drainage-Sewer =>Defaults =>Property Controls

On selecting the **Property controls** option, the **Drainage Property Control Defaults** panel is displayed.

On a section view, the *Profile =>One substring* and *Profile =>Many substrings* options will profile the property control. Note that the centre (axis) of the property control is drawn on the section view, not the invert (bottom) or the obvert (top).

The fields and buttons used in this panel have the following functions.

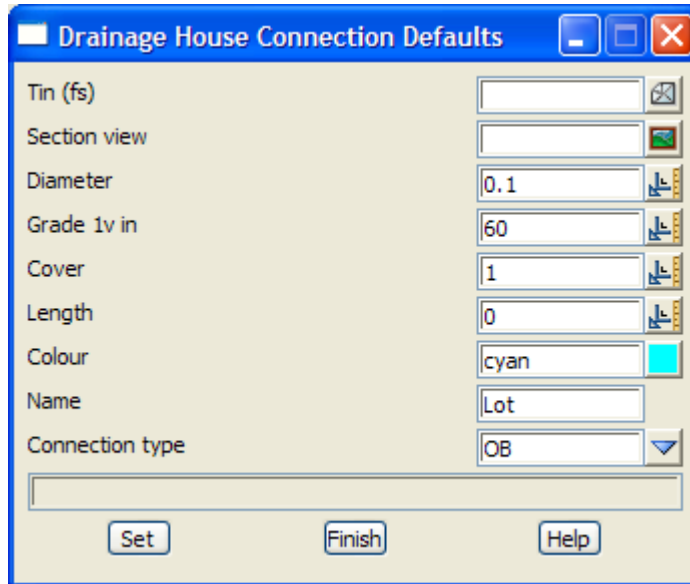

Field Description	Type	Defaults	Pop-Up
Diameter <i>default diameter of the property control.</i>	input	0.1	
Grade 1v in <i>grade (units are "1v in" given value) to use for the property control</i>	input	60	
Cover <i>cover measured from the surface to the top of the property control (world units) to be maintained from the end of the property control in the house block to the drainage string.</i>	input	1.0	
Colour <i>colour to use to draw the property control</i>	input	cyan	available colours
Name <i>name for the property control - usually the lot number</i>	input	Lot	
Set <i>set the property control defaults to the values in the above fields.</i>	button		

House Connections

[drainage_house_connection_defaults](#)

Position of option on menu: Design =>Drainage-Sewer =>Defaults =>House connections

On selecting the **House connections** option, the **Drainage House Connection Defaults** panel is displayed.

This panel is for setting the default information used for connections from the drainage pipe to the house blocks.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin (fs)	<i>name of the tin to automatically add to the section view used for drawing the profile along the house connection.</i>	input	drainage tin	available tins
Section view	<i>the section view used to profile along the house connections as they are placed in plan view.</i>	input		
Diameter	<i>default diameter of the house connection.</i>	input	0.1	
Grade 1v in	<i>grade (units are "1v in") to use for the house connection</i>	input	60	
Cover	<i>cover (world units) to use for the house connection</i>	input	1.0	
Length	<i>length (metres) to use for some types of house connections</i>	input	2.0	
Colour	<i>default colour used for the house connection</i>	input	cyan	available colours
Name	<i>name for the house connection - usually the lot number</i>	input	Lot	

Connection type	input	A special	A, A special, B, C, OB, Special Jump Up
------------------------	-------	-----------	--

the default type of house connection, Please continue to the section “House Connection Types” for a description of each connection type

Set button

set the house connection defaults to the values in the above fields.

House Connection Types

All house connection calculations do not take into account any thickness of pipe, joint sizes or actual entry points into the sewer. Hence they are **approximate only** and should only ever be used as a guide. Any quantities calculations should allow for a suitable margin of error.

House Connection -Type A

House Connection: Type A

House Connection - Type A Special

House Connection: Type A Special

House Connection - Type B

House Connection: Type B

House Connection - Type C

House Connection: Type C

House Connection - Type Special Jump Up

House Connection: Type Special Jump Up

House Connection - Type OB (Oblique)

House Connection: Type OB

Please continue to the next section "Create" .

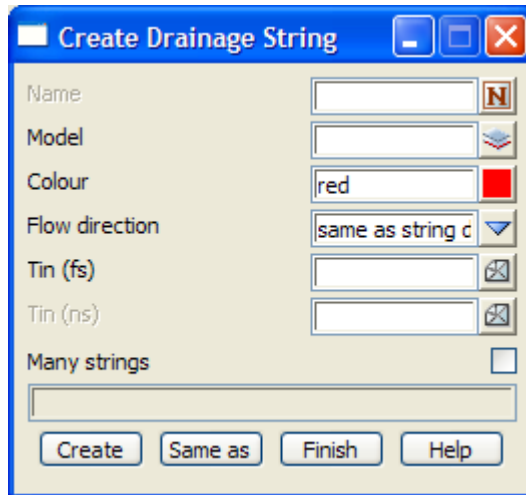

Create

create_drainage_string

Position of option on menu: Design =>Drainage-Sewer =>Create

The **Create** option is used to produce **new** drainage strings and networks. If a drainage string already exists, the **Editor** option is used to modify it.

On selecting the **Create** option, the **Create Drainage String** panel is displayed.

To create a new drainage string, the name, colour, model and style of the new string are entered into the appropriate fields, plus the finished surface triangulation that the manholes are normally flush with, the natural surface triangulation, and the **Create** button selected.

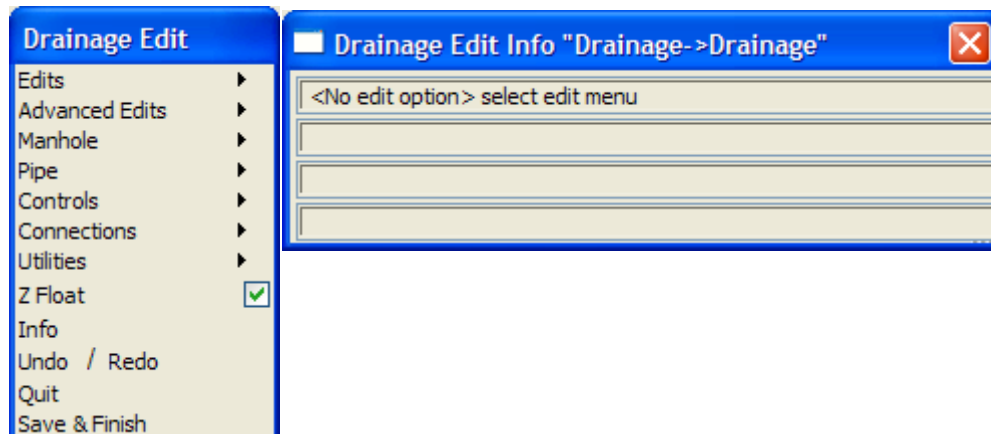

The new fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Flow direction	input	ascending chainage	ascending chainage descending chainage
<i>if ascending chainage, then the flow direction is in ascending chainage (recommended)</i> <i>if descending chainage, then the flow direction is in descending chainage.</i>			
Tin (fs)	input	drainage=>defaults=>tinavailable tins	
<i>the finished surface tin. If manholes are "floating", the top of the manhole is automatically place on the tin surface ("floated" on the surface).</i>			
Tin (ns)	input		available tins
<i>the natural surface tin used in longsection plots.</i>			

The **Create Drainage String** panel is then removed and the **Drainage Edit** menu and **Drainage Edit Info** panel fired up.

As for a 3d string, to create a new drainage string with some of the **same** name, colour, model and style as an existing string (not necessarily a drainage), the **Same as** button is chosen and the appropriate string selected.

The **Drainage Edit** menu contains all the available options for editing a drainage string and its associated block controls and house connections. The **Drainage Edit Info** panel contains information areas. The **Drainage Edit** menu and **Drainage Edit Info** panel are

To create a new drainage string, the user selects the **Append** option from the **Edits** walk right menu on the **Drainage Edit** menu.

Since the **Drainage Edit** menu and **Drainage Edit Info** panel are the same as those used when editing a drainage string, the options will be discussed under the drainage **Edit** option.

For documentation on editing Drainage string, please continue to the next section "Editor".

For drainage utilities and import/export see **More Drainage**

Editor

Position of option on menu: Design =>Drainage-Sewer =>Editor

This is the same option as **Editor** from the **Strings** walk-right menu on the **12d Model** menu.

The string editor is used to modify any **12d Model** strings. After selecting the **Editor** option, the **Edit String** panel is placed on the screen to record any error messages.

The option is already in the **pick** mode (the **pick & edit** button only needs to be selected if the pick was cancelled) and the user simply picks and accepts the string to be edited.

From the picked string's type, the editor is able to determine the edits that apply to the string and list them in the string's **edit** menu.

If a drainage string is selected, the **Drainage Edit** menu and **Drainage Edit** panel (as shown in the previous section) are placed on the screen.

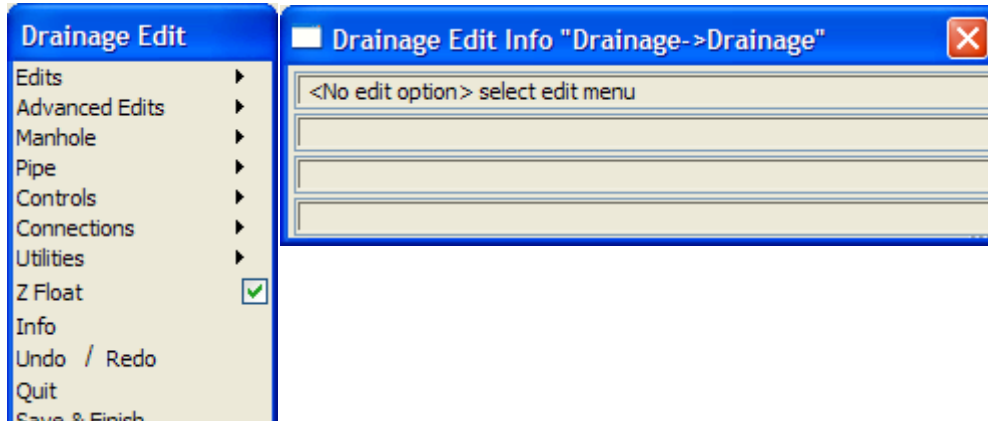

The individual edit operations for a drainage string will now be discussed in detail.

Please continue to the next section "Drainage Edit".

Drainage Edit

[drainage_edit](#)
[drainage_edit_info](#)

On picking a drainage string when in the string **Editor** option, or by selecting **Create** in the **Create Drainage String** panel, the **Drainage Edit** menu and panel are placed on the screen.

The edit is **cancelled** by selecting the **Quit**. No changes to the string are recorded and the **Drainage Edit** option terminates.

The edit is **finished** and the changes recorded when the **Finish** is chosen. The **Drainage Edit** option then terminates.

When either button is selected, a **Yes-No-Cancel** panel is displayed and the user must confirm the selection.

The **Drainage Edit Info** panel is principally used to display information and messages during the creation and editing of the drainage string. It is toggled on and off by **Info** on the **Drainage Edit** menu.

The main message area indicates the purpose of the mouse buttons at each step.

Message area 1 displays the current Drainage Edit option and message area 4 indicate the next step in the edit option.

Message areas 2 and 3 are used to display information about the string as the cursor is moved near the drainage string and the drainage manholes.

Each of the options in the **Drainage Edit** menu will now be described.

For the option *Edits*, please continue to the section “Edits” .

Manholes, please continue to the section “Manhole (Maintenance Hole)” .

Pipes, please continue to the section “Pipe” .

Controls, please continue to the section “House Connections” .

Connections, please continue to the chapter “House Connections” .

Utilities, please continue to the chapter “Utilities” .

Z float, please continue to the chapter “Z Float” .

Edits

[edits](#)

The options in the **Edits** menu are used for placing the initial manholes of a new drainage string, editing a new drainage string once the initial manholes are placed or editing an existing drainage string.

The **Edits** walk-right menu is

Append, Append+Radius

The **Append**, **Append+Radius** operations for a drainage string are similar to the **Append** options for a polyline string except that manholes are also automatically placed at each added point.

Note - a manhole can be removed from the point afterwards using the **Manhole=>Remove** option. The point will still be there but without a manhole on it.

If the **Append + Radius** option selected, then before each point is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next drainage string point and the arc will be drawn correctly as the cursor is moved to the next point.

A **radius** value of **0** is taken to mean no arc.

If **z Float** is set to tick, then the top of the manhole is automatically placed on the terrain given in the tin field for the drainage string.

If height snap is toggled on in the **Snaps** menu, the height will be displayed as a new height entered but the new height will only be used if **z Float** is turned off for the manhole.

Each manhole in the string is connected by a drainage pipe. The diameter, type and cover at each end of the **drainage pipe** are taken from the **Drainage Pipe Defaults** panel.

The **Append** options are terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Move

If used in a plan view, the **Move** option is used to move the (x,y) position of a manhole.

If used in a section view, the **Move** option can be used to change the height of the top of any manhole or the height of either end of the drainage pipe connecting adjacent manholes in the drainage string.

After the **Move** option is chosen, the user selects either a manhole in a plan view or the top of a manhole or a pipe end in a section view.

If a manhole is selected from a plan view, then the plan position of the selected manhole will move with the cursor. The new position for the top of the manhole can be chosen by either cursor selection or typed input in exactly the same way as for moving a point on a 3d string.

If the top of a manhole or the end of a pipe connecting adjacent manholes is chosen in a section view, then only the height of the selected point can be modified. That is, if a point is selected in a section view, then it

is constrained to move in the z-direction only.

The **Move** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Insert

The **Insert** option is designed to place a new manhole between two adjacent manholes (note that the inserted manhole does not have to be on the line joining the two adjacent manholes).

To insert a new manhole, the two adjacent manholes are chosen by selecting the line connecting the two manholes. Once the **line** is selected, the new manhole is assumed to be at the current cursor position. As the cursor is moved, the drainage string is redrawn reflecting the changing position of the inserted manhole.

The **Insert** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Between

The **Between** option is similar to the **Insert** option except that the inserted manhole **does** have to be on the line joining the two adjacent manholes. To accomplish this, the cursor position is projected onto the manhole-manhole line to give the new manhole position.

Note - once the manhole is placed, it is no longer constrained to be on the one straight or arc joining adjacent manholes. If this is required, then the manhole is placed using the **Manhole=>Add** option.

The **Between** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Delete

The **Delete** option is used to delete manholes/and or points from the drainage string.

The manhole/point to be deleted is selected with the cursor and when the selection is accepted (MB), it is **deleted**.

Once a manhole/point has been deleted, the delete option is still current and can be repeated without re-selecting the **Delete** option.

The string, minus the deleted manhole/point, is redrawn after each deletion.

The **Delete** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Extend

The **Extend** option is used to move a manhole/point along the line joining the manhole/point to one of its adjacent manhole/point.

That is, the bearing of the manhole/point-manhole/point line is kept constant and the manhole/point moved along that line either **towards** or **away** from its neighbouring manhole/point.

Extending, like moving a manhole/point, is a two step process.

Step (a) - selecting the manhole/point-manhole/point line and the manhole/point to be moved along that line

Step (b) - selecting the final position for the manhole

Both steps are identical to extending an point in a polyline string.

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The **Extend** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Note - Extend can be used on the end manholes of the drainage string

Height

The **Height** option is used to modify the height (z value) of the top of any manhole, or the height of the ends of the pipes connecting adjacent manholes in the drainage string.

The top of the manhole can be selected in either a plan or a section view. The pipe ends can only be selected in a section view.

After the **Height** option is chosen, the user must select the manhole top or pipe end that is going to have its height modified.

Once the manhole or pipe end has been selected, an New height typed-input box is displayed on the screen with the items current height (z value) in it.

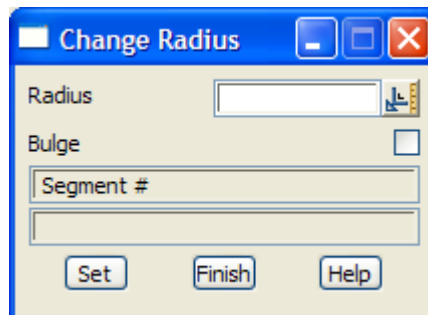

The required height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the manhole or pipe and the string redrawn with the new height at that point. The typed-input box then disappears.

The **Height** option is terminated by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Radius

change_radius

Selecting **Radius** brings up the **Change Radius** panel which is used to modify the radius of any arc/line joining adjacent manhole points.

After selecting the **Radius** option, the user selects the arc/straight to be modified and the current arc radius and bulge setting will be displayed in the **Change Radius** panel.

New values can then be entered and the arc modified by selecting the **Set** button.

If the radius is positive, the arc is drawn from the start point to the next point on the polyline in a clockwise direction. If the radius is negative, the arc is drawn from the start point to the next point on the polyline in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned on, the larger arc is used. The default is bulge turned off.

Manhole (Maintenance Hole)

manhole

The options in the **Manhole** menu are used to modify information about individual manholes in the drainage string.

The **Manhole** walk-right menu is

Add

The **add** option is similar to the **Edits=>Between** option in that a new manhole is created that must be on the line or arc between two adjacent manholes.

However, once the manhole is placed, it is **always constrained** to be on the one straight or arc joining its adjacent manholes.

To **add** a new manhole, the two adjacent manholes are chosen by selecting the line connecting the two manholes. Once the **line** is selected, the new manhole is assumed to be at the current cursor position. As the cursor is moved, the drainage string is redrawn reflecting the changing position of the inserted manhole.

The **add** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Remove

The **Remove** option is used to remove manholes from the drainage string but unlike the **Edits=>Delete** option, the underlying point on the drainage string remains. Hence only the manhole is deleted, but not the polyline point underneath.

The manhole to be removed is selected with the cursor and when the selection is accepted (MB), it is **removed**.

Once a manhole has been removed, the **Remove** option is still current and can be repeated without re-selecting the **Remove** option.

The string, minus the deleted manhole/point, is redrawn after each removal.

The **Remove** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Name

The **Name** option is used to change a manhole's label.

After selecting the option, the mouse is used to pick the manhole to have a name change.

Once a manhole has been selected, an Enter text typed-input box is displayed on the screen containing the selected manhole's name.

The new name is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Name** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

NOTE - if the name of the manhole is *EOL* or *eol* then the diameter of the manhole is forced to zero.

Diameter

The **Diameter** option is used to change a manhole's diameter.

After selecting the option, the mouse is used to pick the manhole to have its diameter modified.

Once a manhole has been selected, an **Enter value** typed-input box is placed on the screen displaying the selected manhole's current diameter.

The new diameter is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Diameter** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Type

The **Type** option is used to change the type of the cover (lid) placed on a manhole.

After selecting the option, the mouse is used to pick the manhole to have its cover type modified.

Once a manhole has been selected, a **Manhole type** typed-input box is displayed on the screen containing the selected manhole's cover type.

The list of common covers for the manhole can be obtained by clicking the [+] in the **Manhole type** input box and getting a menu of valid cover types.

The new cover type is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Type** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Drop

The **Drop** option is used to change the vertical distance between the bottom of the pipes on either side of a manhole, i.e., the difference in the invert levels of the pipe.

Since the drop in simply the difference in vertical distance between two pipes on either side of a manhole, the actual value of the drop can be changed by moving either of the pipes up or down the manhole.

After selecting the option, the end of the pipe to be moved is selected with the mouse.

Once the pipe end been selected, an enter value typed-input box is displayed containing the drop across the manhole that the pipe end connects into.

The new drop type is entered into the typed-input box, terminated with <enter>.

If the end of the pipe was on the upstream side of the manhole (normally the right hand side of a manhole in a section view), the end of the pipe will be moved upward until the drop across the manhole equals the entered value.

If the end of the pipe was on the downstream side of the manhole (normally the left hand side of a manhole in a section view), the end of the pipe will be moved down until the drop across the manhole equals the entered value.

The typed-input box then disappears.

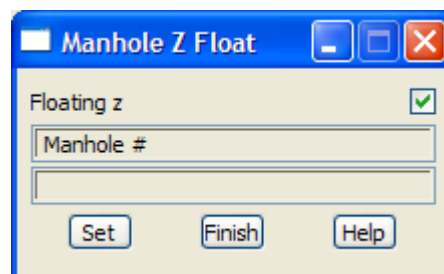

The **Drop** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Z Float

manhole_z_float

A **floating manhole** takes the z-value for the top of the manhole from the tin selected for the drainage string. Hence as a floating manhole moves around in a plan view, the top of manhole will automatically change to suit the new z-value of the drainage string tin.

Selecting **Z float** brings up the **Manhole Z Float** panel which is used to change a manhole from floating to non-floating and vice-versa.

After selecting the **Z Float** option, the user selects the manhole to be modified and the current **floating z status** is displayed in the **Manhole Z Float** panel.

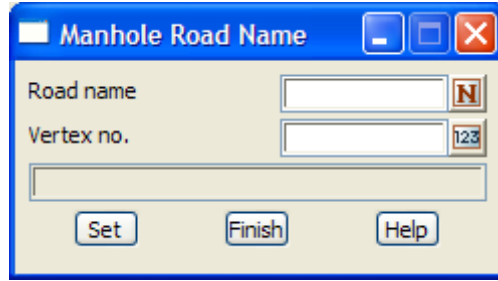

The tick-cross can then be changed and the manhole modified by then selecting the **Set** button.

Road Name

manhole_road_name

A **road name** can be set for a manhole of the line.

Selecting **Road name** brings up the **Manhole Road Name** panel which is used to give and change a road name for a manhole.

The option is running as soon as the panel is on the screen and the user is asked to selected a manhole.

<Select manhole> [picks][Menu]

When the manhole is selected, any existing road name and the manhole number is placed in the road name and vertex no. fields respectively of the **Manhole Road Name** panel.

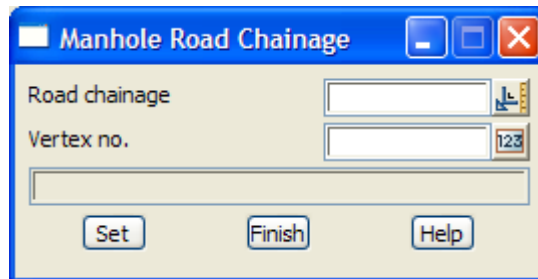

A new **road name** is then typed into the road name panel field and the **Set** button selected to record the road name with the manhole.

Road Chainage

manhole_road_chainage

A **road chainage** can be set for a manhole of the line.

Selecting **Road ch** brings up the **Manhole Road Chainage** panel which is used to give and change a road chainage for a manhole.

The option is running as soon as the panel is on the screen and the user is asked to selected a manhole.

<Select manhole> [picks][Menu]

When the manhole is selected, any existing road chainage and the manhole number is placed in the road chainage and vertex no. fields respectively of the **Manhole Road Chainage** panel.

A new **road chainage** is then typed into the road chainage panel field and the **Set** button selected to record the road chainage with the manhole.

Outfall Height

When a drainage string is created, the furthest downstream is often an outfall and the height of the outfall known.

When the furthest downstream manhole is considered to be an outfall, the **Outfall ht** option is used to set and change the outfall height. Once set, the outfall height is taken to be the height at the *bottom* of the furthest downstream manhole.

If this option is not used, the outfall height is left undefined.

After selecting the option, an enter value typed-input box is displayed on the screen containing the existing outfall height or **null** if no outfall height has been set.

The new outfall height is entered into the typed-input box, terminated with <enter>.

The height of the bottom of the furthest downstream manhole in the drainage string is then set to the given height and the typed-input box removed.

The **Outfall ht** option automatically terminates after use.

Note:

For a drainage string with flow direction in ascending chainage, the furthest downstream manhole is the *last* manhole.

For a drainage string with flow direction in descending chainage, the furthest downstream manhole is the *first* manhole.

Pipe

pipe

The options in the **Pipe** menu are used to modify information about the pipes joining adjacent manholes in the drainage string.

The **Pipe** walk-right menu is

Move

The **Move** option is used to move a pipe connecting two manholes whilst keeping the grade of the pipe constant.

After selecting the option, the mouse is used to pick the pipe to be moved.

Once a pipe has been selected, the pipe will be moved up or down so that the cursor remains on the pipe (or on the extension of the pipe if the cursor is on the other side of the manholes at either end of the pipe). The grade of the pipe is kept constant.

The manholes at either end of the pipe will also be extended if necessary so that the pipe still connects into the adjacent manholes.

The **Move** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Name

The **Name** option is used to change a pipe's label.

After selecting the option, the mouse is used to pick the pipe to have a name change.

Once a pipe has been selected, an Enter text typed-input box is displayed on the screen containing the selected pipe's name.

The new name is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Name** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Cover

The **Cover** option is used to place the selected pipe so that minimum cover is maintained along the top of the pipe (obvert) with respect to the finished surface tin (tin (fs)).

After selecting the option, the pipe to set the cover for is selected with the mouse.

Once a pipe has been selected, an Enter value typed-input box is displayed on the screen containing the existing cover.

The new cover is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the pipe is adjusted so that the specified cover is maintained for the full length of the pipe at the pipes existing grade.

The **Cover** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish,** or a new option from the **Drainage Edit** menu.

Diameter

The **Diameter** option is used to change a drainage pipe's diameter.

After selecting the option, the mouse is used to pick the pipe to be modified.

Once a drainage pipe has been selected, an Enter value typed-input box is placed on the screen displaying the selected pipe's current diameter.

The new diameter is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears

The **Diameter** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish,** or a new option from the **Drainage Edit** menu.

Type

The **Type** option is used to change the type of material that the pipe is made of.

After selecting the option, the mouse is used to pick the pipe to have its material type modified.

Once a pipe has been selected, a Pipe type typed-input box is placed on the screen displaying the selected pipes material type.

The list of common materials for the pipe can be obtained by clicking B3 in the type input box and getting a menu of valid material types.

The new material type is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Type** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish,** or a new option from the **Drainage Edit** menu.

Grade

The **Grade** option is used to specify an exact grade for a drainage pipe. The value for the grade is entered using typed input and is in the units "1v in".

In this option, the new grade is given to a pipe by keeping one end fixed and raising or lowering the other end by the amount required to give the pipe the new grade.

After the **Grade** option is selected, the pipe whose grade is to be modified is selected **at the end that is going to be moved.**

Once the pipe end has been selected, an enter value typed-input box is displayed on the screen containing the current grade of the pipe. The new grade is entered into the typed-input box, terminated with <enter>.

The selected end of the drainage pipe is then moved up or down so that the pipe has the new grade.

If necessary, the manhole at the moved end of the pipe will be lengthened so that the pipe still connects into the adjacent manholes.

The **Grade** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Grade to End

The **Grade to end** option is used to specify a *fixed* grade for all the drainage pipes from a selected pipe to the **low chainage** end (beginning) of the line. That is, it grades from *right to left* on a long section of the drainage string.

The value for the grade is entered using typed input and is in the units "1v in".

This option was originally written for pipes with flow direction in descending chainage direction which is the reason why it works from the selected pipe back towards the beginning of the line.

Hence **Grade to end** should only be run on pipes with flow in descending chainage direction. If the flow is in ascending chainage direction, use the reverse string option (string=>strings edit=>reverse) before using this option, and then reverse the string again after the option is run. Note that the **Default grading** option looks at maintaining minimum *grade* and minimum *cover* for flow in either ascending or descending chainage direction and supersedes **Grade to end**.

In this option, the new grade is given to a pipe by keeping the high chainage end of the selected pipe fixed and raising or lowering the low chainage end by the amount required to give the pipe the new grade. The minimum cover is over ridden during this process. If necessary, the bottom of the manhole will be lowered so that the pipe still connects into its adjacent manholes.

The next lower chainage pipe is then dropped through the default drop and given the new grade. The drop is measured from the lowest pipe invert of all pipes in the network entering the manhole.

This process is repeated until the low chainage end (beginning) of the line is reached.

After the **Grade to end** option is selected, the first pipe whose grade is to be modified is selected.

Once the pipe end has been selected, an enter value typed-input box is displayed on the screen containing the current grade of the selected pipe. The new grade is entered into the typed-input box, terminated with <enter>. The option then does the grading.

The **Grade to end** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Default Grading

`default_grading`

The **Default grading** option starts at the given pipe and then works to the end of the line when the flow direction is in ascending chainage, or the beginning of the line when the flow direction is in descending chainage. The **Default grading** option maintains minimum grade and minimum cover.

Default grading is not designed to optimise the placement of the pipes but provides one solution preserving minimum grade and cover.

Property Controls

controls

Property, block or lot **controls** are trial connections from a sewer line (drainage string) to a user specified plan point.

The property controls are used as checks that selected house blocks can be serviced by the sewer line. That is, they are used to test if the house block is under the control of the sewer line.

For the trial connection, once the cover (measured from the finished surface to the top of the property connection line) that the property connection must maintain and the grade are specified, the position and depth that the trial property connection must have at the sewer line can be calculated, and where the height of the *centre line* of the property control when it reaches the sewer line is displayed in any section view containing a profile of the sewer line.

If the calculated depth of the trial property connection at the sewer line (drainage string) is below the sewer pipe, then no such connection would be feasible and the house block would not be totally controlled by the sewer line.

On a section view, the *Profile =>One substring* and *Profile =>Many substrings* options will profile the property control. Note that the *centre line* (axis) of the property control is drawn on the section view, not the invert (bottom) or the obvert (top).

NOTE - property controls are only accessible by the *Sewer module*.

The options in the **Controls** menu are used to place and modify the trial connections. The **Controls** walk-right menu is

Add

The **Add** option is used to create a new trial control line going from a selected drainage pipe to a user specified plan position (the free end of the connection).

After selecting the option, the mouse is used to pick the plan position of the connection point on the drainage pipe, and then the points defining the path to the plan position of the free end of the trial connection.

After the free end has been selected, the property name typed-input box is displayed on the screen so that a label for the control can be entered (this usually consists of the lot number).

When the property name box is placed on the screen, it will already have some text in it. This text comes from the name field in the **Drainage Property Control Defaults** panel.

A z-value equal to the drainage tin value minus the default control cover depth is automatically given to the free end of the control. The default control grade is then used to define z-values along the trial path

(ensuring that the default control cover depth is always observed) to give a z-value back at the drainage pipe (the connection height of the control).

A cross at the calculated connection height is displayed whenever the drainage string is profiled on a section view.

The colour for the new control is taken from the **Drainage Property Control Defaults** panel.

The **Add** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Include

The **Include** option is used to make a control out of an existing polyline string.

The polyline string must start at the connection point on the drainage string and end at the free end (use *Strings=>Strings Edit=>Reverse* if the string's direction is incorrect).

After selecting the option, the mouse is used to pick the polyline string and its plan position is copied and used to define a new control.

A z-value equal to the default drainage tin at that point, minus the default control cover depth is automatically given to the free end of the new control. The default control grade is then used to define z-values along the trial path (ensuring that the default control cover depth is always observed) to give a z-value back at the drainage pipe.

The **Include** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Delete

The **Delete** option is used to delete a control.

After selecting the option, the mouse is used to pick the block control to be deleted.

Once a block control has been selected, it will be deleted and removed from the screen.

The **Delete** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Name

The **Name** option is used to change the **Property name** of a control.

After selecting the option, the mouse is used to pick the control that will have a name change.

Once a control has been selected, an enter text typed- input box is displayed on the screen containing the selected control's name.

The new name is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Name** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Diameter

The **Diameter** option is used to change the diameter of a control.

After selecting the option, the mouse is used to pick the control that will have its diameter modified.

Once a control has been selected, an Enter value typed- input box is placed on the screen displaying the

selected control's current diameter.

The new diameter is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Diameter** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Cover

The **Cover** option is used to change the distance that the control is below the tin (fs) for the drainage string.

After selecting the option, the cursor is used to pick the control whose cover will be modified.

Once a control has been selected, an Enter value typed- input box is placed on the screen displaying the selected block control's current cover.

The new cover is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the new connection height using the new cover calculated.

The **Cover** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Grade

The **Grade** option is used to change the grade of a control (units "1v in").

After selecting the option, the mouse is used to pick the control whose grade will be modified.

Once a control has been selected, an enter value typed- input box is placed on the screen displaying the selected control's grade.

The new grade is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the new connection height using the new grade calculated.

The **Grade** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Boundary

The **Boundary** option is used to specify a boundary trap depth which is used as a final drop at the drainage pipe end of the control.

After selecting the option, the mouse is used to pick the control whose boundary depth will be modified.

Once a control has been selected, an Enter value typed- input box is placed on the screen displaying the selected boundary depth.

The new boundary trap depth is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the new connection height using the new boundary trap depth is calculated.

The **Boundary** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Calc all

The **Calc all** option is used to re-calculate the connection heights for all controls of the drainage line.

The calculation uses the plan layout of the control, the control's cover, grade and boundary trap depth and the default tin for the drainage line.

The **Calc bc**'s option automatically terminates after use.

Delete All

The **Delete all** option is used to remove all the controls defined for the drainage line being edited.

The **Delete all** option automatically terminates after use.

House Connections

connections

The **Connections** option is used to create the connections from the sewer line (drainage string) to the house blocks in a subdivision.

When placing a house connection, the user indicates the two corners of the frontage of the block to allow the cross-fall of the block to be calculated and allow the frontage to be used in positioning the house connection.

When placing house connections, a section view is used to automatically display the connection to facilitate checking the type of connection used and any obstructions that may need to be avoided.

NOTES

1. House connections are only accessible by the *Sewer module*.
2. All house connection calculations do not take into account any thickness of pipe, joint sizes or actual entry points into the sewer. Hence they are *approximate only* and should only ever be used as a guide. Any quantities calculations should allow for a suitable margin of error.

The **Connections** walk-right menu is

The process for creating a house connection will now be described in detail.

Create from Controls

default_house_connections__drainage__drainage_

The **Create from Controls** option is used to create a new house connection from existing controls. or modify an existing house connection.

After selecting the **Create from Controls** option, the **Default House Connections** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	update all	remove existing first, update new, update all

if remove existing first, all the existing connections are deleted before new ones are created from the controls.

if update new, connections are only created from controls with names different from any existing connection.

if update all, connections are created from all controls.

Factor of safety input 0.15

the connection height for the control is adjust by this depth from the control connection depth.

Create button

*after selecting **Create**, the connections are created from the selected controls.*

Create/Edit

house_connections_edit_panel

The **Create/edit** option is used to create a new house connection or modify an existing house connection. After selecting the **Create/edit** option, the **House Connections** panel is displayed.

The process for creating a house connection will now be described in detail.

Creating A House Connection

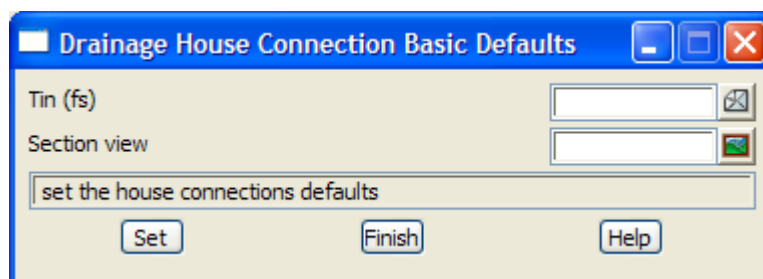

Step 1 Select *Create*

To create a new house connection, the **Create** button is selected from the **House Connections** menu.

drainage_house_connection_basic_defaults

If either the default **drainage tin** or **section view** have not be defined, the **Drainage House Connection Basic Defaults** panel will be placed on the screen after the **Create** button is selected.

The missing values need to be filled in and the **Set** selected. This information is needed so that the house connections can be drawn up in a section view as soon as they are created.

Step 2 Selecting the Sewer (drainage) Pipe to Connect to

The user is then asked to select the sewer pipe to connect into.

Step 3 Selecting the House Lot Frontage

Next the user indicates the two frontage points for the house block.

Step 4 Positioning the House Connection on the Sewer Pipe

From the two frontage points and the default drainage tin, the program calculates the crossfall for the block frontage.

The crossfall is displayed in the name of the enter distance up line typed-input box which is now placed on the screen. The distance up line is the distance along the frontage that the house connection will be placed.

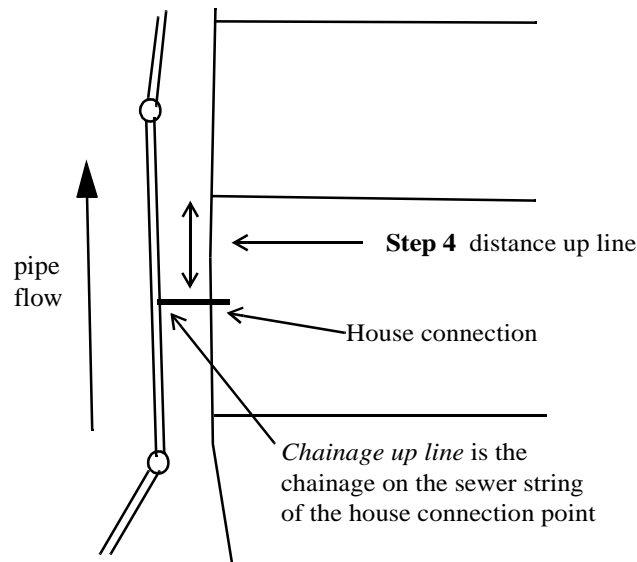

[crossfall_enter_distance_up_line](#)

Depending on the crossfall, a default value for the distance up line is displayed. If the ground crossfall is greater than 1% the lot mid point is the suggested connection location. For crossfalls less than 1%, the connection is located 3m off the *lowest* lot boundary.

A pop-up also exists for placing the connection point at the distance 2.0, 3.0, 5.0 along the frontage, the mid point of the frontage, and the distances 2.0, 3.0 and 5.0 from the other end of the frontage.

The distance up line value is entered into the typed-input box, terminated with <enter>. The typed-input box is then removed from the screen.

Step 5 Defining the House Connection Type

[house_connection_edit_drain](#)

Next the **House Connection Edit** panel is placed on the screen.

Most of the values in the field come from the drainage house connection defaults.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chainage up line <i>the chainage on the sewer string where the house connection is attached to the sewer line.</i>	input/output	chainage of connection	
Lot name <i>name of the house block</i>	input	from drainage defaults	
HCB # <i>a user supplied house connection branch (HCB) number</i>	input		
Material <i>the material used for the house connection.</i>	input	from drainage defaults	PVC, PVC X/HEAVY, VC
Bush required <i>the type of bush used</i>	input	no bush	no bush, PVC to VC
Connection type <i>the type of connection used. Go to the section "House Connection Types" for a description of each connection type</i>	input	from drainage defaults	A, A Special, B, C, OB, Special jump up
Connection side <i>the side of the line to make the connection</i>	input	right side	right side, left side
Connection length <i>length of pipe for the house connection</i>	input	from drainage defaults	
Connection level <i>height of the house connection. When this is first displayed, it is calculated using the invert level of the sewer pipe where the house connection is attached, the house connection type and connection length (if required by the house connection type), the default house connection grade, the default house connection cover and the surface level at the end of the house connection.</i>	input	calculated	
Try <i>using the parameters in the panel fields, create the house connection. Also calculate a section along the house connection and draw it in the drainage default section view.</i>	button		
Finish <i>end the option, remove the panel.</i>	button		

Step 5 Continued

After entering the appropriate values in the **House Connection Edit** panel and then selecting the **Try** button, the house connection will be created.

To help check the house connection parameters, a section along the house connection will automatically be calculated and displayed in the section view given in the drainage defaults panel. Any tins or models on the section view will be included in the section.

Step 6 Modifying the Connection

If any of the fields in the **House Connection Edit** panel are changed, selecting the **Try** button will modify the house connection and redraw the section in the default drainage section view.

Editing A House Connection

To edit an existing house connection, the **Edit** button is selected from the **House Connections** menu and then the appropriate house connection selected.

The **House Connection Edit** panel will then be placed on the screen with the details of the selected house connection.

If any of the fields in the **House Connection Edit** panel are changed, the **Try** is used button to modify the house connection and redraw the section in the default drainage section view.

Delete

The **Delete** option is used to delete a connection.

After selecting the option, the mouse is used to pick the house connection to be deleted.

Once a house connection has been selected and accepted, it is deleted and removed from the screen.

The **Delete** option is terminated by selecting **Cancel** from the **Pick Ops** menu, by selecting a new option from the **Drainage Edit** menu.

Delete all

The **Delete all** option is used to delete all connections.

After selecting the option, all the connections are deleted and the option terminates.

Utilities

drainage_utilities

The options in the **Utilities** menu are used to modify default drainage tin, the name, colour, style and start chainage of the drainage string, and the size, angle, and offsets used when displaying the text for the names of all the manholes.

The **Drainage Utilities** walk-right menu is

Tin (fs)

FS_tin_for_drainage

The **Tin (fs)** option changes the default finished surface tin (tin (fs)) for the drainage string.

After selecting the option, the **FS Tin for Drainage** panel is displayed.

The existing default tin is displayed in the tin panel field. If a new tin is required, simply enter the new tin name into the tin (fs) field and select the **Set** button.

Tin (ns)

ns_tin_for_drainage

The **Tin (ns)** option changes the default natural surface tin (tin (ns)) for the drainage string.

After selecting the option, the **NS Tin for Drainage** panel is displayed.

The existing default tin is displayed in the tin (ns) panel field. If a new tin is required, simply enter the new tin name into the tin field and select the **Set** button.

Angle

The **Angle** option changes the angle of the text for manhole labels.

After selecting the option, an enter angle typed-input box is displayed on the screen containing the current

text angle.

The new angle is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Angle** option then terminates.

Size

The **Size** option is used to change the size of the text for manhole labels.

After selecting the option, an enter value typed-input box is displayed on the screen containing the current text size.

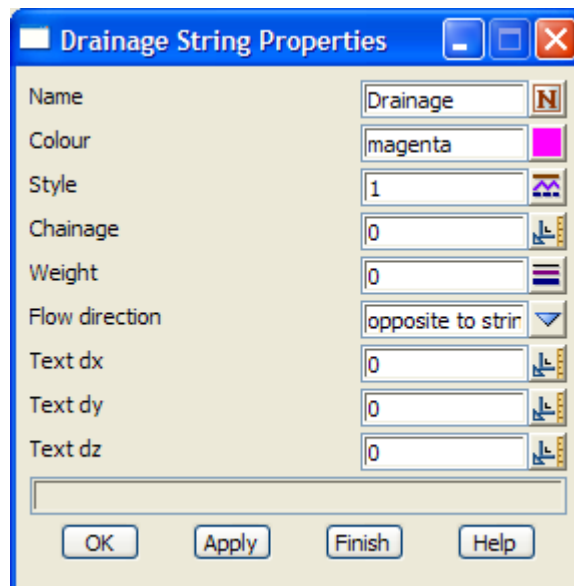

The new size is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Size** option then terminates.

Properties

[drainage_string_properties](#)

The **Properties** option brings up the **Drainage String Properties** panel for the current drainage string.

Any of the data in the panel fields can be modified and then set for the drainage string by selecting the **OK** or **Apply** button.

Z Float

The status of **Z Float** is used each time a new manhole is created.

If **Z Float** is set to tick, then the top of the manhole is set to z float which means that automatically sits on the default drainage tin.

If **Z Float** is not set to tick, then the top of the manhole is given a set z value when it is created.

The z float status of the manhole can be changed after it has been created by using the **Drainage Edit=>Manhole=>Z Float** option.

Reports

drainage_reports

Position of menu: Design =>Drainage-Sewer=>Reports

Reports menu contains an option to report on the property controls for the drainage strings and an option produce network quantities.

The **Reports** walk-right menu is

For the option *Network quantities*, please continue to the section “Network Quantities” .

Network report, please continue to the section “Network Report” .

Property control, please continue to the section “Property Controls” .

Barwon quantities, please continue to the section “Barwon Quantities” .

Barwon HC's, please continue to the section “Barwon House Connections” .

Barwon design checks, please continue to the section “Barwon Design Checks” .

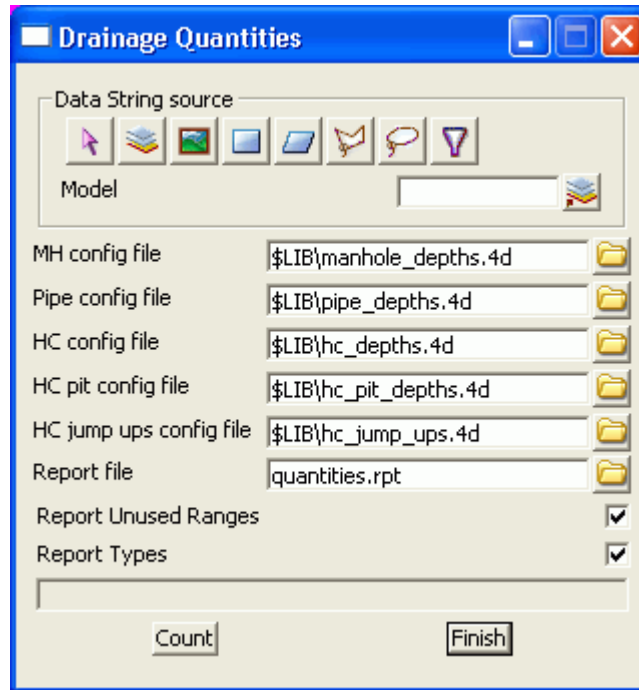

Barwon services reports, please continue to the section “Barwon Services Report”

Network Quantities

drainage_quantities_panel

The **Network quantities** report contains information about the manholes and pipes that make up the selected drainage strings. Configuration files allow the user to specify the depth ranges and sizes of pipes to report on

On selecting **Network quantities**, the **drainage quantities** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to check <i>data source type.</i>	choice box	Model	Model, View
Model/View to check <i>data source for the drainage strings to process.</i>			
Quantities config file <i>file giving the size ranges etc. to report on.</i>	file box		
Report file <i>name of the file for the report.</i>	file box		
Report unused ranges <i>if tick, any size ranges given in the config file that have no pipes are reported.</i>	tick box		
Report types <i>if tick, the manhole types are reported.</i>	tick box	tick	
Count <i>run the option.</i>	button		

Network Report

After selecting the **Network report** option, the **Report on Selected Items** panel is displayed.

This is the same as the option **Reports =>Co-ord/ Brd-dst** on the main menu.

For the given model, it prints out the string information for each string in the model.

If a sewer network model is given, each sewer string in the network model is reported on.

For further information, go to “Coordinates or Bearing-Distance” .

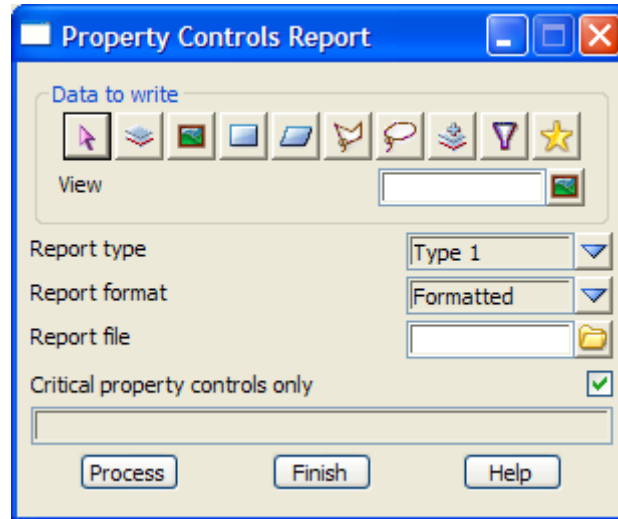

Property Controls

[property_controls_report](#)

Position of menu: Design =>Drainage-Sewer=>Reports=>Property Controls

The property controls report contains information about all the property controls for the selected drainage strings, and if required, denote the critical property control for a lot.

On selecting **property controls**, the **property controls report** panel is displayed.

The fields and buttons used in this panel have the following functions.

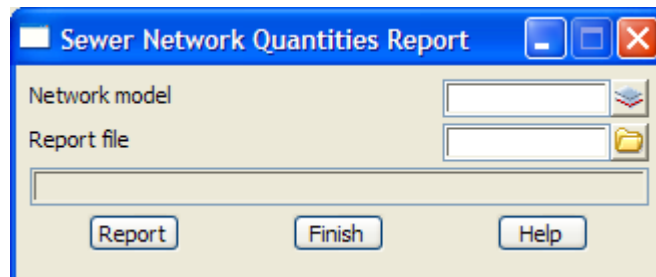

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>			
Data source <i>data source for the drainage strings to process.</i>			
Format <i>format for the property control report.</i>	choice box	ascii	ascii, excel spread sheet
Report file <i>name of the file for the report.</i>	file box		
Critical property controls only <i>if tick, only the critical property controls are reported.</i>	tick box	tick	
Process <i>run the option.</i>	button		

Barwon Quantities

[sewer_network_quantities_report](#)

The report generated from this option includes

- s the lengths of each pipe type for each line and the total length for each pipe type for all pipes in the network.
 - s the quantity of concrete used for the manholes in the network.
 - s the number and type of house connections in the network, including caps, bends and bushes.
- After selecting the **Barwon quantities** option, the **Sewer Network Quantities Report** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Network model <i>model containing the sewer strings.</i>			available models
Report file <i>name of the file for the report.</i>	file box		
Report <i>run the option.</i>	button		

Barwon House Connections

[sewer_house_connections_report](#)

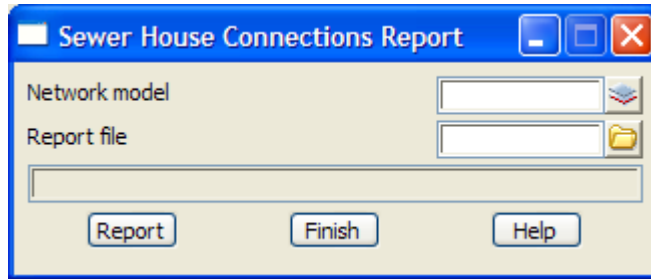

Position of menu: Design =>Drainage-Sewer=>Reports=>House connections

The house connections report contains information about all the house connections for the selected drainage (sewer) strings.

The house connection report includes for each house connection (branch) the

- s name of the sewer line
- s downstream manhole for the house connection
- s lot name
- s house connection number and type
- s chainage of the house connection
- s the invert level at the end of the house connection (IL branch)
- s the invert level of the house connection at the sewer pipe (IL sewer)
- s the drop over the house connection (branch depth)

On selecting **House connections**, the **Sewer House Connections Report** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Network model <i>model containing the sewer strings.</i>			available models
Report file <i>name of the file for the report.</i>	file box		
Report <i>run the option.</i>	button		

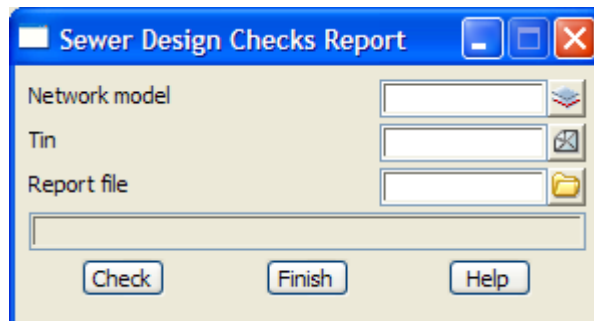

Barwon Design Checks

sewer_design_checks_report

The report generated from this option includes the design checks

- s network validations (checks that there are strings, no closed loops)
- s manholes don't have negative drops
- s other sewer lines connecting in don't have negative drops
- s sewers flows downhill with a minimum grade
- s manholes are not too close together (i.e. on top of each other)
- s a minimum cover for each sewer line
- s block controls are above the pipe invert level

After selecting the **Design checks** option, the **Sewer Design Checks Report** panel is displayed

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Network model		available models
	<i>model containing the sewer strings.</i>	
Tin		available tins
	<i>tin used for checking minimum cover against.</i>	
Report file	file box	
	<i>name of the file for the report.</i>	
Report	button	
	<i>run the option.</i>	

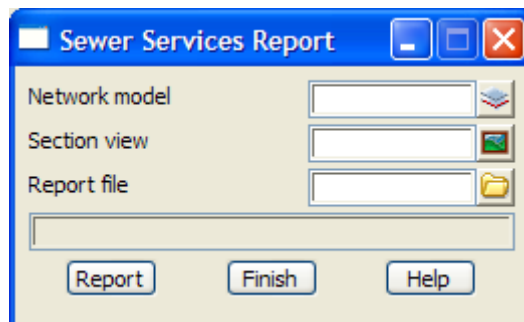

Barwon Services Report

sewer_services_report

For each sewer string in the network, this option generates a report which includes the

- s section through any tins on the section view
- s name and model of any services in the corridor defined by the section view
- s co-ordinates and chainages of the parts of the service in the corridor, and the chainage and offset for each of the point of the parts projected onto the sewer centre-line.
- s clearance at the point where any service goes under or over the sewer string.

After selecting the **Services report** option, the **Sewer Services Report** panel is displayed

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Network model			available models
	<i>model containing the sewer strings.</i>		
Section view			available section views
	<i>section view defining the corridor and service models.</i>		
Report file	file box		
	<i>name of the file for the report.</i>		
Report	button		
	<i>run the option.</i>		

Drainage Plots

drainage_network_plots

Position of menu: Design =>Drainage-Sewer=>Plots

Currently the **Plots** menu contains an option to produce a long section including any HGL values, flows and user defined attributes read in from other sources, and a second option to output the network to Melbourne Water's sewer format.

The **Plots** walk-right menu is

The options **Longsections** and **Melbourne Water** will now be described in more detail.

For the option *Long sections*, please continue to the section "Drainage Longsections".

Melbourne Water, please continue to the section "Melbourne Water".

Drainage Longsections

new_plot_drainage_network drainage_plot_title

Position of menu: Design =>Drainage-Sewer=>Plots=>Longsections

The **Longsections** option is used to generate the longsection plots for all lines in a drainage network.

Given the plot sheet size and the horizontal and vertical scales, the longsections for the drainage lines are plotted starting at the top of the sheet and moving across the sheet. Once one row is full, if there is room the plot moves down the page and begins a new row. When a plot sheet is full, a new plot sheet is automatically begun.

Hence the drainage lines are plotted one after another on one or more plotter sheets.

The drainage lines are plotted in string name alphabetical order.

The drainage longsection plot includes

- s the manholes, drainage pipe and any house connections
- s the height of the finished surface at the manhole
- s manhole names and cover types
- s distances between manholes
- s the invert depth of the pipe on either side of a manhole
- s the grades and types of the pipes
- s any services in the corridor - including their name, invert level and distance from the nearest downstream manhole
- s if the information exists, the velocity, flow, HGL values and diagram

After selecting the **longsections** option, the **new plot drainage network** panel is displayed.

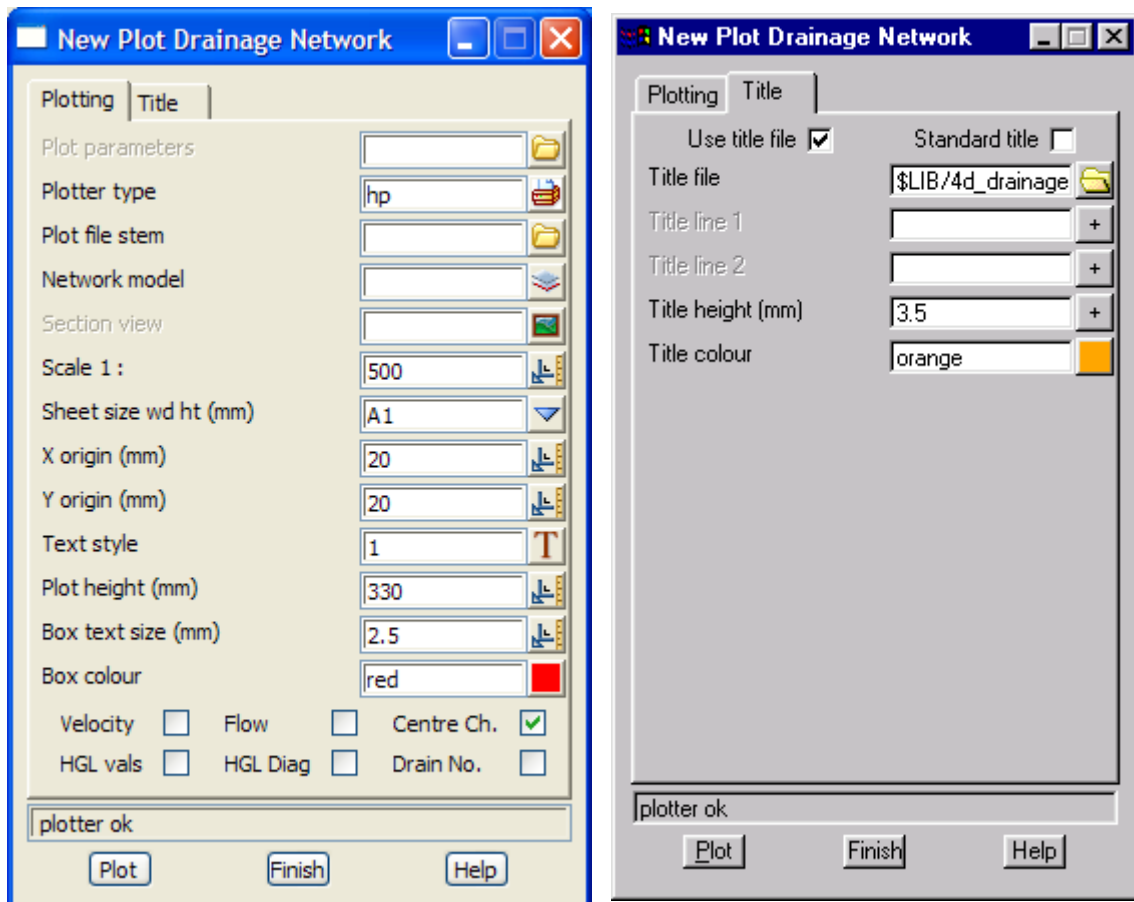

The drainage long section plot is tailored by using the plot parameter file (.ppf file) given in the plot parameters field. A default .ppf file is set by pointing to it with the environment variable

DRAINAGE_PPF_4D

path name of default .ppf file

In the path name to the default .ppf file, \$LIB is used to stand for the library folder set by LIB_4D. For example, "\$LIB/drainage.ppf" is the file drainage.ppf in the library area.

The **title** button on the bottom of this panel controls the use of a title block file and the plotting of a border and two lines of title. If the **title** button is selected, the **drainage plot title** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters <i>file of plot parameters used for extra control of the long section plot.</i>	input		*.ppf
Plotter type <i>format for the plot output.</i>	input	hp	model, windows, hp, dxf, postscript etc.
Network model <i>the model containing all the drainage lines for the network.</i>	input		
Section view <i>the section view to be used to define the vertical exaggeration, corridor widths, tins to section through, services models to section etc.</i>	input		
Plot file stem <i>since more than one plot page may be produced, the plot file names are constructed from the stem plus a plot page sequence number, followed by the appropriate plotter type ending.</i>	input		
Scale 1:	input		

horizontal scale for plotting the drainage long section. The vertical exaggeration is taken from the section view given in the section view field.

Sheet size wd ht (mm)	input		available sheet sizes
	<i>the width and height values (separated by space) or the name of a user defined sheet size.</i>		
X origin (mm)	input		
	<i>the x position on the plot sheet for the bottom left hand corner of the longsection plots. Same as left_margin in the plot parameter file.</i>		
Y origin (mm)	input		
	<i>the y position on the plot sheet for the bottom left hand corner of the longsection plots. Same as bottom_margin in the plot parameter file.</i>		
Text style	input	1	available text styles
	<i>the default text style to use in the longsection plot.</i>		
Plot ht (mm)	input		
	<i>the maximum allowable height for a longsection plot for a drainage line. Datum breaks are applied to any part of the longsection that will not fit into the plot ht</i>		
Box text size (mm)	input	3	
	<i>size (in millimetres) to plot the chainages, heights etc. in the boxes in the plots of the drainage longsections</i>		
Box colour	input	cyan	available colours
	<i>colour used for the text and the boxes.</i>		
Velocity	tick-cross	tick	
	<i>if tick, the velocity values for the pipes are drawn on the longsection plot.</i>		
Flow	tick-cross	tick	
	<i>if tick, the flow values for the pipes are drawn on the longsection plot.</i>		
Centre CH.	tick-cross	tick	
	<i>if tick, the road centre line chainages are drawn on the longsection plot.</i>		
HGL vals	tick-cross	tick	
	<i>if tick, the HGL values for the pipes are drawn on the longsection plot.</i>		
HGL diag	tick-cross	tick	
	<i>if tick, lines joining the HGL values for the pipes are drawn on the longsection plot.</i>		
Drain No.	tick-cross	tick	
	<i>if tick, the drainage line names are drawn on the longsection plot.</i>		
Plot	button		
	<i>plot the drainage longsections for the drainage lines in the model given in the network model field.</i>		
The fields and buttons in the <i>title</i> tab are			
Use title file	tick-cross		
	<i>if tick, a user defined title block file is used.</i>		
Standard Title	tick-cross	tick	
	<i>if tick, the standard 12d Model border and two lines of title are placed on the bottom of the plot</i>		
Title file	input		*.tf

if *non-blank* and use title file is set to *tick*, then the file given in this field is used to generate a user defined title block for the plot.

Title line 1/2	input		
	<i>first/second line of title information</i>		
Title height (mm)	input	5	
	<i>height (in millimetres) to draw the characters in the two lines of title information.</i>		
Title colour	input	cyan	available colours
	<i>colour used for the border and the title information.</i>		

Please continue to the next section “Drainage Longsection Plot Parameter File” .

Drainage Longsection Plot Parameter File

The **Longsections plot** option is used to make special long section plots for a **network** of drainage strings. Some of the look of the drainage long section plot can be controlled from the **plot drainage network** panel itself, however a wider selection of control parameters is available by using a drainage long plot, plot parameter file.

The drainage long section plot parameters are placed in a file with ending **.ppf**.

Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash// is considered to be a comment.

The set of all parameters for the drainage long section plot is enclosed within a set of curly brackets { } with the header

```
drainage_long_plot "plot set name"
```

before the curly brackets.

That is,

```
drainage_long_plot "plot set name" {
    plot parameters
    one per line
}
```

If there is more than one *drainage_long_plot* parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as *section_x_plot* in the same file. The other sets will be ignored when doing a drainage long section plot.

The plot parameters are documented in following groups:

For the *Plot Sheet layout*, please continue to the section “Plot Sheet Layout” .

Labelling the drainage string name, please continue to the section “Labelling the Drainage String Name on the Plot” .

Boxes area, please continue to the section “Boxes Area” .

Chainages and uprights, please continue to the section “Chainages and Uprights” .

Staggering, please continue to the section “Staggering of Chainages and Uprights” .

Below datum area, please continue to the section “Below Datum Area” .

Arrows area, please continue to the section “Arrow Areas” .

Grade arrows parameters, please continue to the section “Parameters for the Arrows for Grades of the Pipes” .

Pipe diameter arrows parameters, please continue to the section “Parameters for the Arrows for Diameters of the Pipes” .

Pipe velocity arrows parameters, please continue to the section “Parameters for the Arrows for Velocity in the Pipes” .

Pipe flow arrows parameters, please continue to the section “Parameters for the Arrows for Flow in the Pipes” .

Drainage line name arrows parameters, please continue to the section “Parameters for the Arrows giving the Drainage Line Name” .

User defined pipe arrows parameters, please continue to the section “Parameters for the Arrows for User Defined Pipe Attributes” .

Graph area parameters, please continue to the section “Graph Area” .

Top area parameters, please continue to the section “Top Area” .

Bubbles area parameters, please continue to the section “Manhole name, Manhole Types and Surrounding Bubbles” .

Change of direction parameters, please continue to the section “Change of Direction Through Pits and Junctions” .

Symbols at manhole parameters, please continue to the section “Symbols at Manholes” .

House connection parameters, please continue to the section “Labelling House Connections”

Symbols at Property controls parameters, please continue to the section “Symbols at Property Controls” .

Property controls parameters, please continue to the section “Labelling Property Controls” .

Hatching cut and fill parameters, please continue to the section “Hatching Cut and Fill Areas” .

Labelling cuts parameters, please continue to the section “Labelling Cuts of Drainage Through Strings in a Model” .

Title block parameters, please continue to the section “Title Block Information” .

Panel modifying parameters, please continue to the section “Parameters that Modify Fields In the Plot Drainage Network Panel” .

Plot Sheet Layout

The plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The overall size of the plot sheet is given by either a defined sheet size, or by the width and height of the plot given in millimetres and separated by one or more spaces.

```
sheet_size          text          // sheet name, or
                    "mm mm"      // sheet size: width height
```

The sheet size name and width and heights can be specified by the user in a file named sheets.4d which is in the normal set up areas, or is pointed to by the environment variable

```
SHEET_SIZES_4D     file          // file of plotter sheets sizes
```

The plotting area is restricted to within the plot sheet by giving the margins

```
left_margin        mm
right_margin       mm
top_margin         mm
bottom_margin      mm
```

The drainage long section plot will break an individual plot up if it doesn't fit across the sheet. There can be one or more rows of plot on the same sheet.

The top row is done first, followed by the second top row, then the third and so on until the bottom row. If there is only one row, it is considered to be the bottom row.

When a sheet is full, a follow on sheet is created.

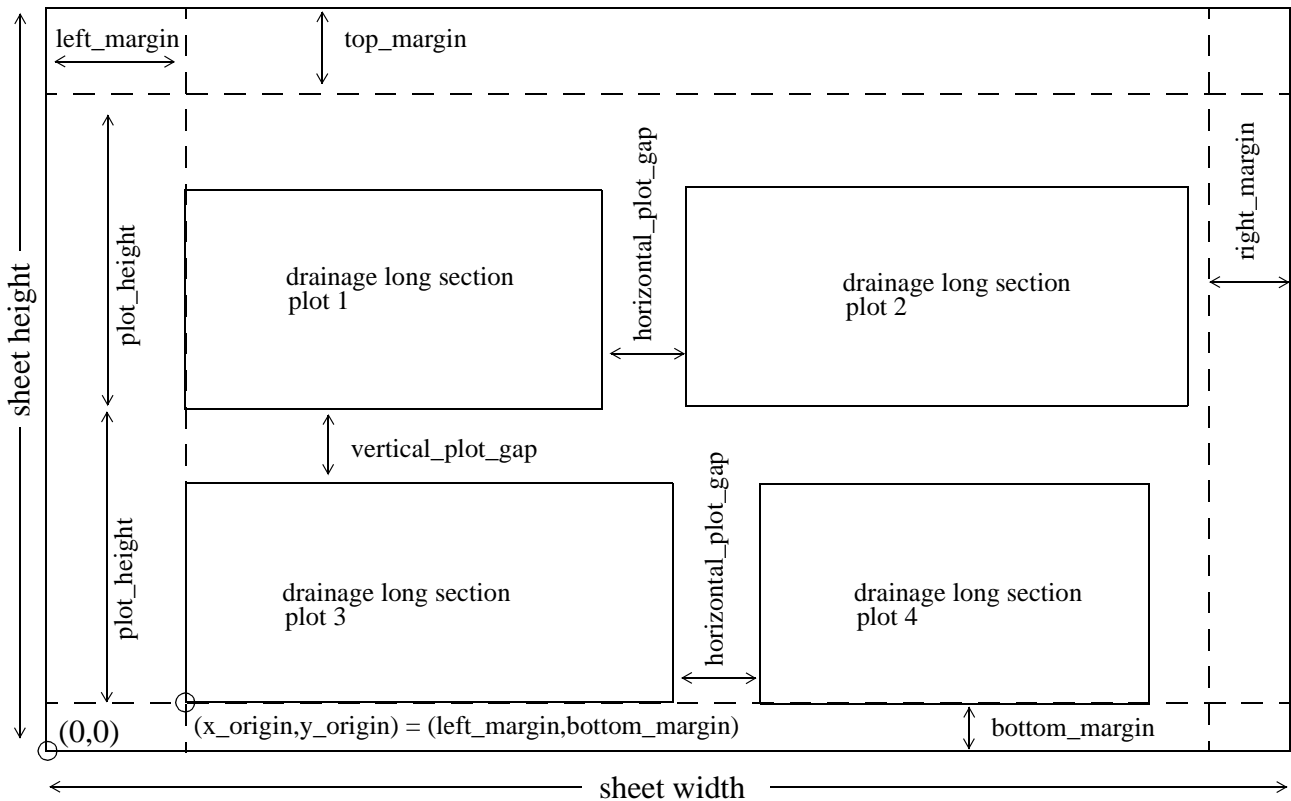

As soon as one drainage string is completed, the next drainage string in the network model is plotted beginning on the same row as the previous drainage string and with a horizontal gap of size *horizontal_plot_gap* between the plots. If there is not enough room on the row to start the next plot, it will

begin on a new row.

The position of the left hand bottom corner of the first plot in the bottom row is given by the parameters, x_origin and y_origin which are the same as $left_margin$ and $bottom_margin$ respectively.

If there are two or more rows of plots, the position of the first plot in each row is given by adding multiples of the $plot_height$ to the y_origin ($bottom_margin$).

network_model	text	// model of drainage strings
x_origin	mm	// Position of the left hand bottom, // same as <i>left_margin</i> .
y_origin	mm	// corner of first plot in the bottom row, // same as <i>bottom_margin</i> .
only_one_line	0 1	// more than one row on a sheet // only one row of plot on a sheet
plot_height	mm	// total height of a plot row. // It includes the <i>vertical_plot_gap</i> .
horizontal_plot_gap	mm	// gap between plots on same row
vertical_plot_gap	mm	// gap between rows of plots, // also the size of the top area

The drainage long plot itself consists of eleven areas. From the bottom up, they are drainage string name, boxes, below datum, arrow 1, bottom stagger, arrow 2, graph, arrow 3, top stagger, arrow 4, top.

The **drainage string name area** is where the name of the drainage string can be plotted.

The **boxes area** is where the chainages and various values for the drainage strings are labelled.

The **below datum area** is a region between the boxes area and the datum line.

The **arrow 1 area** is for drawing arrows where the arrows go between the staggered uprights and below the graph area. The datum line is at the bottom of the arrow 1 area.

The **bottom stagger area** is where the upright line staggers occur before going up from the boxes area to the graph area.

The **arrow 2 area** is for drawing arrows below the graph but where the arrows go between non-staggered uprights.

The **graph area** is the area where the actual plots of the strings are drawn.

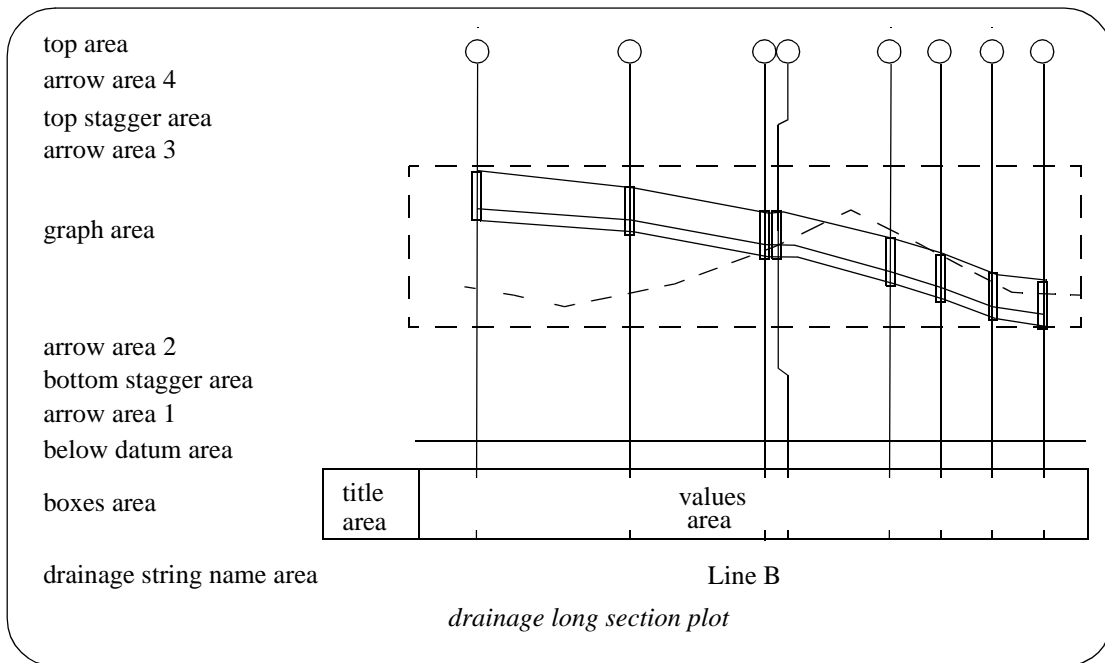

The **arrow 3 area** is for drawing arrows above the graph area and where the arrows go between non-staggered uprights.

The **top stagger area** is where the upright line staggers occur above the graph area.

The **arrow 4 area** is for drawing arrows where the arrows go between the staggered uprights and above the graph area.

The **top area** is an annotation area above the arrow 4 area and is used for bubbles, manhole names (pit names), junctions, deflection angles etc.

The areas and the information in them will now be described in more detail.

Labelling the Drainage String Name on the Plot

The plot can be labelled with the name of the drainage string under the boxes area.

The name is made up of concatenation the text strings:

plot_name_pre_text drainage-string-name plot_name_post_text

The plot name is positioned under the boxes.

```

plot_name_mode            0                    // don't use the drainage string name
                          1                    // use the drainage string name in the
                                                                 // label

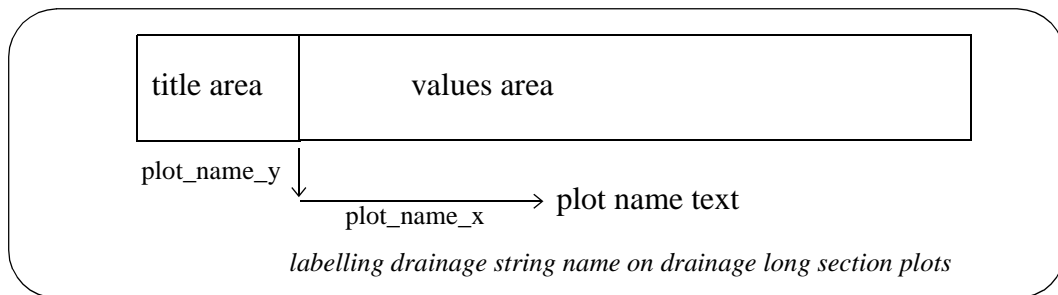

plot_name_pre_text        text
plot_name_post_text       text
plot_name_textstyle       textstyle
plot_name_text_size       mm
plot_name_text_colour     colour
plot_name_x               mm
plot_name_y               mm

```

The *plot_name_x* is measured from the beginning of the height boxes.

The default for *plot_name_x* is centred on the values area.

The *plot_name_y* is measured from the bottom of the box area with positive being **down**.

Example of Labelling Drainage String Name

```

plot_name_pre_text    "Drainage Long Section Plot for String"
plot_name_mode        1
plot_name_post_text    ""
plot_name_text_size    15
plot_name_text_colour  red
plot_name_textstyle    ISO
plot_name_y            30

```

Boxes Area

Many of the drainage string values (invert levels and depth, hgl values, natural and finished surface etc.) can be labelled in the boxes area at the bottom of the drainage long section plot.

Each type of information is plotted in a row made up of a title, and the actual values given at the chainage of each pit in the drainage string.

Each row of information is surrounded by lines to form a box, and the stacked boxes form the boxes area at the bottom of the drainage plot.

The **title** for the information, is drawn in the **title area** of the **boxes area** and the values are drawn in the **values area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

title followed by the **values** along the drainage string.

The **titles area** for the left plot in the bottom row starts at the co-ordinate (x_origin, y_origin) and each row is begun by adding the distance *plot_height* to the y_origin (see previous section).

The width of the **title area** is given by the **box_width** parameter and the height of each box is given by **box_height**.

```

box_width          mm          // width of the label boxes.
box_height         mm          // height of each box

```

The colour of the box line work is given by:

```

box_colour         colour      // colour of the lines in the boxes

```

A default text size and colour can be specified for the title text and the values, or sizes, colours and text styles can be given for each individual box (given later in this section).

```

title_box_text_size  mm          // size of title text in boxes
title_box_text_colour colour     // colour of title text in boxes
box_text_size       mm          // size of value text in boxes
box_text_colour     colour     // colour of values in boxes

```

The values text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_text_left_justify*).

The values text can be on the left, right or centred on the uprights and is given by the parameter *box_text_side*.

The width of the values area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing (see next section).

```

box_text_left_justify      0           // top justify text in values area
                           1           // bottom justify text in values area

box_text_side              0           // left (default)
                           1           // right
                           2           // centre

```

The default order of the boxes from the bottom up is

0. drainage string chainages
1. road centre line chainages - user choice
2. natural surface heights - user choice
3. finished surface heights - user choice
4. before pit and after pit invert levels
5. before pit and after pit hgl values - user choice
6. before pit and after pit depth to inverts - user choice

There are parameters to change the order for 1-6.

Drainage string chainages is fixed at the bottom (box 0) but what is in the boxes above box 0 is can be set by the *box_n* parameters:

```

box_n          number_from_list      // the n'th box above the drainage string
                                           // chainages will contain given item number
                                           // from the list.

```

For example, to have *finished surface heights* in the first box the drainage string chainages, use:

```

box_1          3           // the (1) will be replaced by (3)

```

```

chainage_box_size          mm           // box height for chainage box
centre_chainage_box_size  mm           // box height for centre chainage box
surface_box_size           mm)         // box height for surface box
f_surface_box_size         mm           // box height for finished surface box
invert_height_box_size     mm           // box height for invert height box
hgl_box_size               mm           // box height for hgl box
invert_depth_box_size      mm           // box height for invert depth box

```

The default for each box size is *box_height*

The boxes (1), (2), (3) and (5) can be suppressed by the parameters

```

draw_centre_chainage      0/1          // 0 = don't have centre line chainages

```

		// box
draw_ns_text	0/1	// 0 = don't draw ns values from // ns tin for drainage string
draw_fs_text	0/1	// 0 = don't draw fs values from // fs tin or top of manhole // for drainage string
draw_fs_mode	0	// 0 = fs_text is from fs tin
	1	// 1 = fs_text is top of manhole
draw_hgl_value	0/1	// 0 = don't have hgl value boxes

The definition of depth to invert and whether box (6) is suppressed or not, are given by the parameter *depth_mode*:

depth_mode	0	// don't draw depth to invert values
	1	// draw depth to invert values to fs tin // for drainage string
	2	// draw depth to invert values to top of // manhole for drainage string
	3	// draw depth to invert values to ns tin // for drainage string

The default for the number of decimal places used in the values in the boxes is:

number_of_decimals	<i>integer</i>	// default number of decimal places
--------------------	----------------	-------------------------------------

The text, size, colour and textstyle for the title text and values text for each box can be set by

(0) drainage string chainages

plot_title_chainage_name	<i>text</i>	// first line of title for chainages box
plot_title_chainage_name_2	<i>text</i>	// second line of title for chainages box
chainage_title_colour	<i>colour</i>	// colour of text
chainage_title_text_size	<i>mm</i>	// size of title in chainage box
chainage_title_textstyle	<i>textstyle</i>	// textstyle for title in chainage box
chainage_text_colour	<i>colour</i>	// colour of chainage values
chainage_text_size	<i>mm</i>	// size of values
chainage_textstyle	<i>textstyle</i>	// textstyle of values
chainage_decimals	<i>integer</i>	// number of decimal places in chainage

(1) road centreline chainages

plot_title_centre_chainage_name	<i>text</i>	// title for road centre // line chainages box
plot_title_centre_chainage_name_2	<i>text</i>	// second line of title for road // centre line chainages box
chainage_title_colour_cl	<i>colour</i>	// colour of text
chainage_title_text_size_cl	<i>mm</i>	// size of title in cl box
chainage_title_textstyle_cl	<i>textstyle</i>	// textstyle for title
chainage_text_colour_cl	<i>colour</i>	// colour of cl values
chainage_text_size_cl	<i>mm</i>	// size of values
chainage_textstyle_cl	<i>textstyle</i>	// textstyle of values
chainage_cl_decimals	<i>integer</i>	// number of decimal places in chainage cl

(2) natural surface values

plot_title_surface_name	<i>text</i>	// title for the drainage ns values box
plot_title_surface_name_2	<i>text</i>	// second line of title for drainage ns values
ns_title_colour	<i>colour</i>	// colour of text
ns_title_text_size	<i>mm</i>	// size of title in ns box
ns_title_textstyle	<i>textstyle</i>	// textstyle for title
ns_text_colour	<i>colour</i>	// colour of ns values
ns_text_size	<i>mm</i>	// size of values

```

ns_textstyle          textstyle          // textstyle of values
ns_decimals          integer          // number of decimal places in ns

```

(3) finished surface values

```

plot_title_finished_name      text          // title for the drainage fs values box
plot_title_finished_name_2    text          // second line of title for drainage fs values
fs_title_colour              colour        // colour of text
fs_title_text_size           mm           // size of title in fs box
fs_title_textstyle           textstyle     // textstyle for title
fs_text_colour               colour        // colour of ns values
fs_text_size                 mm           // size of values
fs_textstyle                 textstyle     // textstyle of values
fs_decimals                  integer       // number of decimal place in fs

```

(4) invert levels

```

plot_title_invert_name        text          // title for the invert levels box
plot_title_invert_name_2      text          // second line of title for the invert levels box
il_title_colour              colour        // colour of text
il_title_text_size           mm           // size of title in il box
il_title_textstyle           textstyle     // textstyle for title
il_text_colour               colour        // colour of il values
il_text_size                 mm           // size of values
il_textstyle                 textstyle     // textstyle of values
il_decimals                  integer       // number of decimal places in il

```

(5) hgl values

```

plot_title_hgl_name          text          // title for hgl values box
plot_title_hgl_name_2        text          // second line of title for hgl values box
hgl_title_colour             colour        // colour of text
hgl_title_text_size          mm           // size of title in hgl box
hgl_title_textstyle          textstyle     // textstyle for title
hgl_text_colour              colour        // colour of hgl values
hgl_text_size                mm           // size of values
hgl_textstyle                textstyle     // textstyle of values
hgl_decimals                 integer       // number of decimal places in hgl

```

(6) depths

```

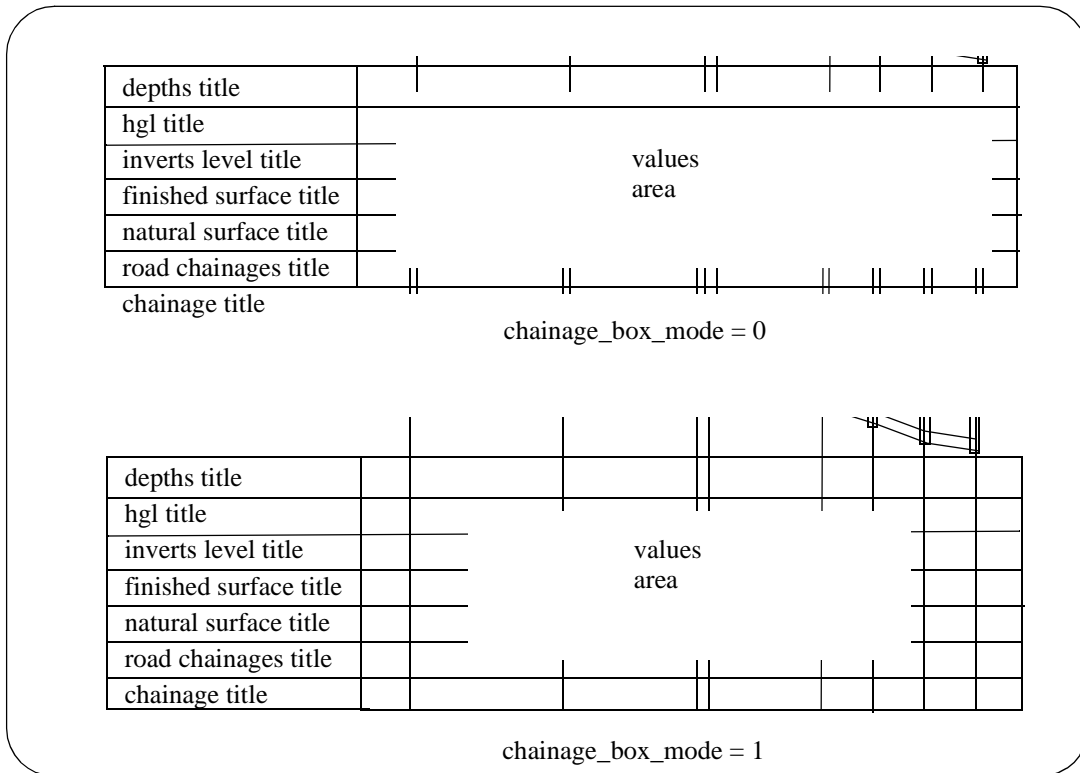

plot_title_depth_name        text          // title for depth of inverts box
plot_title_depth_name_2      text          // second line of title for depth of inverts box
depth_title_colour           colour        // colour of text
depth_title_text_size        mm           // size of title in depth box
depth_title_textstyle        textstyle     // textstyle for title
depth_text_colour            colour        // colour of depth values
depth_text_size              mm           // size of values
depth_textstyle              textstyle     // textstyle of values
depth_decimals               integer       // number of decimal places in depth

```

Drawing the Boxes

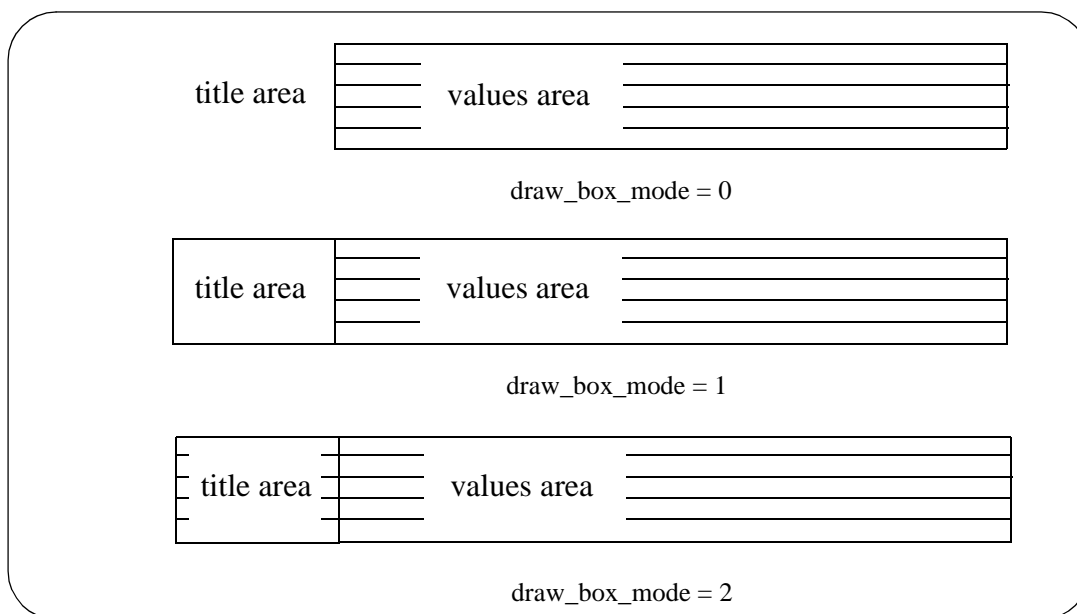

The bottom line from the boxes can be drawn or not drawn:

```
chainage_box_mode    0           // don't draw the bottom line
                    1           // draw all the box line work - default
```

A box can be drawn/not drawn around the title area of the boxes area.

```
draw_box_mode       0           // don't draw the title area box
                    1           // draw the title area box, no lines - default
                    2           // draw title box area with lines
```

Chainages and Uprights

The chainage box contains drainage string chainages for

- the chainages of each pit in the drainage string
- the chainages on the drainage string where any strings in models on the section view are **cut** by the drainage string (crossing services)

For a **pit**, the invert levels, depths, finished and natural surface levels, and hgl of pipes at a pit can all be labelled at the chainage of the pit.

For a **crossing service**, the level of the crossing service and the chainage on the drainage string where the crossing occurs are labelled.

Note - crossing services can also be labelled using cuts of drainage line through strings. However, this does not create a chainage in the chainage box.

Uprights, or leader lines, can be drawn from the chainage values at the bottom of the boxes to the pit in the graph area, and from the top of the pit to the top area.

Using the parameters *uprights_top_mode* and *uprights_bottom_mode*, it is possible to suppress the drawing from the top of the pit to the top area, and also from the top of the boxes to the bottom of the boxes.

<i>uprights_top_mode</i>	<i>0</i>	// stop at top of pit
	<i>1</i>	// go to top area (default)
<i>uprights_bottom_mode</i>	<i>0</i>	// stop at top of boxes
	<i>1</i>	// go to bottom of boxes (default)

Also uprights can be drawn from the chainage values bottom of the boxes to the crossing service in the graph area.

The chainage values at the uprights for the pits can be running chainage along the drainage string, pipe length chainages (i.e. the chainage starts at zero for each pipe) or both.

chainage_mode	0	//pipe length chainage
	1	// running chainage
	2	// both pipe length and running

If the *chainage_mode* includes "pipe length chainage" (modes 0 and 2), the pipe length can either be labelled with a 0.0 chainage at the start pit for the pipe and the pipe length at the end pit, or just have the length centred between the two pits.

centre_pipe_length	0	// default - 0 at start pit, length at end pit
	1	// centre pipe length

The chainage values for the crossing services can be running chainage along the drainage string, chainage length from the previous pit (i.e. the chainage starts at zero at the previous pit) or both.

service_chainage_mode	0	//pipe length chainage
	1	// running chainage
	2	// both pipe length and running

The colour of the uprights for the pits and crossing services are given by:

manhole_line_colour	<i>colour</i>	// colour of uprights to the pits
service_line_colour	<i>colour</i>	// colour of upright to the crossing // services

The crossing services are labelled with the drainage string chainage of the crossing point, the invert level of the service at the crossing and the name of the service which is made up of:

service diameter name of service invert level at the service at the crossing.

The service label is drawn the distance *service_name_y* below the crossing point:

service_name_y	<i>mm</i>	// def 1, distance of label below crossing point
----------------	-----------	--

The colours, text styles and sizes of the service information is specified by:

service_ch_text_colour	<i>colour</i>	// colour of services ch text
service_ch_text_size	<i>mm</i>	// size of services ch text
service_ch_textstyle	<i>mm</i>	// textstyle of services ch text
service_il_text_colour	<i>colour</i>	// colour of services il text
service_il_text_size	<i>mm</i>	// size of services il text
service_il_textstyle	<i>mm</i>	// textstyle of services il text
service_name_text_colour	<i>colour</i>	// colour of services name
service_name_text_size	<i>mm</i>	// size of services name
service_name_textstyle	<i>mm</i>	// textstyle of services name
service_name_decimals	<i>integer</i>	// number of decimal is il in name

A **finished surface** value or **top of manhole** value can also be written vertically along the uprights.

Whether the value is finished surface level or top of manhole level, the values position, size, colour etc. is controlled by the parameters:

```

draw_fs_vertical      0           // don't draw fs vertical values
                    1           // always draw values
                    2           // only draw values when different -see
                               // draw_fs_vertical_mode

draw_fs_vertical_mode 0           // the fs value is the value from the fs tin
                               // for the drainage string.
                               // When draw_fs_vertical is 1,
                               // always draw the fs value.
                               // When draw_fs_vertical is 2,
                               // only draw fs value when it is
                               // different from the top of manhole value
                    1           // the fs value is the top of manhole
                               // for the drainage string.
                               // When draw_fs_vertical is 1,
                               // always draw the fs value.
                               // When draw_fs_vertical is 2,
                               // only draw fs value when it is
                               // different from the value of the fs tin.
    
```

		draw_fs_vertical_mode	
		0	1
draw_fs_vertical	0	nothing	nothing
	1	fs tin	top of manhole
	2	fs tin when different from top of manhole	top of manhole when different from fs tin

```

fs_vertical_pre_text  text           // text before the vertical fs value
fs_vertical_post_text text           // text after the vertical fs value
fs_vertical_decimals integer        // number of decimals in vertical fs
fs_vertical_colour   colour         // colour of the vertical fs text
fs_vertical_size     mm             // size of the vertical fs text
fs_vertical_textstyle textstyle     // textstyle of the vertical fs
fs_vertical_x        mm             // x adjustment to position of text
fs_vertical_y        mm             // y adjustment to position of text
    
```

Staggering of Chainages and Uprights

If the text values are placed at the real chainage positions at the bottom of the plot, text over writing can easily occur if the chainages are very close together.

To prevent such over writing, the text can be **staggered**.

That is, if the text is going to over write a previous text value, the next text value is actually moved along until there is no over writing.

Since the text is no longer at the correct chainage position, the uprights to the pits and services start at the text position and then bend back to the correct chainage position on the plot. The region where the bending occurs is called the stagger area.

For the drainage plot, there is an area below the graph where the uprights bend backwards from the staggered text position to the real chainage position (bottom stagger area).

And there is a second area above the graph where the uprights bend forwards from the real chainage position to the staggered text position (top stagger area).

Hence annotation above the top stagger area will line up with the staggered values below the bottom stagger area.

The stagger area below the graph area is defined by

stagger_height_1	mm	// distance from the top of arrow_area_1 // to the start of the staggers
stagger_height_2	mm	// distance over which stagger occurs
stagger_gap_bottom	mm	// distance from end of staggers to the // bottom of arrow_area_2

The stagger area above the graph area is defined

stagger_gap_top	mm	// distance from the top of arrow_area_3 // to the start of the staggers
stagger_height_3	mm	// distance over which stagger occurs
stagger_height_4	mm	// distance from end of staggers to the // bottom of arrow_area_4

The distance to be left for text to avoid over writing is:

horizontal_text_gap	mm	// minimum distance to leave for text // after pit values
service_text_gap	mm	// minimum distance to leave for text // after service values

When staggering occurs, it is possible for the values area to be longer than the graph area.

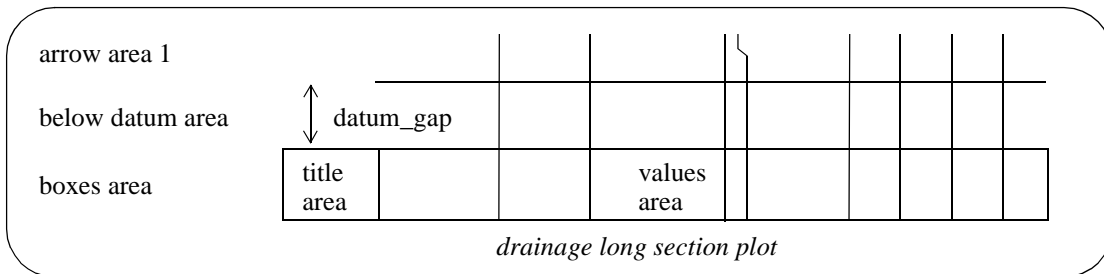

Below Datum Area

The **below datum area** is the region between the boxes area and the arrow_1 area. The datum line is drawn at the top of the below datum area.

The size of the below datum area is

```
datum_gap          mm          // height of the below datum area
```

The datum value is placed above the datum line, preceded by a datum name on the left hand side of the title area.

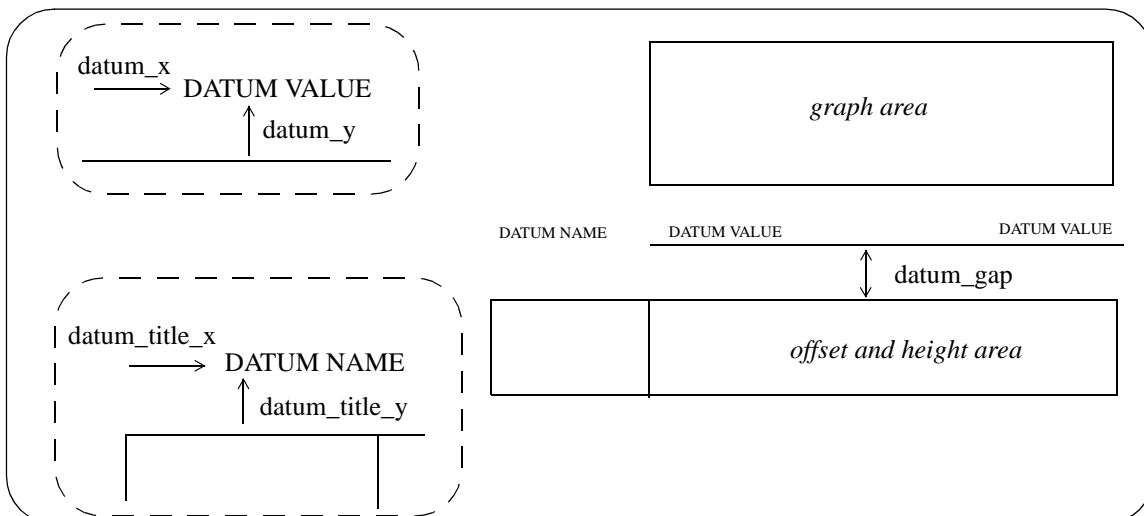

Since the datum value is automatically calculated to try and fit the plot vertically into the graph area, the datum value can change along the plot. When a datum change occurs, the new datum value is written on the datum line at the relevant chainage position.

The datum name, text size, colour and position are controlled by:

```
datum_name          text          // datum title
datum_title_x       mm           // distance to write name from lhs
datum_title_y       mm           // distance above datum line
datum_title_textstyle textstyle  // textstyle of name
datum_title_text_size mm         // text size
datum_title_colour  colour       // text colour
```

The datum value, number of decimal places, text size, colour and position are controlled by:

```
datum_decimals      integer      // number of decimal places in datum value
// >0 drop trailing zeros after decimal point
// < 0 keep trailing zeros
datum_x             mm           // x dist. to write value from manhole
datum_y             mm           // y dist. to write value above datum line
datum_text_size     mm           // size of datum value
datum_textstyle     textstyle    // textstyle for datum
datum_text_colour   colour       // colour of the datum text and line
```

Arrow Areas

Apart from information labelled in the boxes and top areas, the drainage long section plot can place arrows between pits for other information such as

- (a) pipe grade or slope
- (b) pipe diameter
- (c) velocity
- (d) flow
- (e) drainage line name
- (f) user defined pipe attributes

A specific arrow area is defined for each set of arrows.

The **arrow areas** are designed for drawing and labelling arrows between pits.

All the values refer to pipes connecting adjacent pits and the relevant pipe is indicated by drawing an arrow between the uprights from the chainage text to the pits.

Because staggering of the chainage text can occur, the position of the uprights to draw the arrows between can vary depending on whether the arrow is above or below a stagger area.

Hence, there are four arrow areas:

arrow area 1 which is below the graph and the bottom stagger area. The arrows go between the *staggered* chainage positions of the pits.

The datum line is at the bottom of arrow 1 area.

arrow area 2 which below the graph but above the bottom stagger area. Hence the arrows go between the *non-staggered* chainage positions of the pits.

arrow area 3 which is above the graph but below the top stagger area. The arrows go between the *non-staggered* chainage positions of the pits.

arrow area 4 is above the graph and the top stagger area. The arrows go between the *staggered* chainage positions of the pits.

The heights of the four areas (which can be zero) are defined by:

arrow_area_1	mm	// height of arrow_1 area
arrow_area_2	mm	// height of arrow_2 area
arrow_area_3	mm	// height of arrow_3 area
arrow_area_4	mm	// height of arrow_4 area

The parameters for controlling the arrows between manholes and associated text for the values of pipe slope, pipe diameter, flow, velocity, drainage line name and user defined pipe attributes are now given.

Each set of parameters has an arrow_mode with the following values:

..._arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line

Parameters for the Arrows for Grades of the Pipes

Parameters specifying the arrow area used and the position of the arrows.

draw_pipe_grade	0	// don't draw pipe grade
	1	// draw pipe grade
pipe_grade_arrow_area	m	// the arrow area for the arrows // m = 1,2,3 or 4
pipe_grade_y	mm	// distance that the arrow is above the // bottom of the arrow area.

For the arrow, the value of the grade can be specified as either **1 in** or **percent** grade:

percentage_grade	0	// the value is a "1 in" grade
	1	// the value is a percent grade

Parameters for the title text on the left hand side of the plot:

pipe_grade_title	text	//title on the left hand side of the arrow
pipe_grade_title_textstyle	textstyle	// textstyle of the title
pipe_grade_title_text_size	mm	// size of the title
pipe_grade_title_text_colour	colour	// colour of the title
pipe_grade_title_offset	mm	//distance to raise or lower the text // from the arrow position
pipe_grade_title_x	mm	// distance from the left hand side of the // plot

Parameters for the arrow type:

pipe_grade_arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_grade_arrow_colour	colour	// colour of the arrow
pipe_grade_arrow_size	mm	// height of the arrow
pipe_grade_arrow_gap	0	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_grade_arrow_pre_text	text	// text before the arrows text
pipe_grade_arrow_post_text	text	// text after the arrows text
pipe_grade_arrow_decimals	integer	// The number of decimal places used // when writing out the pipe grade // If > 0, all trailing zeros after the // decimal place are removed. // If < 0, the absolute value is taken as // the number of decimal places and no // trailing zeros are removed after the // decimal point.
pipe_grade_arrow_textstyle	textstyle	// textstyle of arrow text
pipe_grade_arrow_text_size	mm	// size of the text
pipe_grade_arrow_text_colour	colour	// colour of the text
pipe_grade_arrow_text_offset	mm	// distance to raise or lower the text // from the arrow position

Parameters for the Arrows for Diameters of the Pipes

The diameter of the drainage pipes can be plotted between each pit.

Inside 12d Model, the pipe diameter is given a world units (usually metres), but on the diameter arrow, the diameter is multiplied by 1000 and written out as an integer value. This is normally millimetres.

For diameters entered in feet and the plot diameter to be in inches, the following parameter should be set

```
pipe_diameter_scale_factor      12.          // default is 1000.
```

Parameters specifying the arrow area used and the position of the pipe diameter arrows.

```
draw_pipe_diameter             0           // don't draw pipe diameter
                                1           // draw pipe diameter
pipe_diameter_arrow_area       m           // the arrow area for the arrows
                                // m = 1,2,3 or 4
pipe_diameter_y                mm          // distance that the arrow is above the
                                // bottom of the arrow area.
```

Parameters for the title text on the left hand side of the plot:

```
pipe_diameter_title            text        // title on the left hand side of the arrow
pipe_diameter_title_textstyle  textstyle // textstyle of the title
pipe_diameter_title_text_size  mm        // size of the title
pipe_diameter_title_text_colour colour    // colour of the title
pipe_diameter_title_offset     mm        // distance to raise or lower the text
                                // from the arrow position
pipe_diameter_title_x          mm        // distance from the left hand side of the
                                // plot
```

Parameters for the arrow type:

```
pipe_diameter_arrow_mode      0           // no arrow
                                1           // arrow
                                2           // line
                                3           // line with uprights at ends
                                4           // uprights, no line
                                5           // line with downrights
                                6           // downrights, no line
                                7           // line with up and downrights at ends
                                8           // up and downrights, no line
pipe_diameter_arrow_colour     colour    // colour of the arrow
pipe_diameter_arrow_size       mm        // height of the arrow
pipe_diameter_arrow_gap       0           // no gap in arrow
                                1           // leave gap in arrow for text
```

Parameters for the text on the arrow:

```
pipe_diameter_arrow_pre_text   text        // text before the arrows text
pipe_diameter_arrow_post_text  text        // text after the arrows text
```

On the arrow, the pipe type can be also plotted after the pipe_diameter_arrow_post_text:

```
pipe_type_mode                 0           // don't include the pipe type
                                1           // include the pipe type after the
                                // post_text
pipe_diameter_arrow_textstyle  textstyle // textstyle of arrow text
pipe_diameter_arrow_text_size  mm        // size of the text
pipe_diameter_arrow_text_colour colour    // colour of the text
pipe_diameter_arrow_text_offset mm        // distance to raise or lower the text
                                // from the arrow position
```

Parameters for the Arrows for Velocity in the Pipes

Parameters specifying the arrow area used and the position of the arrows.

```
draw_pipe_velocity      0           // don't draw pipe velocity
                        1           // draw pipe velocity
pipe_velocity_arrow_area  m           // the arrow area for the arrows
                        // m = 1,2,3 or 4
pipe_velocity_y         mm          // distance that the arrow is above the
                        // bottom of the arrow area.
```

Parameters for the title text on the left hand side of the plot:

```
pipe_velocity_title     text         //title on the left hand side of the arrow
pipe_velocity_title_textstyle  textstyle // textstyle of the title
pipe_velocity_title_text_size  mm     // size of the title
pipe_velocity_title_text_colour colour // colour of the title
pipe_velocity_title_offset  mm     //distance to raise or lower the text
                        // from the arrow position
pipe_velocity_title_x    mm     // distance from the left hand side of
                        // the plot
```

Parameters for the arrow type:

```
pipe_velocity_arrow_mode  0           // no arrow
                        1           // arrow
                        2           // line
                        3           // line with uprights at ends
                        4           // uprights, no line
                        5           // line with downrights
                        6           // downrights, no line
                        7           // line with up and downrights at ends
                        8           // up and downrights, no line
pipe_velocity_arrow_colour colour     // colour of the arrow
pipe_velocity_arrow_size  mm     // height of the arrow
pipe_velocity_arrow_gap   0           // no gap in arrow
                        1           // leave gap in arrow for text
```

Parameters for the text on the arrow:

```
pipe_velocity_arrow_pre_text  text     // text before the arrows text
pipe_velocity_arrow_post_text text     // text after the arrows text
pipe_velocity_arrow_decimals integer // The number of decimal places used
                        // when writing out the pipe velocity
                        // If > 0, all trailing zeros after the
                        // decimal place are removed.
                        // If < 0, the absolute value is taken as
                        // the number of decimal places and no
                        // trailing zeros are removed after the
                        // decimal point.
pipe_velocity_arrow_textstyle textstyle // textstyle of arrow text
pipe_velocity_arrow_text_size mm     // size of the text
pipe_velocity_arrow_text_colour colour // colour of the text
pipe_velocity_arrow_text_offset mm   // distance to raise or lower the text
                        // from the arrow position
```

Parameters for the Arrows for Flow in the Pipes

Parameters specifying the arrow area used and the position of the arrows.

draw_pipe_flow	0	// don't draw pipe flow
	1	// draw pipe flow
pipe_flow_arrow_area	m	// the arrow area for the arrows // m = 1,2,3 or 4
pipe_flow_y	mm	// distance that the arrow is above the // bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

pipe_flow_title	text	// title on the left hand side of the arrow
pipe_flow_title_textstyle	textstyle	// textstyle of the title
pipe_flow_title_text_size	mm	// size of the title
pipe_flow_title_text_colour	colour	// colour of the title
pipe_flow_title_offset	mm	// distance to raise or lower the text // from the arrow position
pipe_flow_title_x	mm	// distance from the left hand side of // the plot

Parameters for the arrow type:

pipe_flow_arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_flow_arrow_colour	colour	// colour of the arrow
pipe_flow_arrow_size	mm	// height of the arrow
pipe_flow_arrow_gap	0	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_flow_arrow_pre_text	text	// text before the arrows text
pipe_flow_arrow_post_text	text	// text after the arrows text
pipe_flow_arrow_decimals	integer	// The number of decimal places used // when writing out the pipe flow // If > 0, all trailing zeros after the // decimal place are removed. // If < 0, the absolute value is taken as // the number of decimal places and no // trailing zeros are removed after the // decimal point.
pipe_flow_arrow_textstyle	textstyle	// textstyle of arrow text
pipe_flow_arrow_text_size	mm	// size of the text
pipe_flow_arrow_text_colour	colour	// colour of the text
pipe_flow_arrow_text_offset	mm	// distance to raise or lower the text // from the arrow position

Parameters for the Arrows giving the Drainage Line Name

Parameters specifying the arrow area used and the position of the arrows.

draw_drainage_line	0	// don't draw drainage line arrow
	1	// draw drainage line arrow
drainage_line_arrow_area	m	// the arrow area for the arrows
		// m = 1,2,3 or 4
drainage_line_y	mm	// distance that the arrow is above the
		// bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

drainage_line_title	text	// title on the left hand side of the arrow
drainage_line_title_textstyle	textstyle	// textstyle of the title
drainage_line_title_text_size	mm	// size of the title
drainage_line_title_text_colour	colour	// colour of the title
drainage_line_title_offset	mm	// distance to raise or lower the text
		// from the arrow position
drainage_line_title_x	mm	// distance from the left hand side of
		// the plot

Parameters for the arrow type:

drainage_line_arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
drainage_line_arrow_colour	colour	// colour of the arrow
drainage_line_arrow_size	mm	// height of the arrow
drainage_line_arrow_gap	0	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

drainage_line_arrow_pre_text	text	// text before the arrows text
drainage_line_arrow_post_text	text	// text after the arrows text
drainage_line_arrow_textstyle	textstyle	// textstyle of arrow text
drainage_line_arrow_text_size	mm	// size of the text
drainage_line_arrow_text_colour	colour	// colour of the text
drainage_line_arrow_text_offset	mm	// distance to raise or lower the text
		// from the arrow position

Parameters for the Arrows for User Defined Pipe Attributes

There can be up to twenty sets of parameters which are used to define arrows for *user defined attributes* on the pipes.

Each *user defined attribute* is referred to by a given *user name* and it is this *user name* that is specified by a parameter and links the set of parameters to the information in the drainage string.

Note: *user defined attributes* on drainage pipes are usually set by special macros.

The parameters for the n'th set (n=1,2, ... 20) are:

Parameters specifying the pipe attribute used for this set of arrows and the arrow area used.

draw_pipe_attr_n	0	// don't draw nth set of arrows
	1	// draw the nth set of arrows
pipe_attr_n_name	text	// the name of the attribute to be labelled // on the n'th set of arrows
pipe_attr_n_arrow_area	m	// the arrow area for the arrows // m = 1,2,3 or 4
pipe_attr_n_y	mm	// distance that the arrow is above the // bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

pipe_attr_n_title	text	//title on the left hand side of the arrow
pipe_attr_n_title_textstyle	textstyle	// textstyle of the nth attribute's title
pipe_attr_n_title_text_size	mm	// size of the nth attribute's title
pipe_attr_n_title_text_colour	colour	// colour of the nth attribute's title
pipe_attr_n_title_offset	mm	//distance to raise or lower the text // from the nth arrow position
pipe_attr_n_title_x	mm	// distance from the left hand side of the // plot

Parameters for the arrow type:

pipe_attr_n_arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_attr_n_arrow_colour	colour	// colour of the nth arrow
pipe_attr_n_arrow_size	mm	// height of the nth arrow
pipe_attr_n_arrow_gap	0	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_attr_n_arrow_pre_text	text	// text before the arrows text
pipe_attr_n_arrow_post_text	text	// text after the arrows text
pipe_attr_n_arrow_decimals	integer	// Only if the attribute is a real number. // The number of decimal places used // when writing out the value of the // attribute. // If > 0, all trailing zeros after the // decimal place are removed. // If < 0, the absolute value is taken as // the number of decimal places and no // trailing zeros are removed after the // decimal point.

pipe_attr_n_arrow_textstyle	<i>textstyle</i>	// textstyle of arrow text
pipe_attr_n_arrow_text_size	<i>mm</i>	// size of the text
pipe_attr_n_arrow_text_colour	<i>colour</i>	// colour of the text
pipe_attr_n_arrow_text_offset	<i>mm</i>	// distance to raise or lower the text
		// form the nth attribute's arrow position

Graph Area

The **graph area** is the area where the actual plots of the drainage strings are drawn.

The length of the graph area is determined by the length of the drainage string to be plotted, the horizontal scale (given by scale) of the plot and the sheet width.

```

scale          value          // 1:value - horizontal scale
                                   // The vertical scale is determined by the
                                   // horizontal scale and the vertical
                                   // exaggeration for the section view.
    
```

The vertical exaggeration is taken from the section view specified for the plot by the parameter:

```

view_name          text
    
```

The tins to be sectioned through by the drainage strings and any service models and corridor settings for the graph area are also taken from the specified section view.

The height of the graph is **calculated** by subtracting the height of the other nine boxes from the plot height.

If the plot will not fit horizontally into a row on the sheet, then the plot will be broken at an appropriate pit and the plot continued on another row.

Datum breaks at pits are used to try and fit the plot vertically into the graph area but if the plot still cannot fit, then it will be truncated at the bottom.

The types of strings that can be drawn in the graph area of the drainage long section plot are:

- (a) drainage string the strings from the network model
- (b) tins sections of the drainage string through any tins on the section view.
- (c) hgl hydraulic grade line values from the drainage string
- (d) services parts of strings from any models on the section view that cut the corridor for the section view.

Whether to draw the hydraulic grade line is controlled by:

```

draw_hgl_diag          0/1          // 1 = draw hydraulic grade line
    
```

The **colour** of the strings in the plot is the actual string colour for case (a) and (d), the colour of the tin used for the section in case (b) and user specified colour for (c).

```

hgl_colour          colour
    
```

Top Area

The **top area** is an annotation area above the arrow_4_area at the top of the plot.

It can be used for pit names, pit types, line names, junctions and deflection angles through pits.

The height of the top area is given by

```
vertical_plot_gap          mm          // size of the top area. If it is not large
                               // enough, the text will over write the
                               // plot in the row above.
```

A line can be drawn at the bottom of the top area:

```
draw_top_line             0/1         // 1= draw line at bottom of top area
                               // (i.e. top of arrow_4_area)
```

Manhole name, Manhole Types and Surrounding Bubbles

The drainage string name, the manhole name (pit number) and manhole type (pit type) can be drawn on the drainage long section plot, with or without a bubble around it.

The bubble text is made up of

line_name / pit_name pit_type

where the bits actually used are controlled by

draw_line_name	0/1	// 1 = include line name. The "/" is only // included if the line_name is drawn.
draw_pit_name	0/1	// 1 = include pit_name
draw_pit_type	0/1	// 1 = include pit type

The size, colour and text style of the bubble text is given by:

bubble_text_size	mm	// size of text in bubble def angled_text_size
bubble_text_colour	colour	// colour of text def angled_text_colour
bubble_textstyle	textstyle	// textstyle for text def angled_text_textstyle
bubble_text_x	mm	// horizontal distance from the default // position (at the pit or in top area)
bubble_text_y	mm	// vertical distance from the default // position (at the pit or in top area)
bubble_pre_text	text	// default ""
bubble_post_text	text	// default ""
bubble_text_angle	value	// default 0
bubble_text_justify	value	// the default is centre justified

A bubble is drawn of radius **bubble_radius** is drawn around the bubble text.

If **bubble_radius** is zero, then no bubble is drawn.

If the *bubble_radius* is zero, the bubble text is still drawn but without the enclosing bubble.

bubble_radius	mm	// if non-zero a bubble of this radius is // drawn around the text
bubble_colour	colour	// colour of bubbles

The "bubble" can be drawn as two semi-circles and two straight lines

bubble_length	mm	// length of the straight line in between // the semi-circles
---------------	----	--

The bubble text (and bubble) can be positioned at the bottom of the **top area**, or can be placed a fixed distance above the top of the corresponding manhole.

If the bubble text is drawn at the bottom of the top area, the upright is automatically drawn up to the bubble text.

If the bubble text is drawn above the pit, it is positioned by the *distance_above_pit* parameter **plus** the top stagger distances, *stagger_gap_top*, *stagger_height_3* and *stagger_height_4*.

This is necessary because the bubble text may need to be staggered.

draw_text_at_pit	0	// draw bubble and/or text in the top
------------------	---	---------------------------------------

	<i>1</i>	// area. // draw it above the pit
distance_above_pit	<i>mm</i>	// distance to add to the top stagger area // heights to draw the bubble above the // pit.
uprights_top_mode	<i>0/1</i>	// 1 = draw line from pit to bubble. Used to be // draw_line_to_text

Change of Direction Through Pits and Junctions

If there is a change of direction of the pipes of the plotted drainage string going through the pit, the deflection angle (in degrees, minutes and seconds) is drawn above the bubble text.

The deflection angle text is made up:

```
angled_pre_text  deflection angle  angled_post_text
```

Also any junctions at a pit in the plotted drainage string can be labelled with the name of the drainage strings coming into the pit, and the angle of the pipes at the junction.

Hence the junction text is made up of **two** lines:

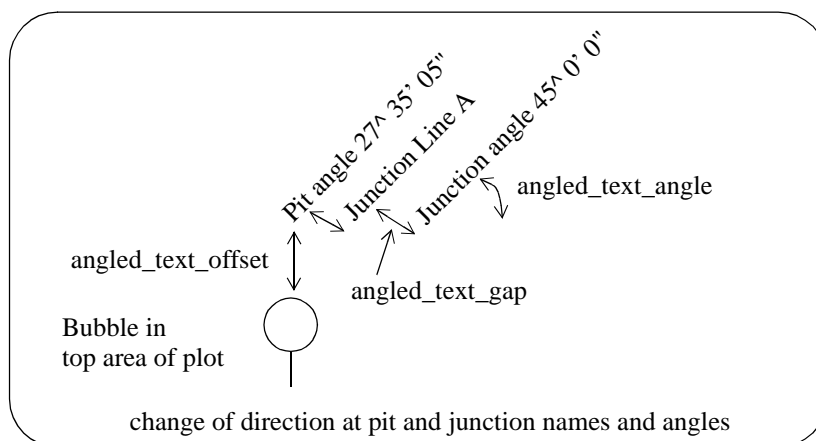

```
junction_pre_text  line_name  junction_post_text
junction_angle_pre_text  junction angle  junction_angle_post_text
```

If bubbles are drawn, the deflection angle and junction name and angle are drawn at the distance *angled_text_offset* above the bubble and with the distance *angled_text_gap* between the lines of information.

If bubbles are not drawn, the bubble text and the deflection angle and junction name and angle is placed the distance *angled_text_offset* above bottom of the top area. Each line of text is separated by the distance *angled_text_gap*.

The deflection angle and junction name and angle are drawn at an angle of *angled_text_angle*.

<i>angled_text_offset</i>	<i>mm</i>	// distance of text above bubble text // or above bottom of top area
<i>angled_text_gap</i>	<i>mm</i>	// distance between text to the right // of bubble text.
<i>angled_text_angle</i>	<i>value</i>	// angle of text

The pre and post text, colour, size and text style for the deflection angle of the drainage string pipes going through the pit are controlled by:

<i>angled_pre_text</i>	<i>text</i>	// default " "
<i>angled_post_text</i>	<i>text</i>	// default " "
<i>angled_text_colour</i>	<i>colour</i>	// colour of deflection angle text
<i>angled_text_size</i>	<i>mm</i>	// size of deflection angle text
<i>angled_textstyle</i>	<i>textstyle</i>	// textstyle of deflection angle text

The junction drainage string name can be included/not included in the first line of junction information:

junction_name_mode	0	// don't include the junction string name
	1	// default - use junction string name

The pre and post text, colour, size and text style for the junction name and the angle that the junction makes at the pit are controlled by:

junction_pre_text	text	// default "JUNCTION "
junction_post_text	text	// default " "
junction_text_colour	colour	// colour of junction name text
junction_text_size	mm	// size of junction name text
junction_textstyle	textstyle	// textstyle for junction name text
junction_angle_pre_text	text	// default " "
junction_angle_post_text	text	// default " "
junction_angle_text_colour	colour	// colour of junction angle text
junction_angle_text_size	mm	// size of junction angle text
junction_angle_textstyle	textstyle	// textstyle for junction angle text

Symbols at Manholes

Manholes can be labelled with symbols which depend on the manhole type. There can be up to twenty (20) sets of manhole symbols.

manhole_symbol_n_type	<i>mh_type</i>	// manhole type to have symbols
manhole_symbol_n_mode	0	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol

0 + 1 | 2 | 3 □ 4 △ 5 ○

predefined symbols for manhole_symbol_n_modes 0 to 5

manhole_symbol_n_position	1	// at top of manhole - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
manhole_symbol_n_size	<i>mm</i>	// size
manhole_symbol_n_x	<i>mm</i>	// x adjustment to position - default 0
manhole_symbol_n_y	<i>mm</i>	// y adjustment to position - default is 0
manhole_symbol_n_style	<i>text</i>	// the name of the linestyle (symbol)
manhole_symbol_n_angle	<i>value</i>	// default value is 0
manhole_symbol_n_colour	<i>colour</i>	//

For example:

manhole_symbol_1_type	"CONC COVER"	// manhole type to use
manhole_symbol_1_position	1	// on top of manhole
manhole_symbol_1_mode	6	// use 12d symbol
manhole_symbol_1_style	"shrub"	// name of 12d symbol
manhole_symbol_1_size	1	
manhole_symbol_1_x	0	
manhole_symbol_1_y	0	

Labelling House Connections

NOTE - house connections are only accessible by the *Sewer module*.

The house connections can be drawn from the pipe to the house connection level, with a line across the top (a T). The full width the T can be specified by the user.

draw_house_connections	yes/no
house_connection_width	value

The lot name for the house connection and the connection type can be labelled above the house connection. The house connection label is made up as:

connection_pre_text lot_name *connection_mid_text* connection_type *connection_post_text*

where lot_name and connection_type are stored with the house connection on the drainage string.

The parameters controlling the drawing of the house connection label are

```

house_connection_mode      0          // don't label the house connection
                           1          // label the house connection with name
                               // and type(default)
                           2          // label the house connection with name only

connection_pre_text        text       // default " "
connection_mid_text        text       // default " "
connection_post_text       text       // default " "
connection_text_colour     colour     // colour of connection label
connection_text_size       mm         // size of connection label
connection_textstyle       textstyle  // textstyle connection label
connection_text_x          mm         // x adjustment to position of text - def 0
connection_text_y          mm         // y adjustment to position of text - def 0
connection_text_justify    text       // default is Bottom_left
connection_text_angle      value     // default vertical 90
connection_text_position   1          // above point height value
                           3          // above top of boxes
                           4          // above highest point
                           100         // to primary string
                           101        // to first found tin

```

Label connection type:

(this is used when the house_connection_mode is turned off, only the connection type is labelled)

```

house_connection_type_mode 0          // default, don't label connection type
                           1          // label connection type

connection_type_text_x     mm         // x adjustment to position of text - def 0
connection_type_text_y     mm         // y adjustment to position of text - def 0
connection_type_pre_text   text       // text before type - def " "
connection_type_post_text  text       // text after type - def " "
connection_type_text_size  mm         // def box_text_size
connection_type_text_colour colour    // def box_text_colour
connection_type_textstyle  text       //
connection_type_text_justify text     //
connection_type_text_angle value     // def vertical 90
connection_type_text_position 1        // above point height value - default
                           3          // above top of boxes
                           4          // above highest point
                           100         // to primary string
                           101        // to first found tin

```

Label the distance from the down stream pit to the house connection

```

house_connection_ds_pit_mode 0         // default, don't label chainage
                             1         // label from down stream
                             2         // label from up stream
                             3         // label from left
                             4         // label from right

connection_ds_pit_text_x    mm         // x adjustment to position of text
connection_ds_pit_text_y    mm         // y adjustment to position of text
connection_ds_pit_pre_text  text       // ("") text before type
connection_ds_pit_post_text text       // ("") text after type
connection_ds_pit_text_size mm         // def box_text_size
connection_ds_pit_text_colour colour    //def (box_text_colour
connection_ds_pit_textstyle text       //
connection_ds_pit_text_justify text     // default Bottom_Left
connection_ds_pit_text_angle value     // default is vertical (90)
connection_ds_pit_text_position 1        // above point height value - default
                             3         // above top of boxes

```

```

4 // above highest point
100 // to primary string
101 // to first found tin
connection_ds_pit_decimals value // def number_of_decimals

```

Label the connection depth from the finished surface

```

house_connection_depth_mode 1 //default, label house connection depth
0 // don't label house connection depth
connection_depth_text_x mm // x adjustment to position of text - def 0
connection_depth_text_y mm // y adjustment to position of text - def 0
connection_depth_pre_text text // text before type - def " "
connection_depth_post_text text // text after type - def " "
connection_depth_text_size mm // default box_text_size
connection_depth_text_colour colour // default box_text_colour
connection_depth_textstyle text //
connection_depth_text_justify text // default Bottom_left
connection_depth_text_angle value // default is vertical (90)
connection_depth_text_position 1 // above point height value - default
3 // above top of boxes
4 // above highest point
100 // to primary string
101 // to first found tin
connection_depth_decimals value // default number_of_decimals

```

Label the finished surface:

```

house_connection_fs_mode 1 //default, label house connection finished
// surface
0 // don't label house con finished surface
connection_fs_text_x mm // x adjustment to position of text - def 0
connection_fs_text_y mm // y adjustment to position of text - def 0
connection_fs_pre_text text // text before type -def " "
connection_fs_post_text text // text after type - def " "
connection_fs_text_size mm // default box_text_size
connection_fs_text_colour colour // default box_text_colour
connection_fs_textstyle text //
connection_fs_text_justify text // default Bottom_left
connection_fs_text_angle value // default (vertical 90)
connection_fs_text_position 1 // above point height value - default
3 // above top of boxes
4 // above highest point
100 // to primary string
101 // to first found tin
connection_fs_decimals integer // default number_of_decimals
// If > 0, all trailing zeros after the
// decimal place are removed.
// If < 0, the absolute value is taken as
// the number of decimal places and no
// trailing zeros are removed after the
// decimal point.

```

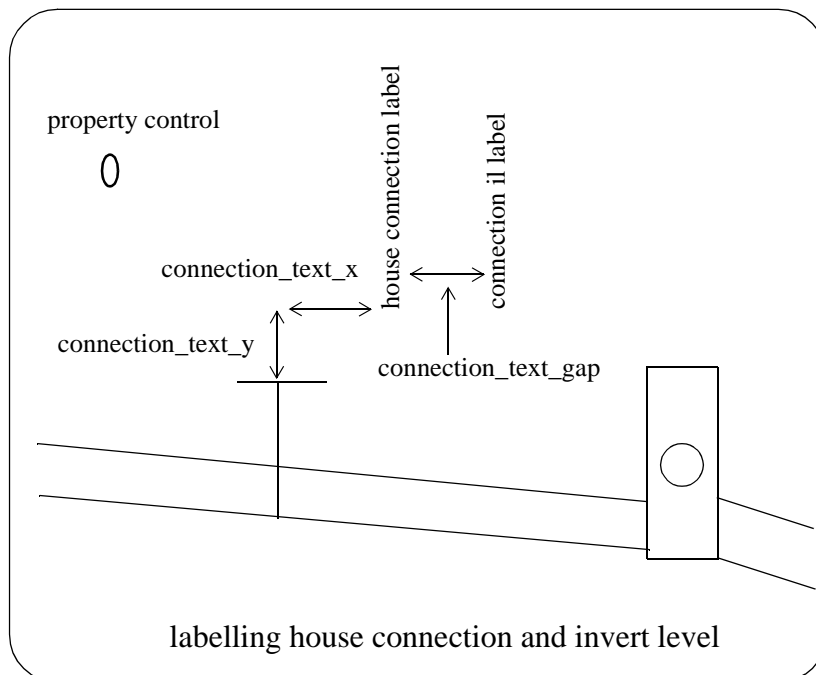

The invert level of the house connection can also be plotted. The house connection invert level label is made up as:

```
connection_il_pre_text connection_invert_level connection_il_post_text
```

The parameters controlling the drawing of the house connection invert level label are:

```
house_connection_il_mode 1 // default, label the house connection il
```

	0	// don't label the house connection il
connection_il_text_position	1	// above point height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
connection_il_text_x	mm	// x adjustment to position of text - def 0
connection_il_text_y	mm	// y adjustment to position of text - def 0
connection_text_gap	mm	// distance from connection label and il label
connection_il_decimals	integer	// def -3, number of decimal places in il value
		// >0 drop trailing zeros after decimal point
		// < 0 keep trailing zeros
connection_il_pre_text	text	// default " ", text before type
connection_il_post_text	text	// default " ", text after type
connection_il_text_colour	colour	// colour of connection il - def box_text_colour
connection_il_text_size	mm	// size of connection il - def box_text_size
connection_il_textstyle	textstyle	// textstyle connection il
connection_il_text_justify	text	//
connection_il_text_angle	value	// (vertical 90)

Symbols at Property Controls

NOTE - property controls and house connections are only accessible by the *Sewer module*.

The position of the property controls can be drawn as circles (which will display as an oval depending on the vertical exaggeration) with the diameter of the property control.

draw_property_controls yes/no

The position of the property control can also be indicated by placing a symbol at the property control.

The position of the property control at the drainage string can be labelled with symbols. There can be up to twenty (20) sets of property control symbols.

property_control_symbol_n_mode	0	// cross
	1	// up from centre of box
	2	// up and down from centre of box

3	// square
4	// triangle, base at bottom
5	// circle
6	// use a 12d symbol

0 + 1 | 2 | 3 □ 4 △ 5 ○

predefined symbols for property_control_symbol_n_modes 0 to 5

property_control_symbol_n_position	0	// at bottom (invert) of property control
	1	// at top (obvert) of property control
	2	// at centre (axis) of property control
property_control_symbol_n_size	mm	// size
property_control_symbol_n_x	mm	// x adjustment to position - default 0
property_control_symbol_n_y	mm	// y adjustment to position - default is 0
property_control_symbol_n_style	text	// the name of the 12d symbol
property_control_symbol_n_angle	value	// default value is 0
property_control_symbol_n_colour	colour	//colour of the symbol

For example:

property_control_symbol_1_position	0	// at bottom of prop control
property_control_symbol_1_mode	6	// use 12d symbol
property_control_symbol_1_style	"shrub"	// name of 12d symbol
property_control_symbol_1_size	1	
property_control_symbol_1_x	0	
property_control_symbol_1_y	0	

Labelling Property Controls

NOTE - property controls and house connections are only accessible by the *Sewer module*.

The property control can be labelled with its name where the property control is at the drainage string. The property control name label is made up as:

property_control_pre_text property_control_name *property_control_post_text*

where *property_control_name* is the stored with the property control on the drainage string.

The parameters controlling the labelling the property control are

property_control_mode	0	// don't label the property control with name
	1	// label the property control with name
property_control_pre_text	text	// default " "
property_control_post_text	text	// default " "
property_control_text_colour	colour	// colour of label
property_control_text_size	mm	// size of label
property_control_textstyle	textstyle	// textstyle label
property_control_text_x	mm	// x adjustment to position of text - def 0
property_control_text_y	mm	// y adjustment to position of text - def 0
property_control_text_justify	text	// default is Bottom_left
property_control_text_angle	value	// default vertical 90
property_control_text_position	1	// above pc centre height value
	3	// above top of boxes
	4	// above highest point
	100	// to primary string

101 // to first found tin

Label the distance from the down stream pit to the property control

```

property_control_ds_pit_mode      0          // default, don't label chainage
                                  1          // label from down stream
                                  2          // label from up stream
                                  3          // label from left
                                  4          // label from right
property_control_ds_pit_text_x    mm         // x adjustment to position of text
property_control_ds_pit_text_y    mm         // y adjustment to position of text
property_control_ds_pit_pre_text  text      // ("") text before type
property_control_ds_pit_post_text text      // ("") text after type
property_control_ds_pit_text_size mm        // def box_text_size
property_control_ds_pit_text_colour colour   //def (box_text_colour
property_control_ds_pit_textstyle text      //
property_control_ds_pit_text_justify text    // default Bottom_Left
property_control_ds_pit_text_angle value     // default is vertical (90)
property_control_ds_pit_text_position 1      // above pc centre height value - default
                                  3          // above top of boxes
                                  4          // above highest point
                                  100        // to primary string
                                  101        // to first found tin
property_control_ds_pit_decimals  value     // def number_of_decimals

```

Label the depth from the finished surface to the invert level of the property control:

```

property_control_depth_mode      1          //default, label property control depth
                                  0          // don't label pc depth
property_control_depth_text_x    mm         // x adjustment to position of text - def 0
property_control_depth_text_y    mm         // y adjustment to position of text - def 0
property_control_depth_pre_text  text      // text before type - def " "
property_control_depth_post_text text      // text after type - def " "
property_control_depth_text_size mm        // default box_text_size
property_control_depth_text_colour colour   // default box_text_colour
property_control_textstyle       text      //
property_control_depth_text_justify text    // default Bottom_left
property_control_depth_text_angle value     // default is vertical (90)
property_control_depth_text_position 1      // above pc centre height value - default
                                  3          // above top of boxes
                                  4          // above highest point
                                  100        // to primary string
                                  101        // to first found tin
property_control_depth_decimals  value     // default number_of_decimals

```

Label the finished surface:

```

property_control_fs_mode      1          //default, label pc finished surface
                                  0          // don't label pc finished surface
property_control_fs_text_x     mm         // x adjustment to position of text - def 0
property_control_fs_text_y     mm         // y adjustment to position of text - def 0
property_control_fs_pre_text   text      // text before type -def " "
property_control_fs_post_text  text      // text after type - def " "
property_control_fs_text_size  mm        // default box_text_size
property_control_fs_text_colour colour   // default box_text_colour
property_control_fs_textstyle  text      //
property_control_fs_text_justify text    // default Bottom_left
property_control_fs_text_angle value     // default (vertical 90)
property_control_fs_text_position 1      // above pc centre height value - default
                                  3          // above top of boxes

```

```

4 // above highest point
100 // to primary string
101 // to first found tin
property_control_fs_decimals integer // default number_of_decimals
// If > 0, all trailing zeros after the
// decimal place are removed.
// If < 0, the absolute value is taken as
// the number of decimal places and no
// trailing zeros are removed after the
// decimal point.

```

The invert level of the property control at the drainage string can also be plotted. The property control invert level label is made up as:

```
property_control_il_pre_text property_control_invert_level property_control_il_post_text
```

The parameters controlling the drawing of the property control invert level label are:

```

property_control_il_mode 1 // default, label the pc il
0 // don't label the pc il
property_control_il_text_position 1 // above pc centre height value - default
3 // above top of boxes
4 // above highest point
100 // to primary string
101 // to first found tin
property_control_il_text_x mm // x adjustment to position of text - def 0
property_control_il_text_y mm // y adjustment to position of text - def 0
property_control_text_gap mm // distance from pc name label and il label
property_control_il_decimals integer // def -3, number of decimal places in il value
// >0 drop trailing zeros after decimal point
// < 0 keep trailing zeros
property_control_il_pre_text text // default " ", text before type
property_control_il_post_text text // default " ", text after type
property_control_il_text_colour colour // colour of pc il -def box_text_colour
property_control_il_text_size mm // size of pc il - def box_text_size
property_control_il_textstyle textstyle // textstyle pc il
property_control_il_text_justify text //
property_control_il_text_angle value // (vertical 90)

```

Hatching Cut and Fill Areas

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins be hatched.

The parameters for labelling cuts and/or fill regions between tins are given by:

hatch_original_tin_n	<i>tin_name</i>	// tin_name for original surface
hatch_new_tin_n	<i>tin_name</i>	// tin_name for final surface
hatch_cut_separation_n	<i>mm</i>	// distance between cut hatch lines
	0	// don't do cut hatching
hatch_cut_angle_n	<i>degrees</i>	// angle in degrees of cut hatching
hatch_cut_colour_n	<i>colour</i>	// colour of the cut hatching
hatch_cut_linestyle_n	<i>linestyle</i>	// linestyle for cut hatching
hatch_cut_draw_sides_n	1/0	// 1 = draw sides of cut regions
hatch_cut_draw_original_n	1/0	// 1 = draw original tin in cut regions
hatch_cut_draw_new_n	1/0	// 1 = draw new tin in cut regions
hatch_fill_separation_n	<i>mm</i>	// distance between fill hatch line
	0	// don't do fill hatching
hatch_fill_angle_n	<i>degrees</i>	// angle in degrees of fill hatching
hatch_fill_colour_n	<i>colour</i>	// colour of the fill hatching
hatch_fill_linestyle_n	<i>linestyle</i>	// linestyle for fill hatching
hatch_fill_draw_sides_n	1/0	// 1 = draw sides of fill regions
hatch_fill_draw_original_n	1/0	// 1 = draw original tin in fill regions
hatch_fill_draw_new_n	1/0	// 1 = draw new tin in fill regions

Notes

- (a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- (b) cut hatching is turned off by setting hatch_cut_separation_n to 0.0.
fill hatching is turned off by setting hatch_fill_separation_n to 0.0.

Labelling Cuts of Drainage Through Strings in a Model

The cuts that the drainage string makes through any strings in user given models can be automatically labelled on the long section plots.

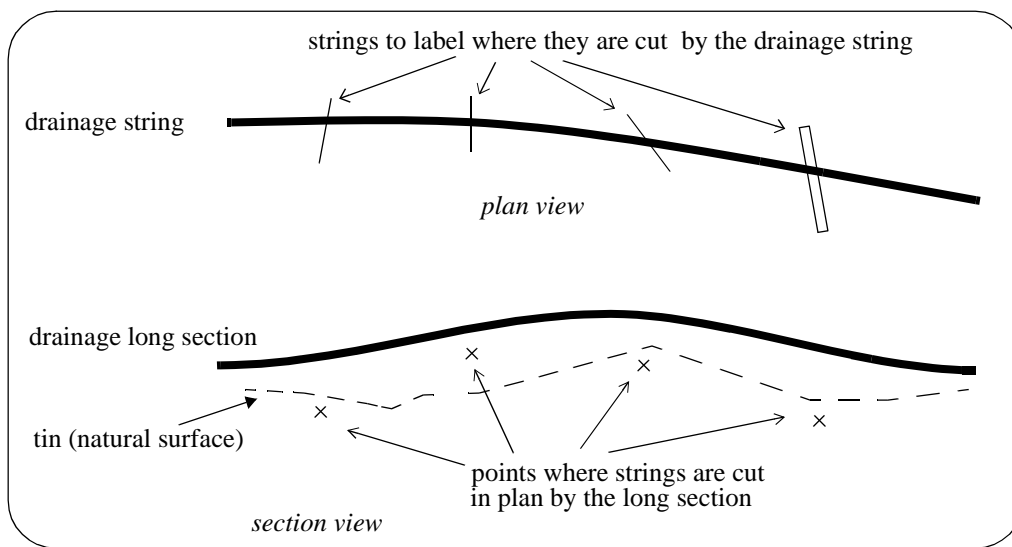

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the

- (a) top of the boxes on the long section
- (b) height value of the cut string
- (c) height of the primary string
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note:

Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings.

For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

Text justification refers to the actual position and is given by

- | | | |
|---------------|-----------------|----------------|
| “top-left” | “top-centre” | “top-right” |
| “middle-left” | “middle-centre” | “middle-right” |
| “bottom-left” | “bottom-centre” | “bottom-right” |

A choice of six special symbols and/or any 12d symbols can be drawn at the cut point.

The special 12d Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are

Up to twenty five (25) separate models of strings can be cut and labelled.

Parameters for Labelling Where the Drainage Line Cuts Strings in a Model

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose name matches the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

The parameters for selecting and labelling the n'th set (where n can be from 1 to 25) of cuts of the design string with the strings in the model are given by:

```
cuts_n_model          model_name          // model of strings to be cut
```

The selection of the strings from the model *model_name* whose cut points are to be labelled is all the strings whose name satisfies the name mask *cuts_n_mask*:

```
cuts_n_mask          name_mask          // strings to check for cuts
                                     // and if a cut occurs,
                                     // parameters show how to
                                     // label the cut
```

where *name_mask* is a text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.

For example

```
cuts_1_mask          "ke*"
or cuts_1_mask          "?bank*"
or, if both masks are required,
   cuts_1_mask          "ke* ?bank*"
```

If *cuts_n_mask* is missing, then all strings in the model are used. This is equivalent to *name_mask* being "*".

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the drainage strings, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the n'th set.

The parameters for drawing a **symbol** at the cut points are

```
cuts_symbol_n_mode    0          // cross
                     1          // up from centre of box
                     2          // up and down from centre of box
                     3          // square
                     4          // triangle, base at bottom
                     5          // circle
                     6          // use a 12d symbol
```

0 + 1 | 2 | 3 □ 4 △ 5 ○

predefined symbols for cut_symbol_n_modes 0 to 5

If *cuts_symbol_n_mode* is 6, then the 12d symbol is given by

```
cuts_symbol_n_style  plotsymbol      // 12d symbol to draw at cut
```

Important Note

The plot symbol of name *plotsymbol* is defined in the file given by:

- (a) the parameter *plot_symbols* in the ppf file

plot_symbols *filename*

or if *plot_symbols* is not defined, then

(b) in the file pointed to by the environment variable PLOT_SYMBOLS_4D
PLOT_SYMBOLS_4D *filename* // default *plotsym.4d*

or if *PLOT_SYMBOLS_4D* is not defined, then

(c) in the file *plotsym.4d*
which is searched for in the standard set up file sequence

If none of the above files are defined, or if the symbol does not exist in the above files, then it will be searched for in the standard 12d symbols file which is:

(d) either pointed to by the environment variable SYMBOLS_4D
SYMBOLS_4D *filename* // default *symbols.4d*

or if the environment variable *SYMBOLS_4D* does not exist, in the file, *symbols.4d*

The position of the symbol or plot symbol is given by:

cuts_symbol_n_position	1	// above point height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.

The symbol can be adjusted by the parameters:

cuts_symbol_n_x	<i>mm</i>	// offset adjustment to position
cuts_symbol_n_y	<i>mm</i>	// height adjustment to position
cuts_symbol_n_angle	<i>degrees</i>	// rotation about point
cuts_symbol_n_colour	<i>colour</i>	// colour of symbol

and for all values of *cuts_symbol_n_mode* other than 6:

cuts_symbol_n_size	<i>mm</i>	// size of symbol, 0 don't draw
--------------------	-----------	---------------------------------

The value of the **chainage** of the cut string can be labelled using the parameters

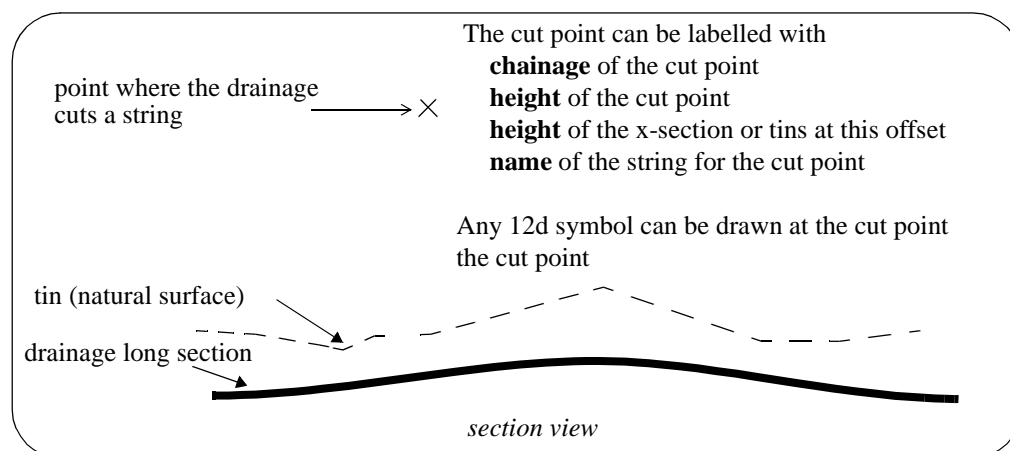

cuts_chainage_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_chainage_n_x	<i>mm</i>	// chainage adjustment to position
cuts_chainage_n_y	<i>mm</i>	// height adjustment to position
cuts_chainage_n_angle	<i>degrees</i>	// rotation about point
cuts_chainage_n_size	<i>mm</i>	// size of text, 0 don't label
cuts_chainage_n_colour	<i>colour</i>	// colour of text
cuts_chainage_n_textstyle	<i>text</i>	// textstyle of text chainage
cuts_chainage_n_pre_text	<i>text</i>	// text before the chainage value
cuts_chainage_n_post_text	<i>text</i>	// text after the chainage value
cuts_chainage_n_justification	<i>justification</i>	// justification of the text
cuts_chainage_n_no_decimals	<i>integer</i>	// number of decimals in chainage

The value of a **height** at the chainage of the point can be calculated and labelled using the parameters

cuts_height_n_mode	1	// use height of cut point itself
	3	// use real world height of position
		// above boxes
	100	// height of primary string
cuts_height_n_position	101-500	// use height of to tin1 or tin2 etc.
	1	// at points position
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_height_n_x	mm	// chainage adjustment to position
cuts_height_n_y	mm	// height adjustment to position
cuts_height_n_angle	degrees	// rotation about point
cuts_height_n_size	mm	// size of text, 0 don't label
cuts_height_n_colour	colour	// colour of text
cuts_height_n_textstyle	text	// textstyle of text height
cuts_height_n_pre_text	text	// text before the height value
cuts_height_n_post_text	text	// text after the height value
cuts_height_n_justification	justification	// justification of the text
cuts_height_n_no_decimals	integer	// number of decimals in height

A **label** which can include the **name** of the cut string is drawn by using the parameters

cuts_label_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_label_n_mode	0	// don't include cut string name
	1	// include cut string name in label
cuts_label_n_x	mm	// chainage adjustment to position
cuts_label_n_y	mm	// height adjustment to position
cuts_label_n_angle	degrees	// rotation about point
cuts_label_n_size	mm	// size of text, 0 don't label
cuts_label_n_colour	colour	// colour of text
cuts_label_n_textstyle	text	// textstyle of text label
cuts_label_n_pre_text	text	// text before the string name
cuts_label_n_post_text	text	// text after the string name
cuts_label_n_justification	justification	// justification of the text

Title Block Information

The plot can have a standard 12d Model title block or a user defined title block.

The standard title block consists of a simple border around the plot and two lines of text in a box underneath the plot. For a user defined title block, all the line work and text is defined by the user.

Standard Title Block

For the standard 12d Model title block, there are extra parameters for two lines of text and text size and colour. The standard title block is turned on or off by the parameter *plot_border*.

<i>plot_border</i>	<i>yes/no</i>	<i>// yes plots a standard title block</i> <i>// default yes</i>
<i>title_1</i>	<i>text</i>	
<i>title_2</i>	<i>text</i>	
<i>title_text_size</i>	<i>value</i>	
<i>title_colour</i>	<i>colour</i>	

User Title Block

For the user defined title block, the title block drawing commands are kept in a file whose name is supplied by the user. The title block drawing commands are almost identical to the linestyle drawing commands and is given at the beginning of chapter Advanced Plotting.

Hence for a user defined title block, there are just two parameters - one to say a title block file is being used and the other to give the name of the title block file. The *plot_border* parameter should also be set to *no* so that the standard title block is not also drawn.

<i>use_title_file</i>	<i>yes/no</i>	<i>// yes draws the title block given in title_file</i> <i>// default no</i>
<i>title_file</i>	<i>filename</i>	
<i>plot_border</i>	<i>no</i>	<i>// turn off standard title block</i>

Some special plot parameters are used to pass information down to variables in a user defined title block

For example, inside the title block file it is possible to have runtime user defined text variables. The actual text values for these text variables are passed down to the title block file from the plot parameter file via the parameters *user_text_n* ($n = 1, 2, \dots, 1000$)

<i>user_text_n</i>	<i>text</i>
--------------------	-------------

The special plot parameters are:

<i>time_format</i>	<i>text</i>	<i>// format for \$time</i>
<i>user_text_n</i>	<i>text</i>	<i>// where n = 1, 2, ... 1000</i> <i>// passed down to \$user_text_n</i>
<i>title_1</i>	<i>text</i>	<i>// passed down to \$title_1</i>
<i>title_2</i>	<i>text</i>	<i>// passed down to \$title_2</i>
<i>start_page_number</i>	<i>integer</i>	<i>// used as the starting value for</i> <i>// \$page_number. If missing,</i> <i>// \$page_number starts at 1.</i>
<i>start_drawing_number</i>	<i>integer</i>	<i>// added to \$drawing_number in title</i> <i>// block file. If missing,</i> <i>// \$drawing_number starts at 1.</i>
<i>drawing_number_prefix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_prefix</i>
<i>drawing_number_postfix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_postfix</i>

Parameters that Modify Fields In the Plot Drainage Network Panel

A number of parameters match those in the **plot drainage network** panel.

When the plot parameter file is first read, any parameters in the panel will be replaced by the values of any corresponding parameters from the parameter file.

However, if the parameter is subsequently modified in the panel, the panel value will be the value used for the parameter.

The plot parameters that also occur in the **plot drainage network** panel are:

network_model	<i>text</i>
scale	<i>value</i>
plotter_type	<i>text</i>
plot_stem	<i>text</i>
view_name	<i>text</i>
sheet_size	<i>text</i> or "width height"
plot_height	<i>mm</i>
x_origin	<i>mm</i>
y_origin	<i>mm</i>
global_textstyle	<i>textstyle</i>
box_text_size	<i>mm</i>
box_colour	<i>colour</i>
plot_border	<i>yes/no</i>
title_1	<i>text</i>
title_2	<i>text</i>
title_text_size	<i>value</i>
title_text_colour	<i>colour</i>
use_title_file	<i>yes/no</i>
title_file	<i>filename</i>

Melbourne Water

Position of menu: Design =>Drainage-Sewer=>Plots=>Melbourne Water

The **Melbourne Water** option is used to generate the longsection plots for all lines in a drainage network to the Melbourne Water sewer standards.

Given the plot sheet size and the horizontal and vertical scales, the longsections for the drainage lines are plotted starting at the top of the sheet and moving across the sheet. Once one row is full, if there is room the plot moves down the page and begins a new row. When a plot sheet is full, a new plot sheet is automatically begun.

Hence the drainage lines are plotted one after another on one or more plotter sheets.

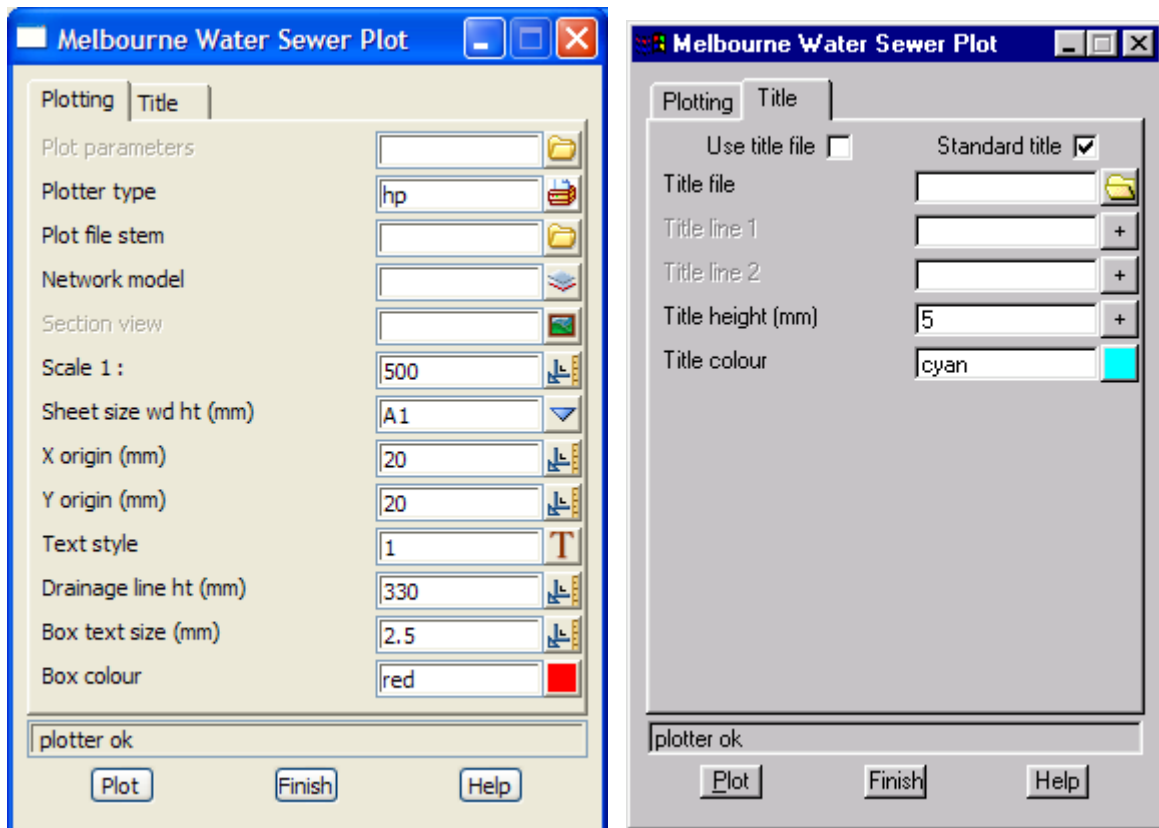

The drainage lines are plotted in string name alphabetical order.

The drainage longsection plot includes

- s the manholes, drainage pipe and any house connections
- s the height of the natural surface at the manhole
- s manhole names and cover types
- s distances between manholes
- s the invert depth of the pipe on either side of a manhole
- s the grades and types of the pipes
- s any services in the corridor - including their name, invert level and distance from the nearest downstream manhole

[melbourne_water_sewer_plot](#) [melb_water_plot_title](#)

After selecting the **Melbourne Water** option, the **Melb plot drainage network** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters <i>file of plot parameters used for extra control of the long section plot.</i>	input		*.ppf
Plotter type <i>format for the plot output.</i>	input	hp	hp, dxf, postscript etc.
Network model <i>the model containing all the drainage lines for the network.</i>	input		
Section view <i>the section view to be used to define the vertical exaggeration, corridor widths, tins to section through, services models to section etc.</i>	input		
Plot file stem <i>since more than one plot page may be produced, the plot file names are constructed from the stem plus a plot page sequence number, followed by the appropriate plotter type ending.</i>	input		
Scale 1: <i>horizontal scale for plotting the drainage long section. The vertical exaggeration is taken from the section view given in the section view field.</i>	input		
Sheet size wd ht (mm) <i>the width and height values (separated by space) or the name of a user defined sheet size.</i>	input		available sheet sizes
X origin (mm) <i>the x position on the plot sheet for the bottom left hand corner of the longsection plots.</i>	input		
Y origin (mm) <i>the y position on the plot sheet for the bottom left hand corner of the longsection plots.</i>	input		
Drainage line ht (mm) <i>the maximum allowable height for a longsection plot for a drainage line. Datum breaks are applied to any part of the longsection that will not fit into the drainage line ht.</i>	input	boxes	boxes, centreline
Box text size (mm) <i>size (in millimetres) to plot the chainages, heights etc. in the boxes in the plots of the drainage longsections</i>	input	3	
Box colour <i>colour used for the text and the boxes.</i>	input	cyan	available colours
Plot <i>plot the drainage longsections for the drainage lines in the model given in the network model field.</i>	button		
The fields and buttons in <i>title</i> tab are:			
Use title file <i>if tick, a user defined title block file is used.</i>	tick-cross		
Standard Title <i>if tick, the standard 12d Model border and two lines of title are placed on the bottom of the plot</i>	tick-cross	tick	
Title file <i>if non-blank and use title file is set to tick, then the file given in this field is used to generate a user defined title block for the plot.</i>	input		*.tf

Title line 1/2	input		
	<i>first/second line of title information</i>		
Title height (mm)	input	5	
	<i>height (in millimetres) to draw the characters in the two lines of title information.</i>		
Title colour	input	cyan	available colours
	<i>colour used for the border and the title information.</i>		

Please continue to the next section “Melbourne Water Plot Parameter File” .

Melbourne Water Plot Parameter File

The **Melbourne Water plot** option is used to make special long section plots for a **network** of new drainage strings to Melbourne Water sewer standards.

Some of the look of the long section plot can be controlled from the **Melb plot drainage network** panel itself, however a wider selection of control parameters is available by using a Melbourne Water long plot, plot parameter file.

Because the Melbourne Water format is so fixed, most of the parameter have sensible default values and can be left out. However, for completeness, all the parameters are given.

The Melbourne Water Sewer (MWS) long section plot parameters are placed in a file with ending **.ppf**.

Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash // is considered to be a comment.

The set of all parameters for the Melbourne Water sewer long section plot is enclosed within a set of curly brackets { } with the header

```
melb_water_sewer_long_plot "plot set name"
```

before the curly brackets.

That is,

```
melb_water_sewer_long_plot "plot set name" {
    plot parameters
    one per line
}
```

If there is more than one melb_water_sewer_long_plot parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as section_x_plot in the same file. The other sets will be ignored when doing a Melbourne Water long section plot.

The plot parameters are documented in following groups:

For the *Plot Sheet layout*, please continue to the section “Plot Sheet Layout” .

Chainages, staggering and uprights, please continue to the section “Chainages, Staggering and Uprights” .

Boxes area, please continue to the section “Boxes Area” .

Datum area, please continue to the section “Datum Value” .

Arrows area, please continue to the section “Arrow Areas” .

Graph area parameters, please continue to the section “Graph Area” .

Top area parameters, please continue to the section “Top Area” .

Manhole parameters, please continue to the section “Manholes” .

Junctions parameters, please continue to the section “Junctions” .

Services parameters, please continue to the section “Services” .

Property controls and house connection parameters, please continue to the section “Property Controls and House Connections” .

Symbols at manhole parameters, please continue to the section “Symbols at Manholes” .

Hatching cut and fill parameters, please continue to the section “Hatching Cut and Fill Areas” .

Labelling cuts parameters, please continue to the section “Labelling Cuts of Drainage Through Strings in a Model” .

Title block parameters, please continue to the section “Title Block Information” .

Panel modifying parameters, please continue to the section “Parameters that Modify Fields In the Melbourne Water Network Panel” .

Plot Sheet Layout

The plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The overall size of the plot sheet is given by either a defined sheet size, or by the width and height of the plot given in millimetres and separated by one or more spaces.

```
sheet_size          text          // sheet name, or
                   "mm mm"       // sheet size: width height
```

The sheet size name and width and heights can be specified by the user in a file named sheets.4d which is in the normal set up areas, or is pointed to by the environment variable

```
SHEET_SIZES_4D    file          // file of plotter sheets sizes
```

The Melbourne Water long section plot will break an individual plot up if it doesn't fit across the sheet. There can be one or more rows of plot on the same sheet.

The top row is done first, followed by the second top row, then the third and so on until the bottom row. If there is only one row, it is considered to be the bottom row.

When a sheet is full, a follow on sheet is created.

As soon as one drainage string is completed, the next drainage string in the network model is plotted beginning on the same row as the previous drainage string and with a horizontal gap of size `horizontal_plot_gap` between the plots. If there is not enough room on the row to start the next plot, it will begin on a new row.

The position of the left hand bottom corner of the first plot in the bottom row is given by the parameters, `x_origin` and `y_origin`.

If there are two or more rows of plots, the position of the first plot in each row is given by adding multiples of the `plot_height` to the `y_origin`.

```
network_model      text          // model of sewer strings
x_origin           mm           // Position of the left hand bottom
y_origin           mm           // corner of first plot in the bottom row.
only_one_line      0            // more than one row on a sheet
                   1            // only one row of plot on a sheet
plot_height        mm           // total height of a plot row.
                   // It includes the vertical_plot_gap.
horizontal_plot_gap mm           // gap between plots on same row
vertical_plot_gap  mm           // gap between rows of plots
```

A `textstyle` can be specified which is used for all the text in the plot.

```
global_textstyle   textstyle    //used for all plot text
```

The Melbourne Water long plot itself consists of nine areas. From the bottom up, they are boxes, arrow 1, bottom stagger, arrow 2, graph, arrow 3, top stagger, arrow 4, top.

The **boxes area** is where the chainages and various values for the drainage strings are labelled.

The **arrow 1 area** is for drawing arrows where the arrows go between the staggered uprights and below the graph area. The datum line is at the bottom of the arrow 1 area.

The **bottom stagger area** is where the upright line staggers occur before going up from the boxes area to the graph area.

The **arrow 2 area** is for drawing arrows below the graph but where the arrows go between non-staggered uprights.

The **graph area** is the area where the actual plots of the strings are drawn.

The **arrow 3 area** is for drawing arrows above the graph area and where the arrows go between non-staggered uprights.

The **top stagger area** is where the upright line staggers occur above the graph area.

The **arrow 4 area** is for drawing arrows where the arrows go between the staggered uprights and above the graph area.

The **top area** is an annotation area above the arrow 4 area and is used for manhole names, junctions, deflection angles etc.

Although the arrow areas exist, the Melbourne Water plot does not have any arrows in them.

Chainages, Staggering and Uprights

All of the labelling of the Melbourne Water sewer plot is done at the chainages of the manholes on the drainage line. For example, the invert levels, depths and natural surface of pipes at a manhole are all labelled at the chainage of the manhole.

The labels for these values are done at an angle of zero degrees rather than ninety degrees for the sewer plots.

Uprights, or leader lines, are drawn from the values at the bottom of the plot to the manhole in the graph area.

If the text values are placed at the real chainage positions at the bottom of the plot, text over writing can easily occur if the chainages are very close together.

To prevent such over writing, the text can be **staggered**. That is, if the text is going to over write a previous text value, the next text value is actually moved along until there is no over writing.

Since the text is no longer at the correct chainage position, the uprights to the manholes and services start at the text position and then bend back to the correct chainage position on the plot. The region where the bending occurs is called the stagger area.

For the Melbourne Water plot, there is an area below the graph where the uprights bend backwards from the staggered text position to the real chainage position (bottom stagger area).

And there is a second area above the graph where the uprights bend forwards from the real chainage position to the staggered text position (top stagger area).

Hence annotation above the top stagger area will line up with the staggered values below the bottom stagger area.

The stagger area below the graph area is defined by

stagger_height_1	mm	// distance from the top of arrow_area_1 // to the start of the staggers
stagger_height_2	mm	// distance over which stagger occurs
stagger_gap_bottom	mm	// distance from end of staggers to the // bottom of arrow_area_2

The stagger area above the graph area is defined

stagger_gap_top	mm	// distance from the top of arrow_area_3 // to the start of the staggers
stagger_height_3	mm	// distance over which stagger occurs
stagger_height_4	mm	// distance from end of staggers to the // bottom of arrow_area_4

The distance to be left for text to avoid over writing is:

horizontal_text_gap	mm	// minimum distance to leave for text // after manhole values
services_text_gap	mm	// minimum distance to leave for text // after service values

When staggering occurs, it is possible for the values area to be longer than the graph area.

The **colour** of the uprights that are drawn from the text to the manholes is given by:

manhole_line_colour	colour	// colour of uprights to the manholes
---------------------	--------	---------------------------------------

Boxes Area

The drainage string values invert level, depth to invert and surface level can be labelled in the Melbourne Water plot with one line of title, and the actual values given at the chainage of each manhole in the drainage string.

The title or **label** for the strings, is drawn in the **labels area** of the **boxes area** and the values are drawn in the **values area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

labels followed by the **values** along the string.

Thus the boxes area is built up as a series of individual boxes and the **boxes area** is made up of two areas side by side - the **labels area** and the **values area**.

The order of the boxes from the bottom up is

- (a) chainage values
- (b) upstream and downstream depth to inverts
- (c) upstream and downstream invert levels
- (d) natural surface heights

The label text size and colour are specified by

```
plot_title_text_size      mm           // size of label text in boxes
plot_title_text_colour   colour       // colour of label text in boxes
```

The width of the label box is given by the **box_width** parameter and the height of each box is given by **box_height**.

```
box_width      mm           // width of the label boxes.
box_height     mm           // height of each box
```

The label text for each box can be set by

```
plot_title_chainage_name  text       // label for chainages box
plot_title_surface_name   text       // label for the sewer ns values
plot_title_invert_name    text       // label for the invert levels
plot_title_depth_name     text       // label for depth of inverts
```

For the Melbourne Water plots, there are also additional parameters for special Melbourne Water labels. They are

```
plot_title_item_name      text       // label for item line
plot_title_d_and_g_name   text       // label for diameter and grade
plot_title_detail_name    text       // label for detail line at top of plot
```

The pipe type can also be included with the diameter and grade values

```
label_pipe_type          yes/no
```

The **labels area** for the left plot in the bottom row starts at the co-ordinate (x_origin,y_origin) and each row is begun by adding the distance plot_height to the y_origin.

```
x_origin      mm           // x coord of bottom lh corner of bot row
y_origin      mm           // y coord of bottom lh corner of bot row
```

The **values area** starts at the end of the label area.

As for the label boxes, the height of each individual box area is given by the box_height parameter.

The width of the heights area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

```
box_text_size      mm           // size of value text
box_text_colour    colour       // colour of values in boxes
```

The colour of the box line work is given by:

```
box_colour         colour       // colour of the lines in the boxes
```

The total height of the boxes area is simply given by number of boxes drawn multiplied by the height of

one box).

The total width of the boxes area is the width of the labels area plus the width of the values area which depends on the amount of staggering that occurs.

Datum Value

The datum value is placed above the top of the natural surface heights box.

Since the datum value is automatically calculated to try and fit the plot vertically into the graph area, the datum value can change along the plot. When a datum change occurs, the new datum value is written on the datum line at the relevant chainage position.

The datum name, text size and colour are controlled by:

datum_name	<i>text</i>	// text to write before the datum value
datum_text_size	<i>mm</i>	// size of datum text and value
datum_colour	<i>colour</i>	// colour of the datum text and line
datum_value_pre_text	<i>text</i>	// text before the datum value
datum_value_post_text	<i>text</i>	// text after the datum value
		// (default " m")
datum_value_decimals	<i>integer</i>	// number of decimal places in the
		// datum value.
		// If > 0, trailing zeros are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and no
		// trailing zeros are removed.

Arrow Areas

The **arrow areas** were designed for drawing arrows between manholes and labelling them with values such as pipe slope, pipe diameter, flow, velocity and drainage line name.

These are not required for the Melbourne Water sewer plot.

However, values can still be given to defined the sizes of the arrow areas.

There are four arrow areas:

arrow_1_area which is below the graph and the bottom stagger area. The arrows go between the staggered positions of the manhole chainages.

The datum line is at the bottom of the arrow 1 area.

arrow_2_area which below the graph but above the bottom stagger area. Hence the arrows go between the non-staggered chainage positions of the manholes.

arrow_3_area which is above the graph but below the top stagger area. The arrows go between the non-staggered chainage positions of the manholes.

arrow_4_area is above the graph and the top stagger area. The arrows go between the staggered chainage positions of the manholes.

The heights of the four areas (which can be zero) are defined by:

arrow_area_1	<i>mm</i>	// height of arrow_1 area
arrow_area_2	<i>mm</i>	// height of arrow_2 area
arrow_area_3	<i>mm</i>	// height of arrow_3 area
arrow_area_4	<i>mm</i>	// height of arrow_4 area

Graph Area

The **graph area** is the area where the actual plots of the drainage strings are drawn.

The length of the graph area is determined by the length of the drainage string to be plotted, the horizontal scale (given by scale) of the plot and the sheet width.

```
scale                value                // 1:value - horizontal scale
// The vertical scale is determined by the
// horizontal scale and the vertical
// exaggeration for the section view.
```

The vertical exaggeration is taken from the section view specified for the plot by the parameter:

```
view_name            text
```

The tins to be sectioned through by the sewer strings and any service models and corridor settings for the graph area are also taken from the specified section view.

The height of the graph is **calculated** by subtracting the height of the other nine boxes from the plot height.

If the plot will not fit horizontally into a row on the sheet, then the plot will be broken at an appropriate manhole and the plot continued on another row.

Datum breaks at manholes are used to try and fit the plot vertically into the graph area but if the plot still cannot fit, then it will be truncated at the bottom.

The types of strings that can be drawn in the graph area of the sewer long section plot are:

- (a) drainage string the strings from the network model
- (b) tins sections of the drainage string through any tins on the section view.
- (c) services parts of strings from any models on the section view that cut the corridor for the section view.

The **colour** of the strings in the plot is the actual string colour for cases (a) and (c), and the colour of the tin used for the section in case (b).

Top Area

The **top area** is an annotation area above the arrow_4_area at the top of the plot.

It can be used for manhole names, manhole types, pegs, junctions and deflection angles through manholes.

The height of the top area is given by

```
vertical_plot_gap    mm                // size of the top area. If it is not large
// enough the text will over write the
// plot in the row above.
```

Manholes

The manhole name, manhole type, special manhole symbol and the change of direction of the pipes going through the manhole can all be displayed at the top of the plot.

The manhole name and type are drawn first, followed by the angle of any change of direction of the pipes going through the manhole (the angle is in degrees, minutes and seconds) and finally any junction information.

The text is drawn at the distance **angled_text_y_offset** above the top of the plot, **angled_text_x_offset** to the right of the manhole position and each piece of information is spaced horizontally by the distance **angled_text_gap** to the right of the manhole name if the **angled_text_angle** is zero, or the distance **angled_text_gap** below the previous text if **angled_text_angle** is non-zero.

The size of the manhole names and type is given by **angle_text_size** and the size of the change of direction angle is given by **manhole_angle_text_size**.

The colour of the manhole names, type and change of direction angle is given by **angle_text_colour**.

label_manhole_type		<i>yes/no</i>	// include manhole type
angled_text_size		<i>mm</i>	// size of manhole name text
manhole_angle_text_size		<i>mm</i>	// size of text for change of // angle through manhole
angled_text_x_offset	<i>mm</i>		// distance of text above top of the plot
angled_text_y_offset	<i>mm</i>		// distance of text to the right of manhole
angled_text_gap	<i>mm</i>		// distance of text to the right of previous // text
angled_text_angle	<i>value</i>		// angle of text
angled_text_colour	<i>colour</i>		// colour of text

The symbol at the manhole is controlled by the manhole name.

manhole_symbol_n_size		<i>mm</i>	
manhole_symbol_n_colour		<i>colour</i>	
manhole_symbol_n_y		<i>mm</i>	// distance above top line
manhole_symbol_n_repeats		<i>integer</i>	// draw the symbol this // many times with a // decreasing size)
manhole_line_colour		<i>colour</i>	// colour of line through // manhole

Junctions

Any junctions at the manhole are also labelled with the name of the lines coming into the manhole.

The junction text is made up of two lines:

```
JUNCTION LINE    line_name
angle of the junction
```

The junction text is at the same height as the manhole and angle text and at a distance **angled_text_gap** to the right of the manhole and angle text, or a previous junction label. The size of the text is given by

junction_angle_text_size	<i>mm</i>
--------------------------	-----------

When a junction does occur, the incoming pipe is drawn at the correct position on the manhole of the main line.

Services

Any services in the corridor are drawn on the plot and if the service actually cuts the drainage string, then a line is drawn to the cut point and the line labelled with the service name. The name is drawn below the cut point and is right justified.

<i>service_text_size</i>	<i>mm</i>	// size of the text for the service name
<i>service_text_x_offset</i>	<i>mm</i>	// adjustment to the drawing position
<i>service_text_y_offset</i>	<i>mm</i>	// for the service name
<i>service_text_colour</i>	<i>colour</i>	// colour of the service name
<i>service_line_colour</i>	<i>colour</i>	// colour of the line to the cut point

Property Controls and House Connections

The position of the property controls can be drawn on the plot and can have a user specified diameter.

<i>draw_property_controls</i>	<i>yes/no</i>
<i>property_control_diameter</i>	<i>value</i>

The house connections can be drawn from the pipe to the house connection level, with a line across the top (a T). The full width the T can be specified by the user.

<i>draw_house_connections</i>	<i>yes/no</i>
<i>house_connection_width</i>	<i>value</i>

Symbols at Manholes

Manholes can be labelled with symbols which depend on the manhole type. There can be up to twenty (20) sets of manhole symbols.

manhole_symbol_n_type	<i>mh_type</i>	// manhole type to have symbols
manhole_symbol_n_mode	0	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol

0 + 1 | 2 | 3 □ 4 △ 5 ○

predefined symbols for manhole_symbol_n_modes 0 to 5

manhole_symbol_n_position	1	// at top of manhole - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
manhole_symbol_n_size	<i>mm</i>	// size
manhole_symbol_n_x	<i>mm</i>	// x adjustment to position - default 0
manhole_symbol_n_y	<i>mm</i>	// y adjustment to position - default is 0
manhole_symbol_n_style	<i>text</i>	// the name of the 12d symbol
manhole_symbol_n_angle	<i>value</i>	// default value is 0
manhole_symbol_n_colour	<i>colour</i>	//

For example:

manhole_symbol_1_type	"CONC COVER"	// manhole type to use
manhole_symbol_1_position	1	// on top of manhole
manhole_symbol_1_mode	6	// use 12d symbol
manhole_symbol_1_style	"shrub"	// name of 12d symbol
manhole_symbol_1_size	1	
manhole_symbol_1_x	0	
manhole_symbol_1_y	0	

Hatching Cut and Fill Areas

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins be hatched.

The parameters for labelling cuts and/or fill regions between tins are given by:

hatch_original_tin_n	<i>tin_name</i>	// tin_name for original surface
hatch_new_tin_n	<i>tin_name</i>	// tin_name for final surface
hatch_cut_separation_n	<i>mm</i>	// distance between cut hatch lines
	0	// don't do cut hatching
hatch_cut_angle_n	<i>degrees</i>	// angle in degrees of cut hatching
hatch_cut_colour_n	<i>colour</i>	// colour of the cut hatching
hatch_cut_linestyle_n	<i>linestyle</i>	// linestyle for cut hatching
hatch_cut_draw_sides_n	1/0	// 1 = draw sides of cut regions
hatch_cut_draw_original_n	1/0	// 1 = draw original tin in cut regions
hatch_cut_draw_new_n	1/0	// 1 = draw new tin in cut regions
hatch_fill_separation_n	<i>mm</i>	// distance between fill hatch line
	0	// don't do fill hatching
hatch_fill_angle_n	<i>degrees</i>	// angle in degrees of fill hatching
hatch_fill_colour_n	<i>colour</i>	// colour of the fill hatching
hatch_fill_linestyle_n	<i>linestyle</i>	// linestyle for fill hatching
hatch_fill_draw_sides_n	1/0	// 1 = draw sides of fill regions
hatch_fill_draw_original_n	1/0	// 1 = draw original tin in fill regions
hatch_fill_draw_new_n	1/0	// 1 = draw new tin in fill regions

Notes

- cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- cut hatching is turned off by setting hatch_cut_separation_n to 0.0.
fill hatching is turned off by setting hatch_fill_separation_n to 0.0.

Labelling Cuts of Drainage Through Strings in a Model

The cuts that the drainage string makes through any strings in user given models can be automatically labelled on the long section plots.

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the

- (a) top of the boxes on the long section
- (b) height value of the cut string
- (c) height of the primary string
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note:

Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings.

For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

Text justification refers to the actual position and is given by

“top-left”	“top-centre”	“top-right”
“middle-left”	“middle-centre”	“middle-right”
“bottom-left”	“bottom-centre”	“bottom-right”

A choice of six special symbols and/or or any 12d symbols can be drawn at the cut point.

The special 12d Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are

Up to twenty five (25) separate models of strings can be cut and labelled.

Parameters for Labelling Where the Drainage Line Cuts Strings in a Model

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose name matches the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

The parameters for selecting and labelling the n'th set (where n can be from 1 to 25) of cuts of the design string with the strings in the model are given by:

```
cuts_n_model          model_name          // model of strings to be cut
```

The selection of the strings from the model *model_name* whose cut points are to be labelled is all the strings whose name satisfies the name mask *cuts_n_mask*:

```
cuts_n_mask          name_mask          // strings to check for cuts
                                     // and if a cut occurs,
                                     // parameters show how to
                                     // label the cut
```

where *name_mask* is a text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.

For example

```

                                     cuts_1_mask          "ke*"
or                                     cuts_1_mask          "?bank*"
or, if both masks are required,
                                     cuts_1_mask          "ke* ?bank*"

```

If *cuts_n_mask* is missing, then all strings in the model are used. This is equivalent to *name_mask* being "*".

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the drainage strings, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the n'th set.

The parameters for drawing a **symbol** at the cut points are

```
cuts_symbol_n_mode    0          // cross
                     1          // up from centre of box
                     2          // up and down from centre of box
                     3          // square
                     4          // triangle, base at bottom
                     5          // circle
                     6          // use a 12d symbol
```

0 + 1 | 2 | 3 □ 4 △ 5 ○

predefined symbols for cut_symbol_n_modes 0 to 5

If *cuts_symbol_n_mode* is 6, then the 12d symbol is given by

```
cuts_symbol_n_style   plotsymbol      // 12d symbol to draw at cut
```

Important Note

The plot symbol of name *plotsymbol* is defined in the file given by:

- (a) the parameter *plot_symbols* in the ppf file

```
plot_symbols          filename
```

or if *plot_symbols* is not defined, then

- (b) in the file pointed to by the environment variable PLOT_SYMBOLS_4D

```
PLOT_SYMBOLS_4D      filename      // default plotsym.4d
```

or if *PLOT_SYMBOLS_4D* is not defined, then

- (c) in the file *plotsym.4d*

which is searched for in the standard set up file sequence

If none of the above files are defined, or if the symbol does not exist in the above files, then it will be searched for in the standard 12d symbols file which is:

- (d) either pointed to by the environment variable SYMBOLS_4D

```
SYMBOLS_4D          filename      // default symbols.4d
```

or if the environment variable *SYMBOLS_4D* does not exist, in the file, *symbols.4d*

The position of the symbol is given by:

```
cuts_symbol_n_position    1          // above point height value
                          3          // above top of boxes
                          100        // to primary string
                          101-500    // to tin1 or tin2 etc.
```

The symbol can be adjusted by the parameters:

```
cuts_symbol_n_x          mm          // offset adjustment to position
cuts_symbol_n_y          mm          // height adjustment to position
cuts_symbol_n_angle      degrees     // rotation about point
cuts_symbol_n_colour     colour      // colour of symbol
```

and for all values of *cuts_symbol_n_mode* other than 6:

```
cuts_symbol_n_size       mm          // size of symbol, 0 don't draw
```

The value of the **chainage** of the cut string can be labelled using the parameters

```
cuts_chainage_n_position  1          // above cut strings height value
                          3          // above top of boxes
                          100        // to primary string
                          101-500    // to tin1 or tin2 etc.

cuts_chainage_n_x        mm          // chainage adjustment to position
cuts_chainage_n_y        mm          // height adjustment to position
cuts_chainage_n_angle    degrees     // rotation about point
cuts_chainage_n_size     mm          // size of text, 0 don't label
cuts_chainage_n_colour   colour      // colour of text
cuts_chainage_n_textstyle text       // textstyle of text chainage
cuts_chainage_n_pre_text text       // text before the chainage value
cuts_chainage_n_post_text text       // text after the chainage value
cuts_chainage_n_justification justification // justification of the text
cuts_chainage_n_no_decimals integer   // number of decimals in chainage
```

The value of a **height** at the chainage of the point can be calculated and labelled using the parameters

cuts_height_n_mode	1	// use height of cut point itself
	3	// use real world height of position // above boxes
cuts_height_n_position	100	// height of primary string
	101-500	// use height of to tin1 or tin2 etc.
	1	// at points position
	3	// above top of boxes
cuts_height_n_x	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_height_n_x	mm	// chainage adjustment to position
cuts_height_n_y	mm	// height adjustment to position
cuts_height_n_angle	degrees	// rotation about point
cuts_height_n_size	mm	// size of text, 0 don't label
cuts_height_n_colour	colour	// colour of text
cuts_height_n_textstyle	text	// textstyle of text height
cuts_height_n_pre_text	text	// text before the height value
cuts_height_n_post_text	text	// text after the height value
cuts_height_n_justification	justification	// justification of the text
cuts_height_n_no_decimals	integer	// number of decimals in height

A **label** which can include the **name** of the cut string is drawn by using the parameters

cuts_label_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_label_n_mode	0	// don't include cut string name
	1	// include cut string name in label
cuts_label_n_x	mm	// chainage adjustment to position
cuts_label_n_y	mm	// height adjustment to position
cuts_label_n_angle	degrees	// rotation about point
cuts_label_n_size	mm	// size of text, 0 don't label
cuts_label_n_colour	colour	// colour of text
cuts_label_n_textstyle	text	// textstyle of text label
cuts_label_n_pre_text	text	// text before the string name
cuts_label_n_post_text	text	// text after the string name
cuts_label_n_justification	justification	// justification of the text

Title Block Information

The plot can have a standard 12d Model title block or a user defined title block.

The standard title block consists of a simple border around the plot and two lines of text in a box underneath the plot. For a user defined title block, all the line work and text is defined by the user.

Standard Title Block

For the standard 12d Model title block, there are extra parameters for two lines of text and text size and colour. The standard title block is turned on or off by the parameter *plot_border*.

<i>plot_border</i>	<i>yes/no</i>	<i>// yes plots a standard title block</i> <i>// default yes</i>
<i>title_1</i>	<i>text</i>	
<i>title_2</i>	<i>text</i>	
<i>title_text_size</i>	<i>value</i>	
<i>title_colour</i>	<i>colour</i>	

User Title Block

For the user defined title block, the title block drawing commands are kept in a file whose name is supplied by the user. The title block drawing commands are almost identical to the linestyle drawing commands and is given at the beginning of chapter Advanced Plotting.

Hence for a user defined title block, there are just two parameters - one to say a title block file is being used and the other to give the name of the title block file. The *plot_border* parameter should also be set to *no* so that the standard title block is not also drawn.

<i>use_title_file</i>	<i>yes/no</i>	<i>// yes draws the title block given in title_file</i> <i>// default no</i>
<i>title_file</i>	<i>filename</i>	
<i>plot_border</i>	<i>no</i>	<i>// turn off standard title block</i>

Some special plot parameters are used to pass information down to variables in a user defined title block

For example, inside the title block file it is possible to have runtime user defined text variables. The actual text values for these text variables are passed down to the title block file from the plot parameter file via the parameters *user_text_n* ($n = 1, 2, \dots, 1000$)

<i>user_text_n</i>	<i>text</i>
--------------------	-------------

The special plot parameters are:

<i>time_format</i>	<i>text</i>	<i>// format for \$time</i>
<i>user_text_n</i>	<i>text</i>	<i>// where n = 1, 2, ... 1000</i> <i>// passed down to \$user_text_n</i>
<i>title_1</i>	<i>text</i>	<i>// passed down to \$title_1</i>
<i>title_2</i>	<i>text</i>	<i>// passed down to \$title_2</i>
<i>start_page_number</i>	<i>integer</i>	<i>// used as the starting value for</i> <i>// \$page_number. If missing,</i> <i>// \$page_number starts at 1.</i>
<i>start_drawing_number</i>	<i>integer</i>	<i>// added to \$drawing_number in title</i> <i>// block file. If missing,</i> <i>// \$drawing_number starts at 1.</i>
<i>drawing_number_prefix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_prefix</i>
<i>drawing_number_postfix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_postfix</i>

Parameters that Modify Fields In the Melbourne Water Network Panel

A number of parameters match those in the **New Melb Plot Drainage Network** panel.

When the plot parameter file is first read, any parameters in the panel will be replaced by the values of any corresponding parameters from the parameter file.

However, if the parameter is subsequently modified in the panel, the panel value will be the value used for the parameter.

The plot parameters that also occur in the **Melb plot drainage network** panel are:

network_model	<i>text</i>
scale	<i>value</i>
plotter_type	<i>text</i>
plot_stem	<i>text</i>
view_name	<i>text</i>
sheet_size	<i>text</i> or "width height"
plot_height	<i>mm</i>
x_origin	<i>mm</i>
y_origin	<i>mm</i>
global_textstyle	<i>textstyle</i>
box_text_size	<i>mm</i>
box_colour	<i>colour</i>
plot_border	<i>yes/no</i>
title_1	<i>text</i>
title_2	<i>text</i>
title_text_size	<i>value</i>
title_text_colour	<i>colour</i>
use_title_file	<i>yes/no</i>
title_file	<i>filename</i>

Frequently Asked Questions (FAQ)

Drainage Overview

The following are the basic steps from creating a urban drainage network to producing your plan/drainage longsection drawings and pit layout table. The optional catchment area models and bypass flow model will be discussed afterwards.

Set drainage defaults

Draw the drainage strings

Set zero chainage to downstream end of the pipe string (Reverse drainage strings) (optional)

Automatically assign pit names

Define catchment areas (optional)

Define Pit/manhole Inlet Capacities via Overland flow strings (optional)

Hydraulic/hydrology calcs via spreadsheets, Drains, RAT2000, PCdrain, XP SWMM or ILSAX

Drainage longsection plots

Pit layout/construction schedules

Manhole and Pipe Table of Quantities (summarise by type, depth and size)

Drainage line excavation volume calculations

Roadway flooded width calculations

Drainage Export and Import to Design Software

Copy/Paste from spreadsheets

Running Drains

Running PCdrain (Windows)

Running Micro Drainage - Win DES

Running XPSWMM

Running RAT2000

Training Course Notes

Drainage and *Advanced Drainage* training course notes (Adobe PDF format for printing) and sample 12d data sets are available on the installation CD. The training course moves through a worked example in detail. The course notes are also included below for your reference.

Drainage Course Notes

Advanced Drainage Course Notes

Drainage FAQ

Why do the **obvert/invert levels not change** when I import data via the "pit/pipe interface"?

On the interface panel there is an **Options** button that displays a panel with the "**hold obverts on import**" option. The default is off but if it is selected the pipe obverts will not change even if import data has new levels. Note that the invert levels will change if the pipe diameters change.

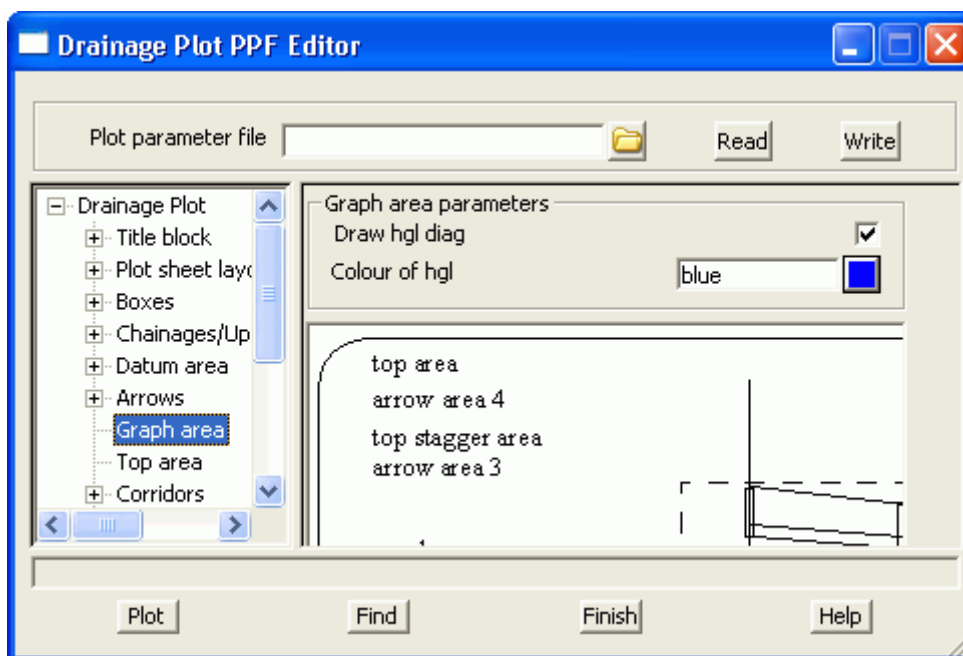

Can I **manually enter catchment areas** in the drainage design programs?

Yes. The catchment strings are optional in 12d. If no catchment string has been linked to a manhole and there has been no manhole "area" attribute a default area of 0.0001 will be sent. When results are imported back into 12d the total areas from the design package will be saved in the manhole "area" attribute.

How do I include/exclude the **hydraulic grade line** on drainage longsections. .

First, there must be HGL results. These may come from the 12d rational drainage design, imported from another design package (including spreadsheets) or manually entered as manhole/pipe attributes. If HGL results exist then they may be viewed in the section view of the drainage line.

Second, the HGL results may be added to the drainage longsection drawings by editing the plot parameter file (ppf) as shown below.

Creating Drainage Strings

Drainage strings may be created in 12d in a number of ways.

1. **Import 2d strings** from other drawing packages and convert them to drainage string inside 12d.
2. **draw the string in 12d** using a design tin to the manhole cover levels and pipe inverts.
3. Enter the details in a **spreadsheet format** and paste the spreadsheet into 12d.

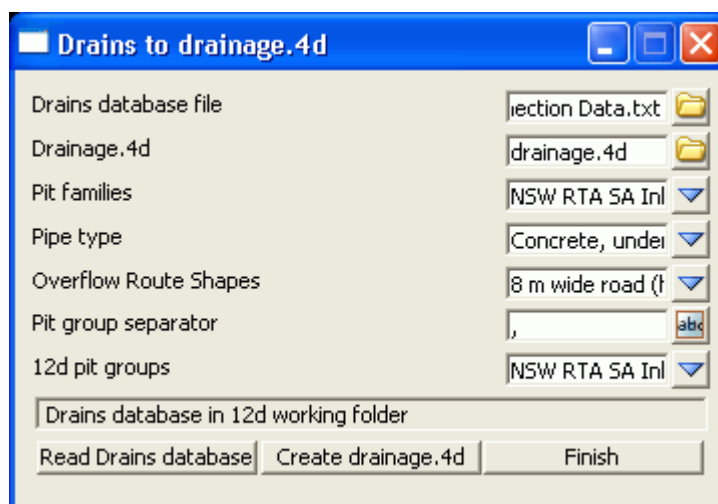

Regardless of the method, take the time to **set your defaults** before you start. You can always change the data later.

Creating a drainage.4d file from the Drains database dump

Drainage_drains_to_drainage4d_panel

Position of option on menu: Design =>Drainage-Sewer =>More=>Drains to drainage.4d

On selecting the Drains to drainage.4d option, the Drains to drainage.4d panel is displayed.

Key Points

1. Select **Read Drains database** (12d will search the usual locations for the Drains database)
2. Review the Drains pit families list to identify the pit group separator and then enter it in the **Pit group separator** field. **PRESS THE ENTER KEY!**
3. Check the **12d pit groups** and if they are acceptable select **Create drainage.4d**.

The Details

The Drains database dump file **Drains Connection Data.txt** is copied into the 12d working folder and read. The choices for the **Pit families**, **Pipe types** and **Overflow Route Cross Section Shapes** are loaded into the panel. The user must select a **Pit group separator** to separate the road grades and crossfalls from the pit family names. The resulting **12d Pit Groups** will be calculated and displayed in the choice box. **Create drainage.4d** will create a **drainage.4d** file that may then be edited to specify the road grade and crossfall threshold values. Once the file is created you may review/edit it by selecting the **More Info** icon then **Edit** on the **Drainage.4d** field. The **Overland route shapes** are not exported to the drainage.4d file and are presented for your information only.

YOU MUST RESTART 12D FOR THE NEW DRAINAGE.4D FILE TO BECOME ACTIVE!

Field Description	Type	Defaults	Pop-Up
Drains database file	file	Drains Connection Data.txt	

You must update this file from Drains before each use of this panel. Inside Drains select Project=>Overflow Route database. Then select OK and then YES. This will cause Drains to export the database to the file "Drains Connection Data.txt".

*Selecting **Enter** in this field or selecting **Read Drains database** will cause the panel to search for the database dump in the folders C:\Program Files\Drains\Program and C:\Program Files\Drains\Demo\Program. If the Drains program is installed in another folder then you must browse for the file. After reading the file choice boxes below will be populated. Drains Connection Data.txt will be copied into the 12d working folder.*

- | | | |
|--|--------|---------------------|
| Drainage.4d | file | drainage.4d |
| <i>The drainage.4d will be created in the 12d working folder unless otherwise specified. It will only be used for 12d projects in this folder.</i> | | |
| Pit families | choice | Drains pit families |
| <i>These are the Drains pit families that will be exported to the drainage.4d file. The 12d pit groups will be created from this list.</i> | | |
| Pipe type | choice | Drains pipe types |
| <i>These are the Drains pipe types that will be exported to the drainage.4d file.</i> | | |
| Overflow Route Shapes | choice | Drains Route Shapes |
| <i>These are the Drains Route Shapes and are for information only.</i> | | |
| Pit group separator | input | |
| <i>These characters will be used to remove the road grade crossfall data from the Pit families above. The data before this character will become the 12d pit groups. Press Enter or select Read Drains database to create a new list of 12d pit groups.</i> | | |
| 12d pit groups | choice | 12d pit groups |
| <i>These are created from the Pit family list above by deleting all text after the Pit group separator. This should delete all of the road grade and crossfall information from the pit group names.</i> | | |
| Read Drains database | button | |
| <i>Searches for the Drains database (see general description above) and populates the choices fields.</i> | | |
| Create drainage.4d | button | |
| <i>Create a local copy of the drainage.4d file.</i> | | |

Editing a drainage.4d file

Drainage_Edit_drainage4d_panel

Position of option on menu: Design =>Drainage-Sewer =>More=>Edit drainage.4d

On selecting the Edit drainage.4d option, the Edit drainage.4d panel is displayed.

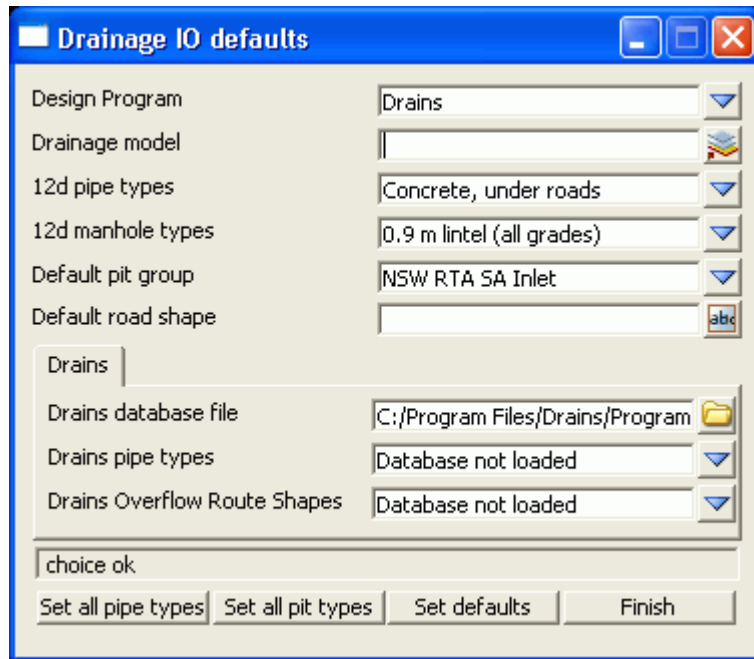

Select the **Find** button to search the 12d path for the current **drainage.4d** file. Select the **More info** button and then **Edit** to edit the file.

Drainage IO Defaults

Drainage_io_defaults_panel

Position of option on menu: Design =>Drainage-Sewer =>More=>Drainage IO Defaults

On selecting the Drainage IO Defaults option, the Drainage IO Defaults panel is displayed.

The routine changes ALL of your manhole and pipe types in a model to a single value. If you have changed your drainage.4d file after creating you drainage network, the manhole and pipe types you originally selected may no longer be valid (i.e. in the drainage.4d file).

Field Description	Type	Defaults	Pop-Up
Design Program	choice	Drains	Drains,PCdrain
<i>The drainage model to be updated.</i>			
Drainage model	file		
<i>The drainage model to be updated.</i>			
12d pipe types	choice		values from drainage.4d
<i>Set all pipe types will set all pipes in the model to this value</i>			
12d manhole types	choice		values from drainage.4d
<i>Set all pit types will set all manholes in the model to this value</i>			
Default pit groups	choice		values from drainage.4d
<i>manhole definitions in the drainage.4d file that have group as a prefix are included.</i>			
Default road shape	choice		values from drainage.4d
<i>type the desired name or if using Drains select the desired shape from the Drains Overflow route shapes.</i>			

Drains Tab

- Drains database file file
pressing enter in this field will start a search for the Drains database dump. The search path is the specified folder, C:\Program Files\Drains\Program then C:\Program Files\Drains\Demo\Program. If the file is found the choice fields below are populated. It is highly recommended that this file be in the 12d working folder.
- Drains pipe types choice 1 values from Drains file
the pipe types are retrieved from the last Drains database dump. Changing this value will update the 12 pipe types above.
- Drains Overflow Route Shapes choice values from Drains file
*the overflow route shapes are retrieved from the last Drains database dump. Changing this value will update the **Default road shape** above.*
- Set all pipe types button
all pipe types in model are set to this value
- Set all pit types button
all pit types in model are set to this value
- Set defaults button
*the defaults for the **Drains Overflow Route Shapes** and **12d pit group** are set*
- Finish button
removes the panel

Drainage Network Editor

Drainage_Network_Editor

Position of option on menu: Design =>Drainage-Sewer =>Drainage Network=>Drainage network editor

The drainage network editor enables the user to edit all of the drainage strings in a model (a network). There are five main tabs and plus function buttons on the bottom of the panel.

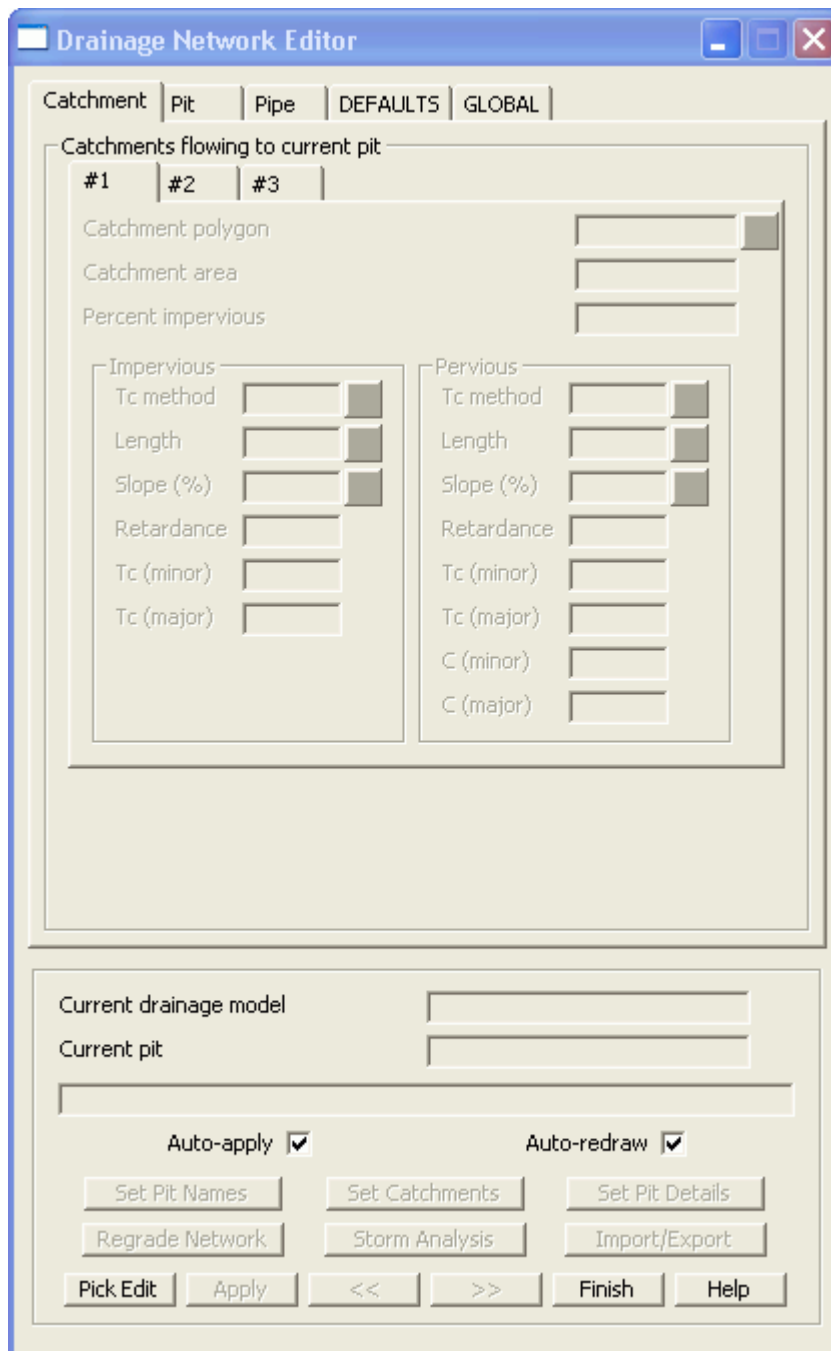

Using the Drainage **Network Editor**

Recommended order to use the tabs and Buttons.

(This is not required but it will lead you through the process in an systematic method.)

<u>Tab</u>	<u>Function Buttons</u>
1. Global tab	3. Set Pit Names
2. Defaults tab	4. Set Catchments
5. Pipe tab	8. Set Pit Details
6. Pit tab	9. Regrade Network
7. Catchment	Storm Analysis
	Import/Export

On selecting the Drainage network editor option, the Drainage network editor panel is displayed.

Global Tab

Design values for the hydrology and hydraulics calculations are set either globally (one value for the entire network) or via Defaults for the manholes or pipes. Defaults values may be overridden by explicit settings found on the catchment, pits or pipes tab. Explicit manhole/pipe settings need only be specified if the default value is not desired.

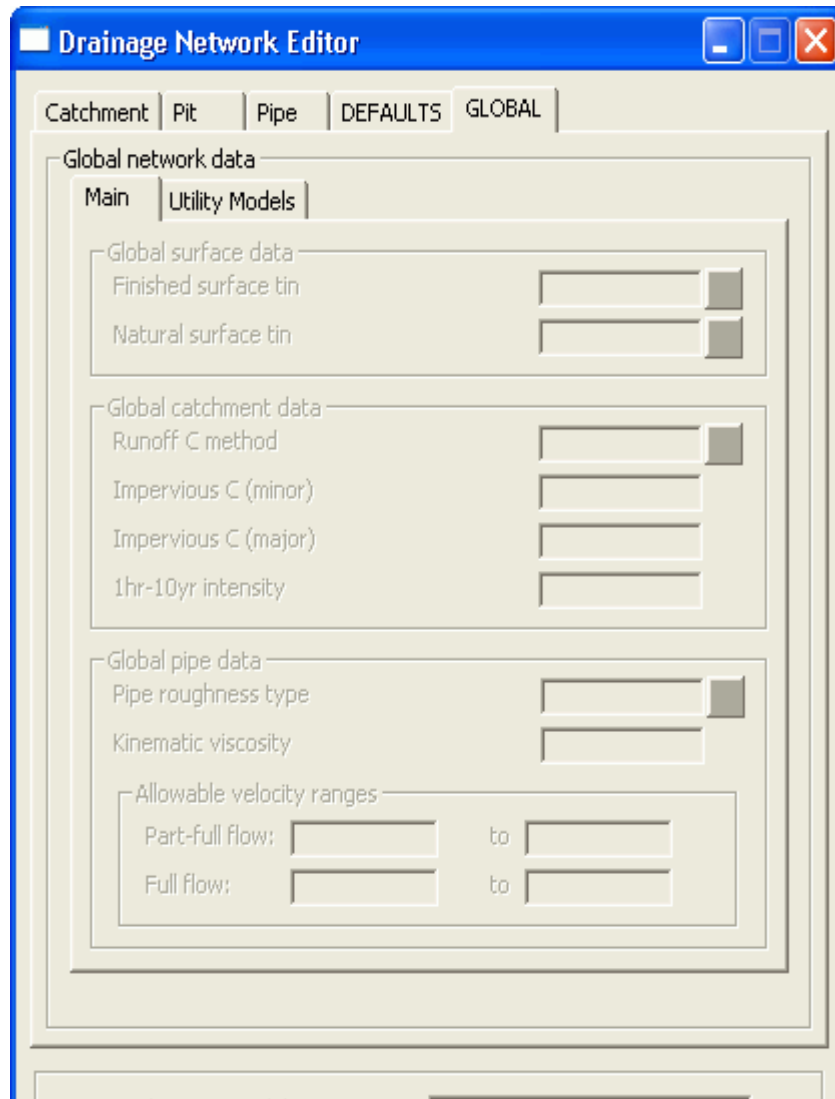

There are 2 sub tabs. See **Main tab** and **Utility Models tab**

Main tab

The **Global surface data**. The **Finished surface tin** is used for determining pipe cover and surface levels for the manholes. The **Natural surface tin** is specified so that it can be included on the drainage longsection plots.

For **Global catchment data** see **Coefficients of Runoff**

For **Global pipe data** see **Pipe Friction Method**.

Utility Models tab

The utility models tab is used to specify the following data:

Catchment polygons, the catchment slope strings, catchment labelling data

Bypass flow strings

Road setout strings., road centre line strings and crossfall/grade offsets

Service/utility models and the allowable clearances

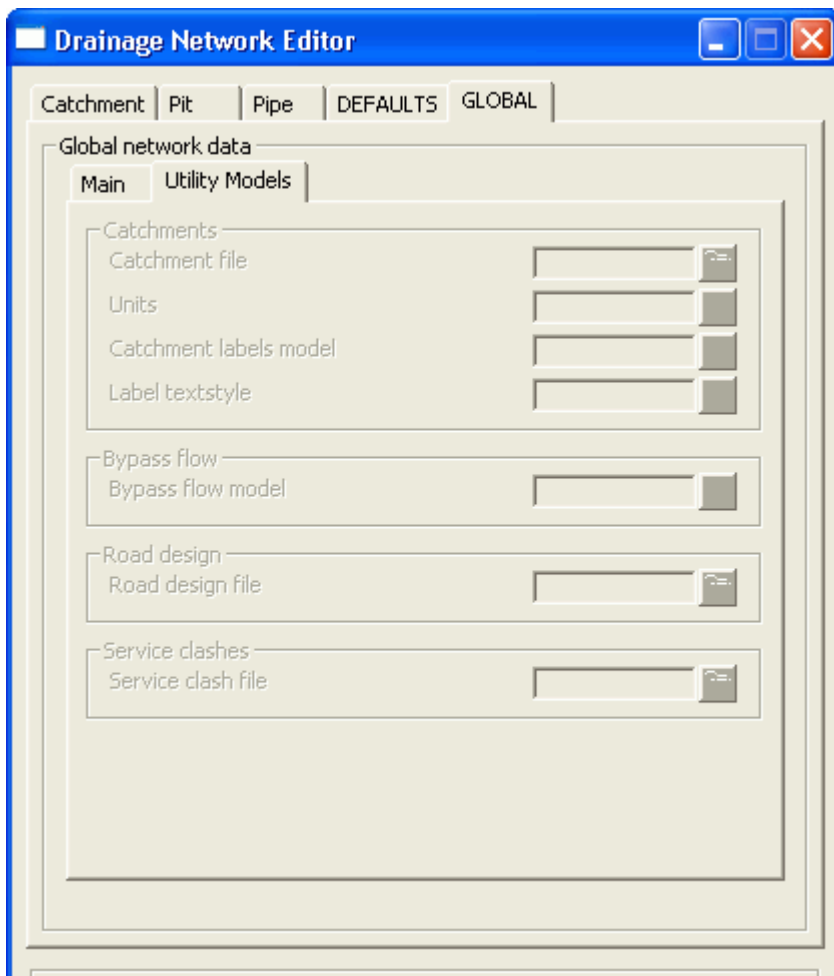

Additional details

Catchments Areas

Bypass flow

Manhole setout via setout strings

Service and Utility Clashes

Defaults tab

See **Default Settings**

Pit tab

Pipe tab

Catchment tab

Regrade Network

Set Pit Details

Set Pit Names

[Drainage_Network_Editor_Set_Pit_Names](#)

The **Set pit name** selection names the pits and pipes for the drainage model (both pits and pipes can be named). Three numbering schemes are available:

drainage strings names are used as the prefix followed by the pit number (ex A-1)
 drainage strings names are used as the suffix followed by the pit number (ex 1/A)
 the pits are sequentially numbered. (ex 1,2,3....)

The names can have pre-text added to the beginning of the pit name and a separator between the string name and the pit number (/ - etc.) if desired.

Design Program Notes:

PCdrain users: Since catchments contain only 3 characters do not use separators. Using the letters A-Z for strings and numbers 1-99 will give you 26 strings and up to 99 pits on each string. Using the numbered stem works very well in PC Drain.

Micro Drainage users: Pits and pipes are numbered separately in Micro drainage. The pipes must use the numbered sequence with the most upstream pipes numbered with the smallest numbers. Number of digits must be set to 3.

ILSAX users: You must use alphabetic characters for your string names and no more than 3 characters

See Also

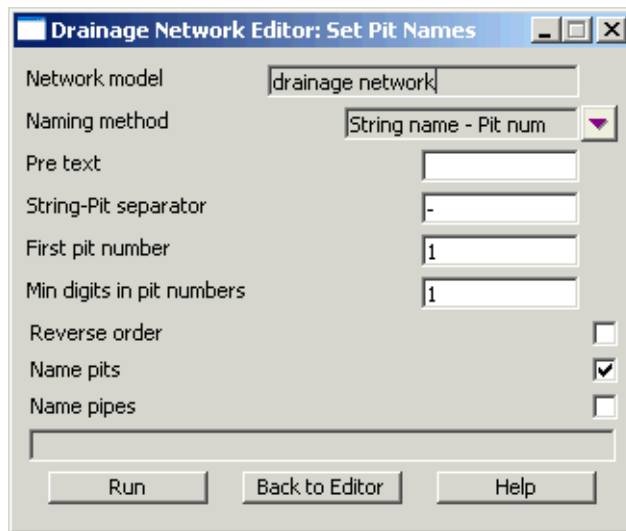

- Labelling a drainage network
- Displaying the Auto Pit Names
- Drainage overview

Usage

The selection is found on the drainage **network editor** and is accessed through the main menu by selecting

Design=>Drainage-Sewer=>Drainage Network=>Drainage=>Network editor

Select the **Set Pit Names button** and the following panel will appear.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model	Model box		drainage model from main dialogue
Naming Method	Choice box		
		<i>Pit num - String name for string A manhole 1 the name is 1A</i>	
		<i>String name - Pit num for string A manhole 1 the name is A1</i>	

Sequential numbering the strings names are sorted alpha-numerically and the manholes are numbered starting at **First pit number**

Pre text input box

this text will precede the pit name (ex Pit A01)

String/pit separator input box

the character that separates the string name from the pit number. For example if pit names A/01, A/02 etc. where desired a "/" would be entered. You may omit the separator if none is desired.

First Pit Number integer box

the starting pit number on the drainage lines. For drainage strings with the flow direction set as descending chainage the first pit is the junction pit.

Min digits in pit numbers integer box

a non zero value will pad the pit numbers with leading zeros. (ex if 2 is entered, pit 1 is not A/1 but rather A/01)

Reverse numbering order tick box

*Unselected, pit **First pit number** is at the low chainage end of the line. Selected, pit **First pit number** is the second pit from the high chainage end of the line.*

Number pits tick box

the pits are assigned names. This allows the pit and pipes to be names differently.

Number pipes tick box

the pipes are assigned names. This allows the pit and pipes to be names differently.

Run button

name the pits/pipes. The pit at the high chainage of the string is not labelled. The only time you will need to name this pit is when it is the outlet from the system.

Back to Editor button

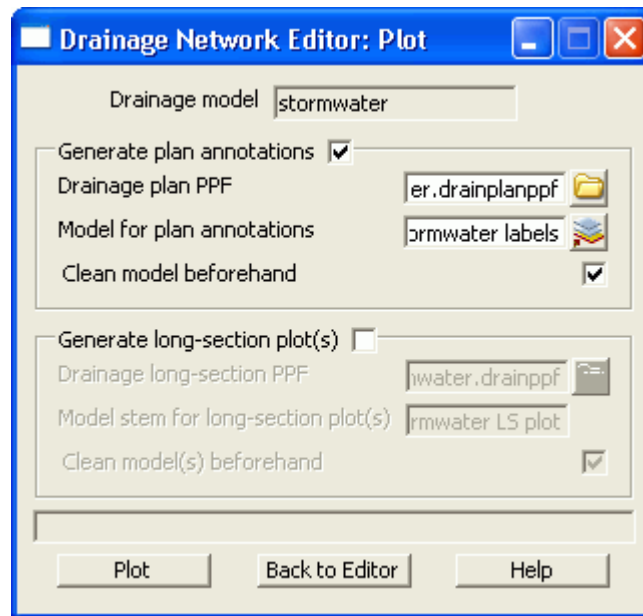

return to the network editor.

Help button

display this page.

Drainage Rainfall File Editor

Rainfall_file_editor

Position of option on menu: Design =>Drainage-Sewer =>Drainage Network=>Drainage Rainfall Editor

Also see Using **Rainfall Editor**

On selecting the Drainage Rainfall Editor option, the Drainage Rainfall Editor panel is displayed.

These defaults are used when creating a manhole in a drainage string. The fields and buttons used in this panel have the following functions.

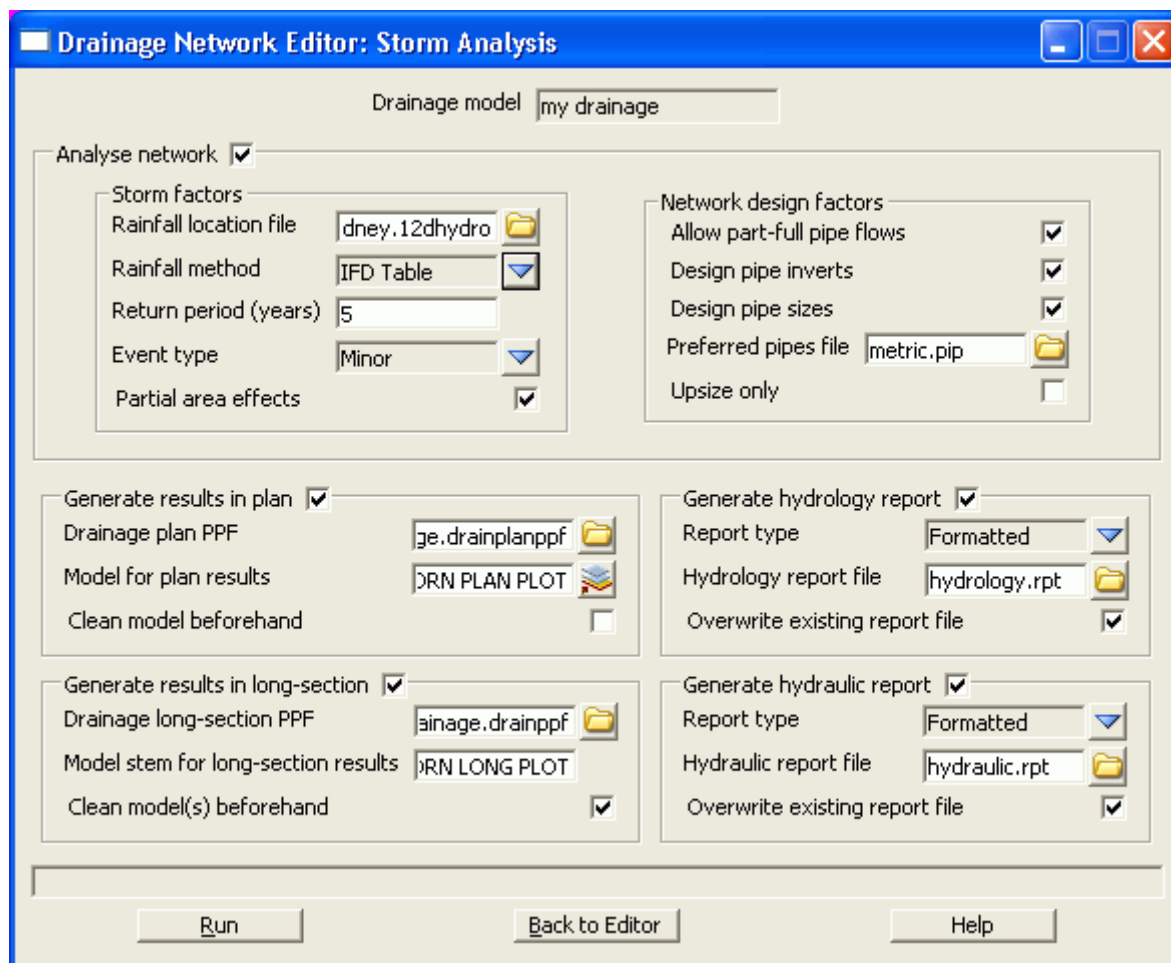

Field Description	Type	Defaults	Pop-Up
Rainfall location file	file		
<i>Each file contains the rainfall data for a specific location. Browse to the 12s library for examples.</i>			
Read	button		
<i>You must select this to load the selected Rainfall location file.</i>			
Write	button		
<i>Select this to save the changes you have made to the Rainfall location file.</i>			
Find	button		
<i>not used in this editor</i>			
Finish	button		
<i>removes the panel</i>			
Help	button		
<i>launches this help screen</i>			

Drainage Network Design

Drainage_Network_Editor_Storm_Analysis

See Also Using **Drainage Design in 12d Drainage Design**

On selecting the Storm Analysis button, the Drainage Network Design panel is displayed.

Field Description	Type	Defaults	Pop-Up
Run	button		
<i>Run 12d hydrology and hydraulic check routine</i>			
Edit	button		
<i>return to the Drainage Network Editor</i>			
Finish	button		
<i>removes the panel</i>			
Help	button		
<i>displays this help page</i>			

Convert to drainage strings

[drainage_create_from_strings_panel](#)

Position of option on menu: **Design =>Drainage-Sewer=>More=>Create drainage from strings**

This function converts 2d strings to 12d drainage strings.

See Also

Drainage overview

Usage

From the menu select

Design->Drainage-Sewer->More->Create drainage from strings

The following panel will appear.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>data source for strings to be converted</i>	choice box	model	view,model,string
Select <i>Model containing strings to be converted</i>	input box		
Drainage model <i>The new drainage strings will be added to this model. If it does not exist it will be created.</i>	model box		
Finished surface tin <i>This tin should be the same as your tin default for the drainage strings.</i>	tin box		
Outfall manhole number <i>The network will be numbered using a numerical method. The most upstream manhole of the outlet line will be assigned this manhole number. This numbering system can be changed if desired.</i>	real input box		
Process <i>Converts the strings to the drainage strings.</i>	button		

Finish

button

Removes the panel from the screen.

Important notes:

The imported strings must be drawn in the direction the water flows.

Manholes are created at all vertices on the strings.

Trunk lines must have a vertex where the branch lines join.

Integer string names can be used to control the order in when the drainage lines are numbered. These names will be transferred to the 12d drainage strings. **Naming the strings is highly encouraged.**

The drainage lines must have string names to use the **Set Pit Names** feature on the **network editor**.

Manholes can always be renamed in 12d after the import is complete.

Set zero chainage to downstream end of line (Reversing the strings)

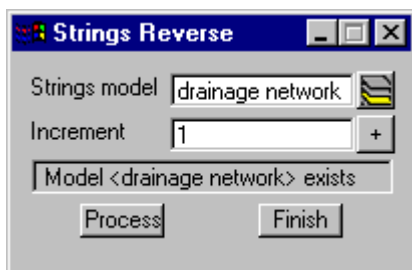

[string_reverse_panel](#)

Position of options on menu: **Design =>Drainage-Sewer=>More=>Reverse all strings**

For drainage direction of flow see **Reversing the strings**

If desired, the reverse function may be used to move the zero chainage to the downstream end of the line. This should be done after entering all of the drainage strings and before naming the pits. From the main menu select

Design=>Drainage-sewer=>More=>Reverse all strings

This will also change the drainage flow direction attribute from **ascending chainage to descending chainage**.

Leave the **Increment** as 1.

Spreadsheet clipboard

Spreadsheets are an effective method to manage the numerous variables urban drainage designers create in the modelling process. Spreadsheet data can be transferred to and from 12d in tab delimited files and stored within 12d as “user definable attributes”. These attributes are linked to the pit and pipes within a network. Drainage long section plots can display the pipe attributes in the “arrows” data area and pit attributes in the bubbles area. Drainage plan drawing can also show these pit and pipe attributes.

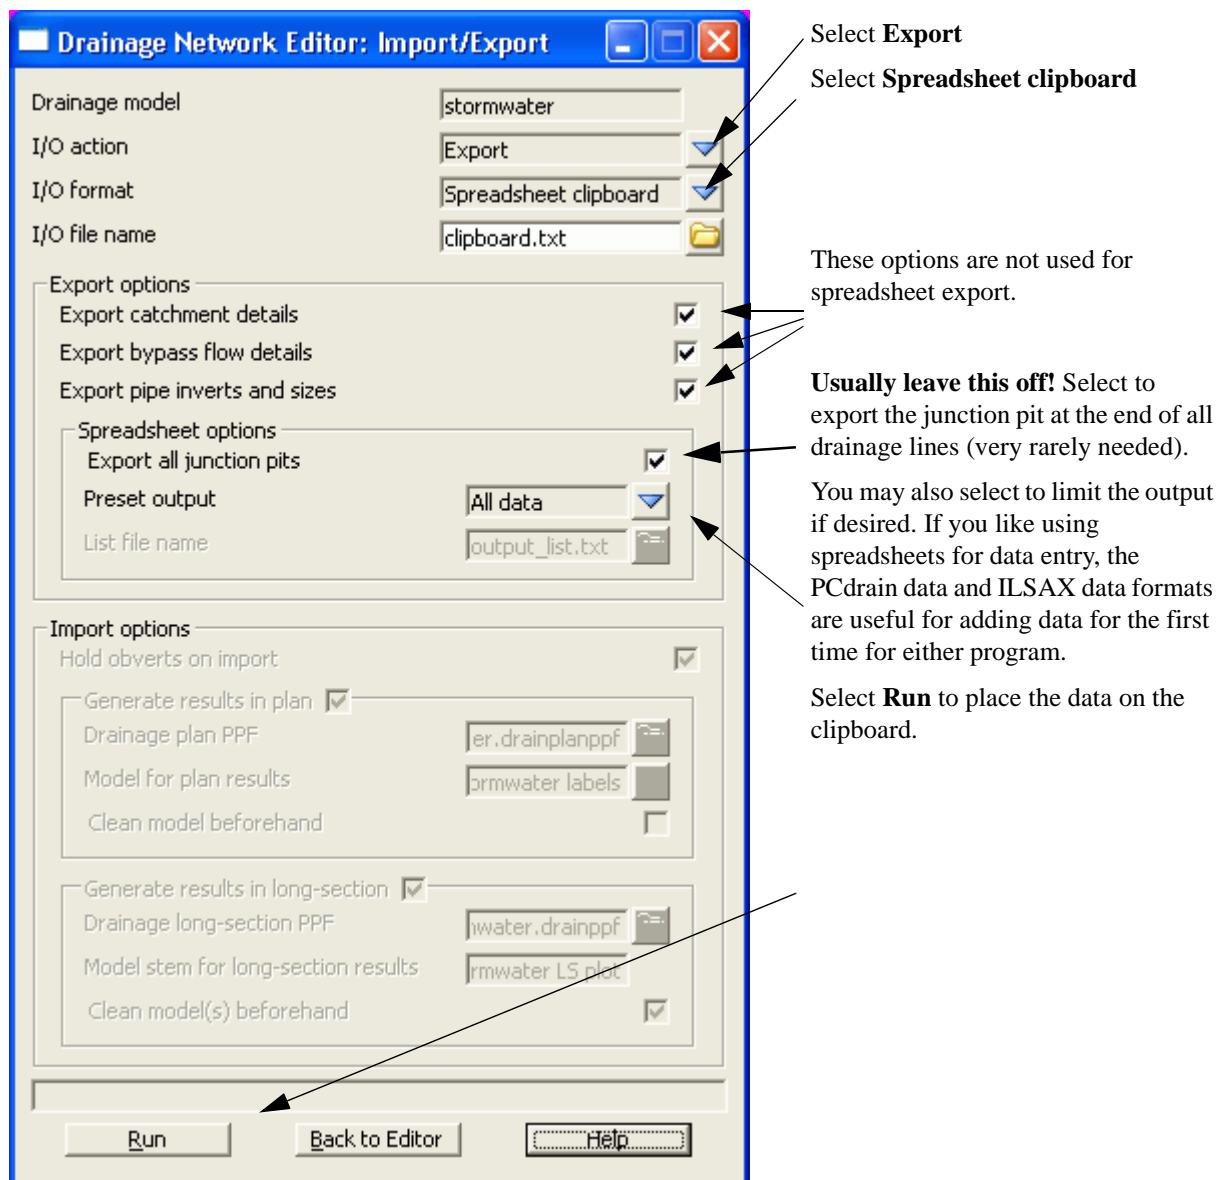

Drainage strings will be created if they do not exist in the model but manholes cannot be added to existing strings.

- 12d to spreadsheet transfers
- Spreadsheet to 12d update and create
- Spreadsheet options

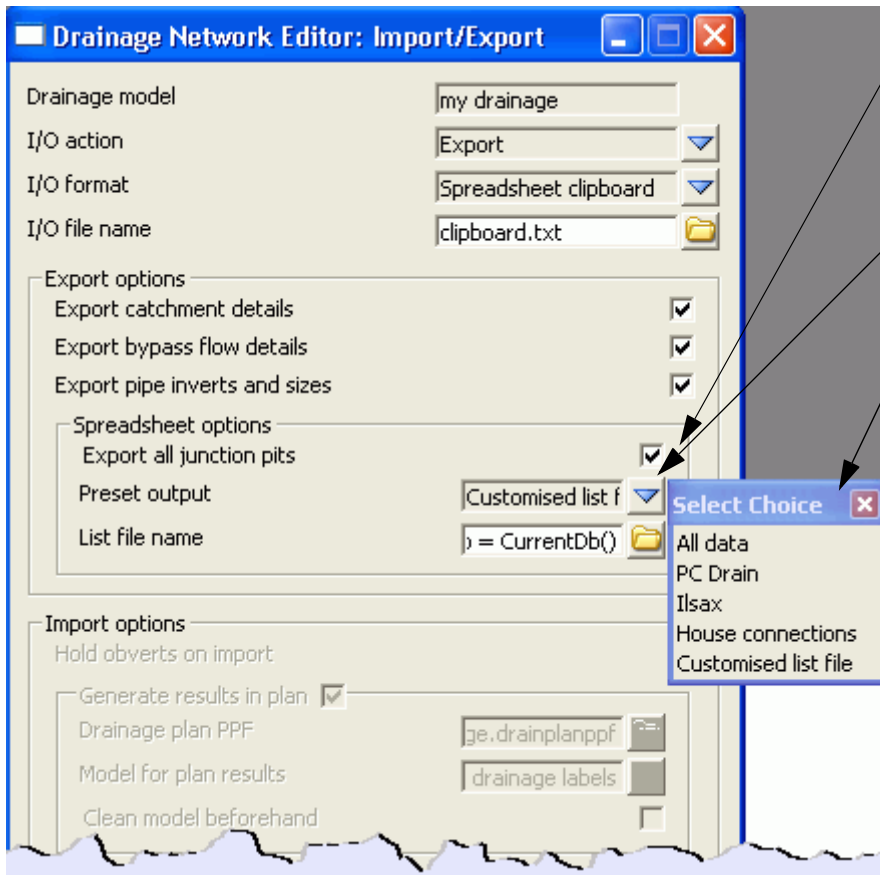

12d to spreadsheet transfers

This interface is accessed the **Import/Export** button on the **Drainage Network Editor**.

Options

The **Spreadsheet Options** section allows the user to define the amount of data exported.

Export all junction pits when selected will repeat the data for the junction pit at the end of each branch line.

Preset Output this choice box offers the following choices:

All Data: All of the 12d drainage string data and the user defined attributes will be exported to the clipboard in a tab delimited format. The 12d data names and the user defined attribute names will appear at the top of the spreadsheets columns.

ILSAX: For the ILSAX program, the spreadsheet column headings will change depending on the pipe and catchment indicators (P2 card) and the inlet type (P3 card). Therefore, use the ILSAX pipe editor macro to set up one pit/catchment for the type of data you wish to enter. Now when you export the pipe network data the column headings will include the names of the relevant parameters.

User defined below: The **Customised list file name** is used to define the drainage values, their order and format you desire.

The **customised list file** is a text file where each line contains a drainage variable or a spreadsheet IO command (blank lines are ignored unless preceded by the header command). The spreadsheet IO commands available are:

header	to define a line of text to be exported
blank	to leave a blank column in the output
pipe data	to specify the following user defined attributes are pipe data
pit data	to specify the following user defined attributes are pit data.
variable name	a 12d drainage variable names
factor	the following variable is multiplied by this factor

The simplest way to create your own customised tab delimited file is to set the **Preset Output** field to **All data** and leave the **customised list file name** field blank. Selecting **Set, Finish** and then **Copy** from the main dialogue. The data will be placed on the clipboard and a **customised list file**, named **output_list.txt** will be created containing the names of all of the drainage variables in the 12d model. Use a text editor to add/or delete the variable names, change their order and/or add spreadsheet IO commands. **Save the file with a new name!** The **output_list.txt** file is overwritten on every export.

A listing of a customised list file follows. Note the words in the header file have a “tab” between them so that they will be spaces across the spreadsheet columns.

diameter

After creating your customised list file, select **Options** again and change the **Preset Output** field to **User Defined below** and enter the new **customised list file** name that you saved above. Select **Set** then **Finish** and finally **Copy** to put the formatted data onto the clipboard.

The data can be pasted into a spreadsheet program for checking or additional formatting.

CUSTOM FORMATED DATA MIGHT NOT BE PASTED BACK INTO 12d!

The data must be in the “12d drainage spreadsheet” format to be read into 12d.

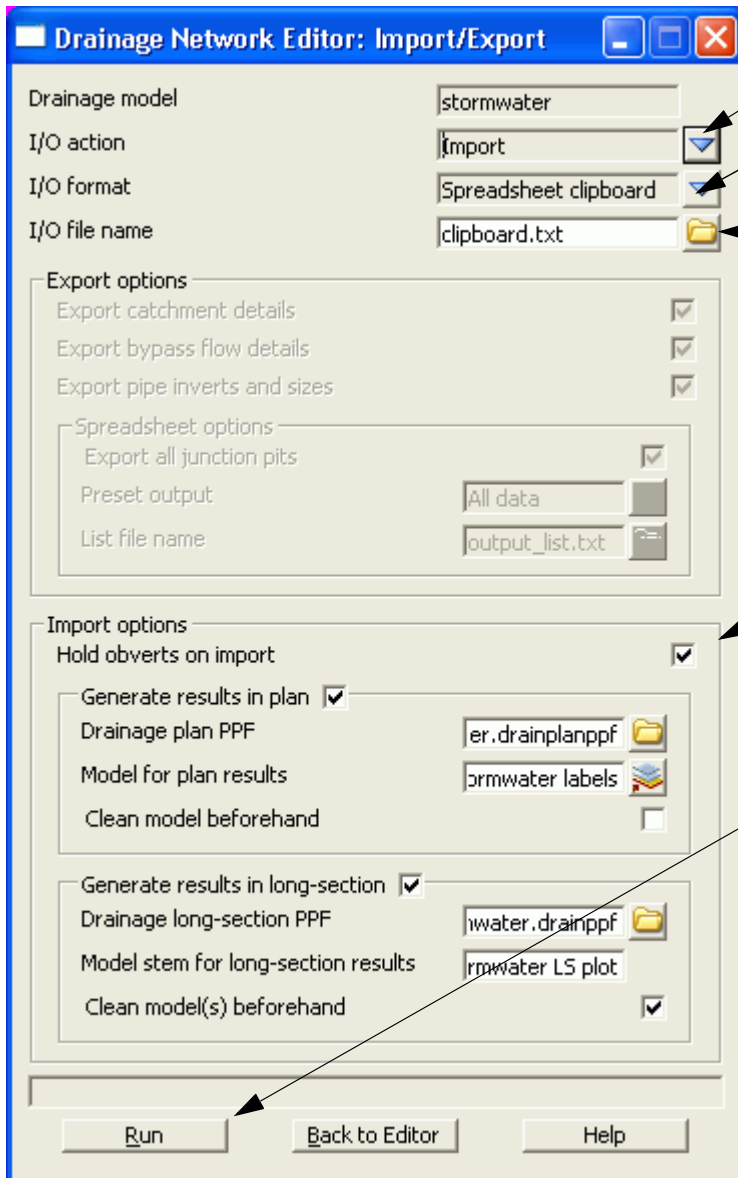

Caution with manhole names in the form 1-1 or 1/1. Some spreadsheets will interpret these values as dates. If you use these formats for your manhole names you will have to paste command them in once, format the columns that contain the manholes names as text data and then paste the information in again.

One final word on using the copy/paste commands in the Microsoft Excel program. The Paste Special command using the “Skip Blanks” option will allow you to copy a large block of 12d data (with blanks in it) on top your data so that your data is preserved where it coincides with the blanks. To use this option paste the data into a blank spreadsheet and then select copy again. The Paste special option with “Skip Blanks” will now be available.

Spreadsheet to 12d Update and Create

This item is accessed from the **Import/Export** button on the **Drainage Network Editor**.

The following panel will appear.

Select **Import**

Select the **Spreadsheet clipboard** format.

The file field is ignored.

This is ignored on spreadsheet imports.

Select **Run** to update the drainage model.

Tab delimited, “12d drainage spreadsheet” format or “from to” format data must be on the clipboard in order to update a 12d drainage model or create a new model. These format are described below.

Updating an Existing Model

The data usually is generated by 12d using the **Export** option, pasted into a spreadsheet and then copied back to the clipboard so that 12d can be updated.

When 12d exports the drainage model to a spreadsheet it includes a column for the unique string identifier and a unique manhole identifier (unique to the drainage model not the 12d project). The names of the strings and manholes may be changed via the spreadsheet if these columns are present at import time.

If the manhole id column is not present, 12d will search the drainage model for a matching manhole name. When the manhole is a junction between drainage lines, only the trunk line will be the data updated.

Creating a New Model

It is possible to create a new string or an entire drainage network using this format. However, manholes cannot be added to an existing string. The entire drainage string must be created at once. Two formats are available, the “from-to manhole” format and the “12d drainage spreadsheet” format.

At present the network editor must select a drainage string to become active. Therefore, if you are not

adding strings to a network, you will have to create a drainage network with one “dummy” manhole. Select this one “dummy” manhole to activate the editor. After importing the data and the new drainage lines are created the “dummy” manhole may be deleted.

12d drainage spreadsheet Format

The top left cell in the clipboard data must be the text “12d” to specify this format. The minimum amount of data required to create a new string is the string name, manhole name, x and y coordinates. You can add as much additional data as you have available. This would include pipe diameters inverts etc. The manholes must be listed from upstream to downstream order. If the string is to join a trunk line, the junction manhole must be included for both the tributary and the trunk line.

An example file exists called **new_network.txt** is supplied in the library. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Set the **I/O Action** to **Import** and select **Run**. The new drainage lines will exist in the model currently being edited.

From-to Manhole Format

The top left cell in the clipboard data must be the text “from to” to specify this format. The minimum amount of data required to create a new string is the upstream pit name (*pit name) , the downstream pit name (*ds pit name) and the x(x location) and y(y location) coordinates of the upstream pit. If the string is to join a trunk line, the junction manhole must be included for both the tributary and the trunk line.

An optional column for the manhole cover elev (cover elev) may be specified. Once the network has been created additional pipe and manhole data may be added using the “12d drainage spreadsheet” format described above.

An example file exists called **new_from_to_network.txt** is supplied in the library. It is shown below. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Enter a new model name in the **Drainage model** field and select paste. The new drainage model will now exist.

from to	pit	pit	pit	pit
*pit name	*ds pit name	x location	y location	cover elev
text	text	real	real	real
E/1	A/3	5309.458	7336.935993	29.2173

B	B/5	SA2	26.3447	26.2947	18	192066
B	A/5	SA2	26.0744	26.0744	19	192066

Duplicate Definitions

Strings Variables such as “direction” are may be defined for numerous manholes on the same string. Searching in a top down direction through the file, the last definition found for the string will be set.

Invert levels may be set via pipe data or pit data or combined. It is recommended that the user only use one method and not combine them. Both are exported so delete the ones you are not going to use. The variables are processed from left to right, so if duplicate definitions of an invert level or found the right most data will be set.

The format definition

- 1.Row1, column 1 must contain either “12d”, or “from to”. Therefore, the first column must be a 12d drainage variable (cannot be a user defined attribute).
- 2.Row 1. The text <pit> at the top of the column indicates the column contains a user defined pit attribute and similarly <pipe> indicates a user defined pipe attribute.
- 3.Row 2. This row contains the names of the 12d drainage variable names and the pit/pipe attributes. All names are case sensitive so be careful where you use capital letters. A list of 12d drainage variables is found below.

Names beginning with an asterix (*) will not be processed (except pit/string names when unique identifiers are present in the data). 12d drainage variables names beginning with an asterix indicate that this data was calculated at export time and cannot be read back into 12d (for example, pipe length, pipe grade and deflection angle).

Prefixing an user defined attribute name with “DELETE ” (no quotes, note the space after the DELETE) will cause the attribute to be deleted from all pits/pipes within the model.

- 4.Row 3. The text in this row define the type of attribute to be stored within 12d. The only valid choices are;

integer
real
text

If you want to change an attribute type you must delete the attribute and create it again. If you simply change the attribute type in the third row then that attribute will not be updated.

5. Blank lines may be inserted as desired.
6. You are not required to fill in all of the cells in the spreadsheets. Blank cells are ignored (you must use a space to remove all data from text attributes (the space will not be stored).
7. Pipe names are included in the data so that they can be changed but they are **not** used to identify the pipe. Pipe data will always be assigned to the pipe following the pit in the direction of **ascending** chainage. If flow directions is ascending then the pipe data will be for the downstream pipe. If the flow direction is descending then the pipe data will apply to the upstream pipe.

12d Drainage Variable Names

Manhole Variables	Pipe Variables	String Variables
*string Name	pipe name	direction
*pit name	pipe type	fs tin
pit type	low ch invert	ns tin
pit diameter	high ch invert	string id
pit low ch invert	diameter	
pit high ch invert	*length	
pit road chainage	*grade	
pit road name	low hgl	
*pit angle	high hgl	
*pit drop	pit hgl	
*pit depth	flow	
*pit chainage	velocity	
x location		
y location		
cover elev		
*fs elev		
*ns elev		
pit id		

Quick Check Lists for Drainage Design Software

The drainage design software packages each have their specific requirements regarding the manhole types, names and then method they use to model pit inlet capacities. The following section details the specific requirement for each package.

Drains Version 2+ Requirements and Notes

Drains clipboard - Ver 5 Rational

Drains clipboard - Ver 5 ILSAX

See also Drainage overview

Basic Check List

1. All manholes must have a unique name (Manhole names cannot begin with "O ")
2. The pipe type used in 12d must exist in the Drains pipe database

Overland flow with Inlet Capacity Check List

1. Make sure you are using Drains Version 2-5 clipboard data. Inside Drains select **Project=>Pit database**. The pit family selection should be available. (CAP1 etc. is Version 1).
2. All Overflow route shapes, pit families and pit types used in 12d must exist in the Drains pit database
3. Overland flow lines must be within 1.0 metres/feet of the manhole

Running Drains - Version 2+

Key Points

1. The Drains database (each project has its own) and the 12d database (drainage.4d) must be synchronised (**More**).
2. For bypass flow, 12d selects pit families for Drains in the following way

The users selects pit group in 12d and at export the pit group is scanned in the drainage.4d file using the road data to select the Drains pit families
3. Data is copied from 12d to the Windows clipboard and then pasted into Drains. 12d can not delete any objects in Drains, it can only add and update.
4. When updating 12d from Drains, always copy the DATA to 12d before the results. 12d will update the network but will not add or delete manholes.

Drains Interface Overview

The Drains program performs the rational and ILSAX hydrology calculations as well as hydraulic grade line calculations that determine pipe sizes and pipe invert levels.

The data sent to Drains includes

- s manhole names and types, easting and northing data with surface levels
- s finished surface profile along the centre line of the pipes
- s optional - bypass manholes, road grades/crossfalls and SAG inlet ponding volumes and depths. Pit family selection using road grade and crossfall data.
- s optional - composite catchment area create from three 12d areas per manhole
- s optional - default catchment characteristics, k values and overland travel times
- s optional - pipe sizes, type and invert levels

Data is copied from 12d to the Windows clipboard and then pasted into Drains (**Edit=>Paste data from spreadsheet**). 12d can not delete any objects in Drains, it can only add and update.

The Drains menu selection **Run=>Design** is used to design the network. Once the drainage network has been designed in Drains the updated design data (**Edit=>Copy data to spreadsheet**) and/or the hydraulic results (**Edit=>Copy results to spreadsheet**) are sent back to 12d via the clipboard.

Always copy the DATA to 12d before the results as the results are deleted inside 12d with every update of the data!

A demonstration version of the Drains program is included on the 12d distribution CD in the directory

Other_Software\Drains

The version is limited in the number of pits allowed.

Synchronising the Drains database and the drainage.4d file.

The Drains database and the 12d drainage.4d file must be synchronised as follows.

All Cases	
Drains database	drainage.4d
Pipe type	Pipe type entries
Only if bypass flow is required	
Drains database	drainage.4d
Pit family	12d manhole group with road data to lookup Drains pit family
Overland route database	One default value set (not in drainage.4d)

Every Drains file begins with a default database and uses that database for the life of the project. This database must be synchronised with the **drainage.4d** file in 12d to ensure the Drains pit families, pit sizes, pipe types and overflow route types.

The following 5 steps will help ensure 12d is synchronised with Drains. More details are given in the sections below.

1) Export the Drains database from your Drains file

Inside Drains select **Project=>Overflow Route database**. Then select **OK** and then **YES**. This will cause Drains to export the database to the file "Drains Connection Data.txt".

2) Create a drainage.4d file from the Drains file

- s From the 12d menu select **Design->Drainage-Sewer->More->Drains to drainage.4d**.
- s Select **Read Drains database**,
- s review the Drains pit families list to identify the character (usually a comma or -) that separates the pit group from the road data and then enter it in the **Pit group separator** field.
- s Check the **12d pit groups** and if they are acceptable
- s select **Create drainage.4d**. The Drains database dump file is copied to the 12d working folder and a drainage.4d file is created in the 12d working folder.
- s **More details below**.

3) Edit the drainage.4d file

From the 12d menu select **Design->Drainage-Sewer->More->Edit drainage.4d**. Select **Find** then edit from the file **more info** button. Set the road grade and crossfalls for the 12d manhole groups. **More details below**.

4) Restart 12d

From the 12d menu select **Project->Restart**.

5) Set the Overflow shape, Update Manhole and Pipe type.

A single global overflow route shape can be specified in 12d via the following routine and then it can be modified in the Drains program. The import operation of the interface will read modified values and store them so that the next export operation will export the modified values.

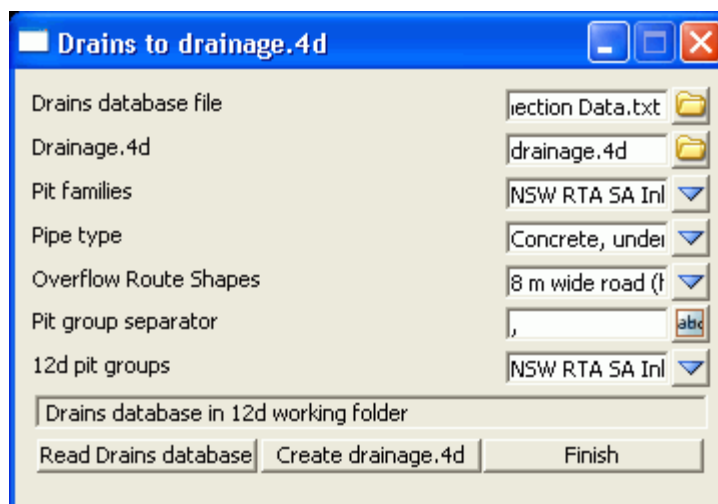

If the network has already been created, using manhole and pipe types that no longer exist in the drainage.4d file, they will have to be updated before the export to Drains can occur. You may update them using the drainage network editor or you may set **all** of the manhole and pipes types to **one value** using this

routine. Later you may change them individually using the **Drainage network editor**.
 From the 12d menu select **Design->Drainage-Sewer->More->Drainage io defaults**.
More details below.

Drains to drainage.4d file

Position of option on menu: Design =>Drainage-Sewer =>More=>Drains to drainage.4d

On selecting the Drains to drainage.4d option, the Drains to drainage.4d panel is displayed.

Key Points

1. Select **Read Drains database (12d will search the usual locations for the Drains database)**
2. Review the Drains pit families list to identify the pit group separator and then enter it in the **Pit group separator** field. **PRESS THE ENTER KEY!**
3. Check the **12d pit groups** and if they are acceptable select **Create drainage.4d**.

The Details

The Drains database dump file **Drains Connection Data.txt** is copied into the 12d working folder and read. The choices for the **Pit families**, **Pipe types** and **Overflow Route Cross Section Shapes** are loaded into the panel. The user must select a **Pit group separator** to separate the road grades and crossfalls from the pit family names. The resulting **12d Pit Groups** will be calculated and displayed in the choice box. **Create drainage.4d** will create a **drainage.4d** file that may then be edited to specify the road grade and crossfall threshold values. Once the file is created you may review/edit it by selecting the **More Info** icon then **Edit** on the **Drainage.4d** field. The **Overland route shapes** are not exported to the drainage.4d file and are presented for your information only.

YOU MUST RESTART 12D FOR THE NEW DRAINAGE.4D FILE TO BECOME ACTIVE!

Field Description	Type	Defaults	Pop-Up
Drains database file	file	Drains Connection Data.txt	

You must update this file from Drains before each use of this panel. Inside Drains select Project=>Overflow Route database. Then select OK and then YES. This will cause Drains to export the database to the file "Drains Connection Data.txt".

*Selecting **Enter** in this field or selecting **Read Drains database** will cause the panel to search for the*

database dump in the folders **C:\Program Files\Drains\Program** and **C:\Program Files\Drains\Demo\Program**. If the Drains program is installed in another folder then you must browse for the file. After reading the file choice boxes below will be populated. Drains Connection Data.txt will be copied into the 12d working folder.

- | | | |
|--|--------|---------------------|
| Drainage.4d | file | drainage.4d |
| <i>The drainage.4d will be created in the 12d working folder unless otherwise specified. It will only be used for 12d projects in this folder.</i> | | |
| Pit families | choice | Drains pit families |
| <i>These are the Drains pit families that will be exported to the drainage.4d file. The 12d pit groups will be created from this list.</i> | | |
| Pipe type | choice | Drains pipe types |
| <i>These are the Drains pipe types that will be exported to the drainage.4d file.</i> | | |
| Overflow Route Shapes | choice | Drains Route Shapes |
| <i>These are the Drains Route Shapes and are for information only.</i> | | |
| Pit group separator | input | |
| <i>These characters will be used to remove the road grade crossfall data from the Pit families above. The data before this character will become the 12d pit groups. Press Enter or select Read Drains database to create a new list of 12d pit groups.</i> | | |
| 12d pit groups | choice | 12d pit groups |
| <i>These are created from the Pit family list above by deleting all text after the Pit group separator. This should delete all of the road grade and crossfall information from the pit group names.</i> | | |
| Read Drains database | button | |
| <i>Searches for the Drains database (see general description above) and populates the choices fields.</i> | | |
| Create drainage.4d | button | |
| <i>Create a local copy of the drainage.4d file.</i> | | |

Editing the Drainage.4d file

Position of option on menu: Design =>Drainage-Sewer =>More=>Edit drainage.4d

On selecting the Edit drainage.4d option, the Edit drainage.4d panel is displayed.

Select the **Find** button to search the 12d path for the current **drainage.4d** file. Select the **More info** button and then **Edit** to edit the file.

The drainage.4d file contains Manhole and Pipe commands. 12d also uses the Manhole commands to specify a manhole group by using the prefix "group". Details follow.

Pit Families and Manhole Groups

Version 2+ of the Drains clipboard interface uses a **pit family** to describe the kerb shape. Optionally, the Drains pit families also have the road crossfall and/or grade attached as a suffix to the name with a special character between them (pit group separator). Therefore there may be many pit families that have the same kerb shape but different road grades and cross falls. All of these pit families with the same prefix are brought together in 12d as a **manhole group**.

An example manhole group is the drainage.4d file is shown below. The 12d group is called **NSW RTA Pits** and 12d uses the road grade to select which pit family should be sent to Drains. In this example the road crossfall would not be used in selecting the pit family.

The **pit group separator** is a "-". This character separates the pit group from the road data.

It is up to the user to decide the grade when the next pit family should be used. In this case the threshold value for the gutter grade is set midway between the published values of the inlet curves. For example at a gutter grade of 2% 12d starts sending the *NSW RTA Pits - 3% slope* pit family.

This pit families listed on the right must match exactly with those in the Drains pit database.

```
Manhole "group NSW RTA Pits" {
//   cross fall, gutter grade, cap1, cap2, cap3, cap4pit family
//4d   0,      1,    0,    0, 0.0, 1.0      NSW RTA Pits - 1% slope
//4d   0,      2,    0,    0, 0.0, 1.0      NSW RTA Pits - 3% slope
//4d   0,      4,    0,    0, 0.0, 1.0      NSW RTA Pits - 5% slope
//4d   0,      6,    0,    0, 0.0, 1.0      NSW RTA Pits - 7% slope
//4d   0,      8,    0,    0, 0.0, 1.0      NSW RTA Pits - 9% slope
}
```

An example with crossfalls follows.

```
Manhole "group NSW RTA Pits" {
//   cross fall, gutter grade, cap1, cap2, cap3, cap4
//4d   1,      1,    0,    0, 0.0, 1.0      NSW RTA Pits - 1% crossfall, 1%
slope
//4d   1,      3,    0,    0, 0.0, 1.0      NSW RTA Pits - 1% crossfall, 3%
slope
//4d   1,      5,    0,    0, 0.0, 1.0      NSW RTA Pits - 1% crossfall, 5%
slope
//4d   1,      7,    0,    0, 0.0, 1.0      NSW RTA Pits - 1% crossfall, 7%
slope
//4d   1,      9,    0,    0, 0.0, 1.0      NSW RTA Pits - 1% crossfall, 9%
slope

//4d   3,      1,    0,    0, 0.0, 1.0      NSW RTA Pits - 3% crossfall, 1%
slope
//4d   3,      3,    0,    0, 0.0, 1.0      NSW RTA Pits - 3% crossfall, 3%
slope
//4d   3,      5,    0,    0, 0.0, 1.0      NSW RTA Pits - 3% crossfall, 5%
slope
//4d   3,      7,    0,    0, 0.0, 1.0      NSW RTA Pits - 3% crossfall, 7%
slope
//4d   3,      9,    0,    0, 0.0, 1.0      NSW RTA Pits - 3% crossfall, 9%
slope
```

}

The Drains pit family names must match the names in the last column EXACTLY!

Manhole Types and Pit Sizes

Each Drains pit family has several pit sizes. The Drains pit sizes link to the 12d manhole types and therefore all Drains pit sizes should exist in the 12d drainage.4d file.

The pit size will be read back from Drains into 12d as the pit type so that it can be placed on the drainage long sections and pit schedules.

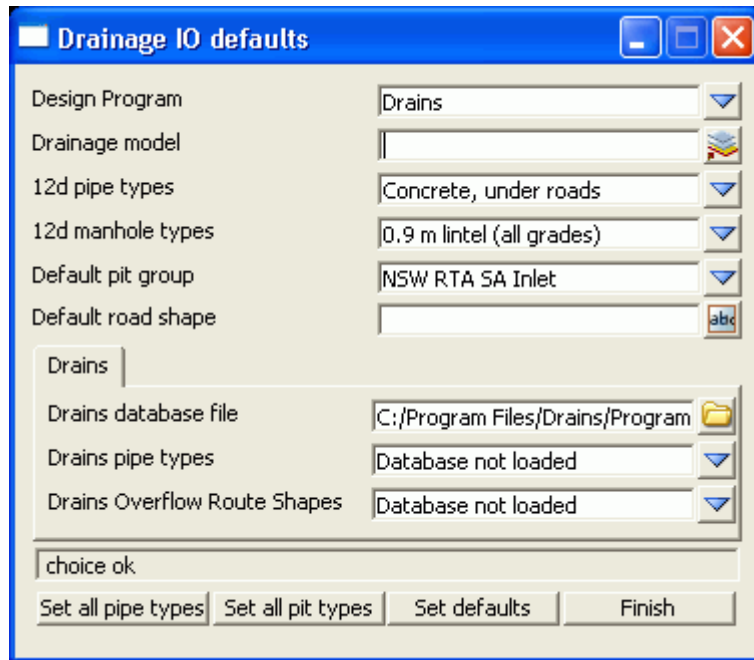

Pipe Types

The pipe type selected in 12d must exist in the pipe database inside Drains. Simple “2” for class 2 or “RCP” do not exist in Drains.

Setting the Overflow Route, the Pit and Pipe types

Position of option on menu: Design =>Drainage-Sewer =>More=>Drainage IO Defaults

On selecting the Drainage IO Defaults option, the Drainage IO Defaults panel is displayed.

The routine changes ALL of your manhole and pipe types in a model to a single value. If you have changed your drainage.4d file after creating you drainage network, the manhole and pipe types you originally selected may no longer be valid (i.e. in the drainage.4d file).

Field Description	Type	Defaults	Pop-Up
Design Program	choice	Drains	Drains,PCdrain
Drainage model	file		
12d pipe types	choice		values from drainage.4d

Set all pipe types will set all pipes in the model to this value

12d manhole types choice values from drainage.4d

Set all pit types will set all manholes in the model to this value

Default pit groups choice values from drainage.4d

*manhole definitions in the drainage.4d file that have **group** as a prefix are included.*

Default road shape choice values from drainage.4d

*type the desired name or if using Drains select the desired shape from the **Drains Overflow route shapes**.*

Drains Tab

Drains database file file

*pressing enter in this field will start a search for the Drains database dump. The search path is the specified folder, C:\Program Files\Drains\Program then C:\Program Files\Drains\Demo\Program. If the file is found the choice fields below are populated. **It is highly recommended that this file be in the 12d working folder.***

Drains pipe types choice 1 values from Drains file

*the pipe types are retrieved from the last Drains database dump. Changing this value will update the **12 pipe types** above.*

Drains Overflow Route Shapes choice values from Drains file

*the overflow route shapes are retrieved from the last Drains database dump. Changing this value will update the **Default road shape** above.*

Set all pipe types button

all pipe types in model are set to this value

Set all pit types button

all pit types in model are set to this value

Set defaults button

*the defaults for the **Drains Overflow Route Shapes** and **12d pit group** are set*

Finish button

removes the panel

Drains Version 2+ Requirements

Manhole Names

The 12d manhole names cannot be more than 9 characters long. 12d uses 2 additional characters to the manhole name at export time create names for the pipes, overflow routes and catchments. For example manhole "A-1" will have a bypass route "F A-1", a catchment "C A-1" and a downstream pipe "P A-1".

Bypass Flow (Overland Flow Routes)

There are 3 requirements for Drains bypass flow.

1. Select **Default pit group** (Network editor->Defaults->Pits->Pit group). The Drains and 12d databases must be in sync.

2. Bypass strings in the **Bypass route model** specified (Network editor->Global->Utility Models->Bypass flow model. For more details see **Bypass Flow**.)
3. Road grade and crossfall calculated (Network editor->Global->Utility Models->Road design file)

The overland flow strings are not allowed to pass through the outlet pit on the network.

SAG Inlet Calculations

SAG inlets are manholes where the water ponds at the surface rather than flowing past. If a SAG inlet has a catchment string the overflow depth and volume are calculated. The catchment string from Set #1 is draped onto the design tin and the lowest point is found on the draped string (stored as a 12d pit attribute **overflow level**). The storage volume inside the string up to this point is measured and stored as a 12d pit attribute **overflow volume from level**. The pit cover level and **Setout to grate offset** are subtracted from the lowest point on the catchment string to determine the Max Ponding Depth.

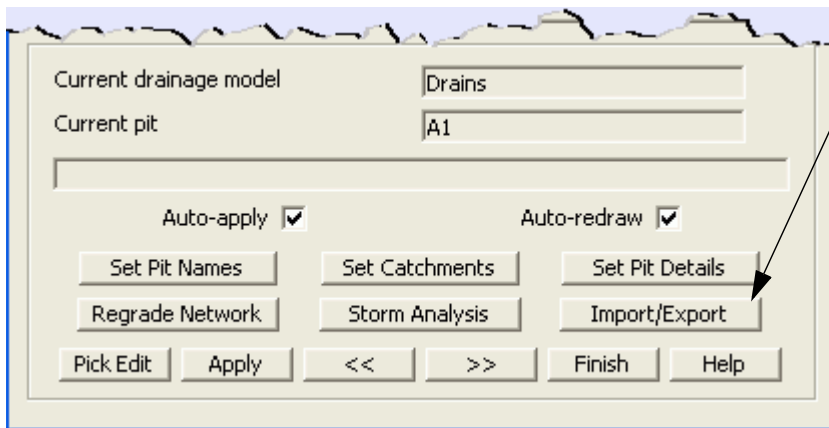

Results

Drains exports the maximum data from all of the rainfall events analysed. Therefore, ensure you analyse only the rainfall events desired before copying the results to the clipboard. To verify the data that is being sent to 12d, copy the data into a spreadsheet so you can view it there first. The pit sizes selected in Drains will be stored in 12d as the manhole type. Therefore the pit sizes in Drains should exist as manhole types in the drainage.4d file. If pit families are changed in Drains the pit group in 12d will be updated by search for the pit family in the drainage.4d file.

12d to Drains

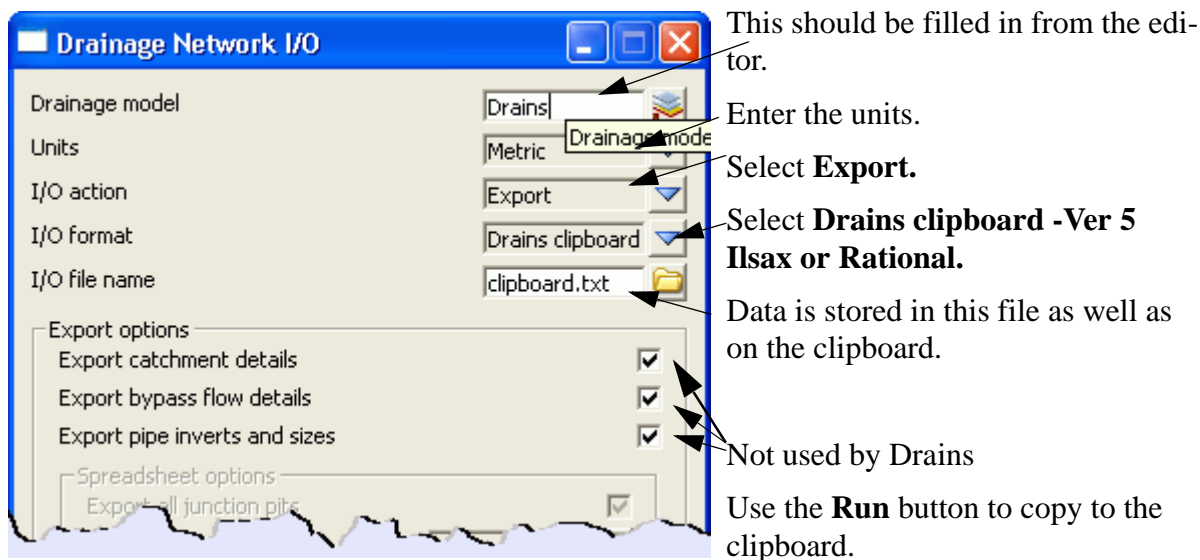

Setup your drainage network models and ensure they have been assigned pit names.

1. Copy the data to the clipboard

From the Drainage network editor select the **Import/Export** button.

The following interfaces dialogues will appear.

2. From within the Drains program select **Edit =>Paste data from spreadsheet**. If you paste the data into a Drains project that has a hydrological model and rainfall data already defined the project will be ready to run.
3. Use the Drains Run=>Standard design to design your pipe sizes and invert levels. The Run=>Advanced Design will select the size of the manholes as well.

Drains to 12d Update

The following steps are required to update the 12d model with the Drains hydraulic results and changes to the pipe sizes and inverts.

1. To update the pipes and invert levels in 12d, select **Edit->Copy Data to Spreadsheet** from the Drains menu.
2. From within the 12d Drainage network editor select **Import/Export**.

This should be filled in by the editor.

Not used on import.

Select **Import**

Select Drains clipboard - Version 5

Leave as clipboard.txt

This will ignore the invert levels read from Drains and the current pipe obverts will remain fixed.

Plan and long section drawings may be created at the import time so that you can see the results on the drawings.

Select **Run** to update the drainage model. To see the changes in the section views you will have to select **Regen** on the section view toolbar.

To return to the network editor select **Edit**

IMPORTANT: THE DATA MUST BE PASTED BEFORE THE RESULTS!

12d erases the hydraulic and hydrology data when the physical data is updated. Therefore, always paste the data before the results.

PCdrain Requirements

PC Drain Int (Windows)

See also Drainage overview

Basic Check List

1. All manholes must have a unique name
2. Only one outlet allowed in the drainage model
3. First export should have “**Export default catchment/pit/overland parameters**” selected
4. Pit types in used in 12d must exist in the PCdrain Inlet gully file selected.

Overland flow with Inlet Capacity Check List

1. A gutter profile named “4d” must exist in PCdrain before the interchange file is read. This gutter profile may be created in PCdrain from the menu selection **Data=>Gutter profiles** then **New**.
2. Overland flow lines must be within 1.0 metres/feet of the manhole

Data is exchanged to and from PCdrain via the interchange (*.int) file. Gutter profiles and inlet type must be specified in PCdrain before the interchange file is read into PCdrain.

The data sent to PCdrain includes

- s manhole names and types, easting and northing data with surface levels
- s pipe deflection angles at manholes
- s finished surface profile along the centre line of the pipes
- s optional - crossing services - level, size and location along the pipes
- s optional - bypass manholes, road grades and SAG inlet ponding depths
- s optional - up to 2 catchment areas per manhole
- s optional - default catchment characteristics, k values and overland travel times
- s optional - pipe sizes and invert levels

PCdrain Requirements

Manhole names

The manhole name from 12d is assigned to both the structure and catchment name in PCdrain. These names cannot exceed 7 characters.

Manhole type

The 12d manhole type is transferred to the structure type in PCdrain. These names must match those specified in the PCdrain Inlet charts selected (**Data=>Inlet charts**). Select the desired inlet charts BEFORE importing the interchange file.

12d manhole types with an “S” in the name are treated by 12d and PCdrain as a SAG inlet pit. 12d will strip off all characters after the “S” before adding the ponding depth. If a catchment string in set #1 is available for the SAG pit then the ponding depth will be calculated. The 12d manhole type will remain unchanged. A typical example would be a manhole type “ITC” with the sag tick box on would become “ITC0.100” if a ponding depth of 0.1 was calculated.

Bypass Flow

When a catchment string is specified for the manhole, the maximum depth before bypass flow commences

is calculated. The lowest point on the catchment string is determined by draping it onto the drainage strings tin. The maximum depth before bypass is calculated manhole setout level less the setout to grate offset less the lowest point on the catchment string.

PCdrain differentiates between manholes (no surface inflow) and gully pits via the 12d manhole type. The bypass flow strings can only be drawn within 1 manhole diameter of the gully pits. Keep the bypass flow strings away from the PCdrain manholes.

Catchments

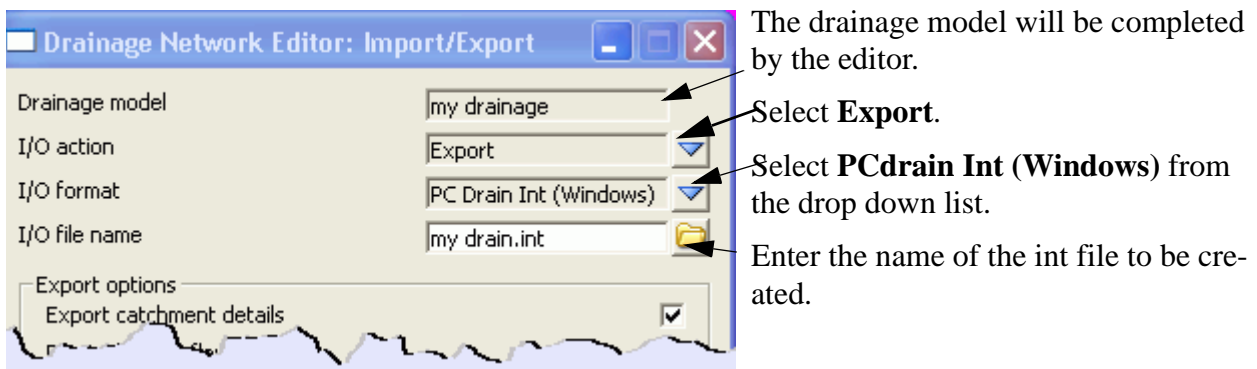

Again, since PCdrain differentiates between inlets and manholes (using the 12d manhole type), ensure that catchments are only drawn for gully inlet and NOT manholes.

12d to PCdrain

1. Export the data to PCdrain selected via the Network editor

Design=>Drainage-Sewer=>Drainage Network Editor

After selecting the drainage network, select the **Import/Export** button and the following dialogue will appear.

Select the **Run** button and the interface file will be created.

2. Launch the PCdrain for Windows program. If you have a project set up with the design parameters, rainfall data, inlet charts and gutter profiles then open it now and skip to step 8. Otherwise continue with step 5.
3. The Design Parameters can be set as desired with the menu selection **Data=>Design Parameters**.
4. Select the rainfall data using the **Data=>Rainfall** menu selection.
5. Select the inlet charts using the **Data=>Inlet Charts** menu selection. The manhole types specified in 12d must be included in these settings. **More - PCdrain to 12d pit converter**
6. At least one gutter profile in PCdrain needs to be defined. These are set through the menu selection **Data=>Gutter Profiles**. The default gutter section name (**Road ID**) from 12d is **4d** and therefore it is recommended you create a profile with this name and your own description. If you have changed the profile names in 12d (through the spreadsheet interface or the Attribute editor) these new profile names will have to exist in PCdrain.
7. Save this file now so that you can retrieve it later if required. It can be used as a starting template for new jobs.
8. **File=>Import** from the menu. Select the file exported in step 1. The information from 12d may be viewed by selecting **Data=>Network** and then selecting the desired tabs.
9. The HGL level and the pipe elevation at the outlet should be set using the menu selection **Data=>Outlet**.
10. If you have not exported pipe data then the pipe size must be determined. Use the menu selection **Proc-**

ess=>Select Pipe Sizes.

PCdrain data values

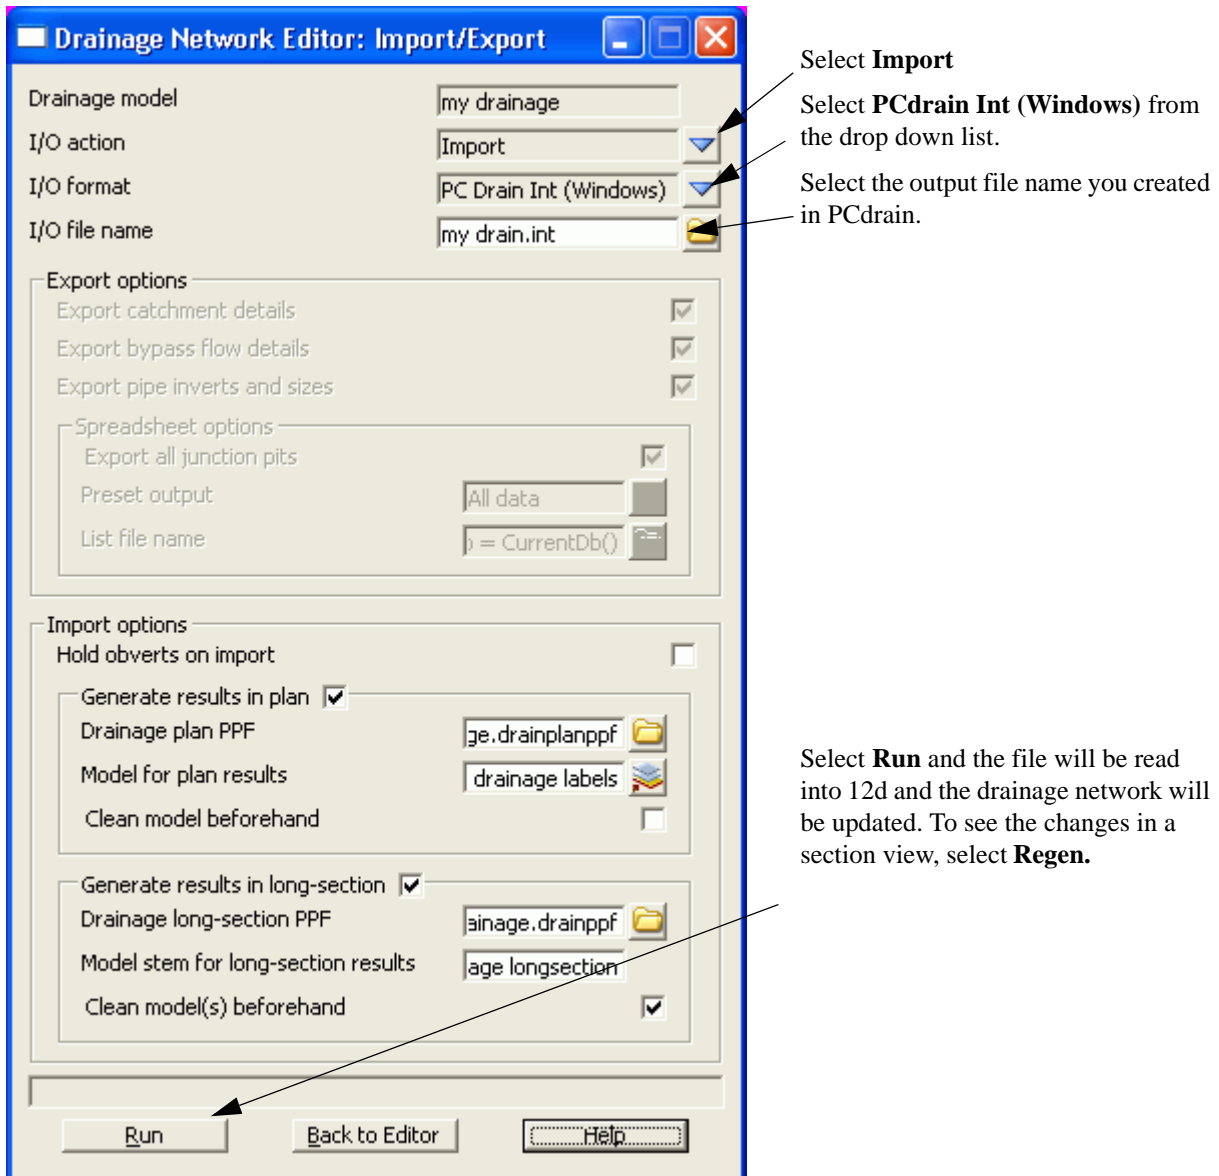

Some PCdrain data values are not available in the 12d network editor. Prior to an import from PCdrain, **initial export values** are used. On the first **import** from PCdrain, 12d attributes are created to hold the PCdrain variables for subsequent exports to PCdrain. These data values are usually changed in the PCdrain menus but may be changed in 12d using the Attribute editor.

PCdrain	12d editor	12d attribute	initial export value
Kw	not available	kw	12d ku value
Minor Coef	Catch Set 1 - Pervious C (minor)	c minor pervious	default
Major Coef	Catch Set 1 - Pervious C (major)	c major pervious	default
Minor Coef2	Catch Set 2- Pervious C (minor)	c minor pervious2	default
Major Coef2	Catch Set 2- Pervious C (major)	c major pervious2	default
Tc overrider	Catch Set 1 - Pervious Tc (minor)	tc minor pervious	default
Length of overland flow	Catch Set 1 - Pervious length	catchment length pervious	default
Grade of overland flow	Catch Set 1 - Pervious slope (%)	catchment grade pervious	default
Length of gutter flow	Catch Set 1 - Impervious length	catchment length impervious	default
Grade of gutter flow	Catch Set 1 - Impervious slope (%)	catchment grade impervious	default
Road XSections left	not available	overland profile name	4d
Road XSections right	not available	overland profile name right	4d

PCdrain to 12d

Export the results to 12d using the **File=>Export** menu selection. Note the name of the interchange file you are creating as you will need to enter it inside 12d.

Return to 12d and select **Import/Export** from the network editor and the following dialogue will appear,

A listing of the data imported is stored on the 12d output window.

Manholes that have been specified as SAG inlets will have the ponding depth removed from the end of the PCdrain structure type before the data is stored as the 12d manhole type.

RAT2000 Requirements

RAT2000

See also Drainage overview

Basic Check List

1. All manholes must have a unique name (they become nodes in RAT2000)
2. Only one outlet allowed in the drainage model
3. First export should have “**Export default catchment/pit/overland parameters**” selected
4. First export should have “**Export pipe diameters and Inverts**” selected
5. Outlet conditions must be set in RAT2000.

6. Start-up data may be specified in the file **drainage startup.xpx** (the standard 12d system file path will be searched).

Overland flow with Inlet Capacity Check List

1. Overland flow lines must be within 1.0 metres/feet of the manhole
2. If inlet capacity curves are to be used then the curve name must match the 12d pit type with the road grade/crossfall data added.

Running RAT2000

Data is exchanged to and from RAT2000 via the interchange (*.xpx) file. The data exported from the 12d drainage model is appended to the xpx startup data specified in the file **drainage startup.xpx** (the standard 12d system file path will be searched). This file may be edited using a text editor or you may create your own default file by exporting your RAT2000 global data this file.

RAT2000 Requirements

Manhole names

All manholes will become nodes in RAT2000 and therefore they must have a unique name inside 12d.

Manhole Types

The manhole types are used to determine the pit inlet capacities if overland flow routes are selected. Fixed inlet capacities values may be set in the drainage.4d file while inlet capacities curves must be included in the drainage_startup.xpx file. The range of available curves for 12d to choose from are set in the drainage.4d file and the curves are determined using the pit type, road grade and road crossfall.

Pipe Types

Pipe types are not transferred to RAT2000.

Overland Flow

When an overland flow model is selected the pit inlet capacities and bypass routes are calculated.

12d to RAT2000

1. Export the data to RAT2000 by selecting
Design=>Drainage-Sewer=>More=>Pit/Pipe Design Interface

The following dialogue will appear.

Select RAT2000 from the drop down list.

Select your drainage model

Enter the name of the xpx file to be created.

Optional.

Specify catchment units **acres** or **ha**.

Not supported in RAT2000.

See overland flow section

Usually leave this selected

See notes below on **Updating an existing RAT2000 file**

Used to set default data and calculations at export time.

The **Export Pipe Diameters and inverts** option should be ticked for if you want the 12d pipe sizes sent to RAT2000. This should always be selected the the first time you create the RAT2000 file. RAT2000 will increase pipe sizes but will not decrease them.

The **Export default catchment/pit parameters** will instruct 12d to export default catchment parameters. This is usually only done on the first export. Catchment areas will always be sent if a catchment string exists for the manhole.

Select the **Write** button and several checks will be made on the drainage network at this time. CAUTION notes will be given... **read them**. If asked, fix any errors that are reported. The interface file will be created.

Updating an existing RAT2000 file

Adding new Nodes and Pipes

If new manholes and pipes have been added to 12d then these new entities will now be included in the xpx file and imported into the RAT2000 project. 12d identifies the nodes in XP by the node names. Therefore if nodes names are changed in either program then they must be manually changed in both programs.

If a manhole is to be inserted in an existing link then the existing link must be deleted in RAT2000 so that the new links and manholes may be created in the void.

WARNING! If the tick box Export catchment/pit/overland flow default data is selected for the update then any changes to these defaults in RAT2000 will be lost. Two options are available to the user.

Option 1 - Preferred method if updating pipe lengths, invert levels for your design.

De select the tick box and export the data. The new node and links created in RAT2000 will not have all

the defaults set but the existing nodes and links will not have revisions to defaults overwritten.

Option 2 - Preferred method if you have created numerous new links and nodes.

Leave the tick box selected but export the RAT2000 to a temporary xpx file first. This will save the existing setting. After RAT2000 is launched and loaded with the new data, import your temporary xpx file you just created to restore the original data.

Deleting Nodes and Pipes

If a node or link is to be deleted then delete the entity from both 12d and RAT2000.

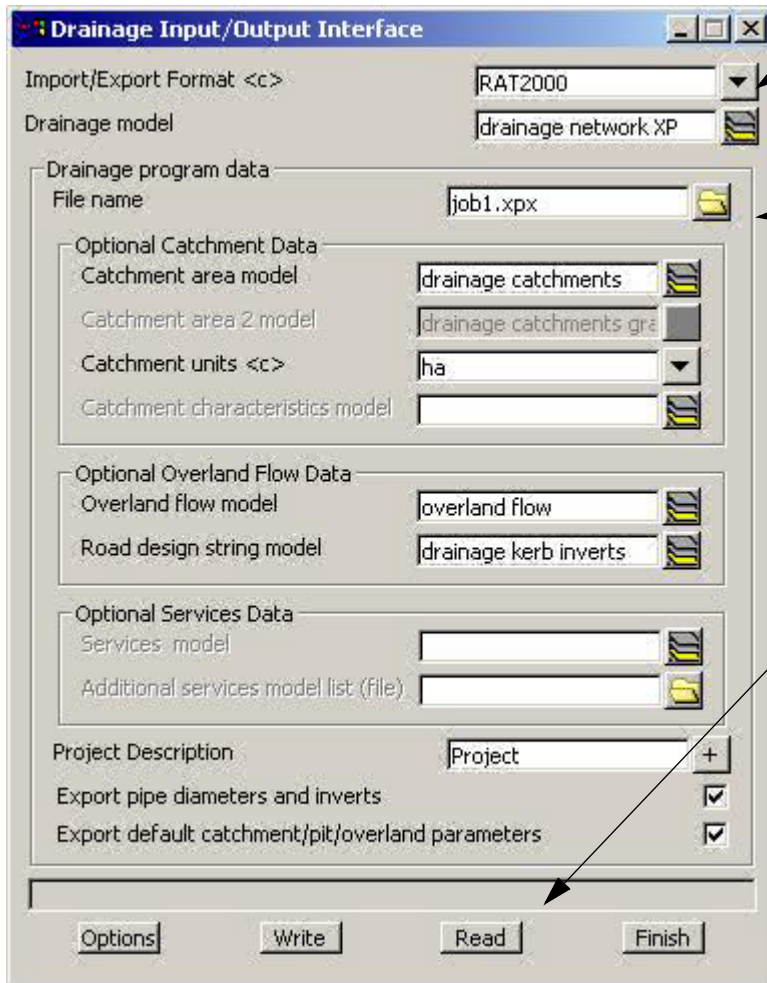

RAT2000 Results to update 12d

If RAT2000 is launched automatically using option 1 above then as soon as RAT2000 is exited an interface file is automatically created (using the same name as the import xpx file). This file will now be read back into 12d to update the pipe network and import hydraulic results for drainage longsection plots.

Return to 12d and select

Design=>Drainage-Sewer=>More=>Pit/Pipe Design Interface

The following dialogue will appear,

Select **RAT2000** from the drop down list.

Select the model containing the drainage network.

Select the output file name you created in RAT2000.

The remaining fields are not used for the import process.

Select **Read** and the file will be read into 12d and the drainage network will be updated. To see the changes in a section view, select **Regen**.

A listing of the data imported is stored in the file **printout.txt** which can be found in the directory above the project.

XP SWMM Program Requirements

XP SWMM

See also Drainage overview

Basic Check List

1. All manholes must have a unique name (they become nodes in XP SWMM)
2. Only one outlet allowed in the drainage model
3. First export should have “**Export default catchment/pit/overland parameters**” selected
4. First export should have “**Export pipe diameters and Inverts**” selected
5. Outlet conditions must be set in XP SWMM.
6. Start-up data (run times and hydrology data) may be specified in the file **master_drainage.xp** (the standard 12d system file path will be searched).

Running RATHGL/RAT2000 and XP-SWMM

The drainage design with all three of the XP software programs follows the same methodology. The process is substantially automated with the XP-SWMM program so that the XPX file is automatically read by XP-SWMM and automatically created when leaving XP-SWMM.

Drainage design with XP programs includes the following steps.

1. 12d creates an XPX file that is read by the XP programs.
2. The XP program is then run in the design mode to determine the pipe sizes and invert levels.
3. If bypass and overland flows are to be modelled then the inlet capacities need to be defined and then run the XP program in the Full Analysis Model.
4. The XP program creates an XPX file for 12d to import.

XP Program Requirements

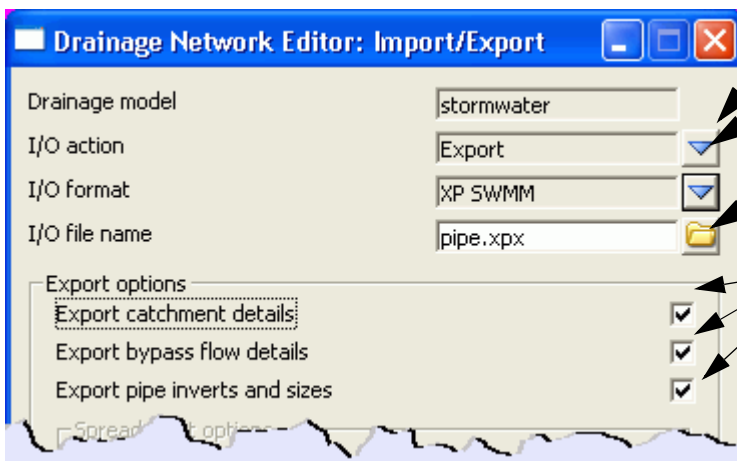

12d to the XP Programs

The x,y pit layouts and the cover/surface levels are obtained from your drainage network while the catchment and overland flow data comes from the models specified in the drainage interface dialogue.

The steps required to transfer the data to the XP programs are as follows.

1. Setup your drainage network models.
2. To create the XPX file for XP programs start the Drainage Network Editor and select **Import/Export**

The following interfaces dialogues will appear.

Select **Export**

Select **XPSWMM** or **RAT HGL** from the drop down list.

Enter the name of the xpx file to be created.

Not used at this time.

Finally, Select the **Run** button to create the file.

If exporting to RAT-HGL the following dialogue will appear.

If you are using old versions of RAT-HGL (1996 or earlier) select use **Local** otherwise select **4D units** (eastings and northings).

Select process.

3. The XP SWMM program will automatically startup and load the XPX file.

From within RAT-HGL, either select **File =>New** and follow the input prompt or load a file that contains all of the pit inlet rating curves, hydrological and design data without a pipe network. Many users

have such RAT-HGL files setup so as to streamline the design process.

The xpx file for RAT2000 will have the file startup.xpx added to it so that you may include all the startup global data that you require. The

Fixed inlet capacities and rating curve names indicating road grade and crossfall may be set in the **drainage.4d** file. The format for these names is pit name-crossfall-road grade (ex SA2-3-4). These curves must exist in this file.

4. To read in the pipe file created above, select **Special =>Import Data** and select the xpx data file. Warnings will be given stating that several fields are inactive. This is expected as more data is sent to RAT-HGL than is needed at this time. Select the **Close Square** on the Help title area and the pipe network and catchments should now appear on the screen.
5. If you want RAT-HGL to redesign you network, change the analysis mode to Design mode by selecting **Special=>Job Control** and **Select Design mode**. Do not do this if you want to analyse the network you layed out in 12d (used for existing systems).
6. Select the rainfall events to design/analyse and the **LB** (twice) on **OK** to return to the layout. Now select the outlet and enter the starting tailwater levels.
7. Now you can run RAT-HGL (**Special =>Solve**).

XP Programs to 12d

Once you have your design finished, the following steps are required to update your 12d model. Your design may contain several return periods in the analysis (Rp1 to Rp7) but 12d reads only the results from Rp1. The following table is taken from the RATHGL output file (*.out extension) and the results indicated are read back into 12d via the xpx file.

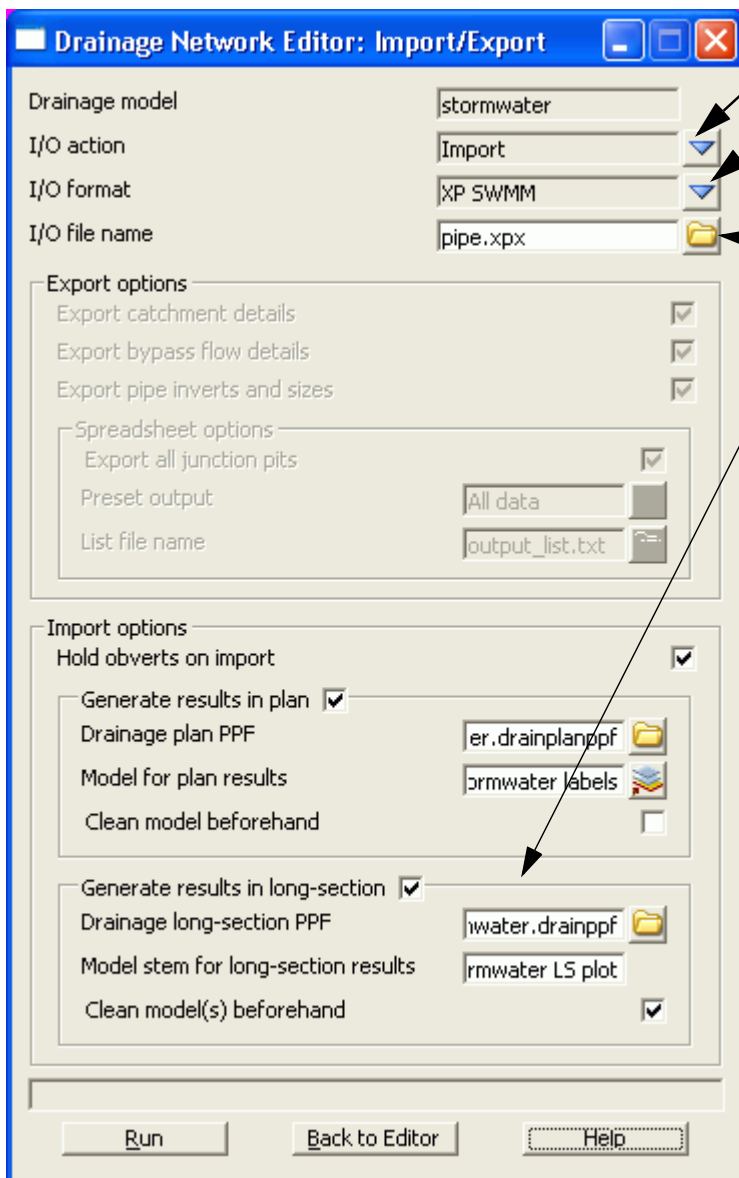

HGL PIPE NETWORK ANALYSIS SUMMARY RETURN PERIOD 5 YEARS
 PROJECT:12d DRAINAGE LAYOUT

In addition to the results, the following input data is read back into the 12d model so that it may be exported back to RATHGL in the future (if required). 100% of your RATHGL data is not included in the XPX formats and the contents of the XPX file will depend upon your design mode. Therefore, use caution if you read an XPX file into an existing RATHGL model and check your data once inside RATHGL.

1. From within RAT-HGL, produce an XPX file for 12d to read by selecting **Special=>Export Data** and following the default prompts.
2. From within 12d, select the **Import/Export** button on the Drainage Network Editor. The following panel will appear.

Select Import.

Select to select **RATHGL** or **XP-SWMM**.

Select the file name specified in step 1

Select **Run** to update the drainage model and import hydraulic/hydrological results.

Running Micro Drainage - Win Des

Micro Drainage (*.sws)

Micro Drainage (*.fws)

See also Drainage overview

Basic Check List

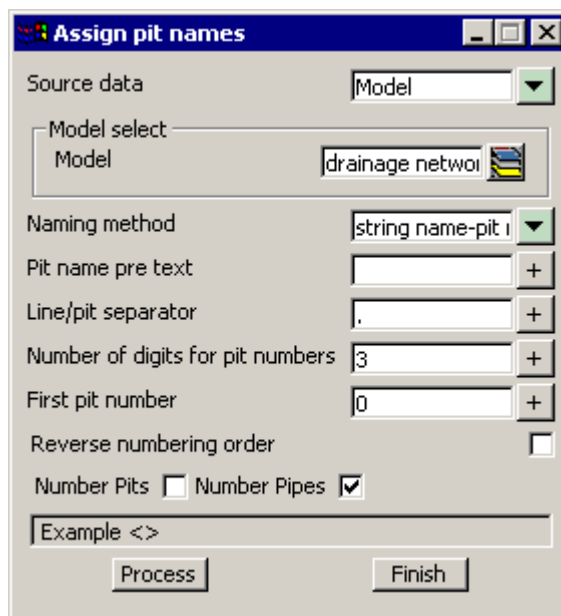

1. All manholes must have a unique name (they become nodes)
2. Only one outlet allowed in the drainage model
3. First export should have “**Export default catchment/pit/overland parameters**” selected
4. First export should have “**Export pipe diameters and Inverts**” selected
5. Outlet conditions must be set in Win DES.

Micro Drainage - WinDes Requirements

Manhole - Pipe names

The pipe names are used in the WinDes interface NOT the manhole names. Therefore the pipes are often named separately to follow the WinDES required naming convention.

The pipes must use the numbered sequence with the most upstream pipes numbered with the smallest numbers starting at 0. Number of digits must be set to 3. If this numbering system is not followed 12d will renumber the strings and request the user to run the drainage misc utilities to rename the pipes and manholes. The panel below shows the naming convention used in misc utilities.

The *.sws or *.fws files may be open directly inside WinDes.

Open channel drainage design.

Win Des can (hydraulically) model any shape of conduit. The conduits are given numbers between 1 and 100. 12d selects these conduits by setting the **pipe type** to **WINDES** (case sensitive) and pipe diameter to

the WinDes conduit number divided by 1000. (examples 0.032 indicates WinDes conduit 32).

12d can create the conduit shape by applying a template to the drainage string. The user must create a template with the same name as the WinDes shape number (32 for example). The templates are created from the main menu

Design->Template->Create Edit

For more information about template design please refer to the 12d training manual.

Once the template has been created it is applied to the drainage string to create the cross sections and strings to represent the conduit shape..

From the main menu **Design=>Drainage-Sewer=>User=>Drainage Volume Calculations**

For more information see **Drainage line excavation volume calculations.**

Drainage Excavation Quantities

Drainage_excavation_volumes_panel

Position of option on menu: Design => Drainage => Reports => Excavation Quantities

See Also

Drainage overview

This routine calculates the excavation volume for all of the drainage strings in a model. Since templates are used for the calculations trench shapes can be customised by depth and over excavation for bedding materials can be included. Net area calculations to exclude pipe area is not supported.

Key points

1. One template for each pipe size (mm)
2. Carefully consider the tin selected.
3. Box culverts should have their own pipe type

A template must exist for each pipe size in the model (pipe size x 1000). For example a 0.3m pipe will require a template to exist named 300. A 0.5ft pipe would require a template named 500. Sample templates are included in the courses section of 12djobs (\12djobs\courses\7.00\drainage). These may be copied to your *.project directory and then added to your project using **Design=>Templates=>Utilities=>Add=>All all to project.**

The templates are run along the strings and the total volumes are reported. Volumes for each strings are given in the report file. An example follows.

-----BEGIN APPLY TEMPLATE REPORT -----

apply template to string report -

```
string      E
tin         design
separation  10.000
left template 375
right template 375
cut volumes and areas are negative
fill volumes and areas are positive
```

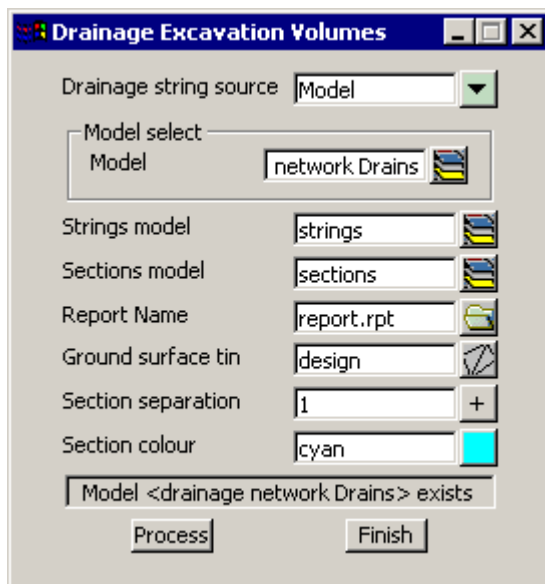

chainage- -----sectional information----- -----intermediate information---- -----accumulative

If a tin is created from these strings then volumes by depth can be determined using **Design=>Volumes=>Exact=>Tin to tin**

Usage

This panel is accessed from the menu selection

Design => Drainage => Reports => Excavation Quantities

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
drainage string source model <i>drainage string selection</i>	choice box	model	View,model,string
drainage model <i>Model to contain all of the pit and pipe network to be worked on.</i>	input box		
Strings model <i>Strings generated from the templates will be stored in this model</i>	model box		
Sections model <i>Sections generated from the templates will be stored in this model</i>	model box		
Report name <i>cut and fill volumes will ne sent to this report</i>	input box		
Ground Surface Tin <i>tins from which the volumes will be calculated</i>	tin box		
Section separation <i>distance between the sections</i>	real box		
Sections colour <i>Sections generated from the templates will be assigned this colour (strings colours are defined in the templates)</i>	colour box		

Pit Schedules

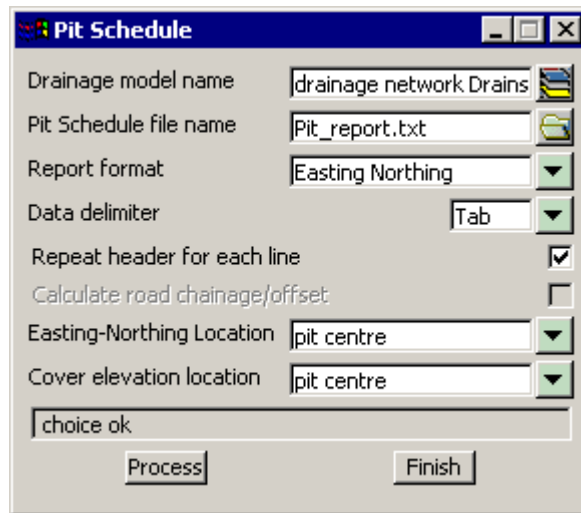

[drainage_pit_schedule_combined_v7_panel](#)

- Selecting design string or tin?
- Drainage overview

Usage

This panel is accessed from the menu selection
 Design => Drainage => More Drainage => Pit schedule

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model name <i>model containing the drainage strings</i>	input box	drainage network	
Pit schedule file name <i>file to be created</i>	input box	pit report	
Report Format <i>file format</i>	choice box	Road change...,Easting...	
Data delimiter <i>tab delimiters are best for spreadsheets and space for some text editors</i>	choice box	Tab, Space	
Repeat header for each line <i>when selected, the column headings will be printed each drainage line</i>	tick box	selected	
Calculate road chainage/offset <i>only used for road chainage-offset format. When selected, the road chainages and offset calculation panel will be displayed so that the this data can be updated before the report is generated. (see below)</i>	tick box	selected	

Easting Northing Location choice box pit centre, road design string

easting northing data can be from the manhole centre or the x,y location on the road design string that the manhole has been linked to

Cover elevation location choice box pit centre, road design string

*the cover level elevation can be from the manhole centre or the elevation on the road design string that the manhole has been linked to (if a link has been made then these values should be the same). Note that the road design string data is **NOT** caclulated at this time. These are the vaules calculated from the Drainage Misc Utilities or the last drainage data export.*

Process button

Create the pit report

Finish button

remove the panel from the screen

Notes:

The columns of data may be separated by spaces or a tab. (tab is used for spreadsheet transfers). The internal width and length data are retrieved from the **drainage.4d** file for the pit type specified. If you want a longer description for the pit then the type used inside 12d this can also be entered in the drainage.4d file. The remarks for each pit are entered as user defined pit attribute named **remarks** and may be set using the attribute editor (on the drainage menu) or via a spreadsheet.

A/75152.699	7322.036	29.241	d002	7.450

Notes

The Set pit details must be run at least once to before printing the report. If the pits are moved or the designed strings changed then this option must re rerun.

The Road Chainage and Offset Pit Schedules use two user defined attributes for each pit. The first is **ctrl string** which identifies the string that the pit will be offset from and the second is **ctrl model** which contains the model name for the control string. These may be manually created/modified using a spreadsheet or the attribute editor.

The easting northing data obtained for the **road design string** option is obtained by dropping the manhole centre perpendicular onto the selected road design string. This data is stored as pit attributes **setout x** and **setout y**. It is calculated when the manhole cover levels are recalculated (drainage misc utilities and during drainage export (recalc level option must not be turned off)).

The cover elevation data obtained for the **road design string** option is obtained by dropping the manhole centre perpendicular onto the selected road design string and obtaining the elevation at this point. This data is stored as pit attribute **level z**. It is calculated when the manhole cover levels are recalculated (drainage misc utilities and during drainage export (recalc level option must not be turned off)).

Attribute Editor

attribute_edit_panel

Position of option on menu: Design => Drainage => More => Top Ten attributes editor

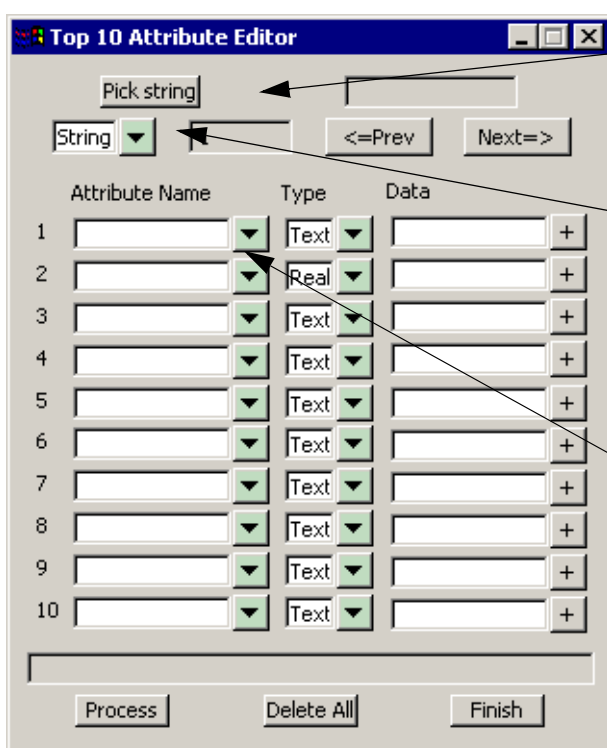

Most of the detailed catchment data is stored within 12d as user defined attributes. These attributes are automatically created by 12d when required but you are free to change them or add more as desired. The attributes may be exported to a spreadsheet and edited and then imported back into 12d or edited inside 12d using this panel.

See Also

Drainage overview

Usage

From the menu select **Design => Drainage => More => Top ten attribute editor**

First Select **Pick** to select the string that contains the user attributes (the drainage string). The strings will be highlighted in white when they are selected.

All catchment data is store with the pits in drainage strings. To access the pit attributes, select the drop down icon and then select **Pit**. A circle will be drawn around the pit selected. **Next** and **Prev** will now move you from pit to pit.

Select the drop down icon and then select the **Attribute Name** from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
pick string <i>used to pick the initial string in a model</i>	button		
string-pit-pipe <i>select the type of attribute to be displayed. Pit and pipe attributes are only available for drainage strings.</i>	choice box		string,pit,pipe
attribute name <i>3 top 10 attributes lists are maintained (pit, pipe and string). The attributes that you can select from are</i>	input box		

*all of the attributes that exist on all of the strings in the model. If the attribute does not exist for the string/pit/pipe that you are displaying the **data** field will display **Not found**.*

type choice box **Text, Real, Integer**

for existing attributes this will display Text, Real or Integer.

When defining a new attribute select the type of data to be stored in the attribute

data input box

the data stored in the attribute is displayed/edited/created in this field.

<= prev button

*move to next string in the model
pit on the string

next => button

*move to next string in the model
pit on the string
pipe on the string*

process button

updates the attributes displayed in the dialogue.

Notes:

First LB select Pick to select the string that contains the user attributes. All catchment data is stored with the pits in drainage strings. The strings will be highlighted in white when they are selected.

To access the pit attributes **LB** this field then select **Pit**. A circle will be drawn around the pit selected.

LB the **Attribute Name** field and then select from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in. They may not be defined for the string you are editing. If the string does not have that attribute defined **not found** will be displayed in the **Data** field.

To change the value for the attribute enter the new value in the **data** field. If the attribute does not exist, deleting the **not found** text and adding data will create it. The following message will be displayed whenever you are creating a new attribute.

Delete All Attributes in a Model

[drainage_att_delete_panel](#)

Position of option on menu: Design => Drainage => More => Delete all attributes in a model

See Also

Drainage overview

This option deletes all model, string, pit and pipe attributes in the model specified. This option allows the user to "start from scratch" while maintaining the drainage, catchment and bypass flow strings.

Usage

From the menu select **Design => Drainage => More => delete all attributes in a model**

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
model name	input box		
<i>the model specified will have all of its attributes and all of the strings attributes deleted</i>			
process	button		
<i>Deletes all of the attributes</i>			

Notes: THERE IS NO UNDO!

Flooded Width Flow Analysis and HEC-RAS

drainage_utilities_panel analyse flooded width

The Calculate Flooded width procedure creates cross sections along the **bypass flow** paths and then calculates the flooded width at each section using Manning's normal depth calculations. A HEC-RAS project (same name as the bypass flow string) is also created for each line. The flooded width is indicated on each section as a blue line if it is less than a user defined width and a red line if the flooded width exceeds the limit. Details of the calculations such as the velocity, depth, wetted perimeter and slope can be exported to a spreadsheet for further analyse (velocity times depth calculations for example). The discharges imports from the urban stormwater design packages are shown in the following table.

Design Program	Discharge Event
PCdrain Drains	Minor ARI Maximum flow event analysed
ILSAX	Maximum flow event analysed
RAT HGL	First return period analysed

The user defines the length of these sections and the interval at which they are to be spaced. 12d calculates the normal flow depth interpolating the pit approach and bypass flows from the hydrology models (ILSAX, Drains, PC Drains or RAT HGL). The cross sections are taken perpendicular to the flow line and the slope is for the normal depth calculations is determined using the distance along the flow line and the change in elevation between the two lowest points in the primary flow channel. The flow line need not intersect the low points on the section but the flow line does mark the primary flow channel. If the depth of the flow exceeds the banks of the primary channel, then all adjacent flow channels will be considered as active flow area.

Limitations where overland flow lines join

Where overland flow lines converge at a manhole, 12d does not know the flow split between the 2 approaching paths. Therefore, 12d uses the total flow from all lines as the flow at the manhole for each line. This may overestimate the flooded width along the flow lines at these points.

Limitations at SAG pits

The flow width are not shown adjacent the sag inlets. The depth of flow due to ponding and the approach flow coming from several directions may overestimated flooded width in these areas. Therefore not flood depths are caclulated approaching SAG inlets.

Manning's n is the n value to be used in the normal depth calculations.

The **Flow correction factor** is the factor described in ARR 1987 for calculating depths of flow in gutter channels.

Distance between sections specifies the interval at which cross sections and therefore flooded width will be calculated along the flow path.

Section Length defines the length of each cross section. The cross section will be centred on the overland flow path.

Trim HEC-RAS sections at levee is used for super critical flow calculations in HEC-RAS. If you plan to do super critical flow calculations then check this box. A levee point is the crest in the cross section found as you move away from the flow line location. If a levee point is encountered then the section is trimmed here. This is a feature because HEC-RAS has problems with cross sections with levees.

Cross Sections and Discharges

The analyse flooded width will proceed along each flow path and identify every pit on the line. Cross sections will be constructed in the model with the length and interval entered in the input dialogue. These cross sections may be plotted using the main menu selection **Plot=>X plot=>X plot**. The **Sort Sections** must **not** be selected for these sections to be plotted.

Discharges will be determined for each cross section by pro-rating the discharge dependant on the distance between the pits. The bypass discharge will be taken from the upstream pit and the approach discharge of the downstream pit.

12d will give warning messages in the output window when it encounters the following conditions and these messages will be stored as string attributes on the flooded width strings. Descriptions of these messages follow.

Inverts do not go downhill

12d locates the lowest point (adjacent to the flow line without moving over a local crest) on each cross section to calculate the slope between the cross sections. This message indicates that the downstream minimum elevation is higher than the upstream minimum elevation.

Sometimes flow lines will go uphill. If you have specified an overflow from a SAG location then the flow line will go uphill until it crosses the overflow crest.

If the flow line is not supposed to be going uphill at this section, check to see where the flow line intersects the cross section located upstream of the one identified in the warning message. If it is in a local sag point

that is not the lowest point on the section, move the flow line.

The program will use a slope of 0.5% to calculate a width at this location. This results in very wide flooded width sections to draw the user's attention to the problem area.

Vertical Walls Assumed at the Ends of the Cross Sections

If the depth of flow exceeds the ground surface elevation at the ends of the cross section a warning message the warning message shown above is shown. The cross sections causing the warning follows.

The vertical wall is placed at cross section chainage -20. Note that the flow line is always at chainage 0

Convert Drainage String to Polyline

drainage_drainage_to_polyline_panel

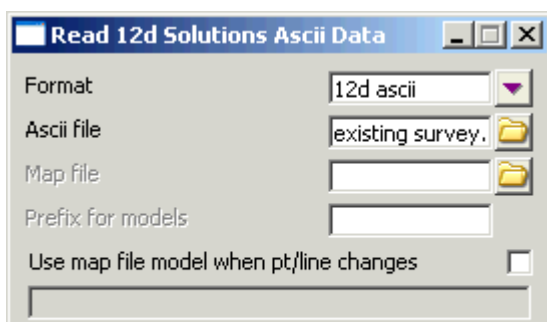

Position of option on menu: Design => Drainage => More=> Convert drainage string to polyline

See Also

Drainage overview

All drainage strings in the specified model are exported to a 4d ascii file. When this ascii file is imported back into 12d model the strings will be converted to polylines. Import the strings using

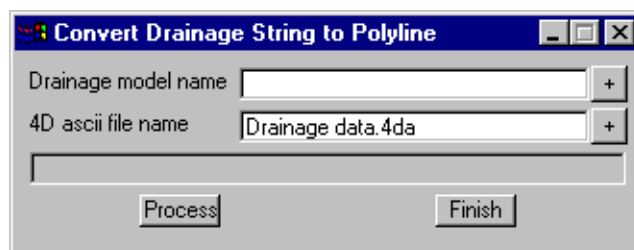

File_io=>Data Input=>12da/4da data

Specify a prefix for the model when it is read back in. Otherwise the strings will be placed in the same model as the originals.

Usage

From the menu select **Design => Drainage => More=> Convert drainage string to polyline**

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
drainage model name <i>Drainage model containing the drainage strings</i>	input box		
4D ascii file name <i>A temporary file that will hold the converted string data.</i>	input box	drainage data.4da	
process <i>Exports the drainage strings and converts the file to polylines.</i>	button		

Drainage.4d file

A sample pit entry in the drainage.4d file is as follows:

Enhancements have been made if exporting to the Drains program. See **Pit Families and Pit Groups**

The drainage.4d file controls many of the settings for the pit and pipes types inside 12d. This section details the format of the drainage.4d file. Changes to this model take effect only after 12dmodel has been restarted.

The original **drainage.4d** file is found in the “program file\12d\12dmodel\7.00\set_ups” directory. **Do NOT** change this file. Copy it into “program file\12d\12dmodel\7.00\user” directory and edit it there. Files in the user directory are used by preference and they are never over written by a 12d update.

```
Manhole "SA2" { // internal pit size data (width, length)
//SIZE 100, 200
//DESC "2m lintel - grate and side entry"
// pit inlet capacities from Mathematical Description of Pit Entry Capacities Feb 1992
// cross fall, gutter grade, cap1, cap2, cap3, cap4
//4d 1, 1, 0, 0, 0.230, .621
//4d 1, 3, 0, 0, 0.225, .604
//4d 1, 5, 0, 0, 0.215, .577
//4d 1, 7, 0, 0, 0.200, .538
//4d 1, 9, 0, 0, 0.235, .593

//4d 3, 1, 0, 0, 0.495, .819
//4d 3, 3, 0, 0, 0.270, .568
//4d 3, 5, 0, 0, 0.290, .599
//4d 3, 7, 0, 0, 0.400, .727
//4d 3, 9, 0, 0, 0.330, .649

//4d 5, 1, 0, 0, 0.540, .793
//4d 5, 3, 0, 0, 0.480, .747
//4d 5, 5, 0, 0, 0.460, .744
//4d 5, 7, 0, 0, 0.450, .729
//4d 5, 9, 0, 0, 0.420, .704
```

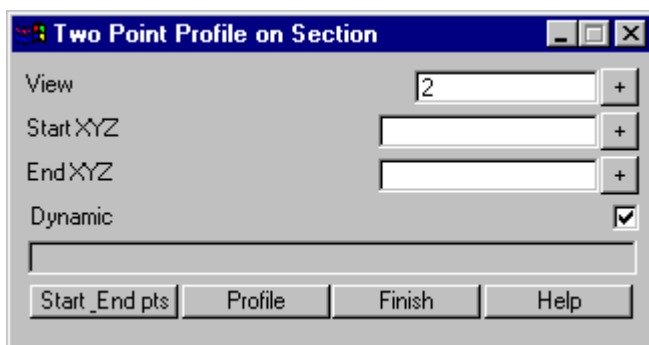

The format of the entries is as follows.

1. All lines are to be blank or begin with //. This is not the normal 12d convention.
2. //SIZE indicates the values to be read and stored in the user defined pit attributes **pit internal width** and **pit internal length** when the pit schedule macro is run. A comma is used to separate the two values.
3. //DESC indicates that the following quoted text will be read and stored in the user defined pit attribute **pit type description** when the pit schedule macro is run.
4. The pit inlet capacity table data must begin //4d and commas are used to separate the data (comma delimited).
5. SAG pit names must begin with the 3 letters SAG.
6. The sample data provided is taken from the paper, “Mathematical Description of Pit Entry Capacities”, Feb 1992, by Geoffrey O’Loughlin *et al.*

Two Point Dynamic Profiles

If at any time you want to obtain a temporary section view, 12d has a dynamic profiling capability (2 point profile). First, add your tin design model to the section view.

Next RB on the section view title area and then LB select 2 points. The following panel will appear.

Select **Start_End pts** to begin and then pick/accept a point on a Plan View Now as you move your cursor the section view will be dynamically updated (the dynamic box should be checked on and a surface tin model added to the section view). When you obtain the cross section you want LB select then accept (MB) the second point.

LB select Finish when done.

ILSAX Editors

[ilsax_editors](#)

ILSAX Pipe/Catchment Editor

[drainage_ilsax_pipe_editor_panel](#)

Position of option on menu: **Design => Drainage => More=> ILSAX editor=>ILSAX pipe editor**

See Also

ILSAX Rainfall File Editor
 Drainage overview

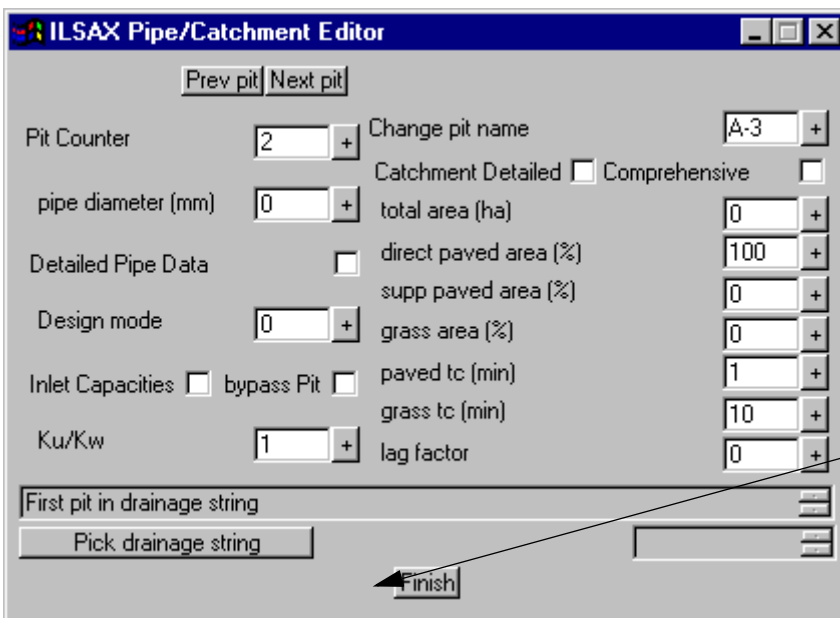

The ILSAX pipe data editor allows the user to edit pipe and catchment parameters. Most commonly used functions are supported but some of the less used functions are not included at this time. The same names have been used as those in the ILSAX drainage manual for easy reference.

Unlike the rainfall editor, all of the data in the pipe data editor is stored with the drainage string as user attributes. These user attributes can be changed using the editor (recommended for the novice user) or they may be output to a spreadsheet, changed and then read back into 12d.

CAUTION: If the drainage string is deleted then all of the attributes are deleted at the same time.

Usage

The ILSAX pipe data editor is accessed by selecting **Design=>Drainage-Sewer=>More=>ILSAX Editors=>ILSAX Pipe file editor**. The following dialogue will appear.

The panel to the left is only an example of what the editor panel may look like. This dialogue will change in size and complexity depending on the check boxes selected. The left side of the dialogue is reserved for pipe and pit data while the right side contains catchment data. The first step is to select the drainage string to be edited. Click on **Pick drainage string** and then select the drainage string from one of the views.

There are two ways to move between pits. The **Prev pit** and **Next pit** will move the user between the pits

with the current pit name been shown in the **Change pit name** field. Do not use the **Change pit name** field to move between pits. It will not work! This field is used to manually change the pit name. Entering the **pit number** and pressing **Enter** is the second method for selecting pits. This is a good way to move between pits on long drainage lines (from pit 20 to pit 1 for example).

The **pipe diameter** will change the diameter of the pipe leaving the pit in the direction of increasing chainage. Note that the invert level of the pipe will remain fixed as the obvert level changes.

The most common **Design mode** is 1 for design. This ignores the present pipe size and resizes the pipe as required.

When the **Inlet capacity** and **Bypass pit** tick boxes are checked, additional fields are added to the dialogue. These will be discussed in the section 5.0 above

The **Catchment Detailed** and **Comprehensive** tic boxes also add additional fields to the dialogue. Again, the ILSAX drainage manual contains detailed descriptions of these parameters.

ILSAX Rainfall File Editor

[drainage_ilsax_rainfall_editor_panel](#)

Position of option on menu: Design => Drainage => More => ILSAX Editor=>ILSAX rainfall file editor

The ILSAX rainfall file editor assists in the creation and editing of the ILSAX rainfall files. It is truly a file editor and no data is stored inside the 12d model. Most common features of the ILSAX rainfall file are included but some have been omitted as they have been rarely used. The files can be created using the editor and then manually edited using a word processor if required.

See Also

ILSAX pipe editor
Drainage overview

Usage

This panel is accessed from the menu selection **Design => Drainage => More=> ILSAX editors => Ilsax rainfall file editor**

The **Rainfall file name** must be specified before the **Read** or **Write** buttons will operate. If you want to create a file, fill in the **Rainfall file name** field and then **LB** select **Write** to save the data.

Intermediate Files and **Separate Rain/pipe files** must be ticked to have ILSAX run within 12d.

The minimum value for **Num Rainfall Events** is 1.

The remaining data in the left column is the data for the ILSAX R3 and R4 cards and the data in the right column is the data for the ILSAX R2,R6, R6B and R8 cards. Please refer to the ILSAX manual for a description of these values. The fields are not in the same order as the ILSAX files but instead the fields at the top of the column are those changed most frequently between rainfall events.

The **Prev Rainfall** and **Next Rainfall** buttons select the rainfall events up to the number specified in **Num rainfall events**. If you wish to add or decrease the number of events analysed change the **Num rainfall events** value.

CAUTION: the **Finish** button does not perform a save so make sure you click **Write** before **Finish**.

The fields and buttons used in this panel are described in the ILSAX users manual.

PCdrain to 12d pit converter

Drainage_pits_pcdrain_to_12d_panel

Position of option on menu: Design => Drainage Sewer => More=>Create Pit type from PC Drain gully files

This option is used to read a PCdrain gully file and create the same pit type in the 12d drainage.4d file. The sag pits in the gully file have an "S" added as a suffix as they are imported.

Important: 12d must be restarted to see the new pit types.

See Also

Drainage overview

Usage

This panel is accessed from the menu selection **Design => Drainage Sewer => More=>Create Pit type from PC Drain gully files**

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
PCdrain pit file <i>the PCdrain gully file to be imported into 12d</i>	file box		
Process <i>import the data file</i>	button		
Finish <i>removes the dialogue from the screen</i>	button		

Drainage Network Quantities

Drainage_quantities_panel

Position of option on menu: Design => Drainage => Reports=> Network Quantities

This option creates quantity tables for manholes, pipes and house connections.

The manholes/pipes/house connections are summarised by user defined depths and types.

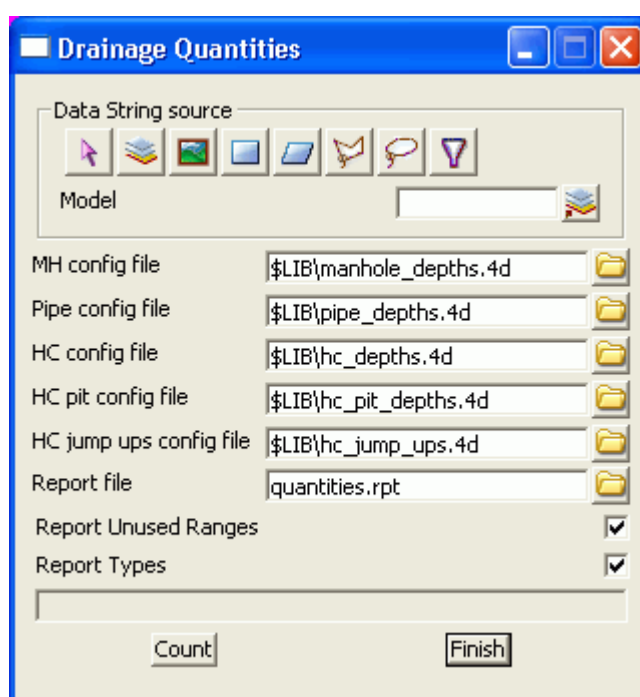

See Also

Drainage overview

Usage

This panel is accessed from the menu selection

Design => Drainage Sewer => Reports=> Network Quantities

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data String Source	Choice		
---------------------------	--------	--	--

usually the entire model is selected but view is also available for combining models

MH config file	file box		
-----------------------	----------	--	--

This file specifies the types and depth ranges for the manholes. Details of this file are contained below.

Pipe config file	file box		
-------------------------	----------	--	--

This file specifies the types and depth ranges for the pipes. Details of this file are contained below.

HC config file	file box		
-----------------------	----------	--	--

This file specifies the types and depth ranges for the house connections. Details of this file are contained below.

HC pit config file file box

This file specifies the types and depth ranges for the HC pits. Details of this file are contained below.

HC jump ups file file box

This file specifies the types and depth ranges for the house connections jump ups. Details of this file are contained below.

Report file file box

a sample report file is given below.

Report unused ranges tick box

*the depth ranges for the manhole/pipe/house connections are defined in the *.4d files. Selecting this option will cause the depth ranges in the file to be printed even if there are no manhole/pipe/house connections in these depth ranges (zero quantity values will be shown).*

Report types tick box

*Selecting this option will cause the manhole/pipe/house connection types used in the model types to be listed (even if quantities are not requested in the *.4d files). Since this is a complete of the type used in the model, the list informs the user what types have not been included in the quantity calculation.*

Count button

executes the option.

Finish button

removes the dialogue from the screen

The *.4d files listed above are contained in the 12d **library** directory. Each line is the file performs a count (count lines). No items are counted twice. Therefore, if an item is counted its type and then a count line is found the wild card is used for the type, the type already counted will not be included in the count.

The format for a count line is three or four values (space delimited) per line. Size is optional.

`<type (from drainage.4d)> <size> <starting depth> <ending depth>`

Notes:

All **types** with spaces in the name must be enclosed in quotes The wild card * may be used.

The **size** is optional and if omitted the all sizes will be counted in this group (do not use the * for a wild card).

The **starting depth** and **ending depth** are required for all count lines.

Sample count lines for manholes follow.

```
// sum concrete cover manholes is various ranges

"CONC COVER" 0.0 1.6
"CONC COVER" 1.5 3.0
"CONC COVER" 3.0 999.9 // this is expected to be zero
"CONC COVER" -999.0 0.0 // trap errors

// any that are not Concrete cover will be counted here

* 0.0 1.6
* 1.6 3.0
* 3.0 999.9
```

Manhole Quantities
=====

CONC COVER	0.00	1.60	13	16.506
CONC COVER	1.60	3.00	1	1.510
CONC COVER	3.00	999.9	0	0.000
CONC COVER	-999.0	0.0	0	0.000
*	0.00	1.60	0	0.000
*	1.60	3.00	0	0.000
*	3.00	999.9	0	0.000

Since the **Report unused ranges** tick box was selected, these lines were printed even though there were no manholes in the data ranges.

total length = 18.016

Types Used

CONC COVER

Diameters Used

1.100

This data results from selecting the **Report types** tick box.

Sample count lines for pipes follow.

```
// sum class 2 pipes by diameter and for various ranges

// count 375

2 0.375 0.0 2.0
2 0.375 2.0 5.0
2 0.375 5.0 999.

// count 450

2 0.450 0.0 2.0
2 0.450 2.0 5.0
2 0.450 5.0 999.

// count 525

2 0.525 0.0 2.0
2 0.525 2.0 5.0
2 0.525 5.0 999.

// count pipe sizes that were missed

2 * 0.0 2.0
2 * 2.0 5.0
2 * 5.0 999.

// count all other missed pipes

* 0.0 999.
```

Calc pit overflow areas

Drainage_pit_volume_panel

Position of option on menu: Design => Drainage Sewer => More=>Calc pit overflow areas

This option is used to graphically display the overflow storage volume at a sag pit. The following pit attributes must exist for the flood extents to be calculated.

overflow volume	value greater than zero required.
sag pit	must be equal to 1.
catchment model id	set by labelling catchments
catchment string id	set by labelling catchments

The maximum storage volume is read from the drainage pit attribute "overflow volume". This may be entered manually using the **Attribute Editor** or it will be created when data is read from the drainage design programs Drains or XP SWMM design programs.

This routine locates the lowest point on the catchment string by draping the string on the tin specified and adds the overflow limit specified to this value. This becomes the **overflow limit**.

The volume at this level is calculated and the compared to the **overflow volume** read from the user defined attribute. If the overflow volume is less than the volume in the catchment then the routine iterates to find the flood level for the overflow volume.

If the overflow volume is greater than the volume in the catchment, the results depend of the **Use overflow limit** tick box.

If the box is selected, the **overflow limit** (calculated above) is reported at the flood level in the catchment.

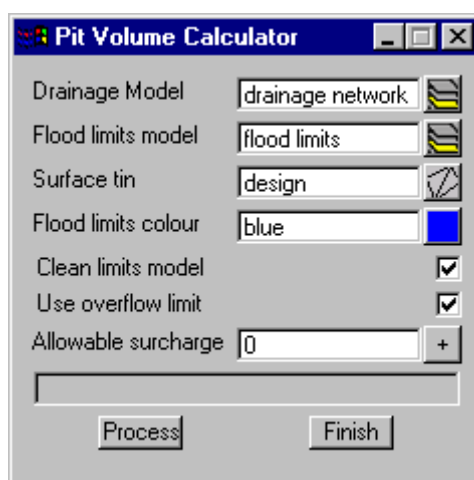

If the tick box is not selected the routine iterates to find the flood level where the storage equals the **overflow volume** read. This option allows the user to see the maximum flood level should the catchment low point become blocked.

See Also

Drainage overview

Usage

This panel is accessed from the menu selection **Design => Drainage Sewer => More=>Calc pit overflow areas**

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Surface Tin	tin box		
<i>ground surface tin used to calculate the volumes and flood limits</i>			
Flood limits colour	colour box		
<i>flood limits strings will be created using this colour</i>			
Clean limits model	tick box		
<i>if selected all strings in the Flood limits model will be deleted before the calculations commence.</i>			
Use overflow limit	tick box		
<i>if the elevation calculated from the storage volume is higher than the lowest point on the catchment string then the allowable surcharge value below will be added to the lowest point on the catchment string and this elevation will be used to determine the flooding limits</i>			
Allowable surcharge	real box		
<i>this value is used only if Use overflow limit is ticked. Its purpose is described in the field above.</i>			
Process	button		
<i>executes the option.</i>			
Finish	button		
<i>removes the dialogue from the screen</i>			

Stormwater Design - Introduction

The 12d drainage module contains functions to perform the following steps in the drainage design and documentation process:

- s set drainage defaults and layout a drainage network,
- s use the powerful 12d drainage network editor to avoid service clashes, grade pipes, align oberts, minimise depth and many other design tools,
- s automatically assign names to the pit/pipes in the network,
- s designate catchment areas and produce catchment plans,
- s transfer data to and from electronic spreadsheets to enable the user to easily review the data and add user defined data to the 12d pipe network. This data may include such data as pipe bedding types and trench width,
- s create pit layout schedules to export to spreadsheets or word processors for final formatting.
- s produce long section drainage profiles including HGL data, flows, invert levels, service crossings
- s create plan drawings with pipe sizes, flows, manhole symbols, linestyles for pipe sizes, design parameters for manhole and pipes and user defined data
- s locate pits/manholes at exact chainage and offset locations

This user manual will lead the user through the steps itemised above.

In addition to this manual there is the *Advanced Stormwater Design* training manual which includes the following topics.

- s drainage trench exvavation volume calculations
- s pipe and manhole quantity calculation
- s customising the drainage.4d file
- s design or evaluate the drainage system using 12d Drainage or create input files for the XP SWMM/RAT2000, Micro drainage, Drains and PCdrain drainage design packages,
- s read the output from the drainage design packages (automatic if using 12d Drainage), update the drainage network and store the hydraulic data, such as hgl (hydraulic grade line) levels, peak pipe flows and pipe capacities,
- s pit inlet capacity calculations and over land flow
- s flooded width analysis
- s surcharge volumes at SAG pits
- s and detailed drainage plan labelling

The terms pit, catch basin and manhole are used interchangeably throughout this document. The type, dimensions and inlet capacities of the structures are set in the drainage.4d file.

Setup Files and Their Locations

The drainage module consists of the optional 12d Drainage engine, utilities, startup configuration files for RAT2000, XP SWMM and the 12d drainage configuration file (drainage.4d). Demonstration versions of Drains, RAT2000 and PCdrain have been included on the CD along with a copy of the ILSAX hydrology package. Manuals for the ILSAX program may be obtained from the Civil Engineering Department at the University of Technology Sydney.

All setup files have been configured for the training version. However, when you start working on real projects you may want to customise the drainage module. **More - Customising the drainage module**

The **drainage.4d** file contains pipe types (RCP, Class 2 etc.) and example pit inlet capacity tables for RTA (NSW Road and Traffic Authority) standard pits. Detailed pit type descriptions and internal pit dimensions can be included in this file to be inserted into your pit schedules. For PCdrain users there is a routine to read your gully pit file and include these pit types in 12d **More**.

REVIEW THIS DATA CAREFULLY! The **drainage.4d** file may be customised for any additional inlet capacity data you may have.

To edit the **drainage.4d** file, from the main menu select

Design->Drainage-Sewer->More->Edit drainage.4d

Select the **Find** button to search the 12d path for the current **drainage.4d** file. Select the **More info** button and then **Edit** to edit the file.

Survey data and design surfaces (TINs)

We will begin a 12d project from scratch by first creating the project and then reading in the survey design data. The design can then be triangulated so that we have a final surface profile to design the drainage for. Start up the 12d model by selecting the courses icon from your desktop.

The project selection panel will appear. The bottom corner of the panel is shown below

Note: If you are using the practice version the folder will be:

C:\12d Model v7.00 Practise\courses\7.00

LB select the icon and the following panel will appear.

12d works with a folder **NOT** a single file. Therefore, to open the folder we are going to work in, double click the **Drainage** folder and then select **Open**.

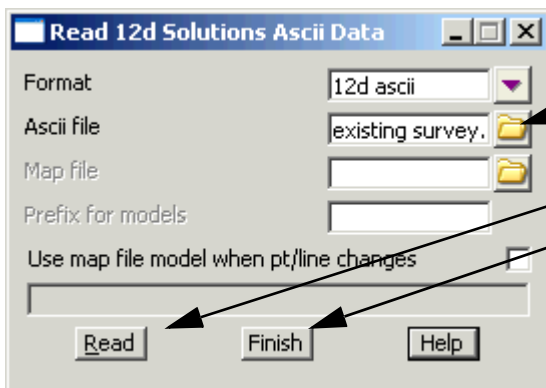

In the **Project** field type the name for your new project and then select **Proceed**. 12d will create a sub folder with this name. All of the 12d files that you should not touch will be created in this sub folder. Please stay out of the sub folder. All files created for the user will be kept in the folder that you opened (i.e. c:\12jobs\Courses\7.00\Drainage).

Importing the Raw Survey Data

You have created a new project into which we will import the survey data. From the main menu select.

File I/O => Data input => 12da/4da data

LB select to display the file list.
Select the file **existing survey**.

Select **Read** to read the data
then Select **Finish** to remove
the panel

To add all of the data to the view select **Menu** icon in the **plan view title area** and then from the drop down menu select

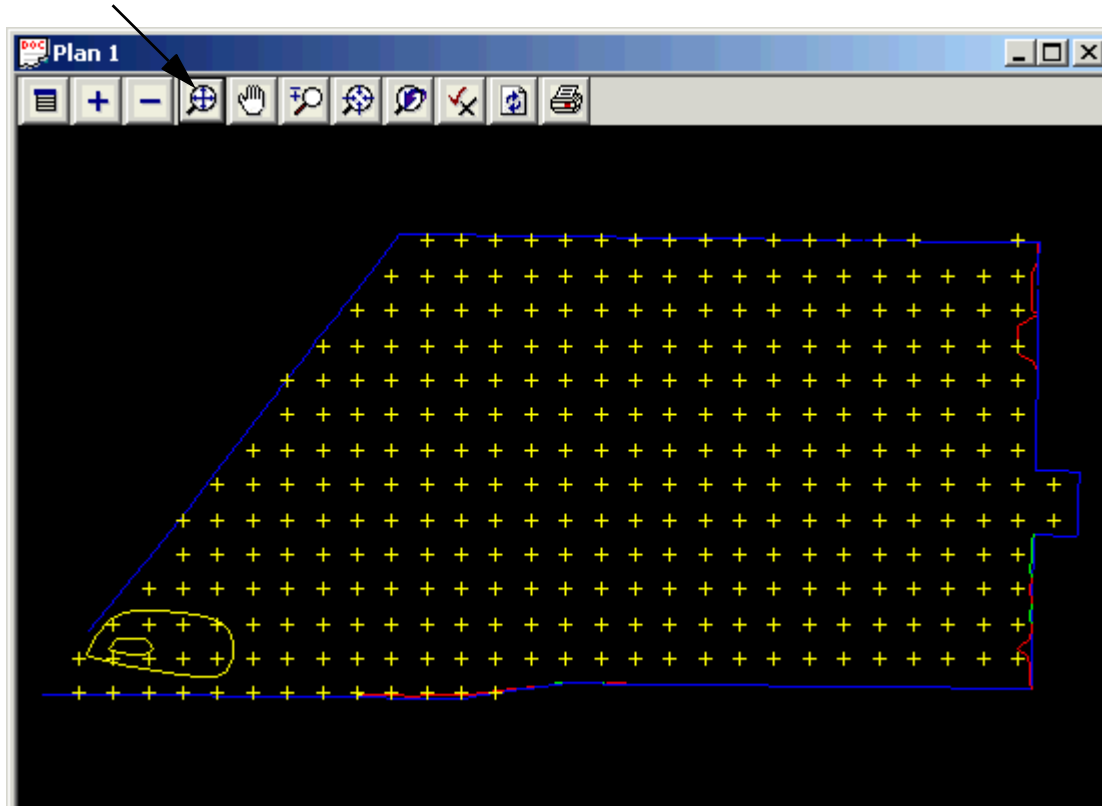

Models=> Add all models

or

select this "+" icon and select **existing survey data**.

Next select **Fit** on the **plan view title area**. You should see the following data.

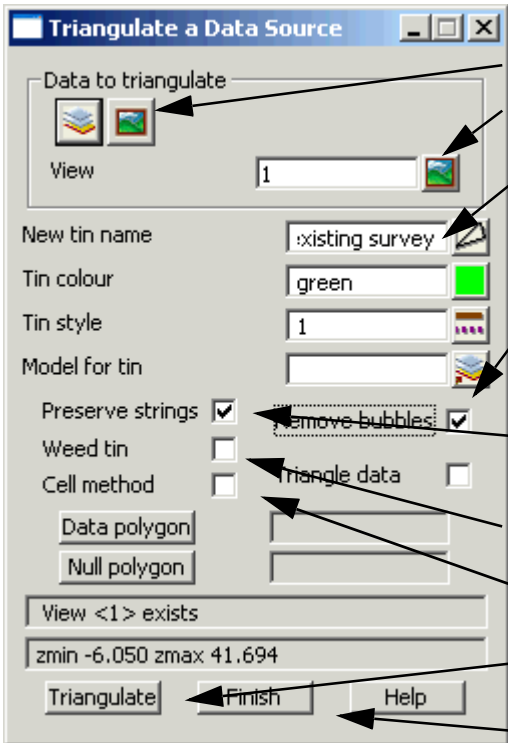

The view will contain survey data.

Creating the existing Ground Surface

From the main menu select

Tins=>Create=> Triangulate data

Select the **View** button

LB select then **LB** the view to be triangulated.

Type a new tin name, not the model for the tin. Remember a tin is like a string and it must reside in a model. Press enter and the **Model for tin** field will be filled in for you.

Select if creating a tin with contour data.

Preserve strings will make the string one side of the triangle thereby preserving the levels along the string all duplicate points are removed from the tin database

The cell method is a good enhancement for data that is in a grid type pattern but it is not required.

Select **Triangulate** to create the tin.

Select **Finish** to remove the panel from the screen.

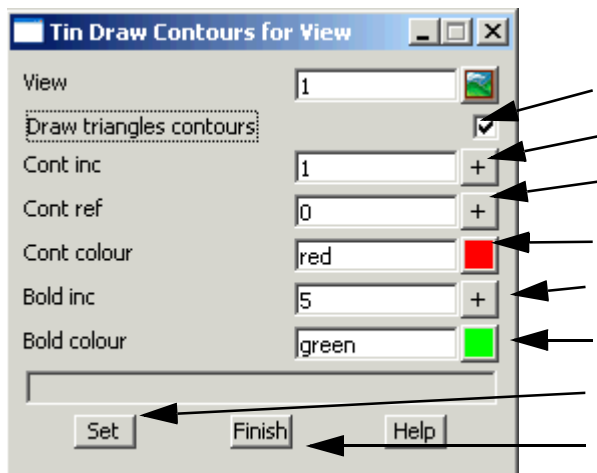

Now we are ready to look at the existing surface tin. Place your pointer over the “+” sign on the **plan view title area** and press the **t** key. All of the models beginning with lower case t will appear. **Double click** on **tin existing survey** to add it to the view.

The tin will be shown with the tin edges turned on. This is the default when you have all tin display modes turned off. Let us now turn on the fast contours and the fast flow arrows. Select **Toggle** on the **plan view title area** and then **LB** on **Tin contours**. The contours will be shown on the view. **LB Toggle** on the **plan view title area** and then **LB** on **Tin flow**. Now the flow arrows will be shown on the view.

To change the contour intervals and the contour colours select the **Menu** button on the **plan view title area** and then select.

Settings=>Tins=>Contours and the following dialog will appear.

Turns the contours on or off

Minor contour interval.

Value for first bold contour (usually 0)

Minor contour colour.

Major interval.

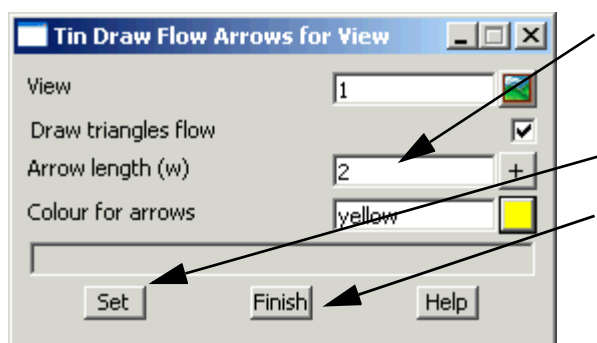

Major contour colour.

LB to observe the new settings on the view.

If you like the settings **LB** on **finish** to remove the select.

To change the length and the colour of the flow arrows select the **Menu** button on the **plan view title area** and then select.

Settings=>Tins=>Flow Arrows and the following dialog will appear.

A length of about 2 units looks very small now but it is good when you are zooming into the actual catchments.

LB to observe the new settings on the view.

If you like the settings **LB** on **Finish** to remove the panel.

Inquiring about Heights on the Surface

The elevation anywhere on the tin can be obtained by simply moving the pointer over the desired spot. To obtain the tin elevations select,

Tins=>Inquire=>Height

You will see that data in the panel change as you move the pointer around the screen,

Viewing the Surface Tin in a 3d Perspective

To create a 3d perspective view select

View=>New=>Perspective and a perspective view will appear.

Add the model **tin existing surface** to the view and then **toggle** the **shading** on. You may also want to **toggle** the **contours** on as well.

Now remove the tin from the view as it is not needed for the next steps (Hint: use the “-” button).

Reducing the number of points for the 12d Practice Version

We can delete the survey data to save space for those using the practice version of 12d. If you have a full version of 12d this is not required. From the main menu select.

Models=>Delete=>Delete a Model and the following dialog will appear.

LB then select the model **existing survey data** and then LB to delete the model and then Select **yes** to confirm the deletion.

Importing the Road Design Data and Creating the Design TIN

Repeat the process of importing the 12da data.

File I/O => Data input => 12d ascii

(file is road design.12da).

Remove all of the models from the view and then add the road design models onto the view.

Road Centrelines
Road Strings
Road sections

Now create a new tin called design using the **TINS->Create->Triangulate data** option.

Nulling the long Triangles

Add the tin that you just created onto the view. Toggle the **tin contours** off and the **tin flow** off. Now toggle the **tin edges** on. Notice the long triangles around the edge of the design.

To remove the long triangles select

Tins->Null->by angle/length

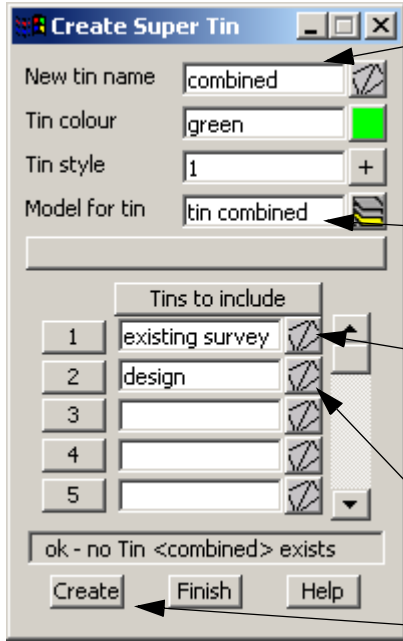

Select the design tin and then select **Null**. Using the default values removes most of the long triangles. Note that this option removes triangles from the outside inwards and it stops whenever it reaches a breakline.

Now reduce the **Length** value to 1 and then select **Null** again. Any exterior triangles with a length greater than 1 have now been removed!

Creating a Super Tin from the Survey and Design Data.

To create a tin that is the combination of the survey data and the design data you will need to create a super tin. From the main menu

Tins=>Create=>supertin

Enter a name for the super tin and press **Enter**.

The model field will be auto completed for you because you pressed **Enter** above. A new model will be created.

Now select the tins to combine. Tin 1 is the tin on the bottom (like the levels in a building) and tin 2 is above. i.e. wherever tin 2 exists it will be used. If there is no tin 2 at a location then tin 1 will be used.

Select the tins using the icon and then click **Create** to create the supertin.

Changing the Colour of a Tin

To change the colour of the design tin use

Tins->Colour->Colour of tin

Select the design tin and choose a new colour and then select **Colour** to change the tin colour (you may have to do a **Menu->redraw** on the view to see the new colour).

Drainage Layout

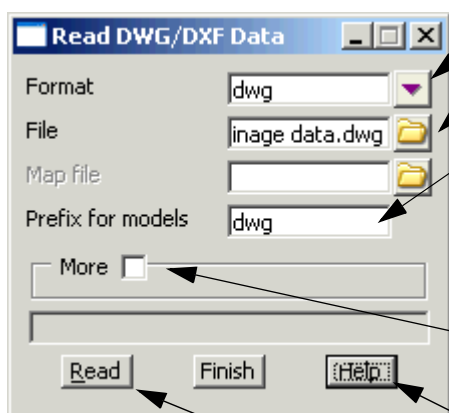

Where a drainage designer chooses to start their design is depends a great deal on the project and the designer. Identifying overland flow routes is essential because it is on these routes that the manholes are to be placed. Inlet manholes are then placed at critical locations (sag points, upstream of pedestrian crossings etc.), and then the spacing of additional manholes is determined by the size of the catchments. Finally, the pipe drainage system can be created linking the drainage manholes.

However, during training, most users want to get straight to the manhole and pipes. Therefore, lets import a pipe layout that was drawn in AutoCAD along with the overland flow routes and catchment areas (These could have been created in 12d as well). When these were drawn the following rules were followed.

- 1.polylines were used
- 2.lines drawn from upstream to downstream (direction of flow)
- 3.a vertex was placed at every manhole location

From the main menu select

File IO->Data Input=>DWG/DXF.

Verify setting as dwg

Select the dwg file (drainage data.dwg)

Entering a prefix for the models will help organise the layers that will be read from AutoCAD. Every layer goes into a separate model in 12d. If you specify a prefix then all of the layer names will be prefixed with this text. The prefix used is `dwg<space>`.

There are many optional settings not required at this time.

The rest of the data can remain as the default value. Refer to the **Help** button if more detail is desired.

Select **Read** to import the data. **The data will not immediately appear on the plan view.** The new models have to be added to the view using the “+” on the view tool bar. Every time you press the **Read** button the data will be imported again and you will get duplicate, tripllicate...etc data.

All of the models imported will begin with dwg.

The models that have been created are,

```
dwg d catchments
dwg d overland flow
dwg drainage network
```

Remove all of the models from the view and add the model **dwg drainage network**. This is a 2d drainage layout that we will use to locate the manholes in our drainage design.

Setting Drainage Defaults

The defaults for the drainage network are accessed through three panels; pipe defaults, manhole defaults and Tin defaults. They may be accessed through the menu system as

Design =>Drainage-Sewer =>Defaults

Warning! You **must** click the **Set** button to set the default values. **Finish** alone will **not** set the defaults. If you plan to export to other drainage software packages you will have additional defaults to set before you export. See **Drainage Import/Export**.

Tin Default

The default TIN is used to set the initial setout level of the manhole and the pipe invert levels. Super tins may be used if you want to place manholes on both the existing and the design ground surface (see Creating Super tins). Select the icon to choose from a list of existing TINs. Note that the panel will list the tins not the models that contain the tin. Remember a tin is like a string. It has a name and is stored in a model.

Warnings about using tins. If you place a manhole outside the tin boundary:

- s then no elevation will be set for the top of manhole, (it can be set later manually or by linking it to a design string).
- s Pipe invert levels cannot be set using the default cover. Pipe invert levels must be set manually as 12d cannot automatically determine cover levels without a TIN.
- s Finally, if your drainage design package accepts surface levels along the string, then an error message will be displayed at export time. The message will say that the surface level string is shorter than the pipe length.

Manhole Defaults

The manhole diameter is specified in metres/feet **not** mm/inches. Although most stormwater manholes are rectangular, 12d uses circular manholes to eliminate problems showing the alignment of the manhole. If the actual size and orientation of the manhole need to be drawn on the final construction drawings a symbol may be used in the use drainage plot annotations. The actual internal manhole dimensions and a detailed manhole description can be added to your **drainage.4d** file so that they can be added to your manhole schedules.

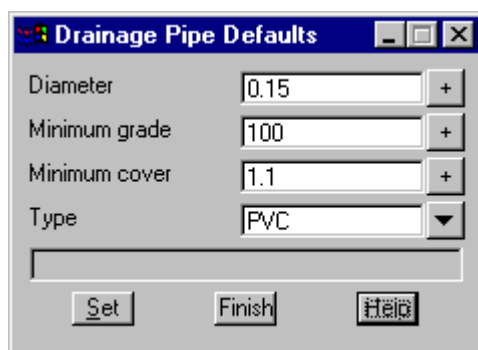

The **drop** will be used to set the invert level of the outlet pipe relative to the invert level of the inlet pipe. The drop should always be entered as a positive value. The **network editor** has many more options for aligning the pipe inverts at the manholes.

Generally, do not use a default name. Leave all of the manholes unnamed and then use the **Set Pit Names** function on the drainage network editor.

The manhole **type** is selected from a list by selecting the icon beside the **Type**. This list is obtained from the **drainage.4d** file. This manhole type will be used by ILSAX, PCdrain and RAT-HGL, RAT2000 and XP SWMM to identify the inlet capacity of the manholes. This value is not exported to the Drains program but it will be imported after a Drains design run. See **Drainage Import/Export**. It is best to set this to the most common manhole type and then change the few that are different later in the **network editor**.

You **must** click the Set button to set the default values. Finish alone will **not** set the defaults.

Pipe Defaults

The pipe **diameter** is set in metres or feet **not** mm or inches. Set this to a minimum pipe diameter for your project and then your drainage design package can increase them if required. To model an existing system enter the most common pipe size and then alter as required in the **network editor**.

Allowing for Pipe Thickness

When 12d set the pipe inverts it checks the **minimum cover** from the obvert of the pipe to the finished ground surface at both manholes. If the grade of the pipe is less than the **minimum** grade, the grade of the pipe is increased. Finally, 12d checks if there is anywhere along the pipe length that has less than the **minimum cover**. If there is such a low point in the design surface, the pipe is shifted vertically downwards to achieve the cover required. 12 defines cover as

$$\text{Cover} = \text{surface level} - \text{diameter} - \text{invert}$$

Therefore, an allowance for pipe thickness may be added to the minimum cover.

When using the network editors to change the pipe diameters the invert levels will remain fixed and the obverts will change. The inverts may be reset using **Regrade Network** on the **network editor**.

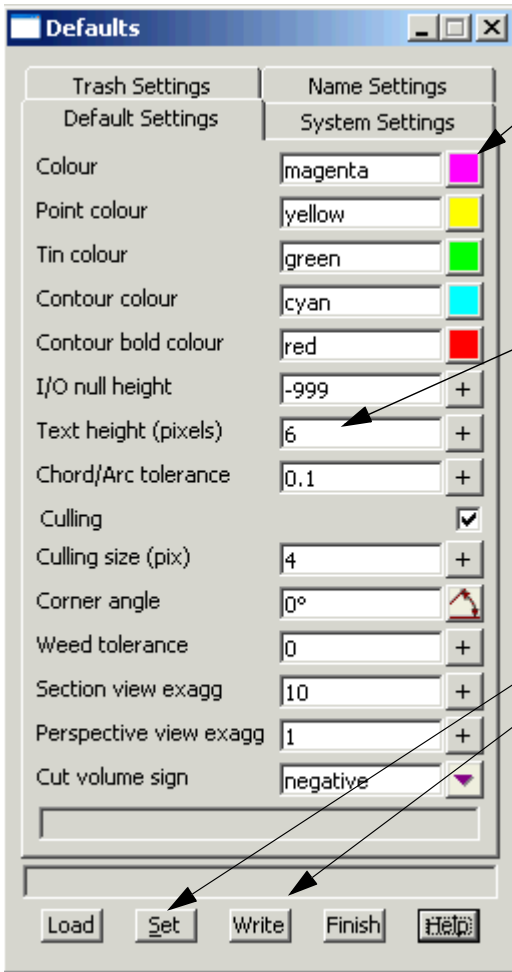

Select the drop down icon beside the **Type** field to select from a list of pipe **types**. These pipe types will be sent to your drainage design package so make sure you use the same names in 12d as you plan on using in the design package. The list of available pipe types is set in the **drainage.4d** file.

You **must** click the **Set** button to set the default values. Finish alone will **not** set the defaults.

String Colour and manhole Label Text Size/location (string defaults)

12d can automatically label the manholes at a fixed offset from the manhole using **view text** OR you can use the network editor **Set Catchments** to create text labels that can be moved/rotated etc.

For view text, the default line colour and text size are set by selecting **Utilities =>Defaults**. The following panel will appear.

LB to set the colour of the drainage string and man-hole labels.

The default size of the text is set in the **Text height (pixels)** field. A text size of 6 to 8 pixels is generally adequate. Your choice will depend on your screen resolution and the age of your eyes.

Select **Set**
Select **Write**
the following panel will appear.

Selecting **Current folder** will save ALL these defaults for projects in this working folder only. The defaults set in the **user** or **setups** directories will not be used if you select this option.

Selecting **User folder** will save your defaults so that all other 12d projects will use this defaults. This is the most common option (unless your network administrator has not given you write access to this area (check **Properties**)).

Select **Write** then **Finish**

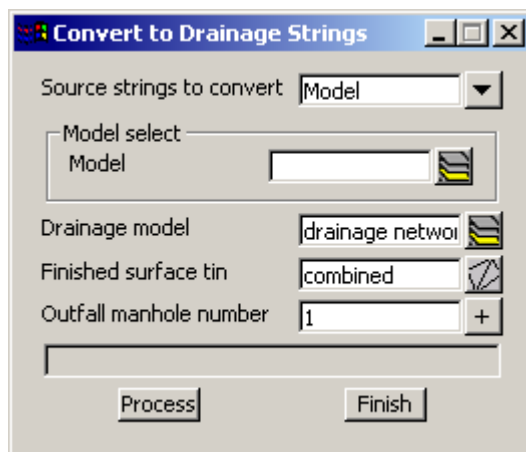

Create the drainage strings from the dwg strings

12d will convert the import strings into 12d drainage strings. The default pipe, manhole and tin data will be used to set the levels for the network

From the menu select

Design->Drainage-Sewer->More->Create drainage from strings

The following panel will appear.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>data source for strings to be converted</i>	choice box	model	view,model,string
Select <i>Model containing strings to be converted</i>		input box	
Drainage model <i>The new drainage strings will be added to this model. If it does not exist it will be created.</i>	model box		
Finished surface tin <i>This tin should be the same as your tin default for the drainage strings.</i>	tin box		
Outfall manhole number <i>The network will be numbered using a numerical method. The most upstream manhole of the outlet line will be assigned this manhole number. This numbering system can be changed if desired.</i>	real input box		
Process <i>Converts the strings to the drainage strings.</i>		button	
Finish <i>Removes the panel from the screen.</i>		button	

Important notes:

The imported strings must be drawn in the direction the water flows.

Manholes are created at all vertices on the strings.

Trunk lines must have a vertex where the branch lines join.

Integer string names can be used to control the order in when the drainage lines are numbered. These names will be transferred to the 12d drainage strings. **Naming the strings is highly encouraged.**

The drainage lines must have string names to use the **Set Pit Names** feature on the **network editor**.

Manholes can always be renamed in 12d after the import is complete.

Drawing the Drainage Network in 12d

The following method of drawing the drainage pipe systems has proved very efficient in the past. However, many people will have their own, “tricks of the trade”. Therefore, the rationale behind the following procedure will be important for the user to understand when they want to try out their own procedures.

Key Points

1. Draw the pipes where they actually are! Do not place the manhole centres at the setout point and have the pipes in the wrong location (pipe cover will be affected). Use setout strings for setout points!
2. Draw all drainage lines in the same direction. Either all uphill to downhill (flow in the direction of increasing/ascending chainage) or downhill to uphill (flow in the direction of decreasing/descending chainage). You choose but they all must be the same.

If you choose **descending chainage** then you must select Pipe=>Default Grading then Grade to have the grading applied to the drainage string.

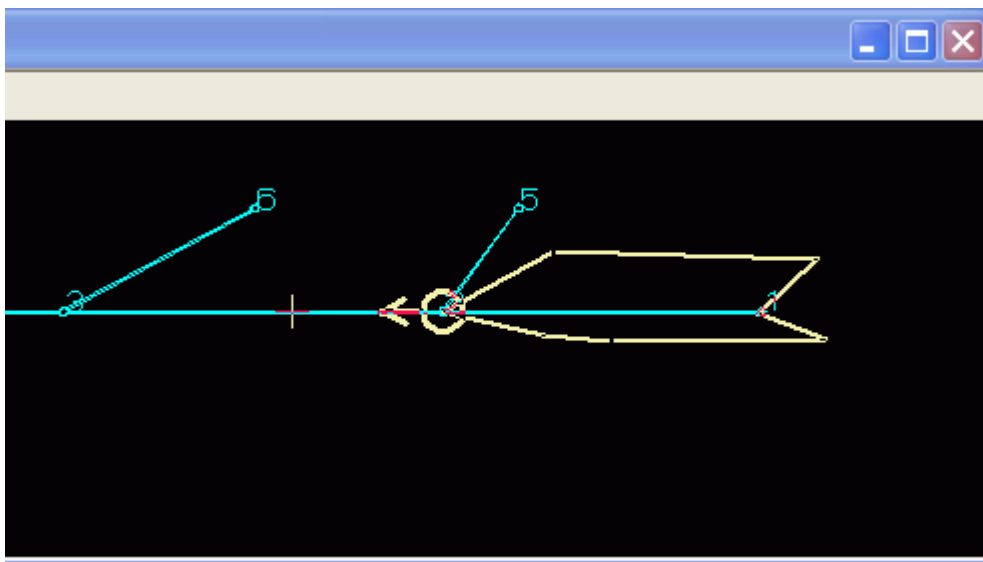

The 12d drainage network editor and the drainage design software packages have sophisticated algorithms to set pipe inverts as well. Consider this grading a preliminary estimate.

3. Begin creating the smaller branch lines before the trunk lines and terminate the branch lines where you plan to join the trunk line. This method ensures that when the trunk line is laid down, it will be low enough to accept flows from the branch lines. If you decide to create the trunk line first, you will have to select the **Regrade Network** later to adjust its levels.

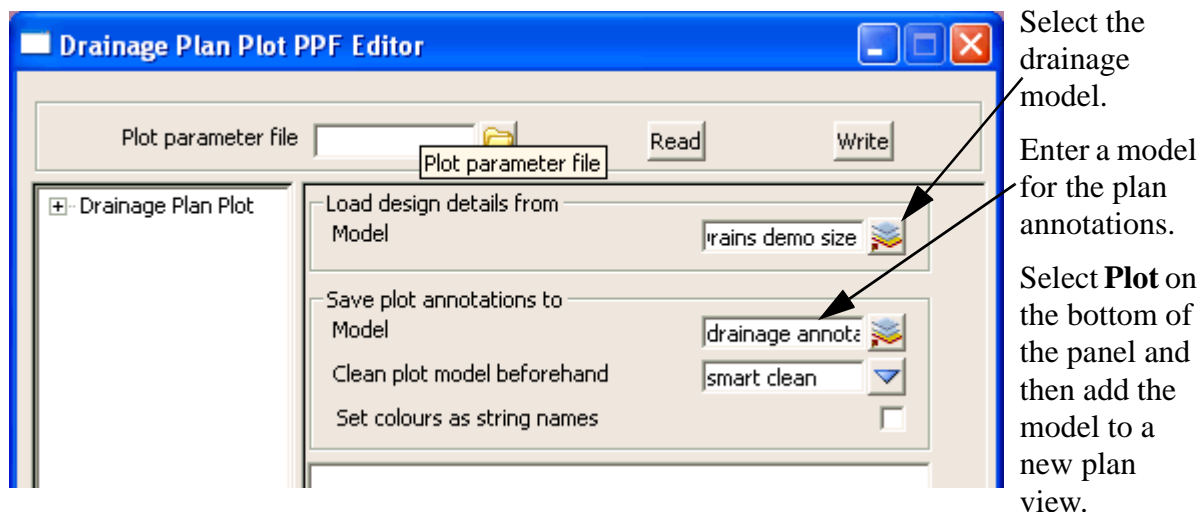

Flow in the Wrong Direction

The direction of flow is used by 12d to determine where the outlet is on the drainage line.

The direction of flow will be indicated with the arrow when using the **Drainage Network Editor** and you have selected an manhole (all but the outlet).

Also, the **Drainage=>Plot=>Plan annotation** option can be used to label the network with the direction of flow.

If one of the arrows in the plan annotations is going in the wrong direction then the direction of flow flag must be changed. From the main menu select

Strings=>Properties=>String

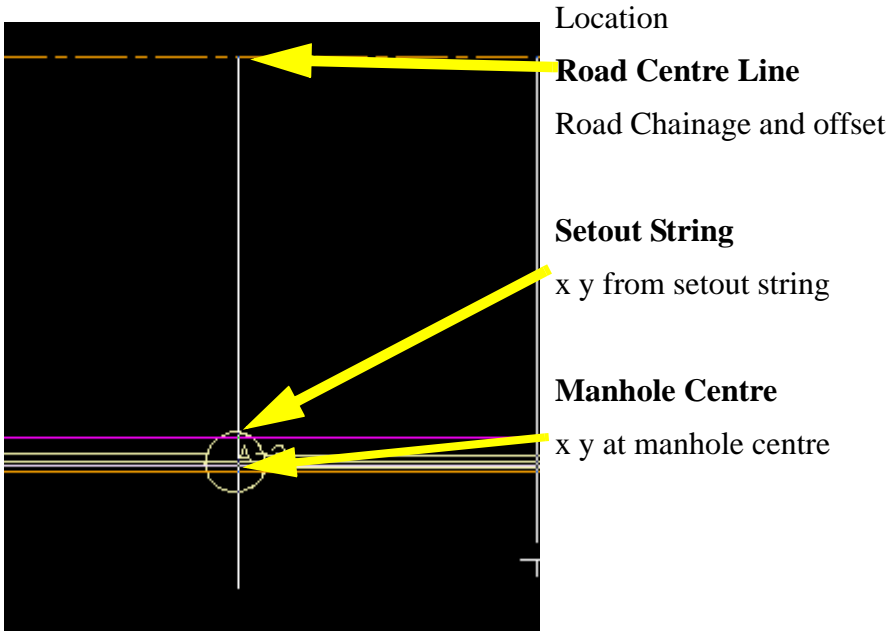

and change the **Flow direction** to the other value (there are only 2 options). You may replot the annotations if you want to confirm the change.

Manhole Setout Point, setout strings and selecting the location for the manhole centre

The centre of the manhole (x,y and z) need not be the **manhole setout point** used in the setout tables. The setout location can also be set independently of the level. It is recommended that you place the manhole so that the pipes are shown in the desired location and then use the desired option for setout. The default settings for the manhole setout location are found on the **network editor-defaults-pits-setout** data.

Key Points in Using Setout Strings

1. Enter the road models and the strings names (identifies) via the **Network Editor, Global-Utility Models** tab, **Road design file**.
2. Specify that these strings are to be used. Select **Setout string** for the XY or Z setout modes on the **Defaults->Pits setout** area or **Pits->Setout** tab.
3. Select the **Set Pit Details** button.

X,Y Option 1 Manhole Centre

The x,y location will be the centre of the manhole.

X,Y Option 2 Road Centre Line

The road chainage and offset are measured perpendicular to the road centre line out to the manhole centre or setout point.

X,Y Option 3 Setout string

The manhole centre is dropped perpendicular onto the set out string to obtain the x and y.

Z Option 1 FS tin

The manhole setout level is obtained from the finished surface tin at the manhole centre.

Z Option 2 Setout String

The manhole centre is dropped perpendicular onto the setout string and the level is obtained from the elevation on the string.

Example

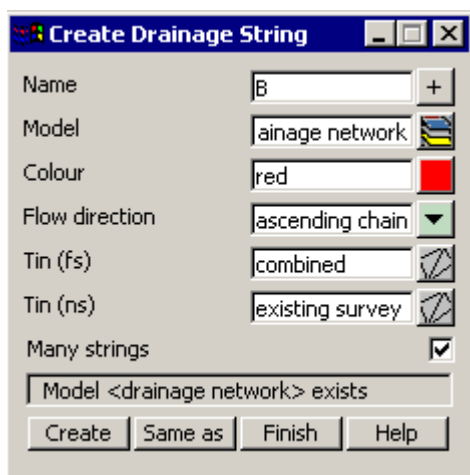

In the diagram below the setout point is lip of kerb. The setout x,y location level z will be obtained from the setout string and the pipe will be shown at its proper position.

Creating the Drainage Strings in 12d

Drainage strings can also be created in 12d. A drainage string is created by selecting

Design =>Drainage-Sewer =>Create

TIP: If you have already created a drainage string, click the **Same as** button and select the drainage string to obtain the panel values from that string. After selecting the string, change the string **Name**.

Each drainage string in the model must have a unique **Name** if you plan on using the **Set Pit Names** option after all of the strings have been drawn. The name of the string should be kept short, for example, as it will be used as the prefix or suffix for the manhole names. Examples of manhole naming schemes available for a string labelled, , are B1, B2, B3 ... ,or 1B, 2B,3B...or 1/B,2/B, 3/B... etc.

Sequential numbering all of the manholes (1,2,3 etc.) is also an option. The manholes on the string named **1** will be labelled first and then **2** and so on. If you insert a new string with a name in the middle an existing series (i.e. add a new string 2 when strings 1,2 and 3 already exist) then name the new string 1.1 (for this example) and then use the **Strings=>User=>Set String Name by number** command.

Drainage String Create Panel

For auto manhole naming, every drainage string must have a different **name**.

All drainage strings for the one outlet should be in the same **model**. Only drainage strings should be created in this model. If the model does not exist it will be created.

Colour will be the colour used in the drainage longsection drawings.

Flow direction should be **ascending chainage** if drawing uphill to downhill or **descending chainage** if drawing downstream to upstream. All of the strings in the model can have their direction changed later using the **Design=>Drainage-Sewer=>More=>Reverse all strings** command. To graphically check the flow direction of all strings see **Flow in the Wrong Direction**.

The **Tin (fs)** field will be completed for you with the default value you entered in **Design=>Drainage-Sewer=>Defaults=>Tin(fs)**. The finished surface levels on your long section plots will be obtained from

this tin.

The **Tin (ns)** field is optional. By specifying a natural surface tin, natural surface levels can be shown on your drainage long section profiles.

Selecting **Many strings** will have the panel re-appear, ready to go again, after creating each string.

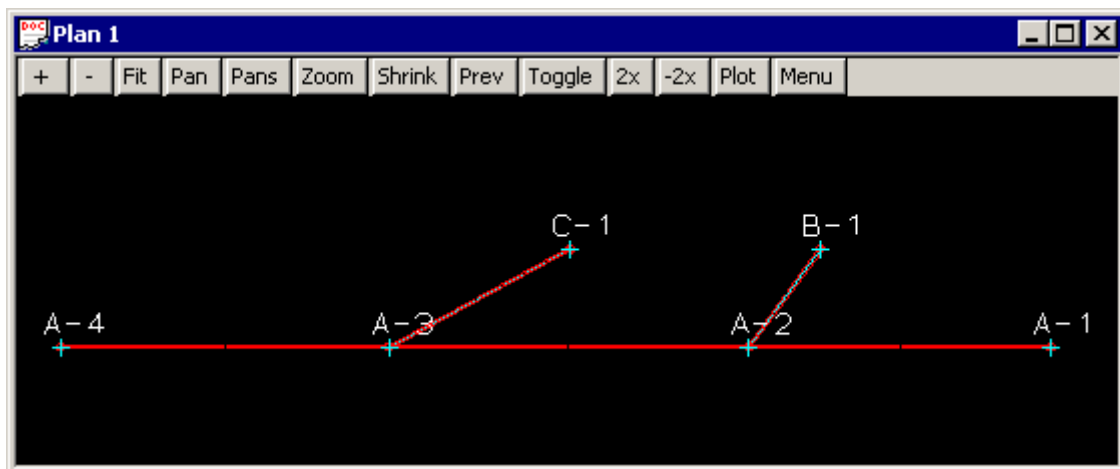

Click the **Create** button to begin creating the drainage string. The following panel will appear.

To create your first manhole, select **Edits =>Append**. A + will appear with your pointer.

We are going to place our manholes on the vertices of the layout that we imported. **Toggle the vertices on** (just to help you see where the manholes are going to be placed), turn your **line snap** off and the **point snap** on.

The first line we will create is the branch line on the east (Line B) then the branch line to the west (Line C) and finally the trunk line running from east to west (Line A). The drawing below shows the manhole names. You will not see these as you draw the strings but we will create them later.

Click and accept the point labelled B-1 and then click and accept the point labelled A-2. Since this is the end of the branch line, select **Finish** from the **Drainage Edit** panel. If you have other edits to make to the string do not select **Finish** yet (i.e. set some specific invert levels) **RB** then select **Cancel** from the menu. This will leave the edit menu active for further changes.

The **Create Drainage String** panel will appear again for you to create additional drainage strings.

Create line C in a similar fashion. When this line is finished, start on line A but only place the first manhole, A-1. manhole A-2 is a junction manhole and requires some special attention.

Exact Methods for Placing Manholes

To place your manholes on a kerb line string, turn the **line snap on** and the **point snap off**. Keep the **height snap off**.

For locating manholes at specific x, y coordinates, simply start typing the x coordinate instead of clicking onto a location. An input panel will appear for you to enter the x and y coordinate separated by a space.

To place the manholes at a specified distance from a point use the **RB** and select **SNAPS COGO=>Locate=>Offset**. Follow the prompts given in the message area (bottom left corner of the screen). You will need experience with the 12d “directional pick” to use this capability.

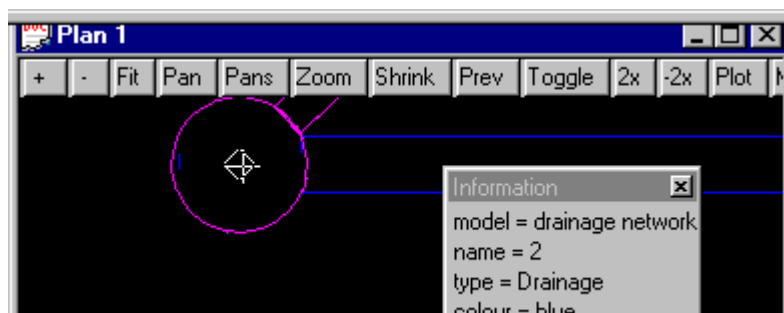

Junction manholes on Trunk Drainage Lines

Key Points

1. The branch line must **Point Snap** onto the centre of a manhole on the trunk line.
2. All strings must be in the same model.

Trunk drainage lines are created the same way as the branch lines except special care must be used when placing the junction manholes. When placing the junction manhole *on top of* the branch line turn the point snap on and the line snap off (the F3 and F4 keys are convenient for this). Zoom into the branch line junction manhole so that you can snap onto the centre of the manhole.

A manhole contains three points; one at each point where the pipes join (invert level points) and the one you want to snap onto at the centre of the manhole (setout level point). In the figure below, the blue line is being placed to join the magenta line. Note that the diamond indicates that there is a point snap and the information panel indicates that we are snapping to line 2. The information panel also indicates the snap was a point snap.

After snapping onto the branch line manhole click **Prev** on the **plan view title area** to return to the previous view and continue appending manholes.

You can tell that you have created a junction manhole correctly when you profile the trunk line and you can see the branch lines joining at the junction manhole. If the branch lines are not shown then one of three things have gone wrong.

- 1) centre of the manholes did not align, **Use Strings=>Points Edit=>Move** to move the branch string manhole
- 2) the “downstream end” of the branch line must be the junction manhole. With the direction of flow for the string set to “Ascending” the junction manhole must be at the high chainage end of the string. If the direction of flow for the string set to “Descending” the junction manhole must be at the low chainage end of the string. To check the flow direction see **Flow in the Wrong Direction**.
- 3) The branch string and the trunk string have not been created in the same drainage model. From the main menu select **Strings->Inquire (F2)** and select the strings to check their models. If this is the problem, use **Strings=>Edit=>Change** and specify the correct drainage model (enter the model BEFORE picking the string) or **Strings=>Edit=>Duplicate** to duplicate one of the strings into the correct model.

Drainage Section Views and Plots in the Wrong Direction

If the section views and the profile plots are running downhill in the wrong direction, the **reverse** function may be used to change the direction.

To reverse only one string, from the main menu select

Strings =>Strings Edit =>Reverse

and pick the drainage strings to reverse. This will also change the drainage flow direction attribute from **ascending chainage** to **descending chainage**.

To reverse all of the strings in a model select the **Strings Reverse** option,

Design =>Drainage-Sewer =>More=>Reverse all strings

To confirm the direction of flow see **Flow in the Wrong Direction**

Drainage Network Editor

The drainage network editor is used to automatically or manually change the attributes of your drainage network. These abilities include:

General

- s **Setting manhole names**

Hydrology

- s **Catchment Areas**
- s **Checking the Automatic Catchment Linking**
- s **Global and Defaults Tab**
- s **Drainage Templates**

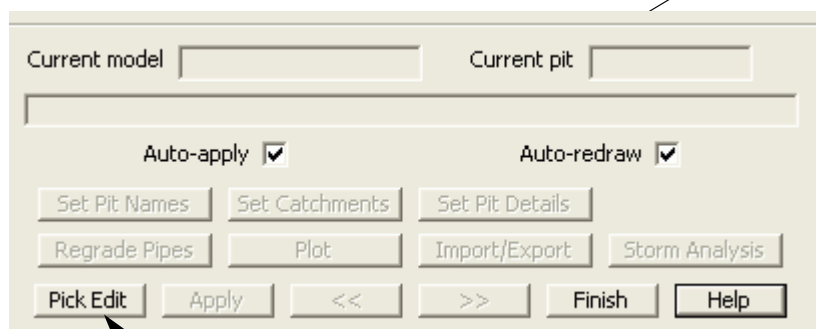

Hydraulics

- s **Outlet and Tailwater Conditions**
- s

The drainage network editor is accessed through the main menu by selecting

Design=>Drainage-Sewer=>Network Editor.

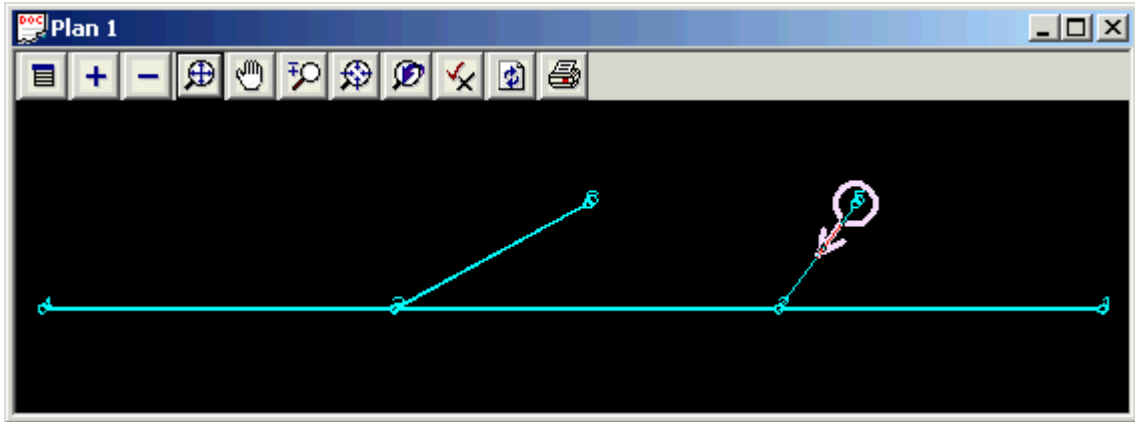

The bottom section of the network editor panel is shown below.

To begin select a 12d drainage manhole that is in your drainage model.

You must pick and accept the manhole and not the pipe! Pipes cannot be used to pick the network!

The manhole that was selected is highlighted with a circle and an arrow shows the direction of flow (see image below).

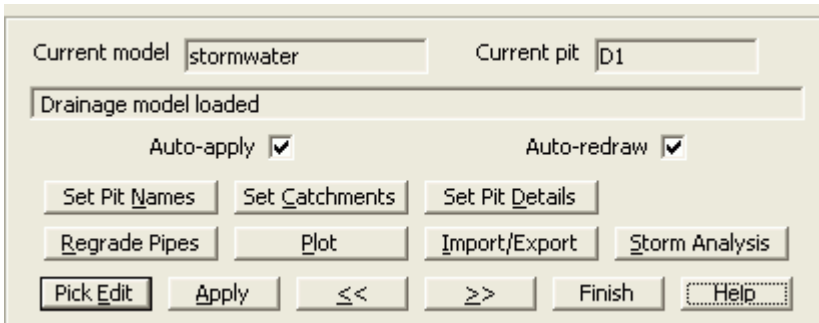

The option buttons on the drainage editor now become active.

Setting manholes names (and pipes)

If your network was created from 2d strings the manholes will be named incrementally using integer numbers. Use the drainage **network editor** to manually change explicit ones or quickly change all the names using a different naming method.

The manhole names are based on the string names so make sure the string names are set. To view string names on the plan view, go to the Plan View tool bar and select **Toggle=>Names**. If they do not appear see Displaying View Text. The string names may be changed using **String->Strings Edit->Change**. When using this function always...

Enter the new name BEFORE selecting the string!

Select **Set Pit Names** and the following panel will appear.

Field descriptions

After selecting the desired naming method and options.

Select Run to change/assign the manhole names. These names should be visible on the plan view with the drainage network model. If they do not appear, see the section below: **Displaying View Text**

To create larger text labels that can be moved see **Labelling the Manholes**

Select Back to Editor to remove the panel.

Displaying View Text

After you have named the manholes in your network, the names should appear beside each manhole in the plan views. If they do not appear check the following.

After you have named the pits in your network, the names should appear beside each pit in plan. You can change the text size for each string by selecting **Strings=>Editor** and then pick-accept the drainage string. The text size is set from the selection **Utilities=>Size**.

The offset from the pit is set by selecting **Strings=>Properties=>Strings**, picking the drainage string and setting the values for **Delta x**, and **Delta y**.

Note: Auto pit names are **NOT** shown in the section view.

Trouble shooting auto pit names not being displayed

Problem	Solution
Plan text is toggled off	select Toggle on the plan view title area

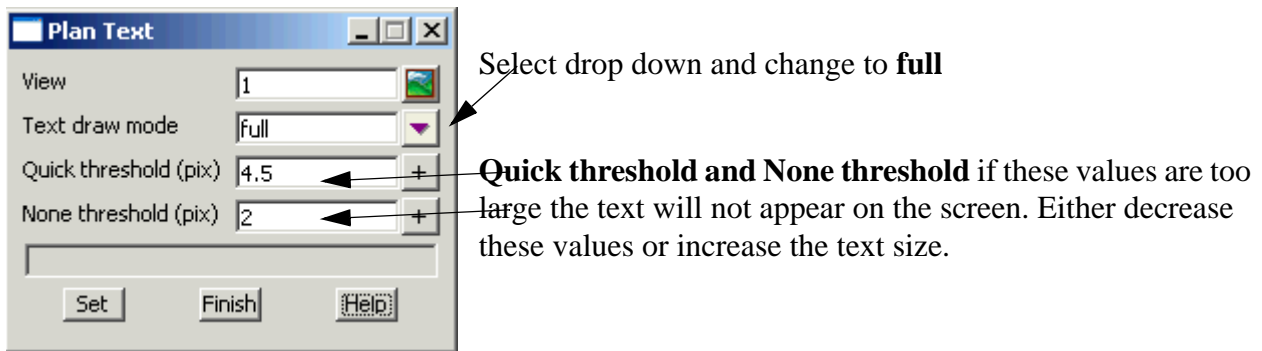

Check that the **Text** is toggles on. If it is on then walk right and ensure the text is turned on or n/a for your drainage network.

Small text is turned off select the **Menu** button on the **plan view title area** and select **Settings =>Text =>Text**

- if these values are too large the text will not appear on the screen. Either decrease these

values or increase the text size.

string text size is 0. Each drainage line can have its own size of the text. To change it, select **Strings=>Editor** then pick-accept the drainage string. The text size is set from the selection **Utilities=>Size**. If this is set to zero the labels are not drawn.

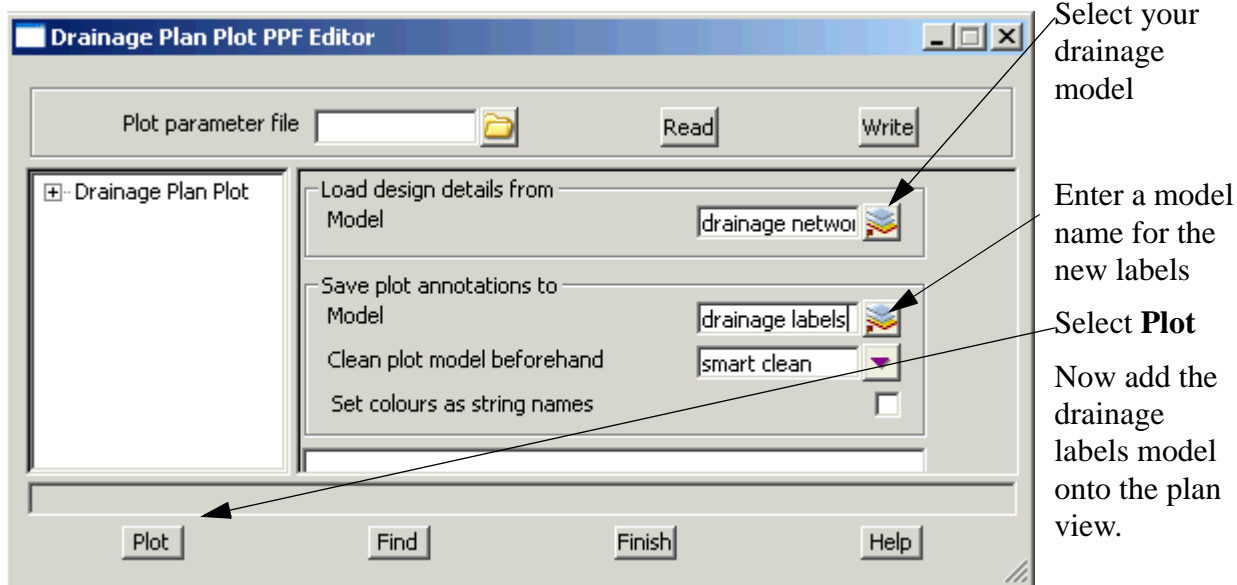

Labelling the Manholes and Pipes

To label the manholes and the pipes use Drainage Plan Annotations. This may be accessed from one of three locations. From the plan toolbar

or **Design->Drainage-Sewer->Plots->Plan annotations**
 or **Plot->Plot and ppf editors->Drainage plans**
 or **from the Drainage Network Editor - Plot Button**

Note (The following panel has been reduced in size).

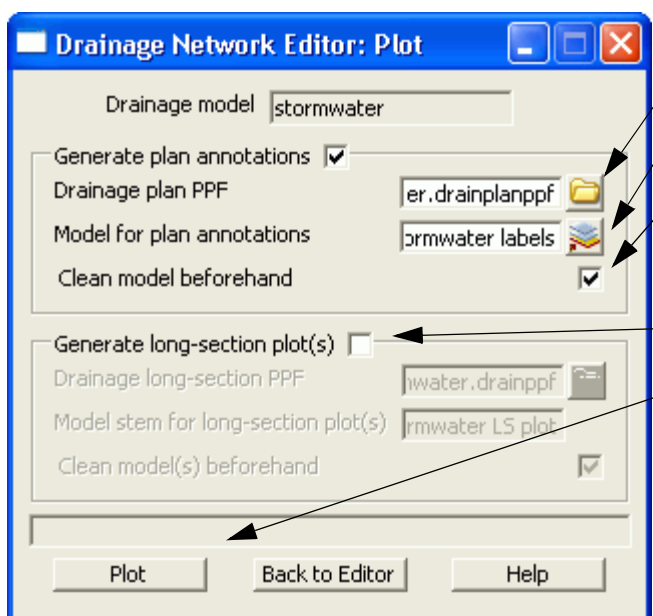

Select your drainage model

Enter a model name for the new labels

Select **Plot**

Now add the drainage labels model onto the plan view.

Option 2 is to select the **Drainage Network Plot Button**, the following panel will be displayed.

This plot will plot both the long section and plan at the same time. Select a ppf file from the library.

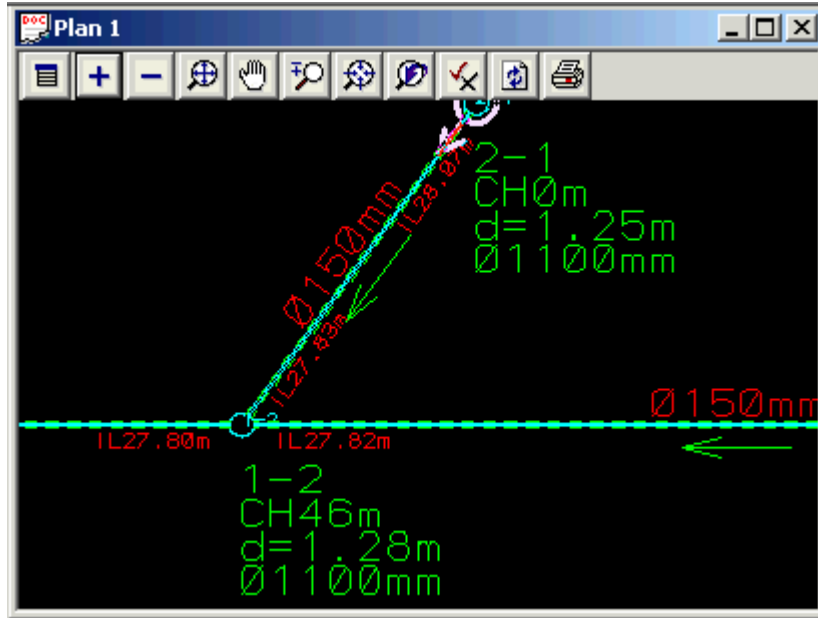

Enter a model for the plan annotations.

Select **Clean model beforehand** if you have not manually moved any of your manhole labels.

Turn off the long section plot for now.

Select **Plot**.

Now add the **Model for plan annotations** onto the plan view.

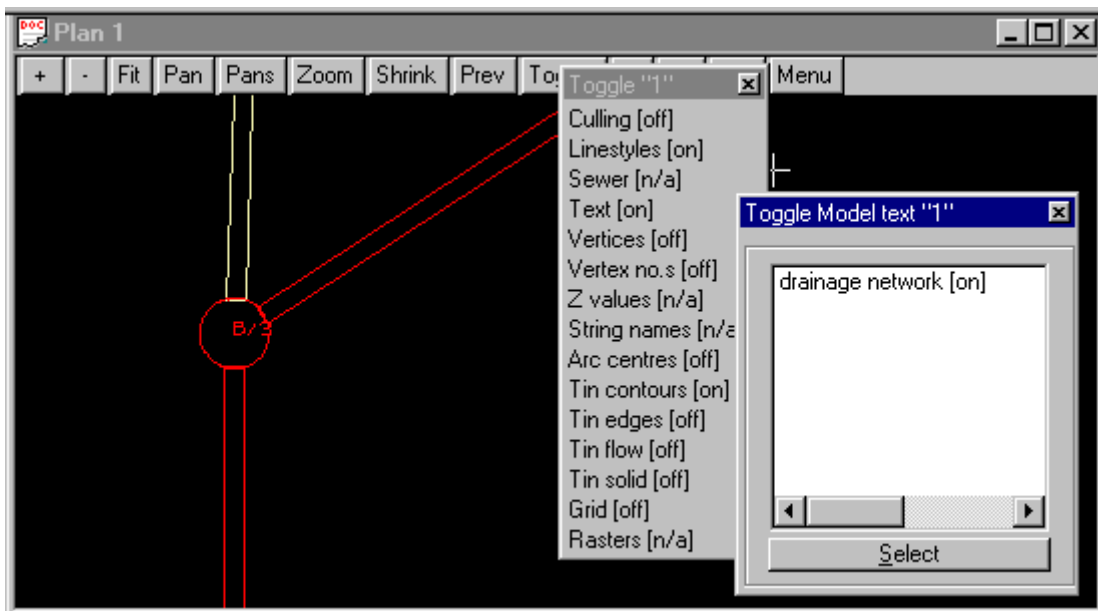

By default, the manholes are labelled with the name, chainage, depth and size. The pipes are labelled with their size in mm, the invert levels and the normal direction of flow. The text properties can all be customised using the plot parameter file but this will be discussed later in the plotting section.

These labels are **not** automatically updated when you change the names or pipe diameters. You must rerun the labelling routine to update the labels.

Turn off View Text Manhole Labels

To turn off the automatic view text manhole labels for this view select Toggle=>Text and then walk right to select the drainage model. Do not click on **Text**, rather walk right. If you click **Text** you will toggle on/off all of your text on the view. Not just the drainage model.

Moving Text

The labels created may be manually moved using the **CAD toolbar** but if the model is relabelled the text

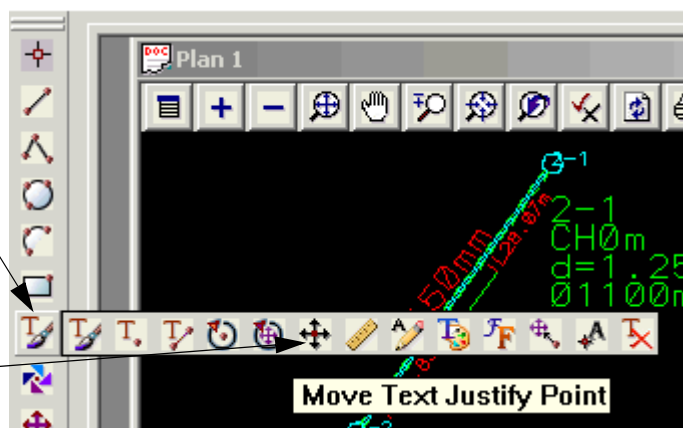

will return to its original location! Text moved via the **Drafting->Multi string translate** will remain in the moved position when **Smart Clean** is selected in the Plan Annotation panel.

Before selecting text turn on your **teXt snap**.

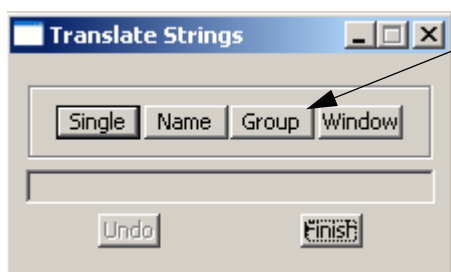

To move a single line a text use the **CAD** toolbar. Select the **Move text justify** button. To use this toolbar you must **DRAG** the **Create text** button to the right

and then release when the pointer is on the **Move Text Justify Point**.

To move a pre-defined **Group** of text select **Drafting->Multi string translate**

Select **Group** and then pick and accept one of the text items in the group. Move it to its new location and accept.

Note: To move another group you must select the **Group** button again.

Catchment Areas

Key Points

1. Start near the manhole for auto linking.
2. Manual linking available via Network Editor->Catchments->Pick button.
Disable the auto selection of a string via Right mouse on pick button then select **Clear**.

Catchment areas for your hydrological model may be defined using a Super, 2d, 3d or polyline string to set the catchment boundaries. Other ways to set the areas are: manual entry in the **network editor**, via a spread sheet program, the **Top 10 Attribute Editor** or the **ILSAX pipe editor**.

Note that if a catchment string is created to define the area for a manhole then all other data entry types will be ignored and the area from the string will be used.

There are 3 sets of catchments and it is up to the user to decide how they are to be used. Often set 1 will be all the impervious areas and set 2 the pervious and set 3 for special areas. Each set of catchments has its own model. Another option is to have only one set of catchments and to use the percent impervious field.

If exporting to external drainage design programs they may not accept all three sets so check the interface notes before defining the catchments.

In each set/model, 12d will automatically link the catchment string to the manhole that is closest to the first point on your catchment string. This is the preferred method. If this is not possible, then a manhole may be manually linked to a catchment string using the **Catchment manual link**.

Also see **Checking the Automatic Catchment Linking**

Drawing Catchment Strings in 12d

Before creating the catchment string set the **CAD control bar** data.

Type the name of a model for the catchment strings

Now to create the catchment string use the **Create line string** button on the CAD toolbar.

DRAG the **Create line** button and release at the **Create Line String** button.

The first point should always be placed near the manhole. 12d will assume that the catchment will drain to the manhole closest to this first point.

There is no need to go “overboard” with the accuracy of the catchment strings (except maybe with SAG pit catchments near the low points). From experience, it is more important to spend time verifying catchments in the field than spending a lot of time getting them “exactly” placed on the catchment plan. If you want to use the drawing as a catchment plan submission then the extra care in creating the strings may be warranted. Continue selecting and accepting the points on the catchment string.

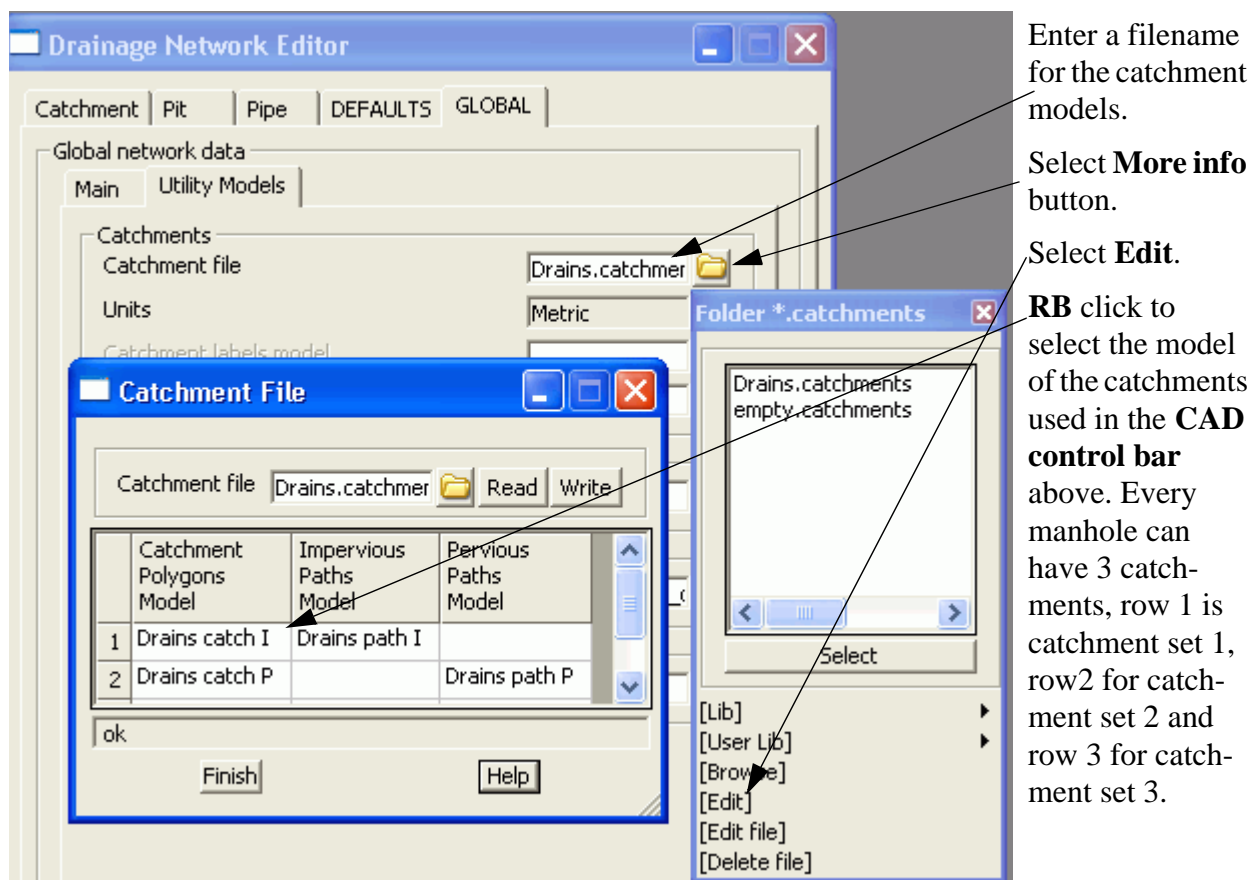

SAG inlet catchments: DO NOT START AT THE INLET, just start nearer to this inlet than any other! If you start at the inlet then move out to the crest of the catchment, the catchment overflow level cannot be determined from the catchment string.

For the last point on your catchment line select **Close** from the **CAD** toolbar. This function places the last point on the string over the first point on the string forming a closed polygon.

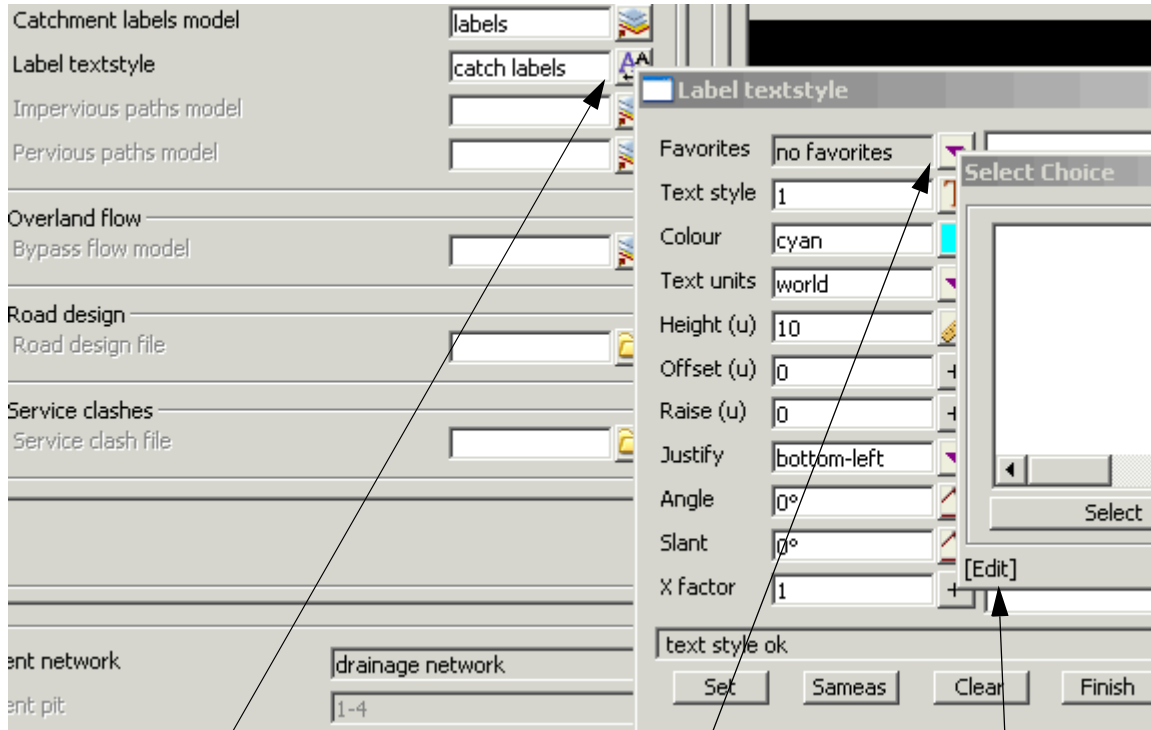

Once the catchments are drawn they become linked to the drainage network in the **Drainage network editor**. We will label the catchment with the manhole name and area at the same time.

Start the **Drainage network editor** and move to the **Global** Tab and then the **Utility Models** sub tab.

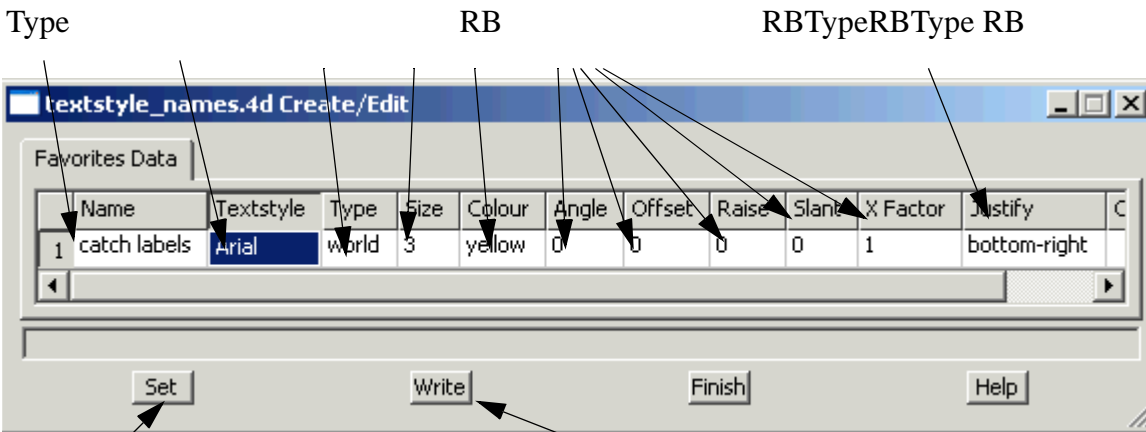

We now need to create a label textstyle if you do not have any favourites defined.

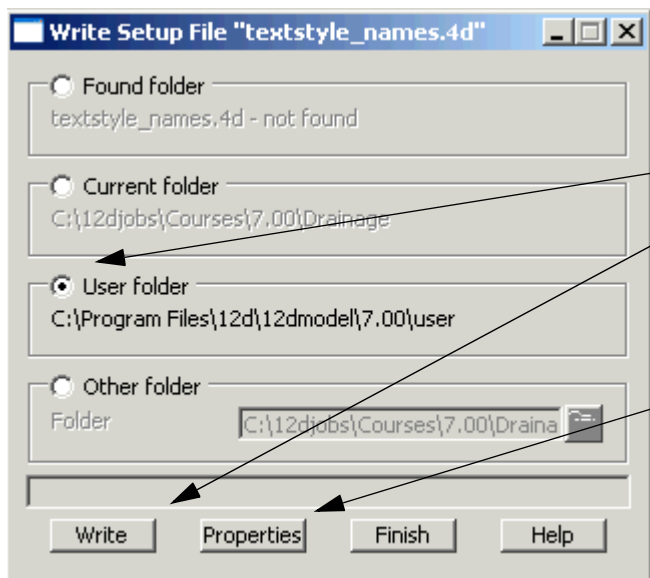

Select the **textstyle** button and then the drop down for **Favourites**. Now select **Edit**.

Enter the data as show. Some data you will have to type on the keyboard (**type**) and other you may use the right mouse button (**RB**) and then select browse.

Select **Set** to store the textstyle favourite for this session only. To permanently save this textstyle favourite and have access to it in all of your projects select **Write** and the following

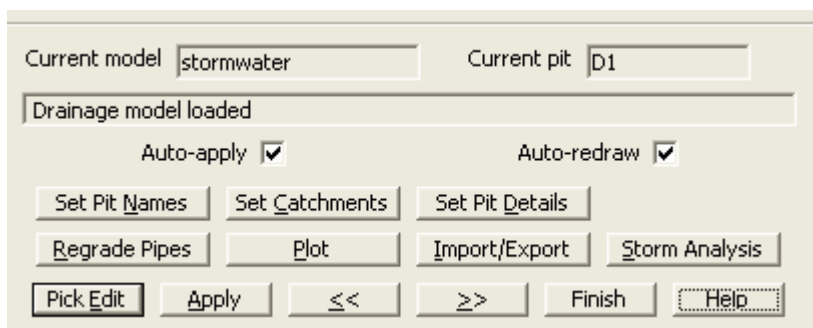

Select the **User folder**.

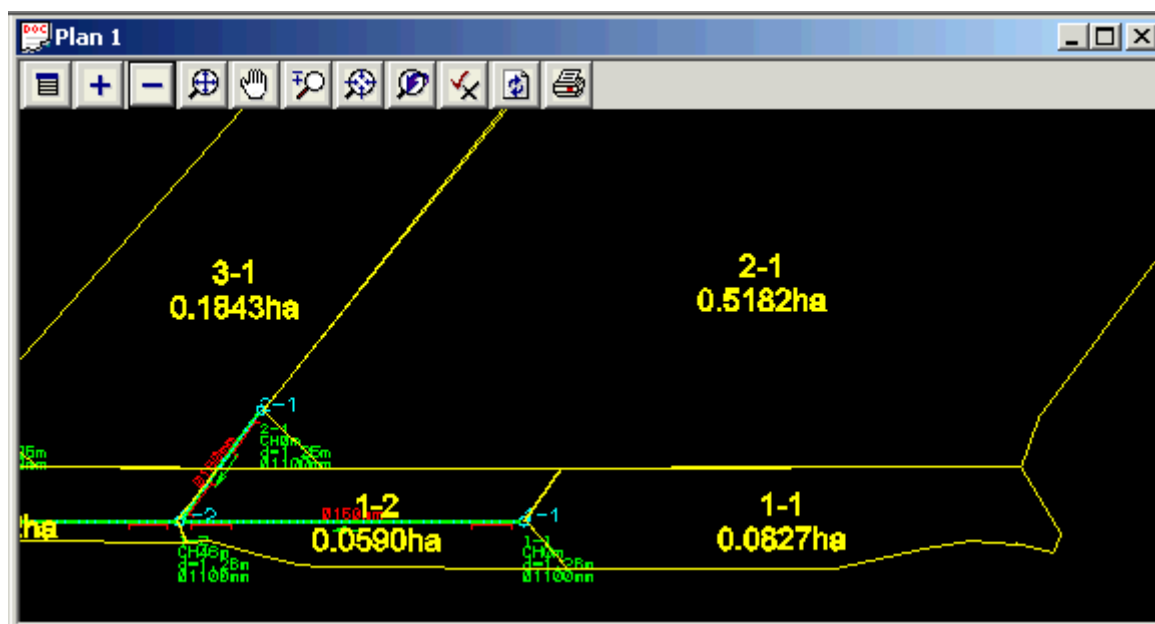

Select **Write** to save the favourite to the **User folder**.

If you are in a network environment and want to see if you have write access to this files select the **Properties** button.

Label Catchments

Finally select **Set catchments**. This will link the catchments to the manholes and label the catchments. Now add the model **labels** onto the plan view.

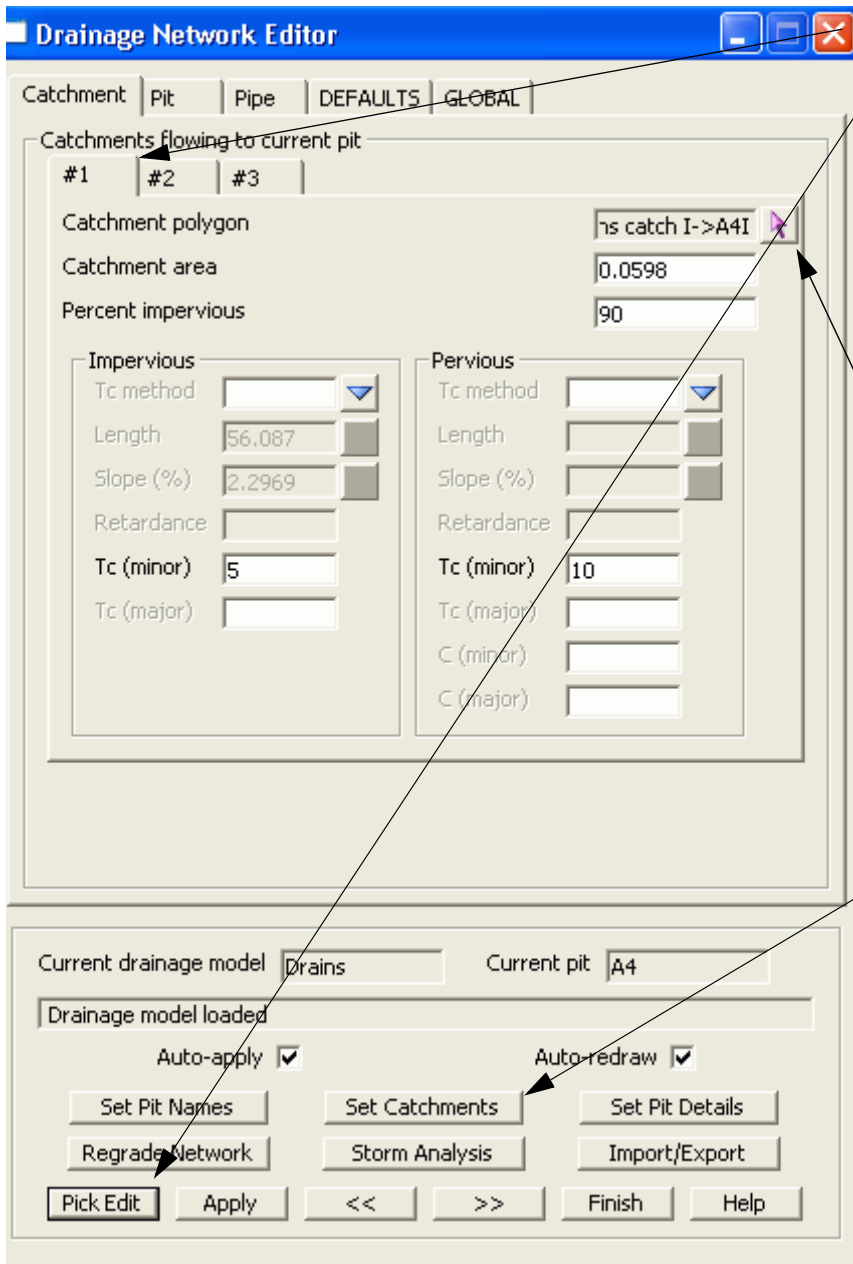

There are some cases where linking the closest manhole to vertex 1 is not feasible. In these cases you may manually link the manhole to a catchment.

Catchment manual link

The manual links are used when the first point on the catchment string is closest to the wring manhole. Note that the following restrictions still apply.

1. The string selected for catchment 1 must be in the model for set 1. To check if you have selected a valid string select the **Set Catchments** button.
2. If the catchment string has already been linked to another manhole (automatic or manual) then the new link will be created and the old link erased.
3. If you change the catchment model for one of the sets on the **Network Editor->Global->Utility Models->catchments** than all of the manual links in that set will be erased.

First change to the **Catchment** tab. Now either use the **Pick Edit** button to select the manhole or use the >> (next) or << (prev) buttons to move to the desired manhole. The manhole will be circled in the plan view and its name shown in the **Current Pit** field.

Now select the **Catchment polygon** button and pick the desired catchment string.

NOTE! If you decide to enter a value and NOT use the selected string **RB** on the button and select **Clear**.

If the **Auto apply** tick box is not selected then you will have to select the **Apply** button for the manual link to become active.

After the **Set Catchment** button is selected the measured catchment area will be shown in the **Catchment area** field using the units specified in the **Global-Utility models-Units** field.

Checking the Automatic Catchment Linking

The automatic manhole-catchment linking is easily checked by specifying a **Catchment labels model** with **Labels textstyle** on the **Global->Utility models** tab and selecting the **Set Catchments** button on the network editor. Also once the **Set Catchments** has been selected, the catchment is indicated when the

manhole is selected using the network editor. Since there may be three catchments per manhole the catchment data last viewed in the editor is the catchment that is highlighted.

The catchment strings may be drawn in a CAD package and then imported into 12d or drawn inside 12d. The strings may be easily drawn in 12d with the tin contours and/or flow arrows displayed in the plan view.

Network Editor - Global, Default Settings and Explicit Settings

Design values for the hydrology and hydraulics calculations are set either globally (one value for the entire network) or via Defaults for the manholes or pipes. Defaults values may be overridden by explicit settings found on the **catchment**, **pits** or **pipes** tab. Explicit manhole/pipe settings need only be specified if the default value is not desired.

Drainage Templates

The default and global settings may be saved as a template for other projects/networks. Set the defaults for a network and then export the model using **File IO->Data output->12da/4da data**. This file may now be imported to another project via **File IO->Data input->12da/4da data**. Since the global and default values are stored as model attributes, they will be imported with the network.

Tip: If you do not want the drainage system imported then delete them from the model before exporting the 12da file.

Network Editor - Hydrology

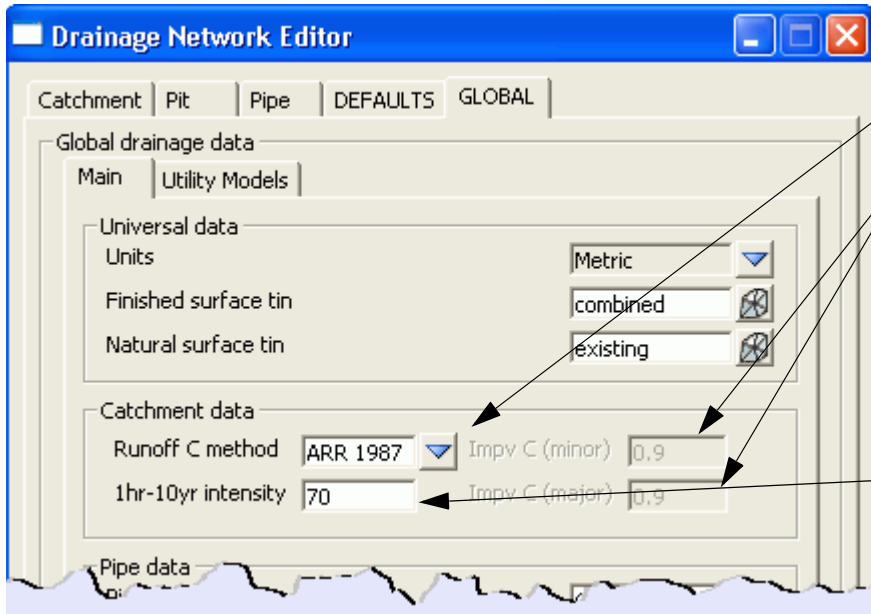

The **network editor** edits both the network and catchment data and it has already been introduced in the previous sections. This section will discuss the Hydrology **Global**, **Defaults** and **explicit setting** for the hydrology parameters. The parameters described on the **defaults** tab will also be found on the **Catchment** or **Pit** tabs.

Catchment Areas

The catchment areas have already been discussed in the previous section. There is no default catchment area to apply to all catchments (as would be expected).

Note! If a catchment string is linked to the manhole and the Set catchments button is selected, this string area will override any manual value that you type into the drainage area field. To ensure manual entry is maintained, RB select the string selection button and select Clear.

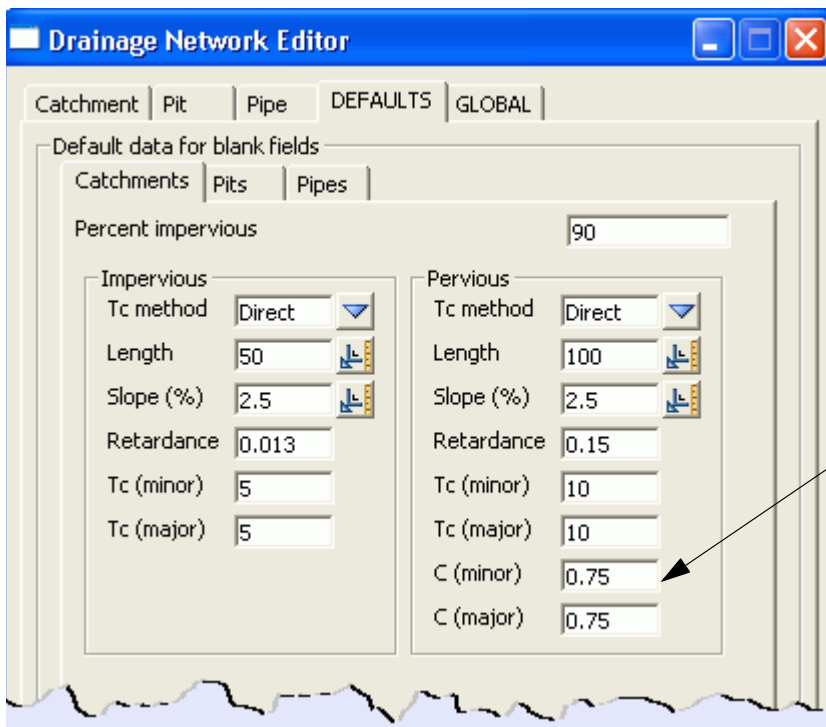

Coefficients of Runoff

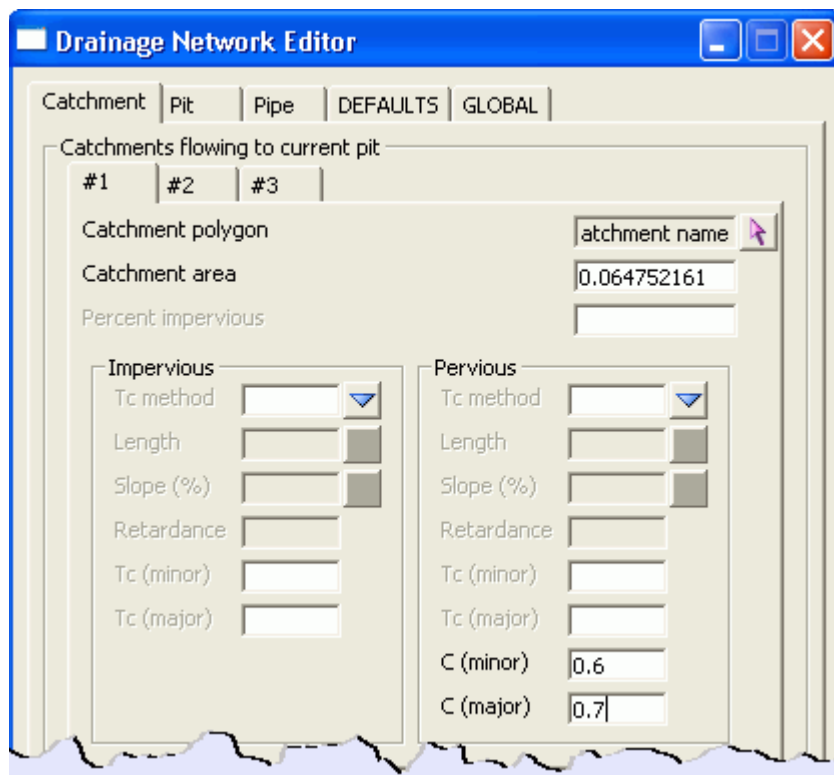

Runoff C methods include **Direct** and **ARR 1987**. For the **ARR 1987**.

Direct: There is a global impervious C value for both the minor and major storms.

ARR 1987: The composite C value is calculated using the **1hr-10yr intensity**, the percent impervious, ARR frequency factors and the return period specified when hydrology runs are made.

The **ARR 1987** has no explicit settings. The **Direct** method has both **defaults** and **explicit settings** on **Catchment** tabs (see below).

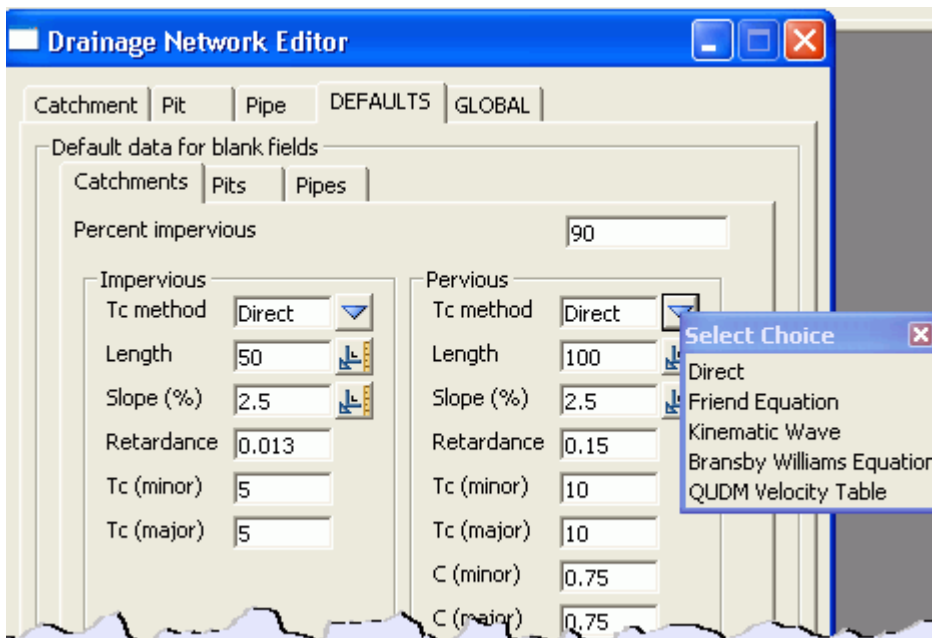

Percent Impervious

The default percent impervious for the network is set on the **Defaults->Catchment Defaults** tab and the **explicit settings** are on the **Catchment** tab (see above). The percent impervious is used to determine the area for the impervious and pervious components and the composite C value if using the **ARR 1987** method for calculating runoff coefficients.

Times of Concentration

There are several methods for entering times of concentration for the catchment areas (see list below). Default and explicit settings (catchment tabs) are entered/calculated for both the methods and values for the pervious and impervious areas. Since each catchment may use a different tc method all of the tc parameter fields on the defaults tab are active. They must be filled in even if you do not plan on using that value.

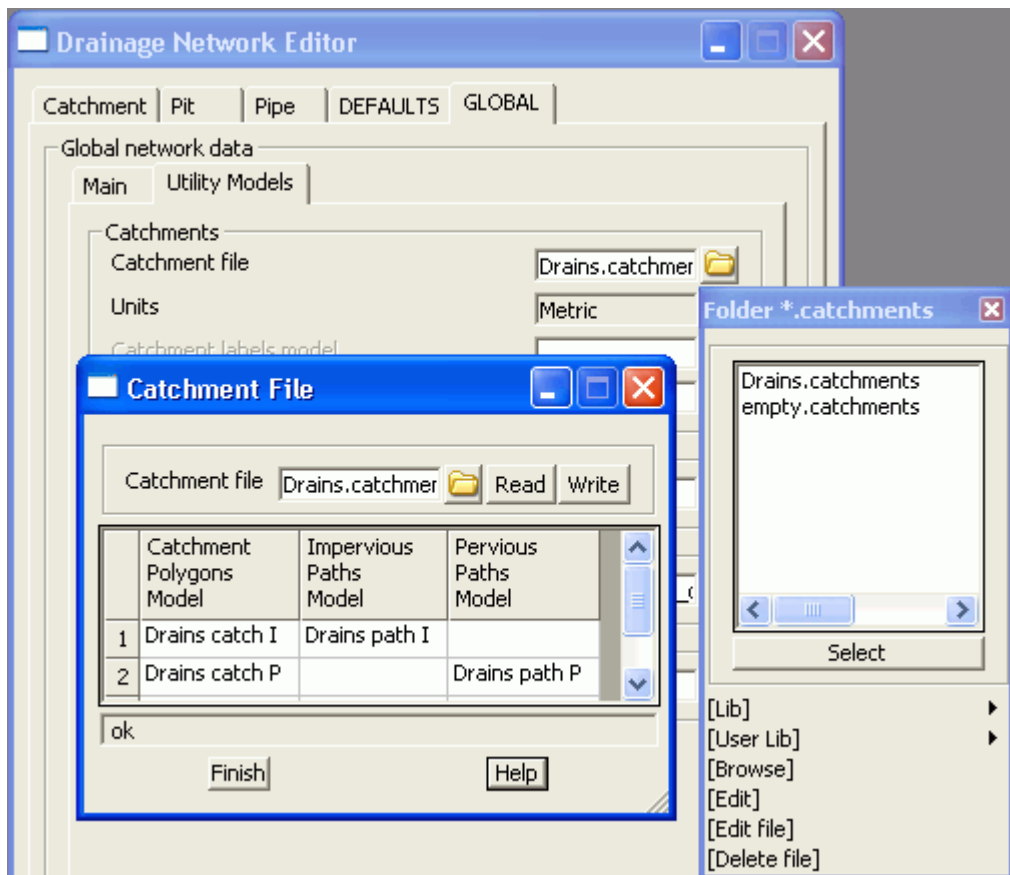

1. **Direct method** requires minor and major tc values.
2. **Friend, Kinematic Wave** and **QDUM** methods require the retardance, length and slope of the catchments to be entered. Default values must be entered but the optional **explicit settings** for slope and length can be entered on the catchment tabs or a catchment characteristic strings may be drawn (see **Catchment Tc path strings**). The length of this string is used for the length parameter and the design tin is used with the string to calculate the slope using the equal area method.
3. Data for the remaining methods is entered in a similar fashion.

Tc Path Strings

These strings are used to calculate the time of concentration for the impervious and pervious areas. They are drawn in two models; one for the impervious paths and one for pervious paths. The models are specified using the **Catchment file** field on the **network editor** (Global->Utility model tab). The 3 rows in the **catchment file** correspond to the 3 catchments available for each manhole. Therefore it is possible to have a maximum of 6 Tc paths models!

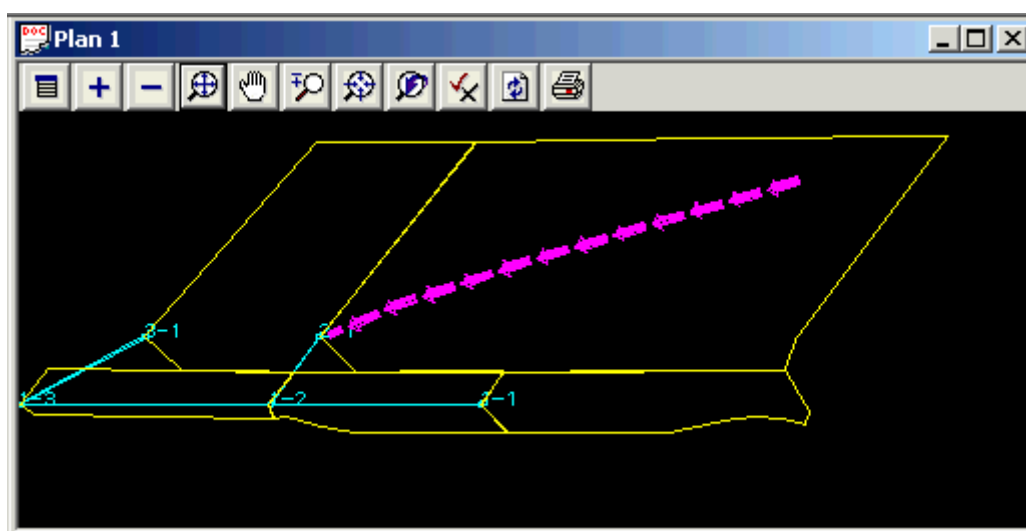

Key Points

1. Each Catchment set may have 2 Tc paths models. Pervious and impervious paths are kept in separate models.
2. End the Tc path string at the manhole that it is to be linked to.
3. Enter the paths models via **Catchment file** field on the **network editor** (Global->Utility model tab)
4. You must select a Tc method (explicit or implicit) via the **Defaults->Catchments tab** or the **Catchments Tabs**. Just specifying the models is NOT enough!

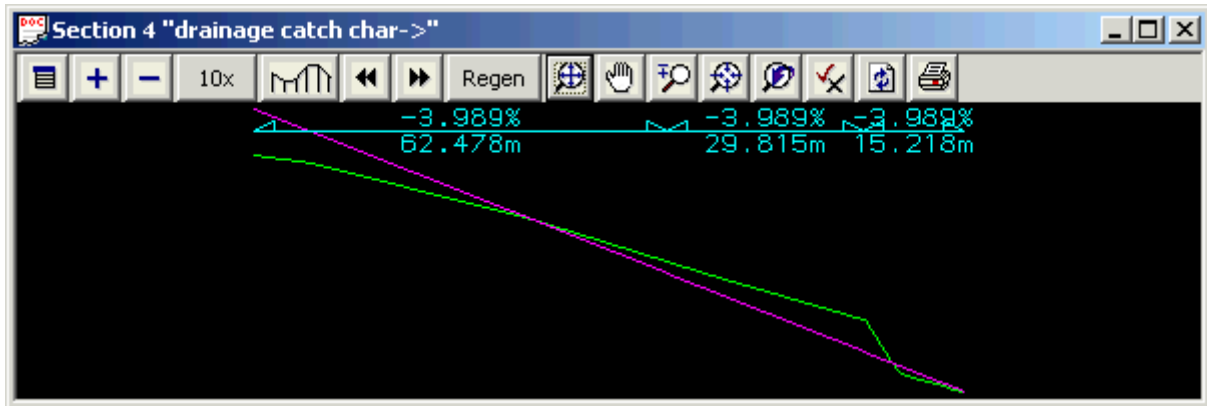

Catchment slope (equal area)

The length of this string is used for the length parameter and the design tin is used with the string to calculate the slope using the equal area method. These strings are drawn from upstream to downstream, finishing nearest to the manhole they are to be linked to. The line style for these strings must be the **flow line** style found under **Drainage 12d** in the linestyle drop down list.

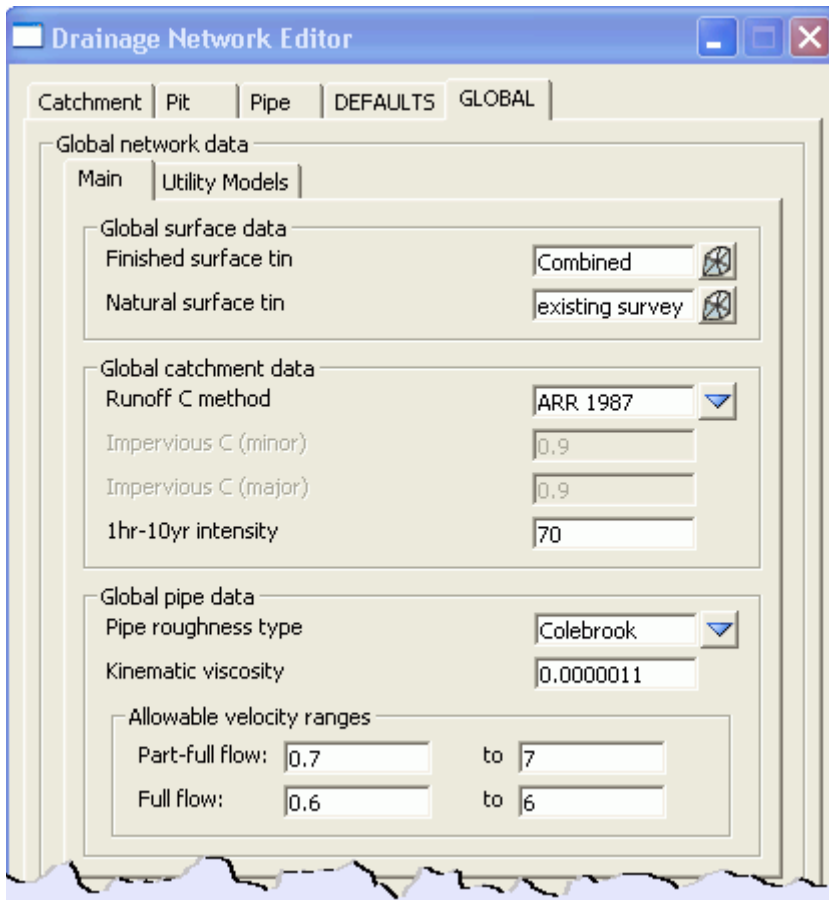

The equal area slope is calculated at export time. After the export the slope string, it may be profiled to see the slope (see below).

Network Editor - Hydraulics

This section will discuss the hydraulic **Global**, **Defaults** and **explicit settings** for the hydraulic parameters. The **explicit settings** for the parameters described on the **defaults** tab will also be found on the **Pit** or **Pipe** tabs.

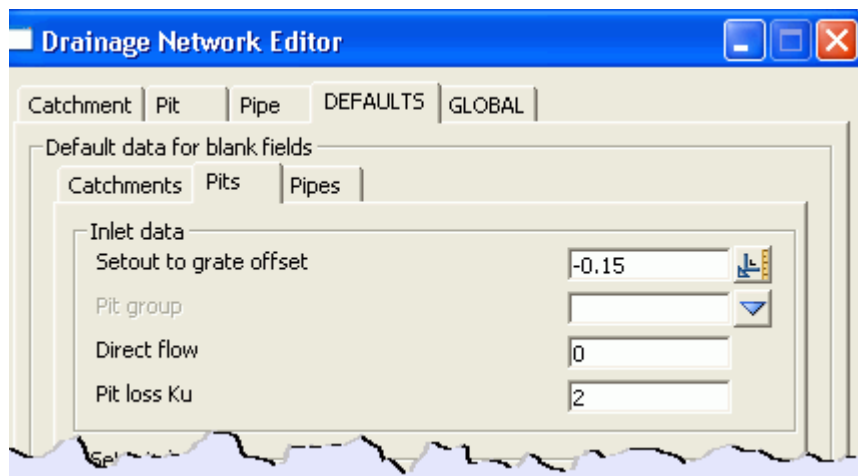

Pipe Friction Method

The **Global** friction loss method for the pipe roughness method is set here (**Colebrook** or **Manning**). The default **pipe friction values** are set on the **Defaults->Pipes** tab.

The ranges for pipe peak velocities are used for checking purposes only. If the velocities are outside this range, warning messages will be given in the output window.

Pit Losses Ku, and Direct Flow

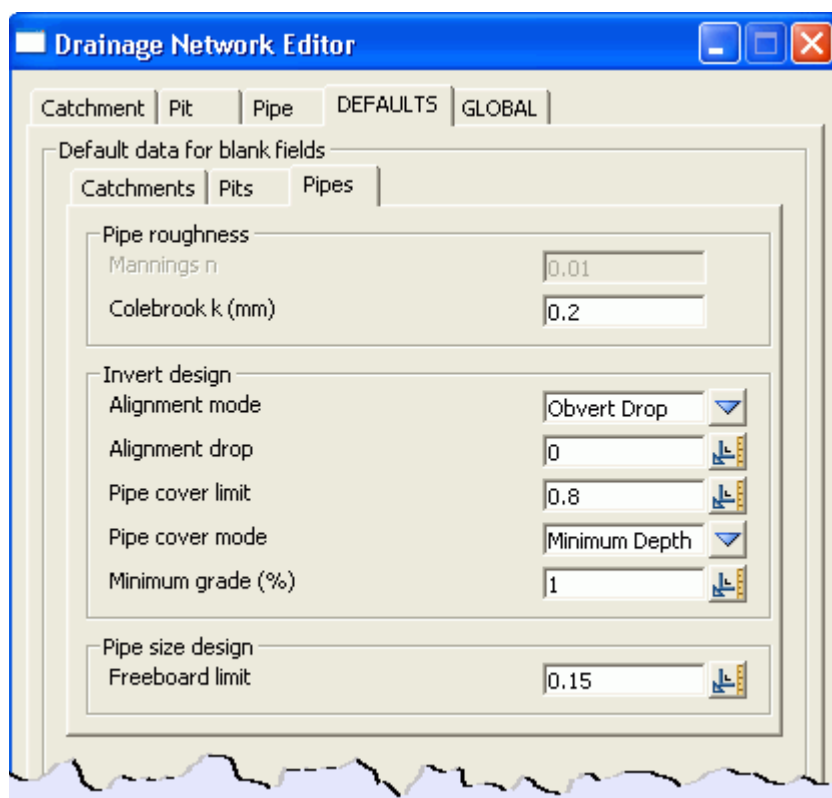

If the setout point was on top of the kerb, enter the **Setout to grate offset** so that the overflow level of the manhole can be determined.

The **Direct flow** (cms/cfs) is water flowing into the manhole. It is not added to the approach flow and therefore is not affected by manhole inlet capacity.

The **Pit loss Ku** is used to model the energy losses through the manholes.

Pipe Friction Values and Freeboard Limit

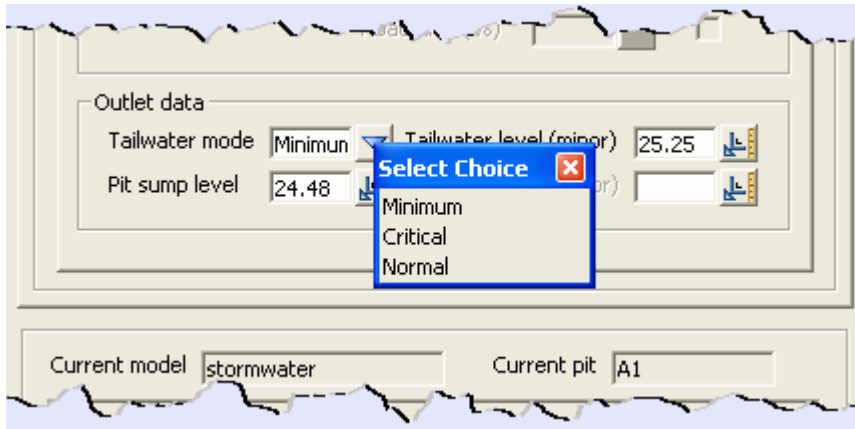

The global **pipe friction method** on the **Global** tab determines which fields are active, **Colebrook k** or **Mannings**. The default value for the selected method is entered here.

The **Freeboard limit** is the limit for the upstream manhole (after the ku has been applied). The freeboard is measured from the grate level (**setout level minus setout to grate offset**).

Outlet and Tailwater Conditions

The most downstream manhole on each network requires tailwater conditions. Often the invert level on the downstream end of the last pipe also needs to have the level locked to either discharge into a waterway or join into an existing drainage system. When the most downstream manhole is selected the following fields will become active on the **Network Editor - Pit - Main** tab. If these field are not active and you think you are at the outlet see **Flow in the Wrong Direction**.

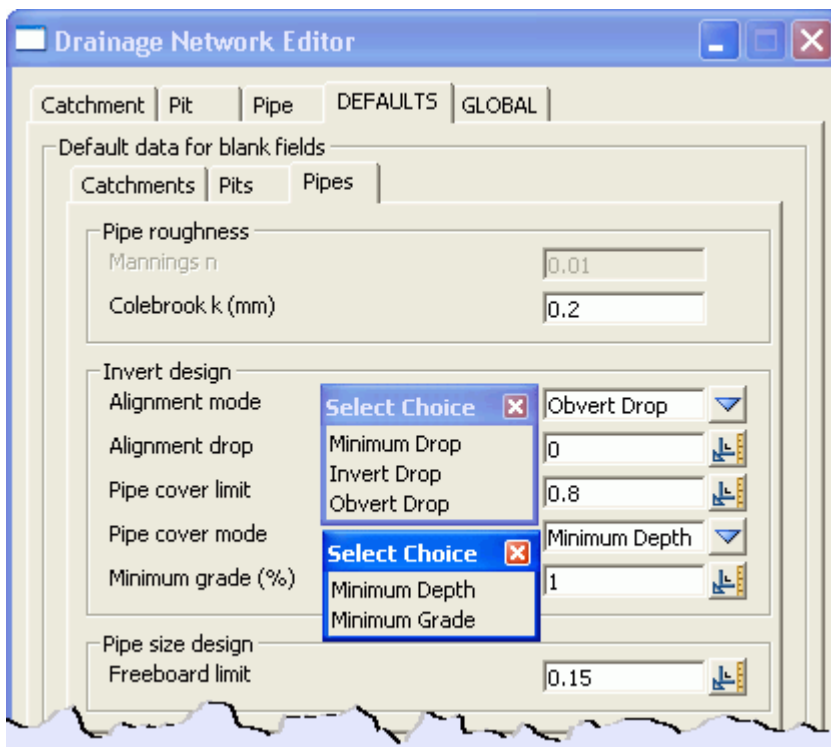

Minimum will use the least of the **Critical** or **Normal** depths. If a fixed level is available for the minor and/or major storms, these value may be entered here. The **Pit sump level** is used to enter the sump level of the network that is being connected to (Optional).

Pipe Design Parameters - Sizes, Invert alignment, Min Cover, Max Height

The invert levels during design are controlled by the **pipe sizes**, **max pipe height**, **min pipe cover** and **invert alignment** mode.

Invert Alignment Modes

12d has 3 design modes for setting the pipe inverts upstream and downstream of the manholes. These work together with the 2 pipe cover modes as follows.

The tin specified in the **Global-Main Finished Surface Tin** field is used for these calculations. The description below assumes that none of the inverts have been manually locked.

NOTE! Invert design parameters are set on the **Pipe-Design** tab not the **Pit** tab. The **Alignment mode** refers to the **DOWNSTREAM INVERT ONLY**.

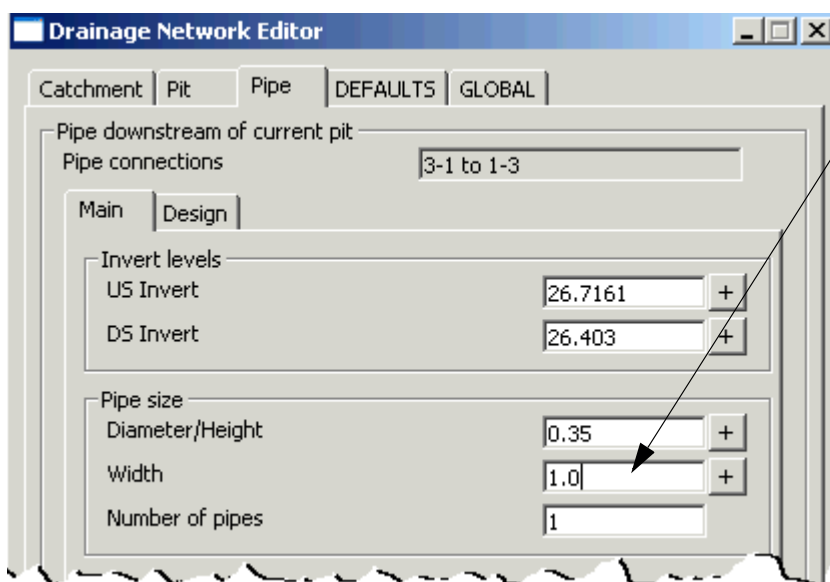

1. The initial pipe grade is set as the **Minimum grade (Minimum Grade mode)** or the grade between the ground levels at the manholes (**Minimum Depth mode**). Even in the **Minimum depth** mode the minimum grade constraint is checked.
2. 12d shifts the pipe down so that there is at least the **Pipe cover limit** along the pipe. The **Pipe cover limit** should include an amount for the pipe thickness.

3. Inverts are moved down if required according to the setting in **Alignment mode**.
 Obverts are aligned using **Obvert Drop** with a zero **Alignment drop** and similarly the inverts are aligned with the **Invert drop** mode. **Minimum drop** ensure that the inverts drop a minimum of the specified drop but the drop may well be more than the **Alignment drop** specified. As the inverts are moved down the minimum pipe grade is maintained.

NOTE! If **Obvert Drop** is selected and the downstream pipe is a smaller pipe then the inverts will be aligned!

Pipe sizes, Max pipe height and Multiple Pipes and Box Culverts

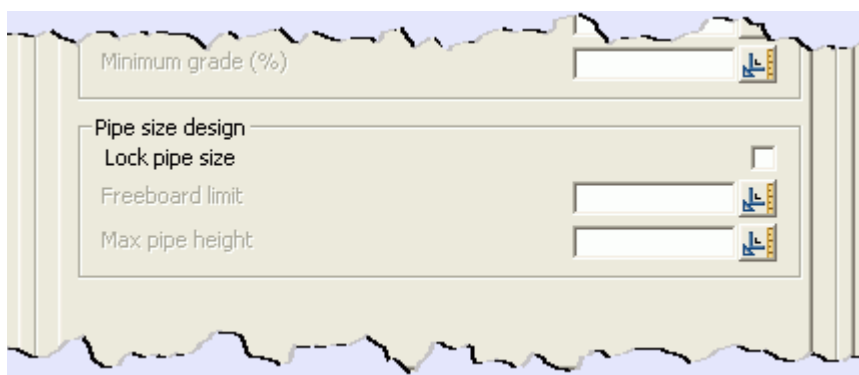

The 12d design engine will select pipe sizes from the file specified on the **Drainage Network Design** panel, **Preferred pipes file** field list. See **selecting pipe sizes**. However, the maximum pipe height allowed before multiple pipes are used and the selection of box culverts is set on the **pipe->main** and **pipe >design** tabs respectively.

To specify a box culvert in your network, select the pipe segment and enter a width for the pipe.

For box culverts, the design engine increases the widths and maintains the height through the available sizes. Once the maximum height has been reached, the next culvert height and minimum width is checked.

On the **Pipe->Design** tab the **max pipe height** can be set for each pipe segment (there is no default for this value). If the 12d design engine requires a larger pipe, then multiple pipes will be selected.

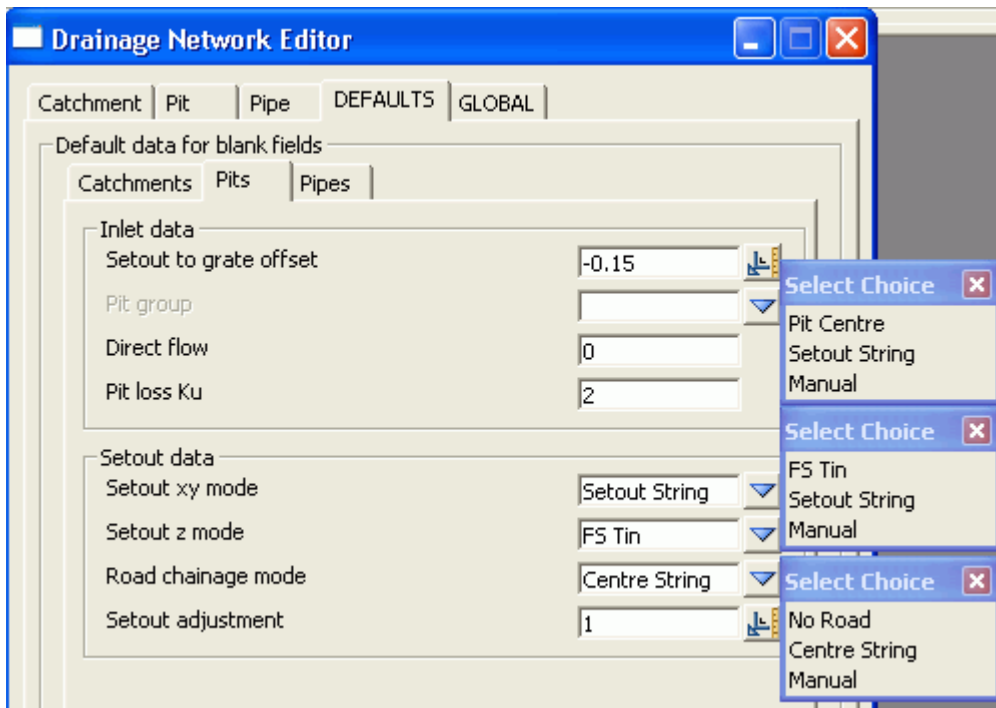

Road Design File for Pit Setout - x,y, level, road chainage and setout offset

The road design file is used to automatically link the manhole to a road setout string and a road centre line

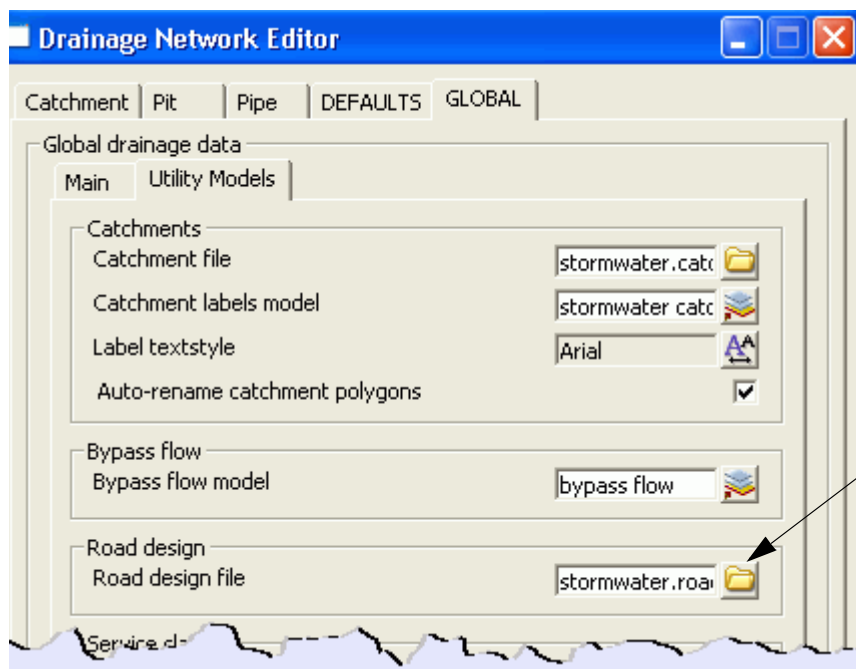

string. Explicit picking of these strings may be found on Pits->Setout->String selection. These strings may be used calculate road grades and crossfalls (bypass model required) and/or construction setout data.

The construction setout point defines the location on the manhole to be printed in the **manhole schedules**, plotted on the **plan annotations** or listed on the **drainage long sections**. The setout point and level can be set to the centre of the manhole or it can be linked to a road design string. The setout level plus the **Setout to grate offset** determines the grate level for surcharging calculations.

The centre of the manhole or setout point can also be dropped perpendicular onto the road centre line to obtain the road chainage and offset distance.

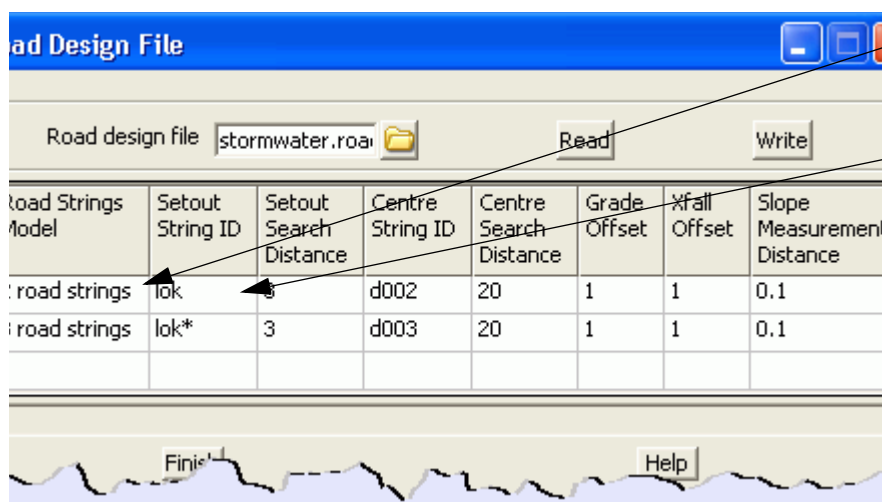

Pit centre is the centre point of the manhole (the intersection of the joining pipes). Often the setout point for a manhole or catch basin is not the centre of the manhole but rather a point on the kerb or back on the foot path. The **setout string** option will drop the centre point of the manhole onto the closest string in the **Road design** model list specified on the **Global->Utility models** tab. The manhole cover level will be set to **level on this string**.

Type a file name, select the folder icon and then select **Edit** from the drop down. **NOT Edit file.**

The following editor will appear.

RB select this box and choose the models containing the setout strings. In the **Setout string ID** box enter the string name prefix (wild card * allowed) to limit the selection for setout string. If no **ID** is entered then this model will NOT be searched!

The **Centre string ID** is used in the same way to find the centre line string. If needed, this string is used for road chainage and to determine which direction to measure the crossfall (between the setout string and the centre string).

The distances and searches are optional. The **setout** and **centre search distances** are the maximum distance that the routine will look when trying to locate the setout and centre line strings respectively.

The **grade offset** is the distance upstream from the setout point that the road grade measurement will start and the **Xfall offset** is the distance from the setout point to the start of the crossfall measurement. The measurements will be taken over a distance of **slope measurement distance** with the actual levels taken from the finished surface tin specified on the Global-Main tab.

Repeat this for each road string model used in the design. **Remember to select Write when finished!**

Select the **Set Pit Details** button on the bottom of the panel the calculate these values.

Explicit settings for the setout strings and the auto calculated values are found on the **Pit-Setout** tab. If the **manual** mode is selected the Easting and Northing locations may be picked in plan view or typed into the input boxes.

The setout level defines the level on the manhole to be printed in the manhole setout tables and in the drainage longsection plots. The **FS Tin** selection obtains the level from the FS tin, specified on the **Global-Main** tab, at the centre point of the manhole. The **Setout String** location obtains the z level from the setout string as described in the section above. **Explicit settings** and the auto calculated value are found on the **Pit-Setout** tab.

If **Road chainage mode** is set to **Centre string**, then the **Centre String ID** in the **Road design file** (shown above) is used to select the road string to measure the chainage and offset from. The values and **explicit settings** for the road chainage and offset are found on the **Pit->Setout** tab.

Setout to Grate Offset

The grate level is used by 12d when determining the freeboard and when calculating depth of flooding at SAG pits. The grate level is often exported to other design packages. The grate level is calculated as

$$\text{Grate Level} = \text{Setout z} + \text{Setout to grate offset}$$

The setout to grate offset is generally zero or negative and implicitly set on **Network Editor->Defaults->Pits->Setout to grate offset** or explicitly on **Pits->Main->Setout to grate offset**.

Calculate Bypass flow routes

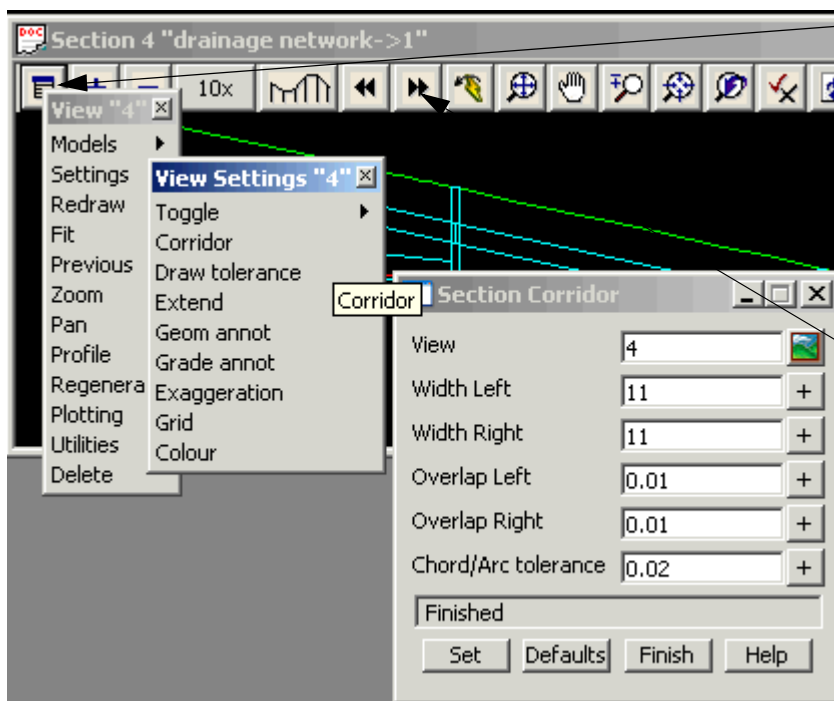

This option is required for manhole inlet capacity calculations and is covered in the advanced drainage training.

As an introduction, the overland flow parameter routine determines the road grade, crossfall, manhole inlet capacity and downstream bypass manhole for each manhole. To achieve accurate measurements for the road grade and crossfall, the manhole is linked to a setout string (see below).

Service and Utility Clashes

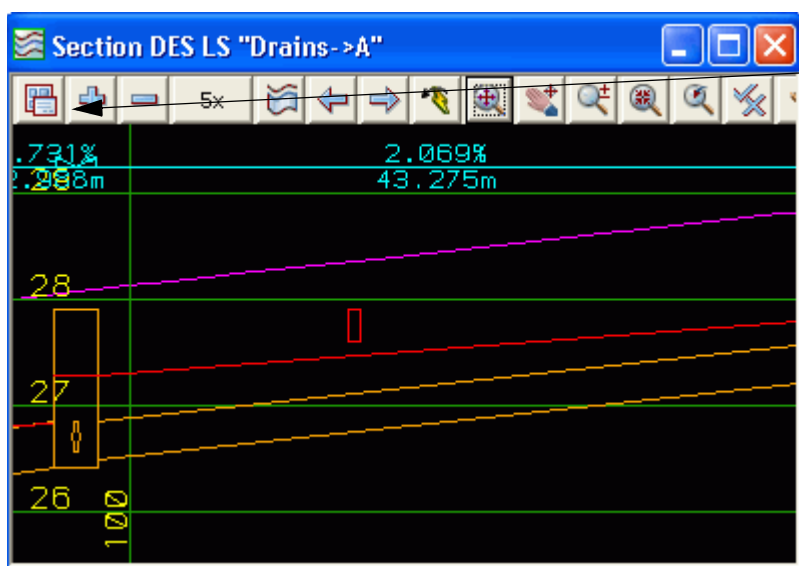

WARNING!

12d service clash routines notify the user of crossing services but not parallel services that are close to each other. To view parallel services, add the services model onto a section view, profile a drainage string and then set the corridor value for the section view.

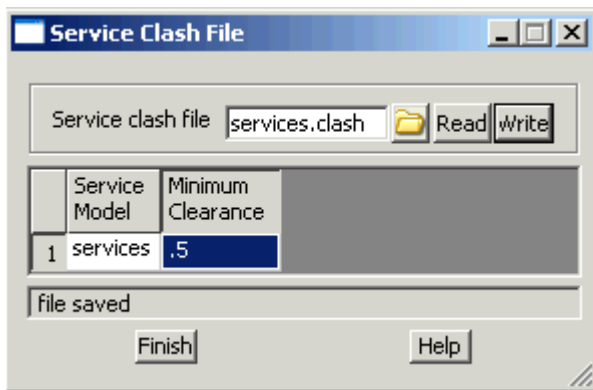

Settings->Corridor and then set the **Width left** and **Width Right** to the desired clearance. If the service can be seen then it is within the tolerance. 11 is used in this example only so that you can see the service on the other side of the road.

Use the **Next** and **Prev** button to switch drainage strings.

To obtain a report of all strings inside or crossing the drainage string profiled, select the **View** menu button then **Utilities->Report**

The service clash model list is entered on the **Global-Utilities Model** field.

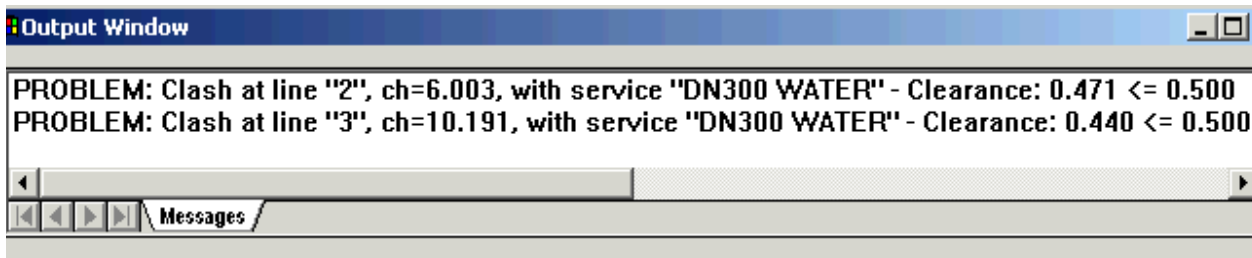

To create a list enter a list name, select the folder icon and then select edit.

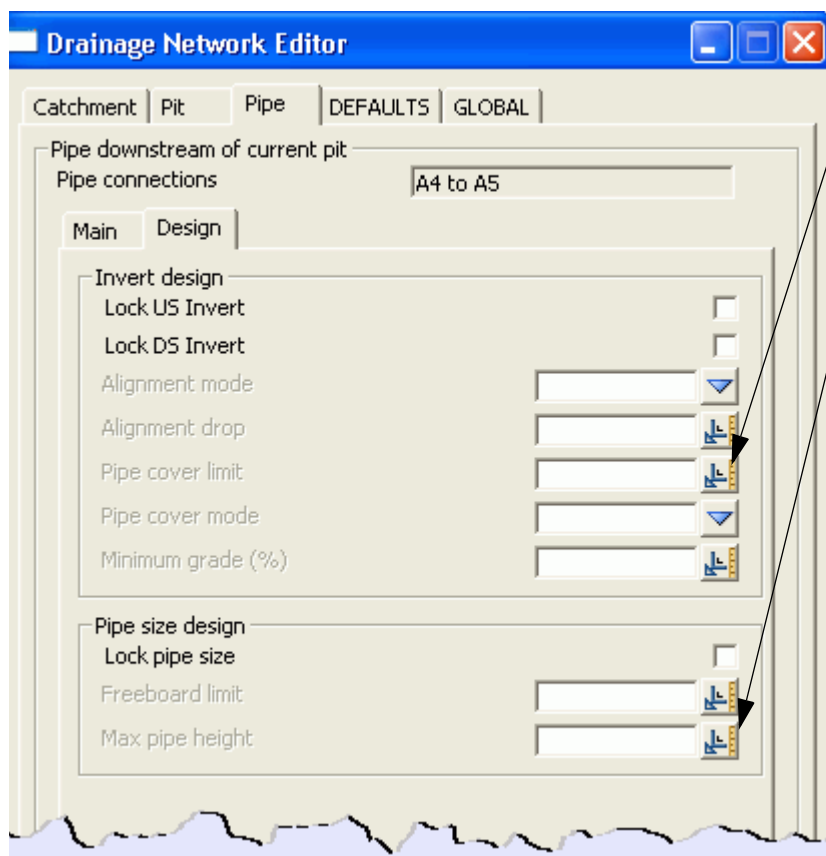

In the **Service model** column **RB** to select the model. Enter **Minimum Clearance** for the services in this model. If different clearances are required for different services then place the services in different model. Warnings will be issued at design time. Cover levels or fixed inverts can be used to avoid the services.

Service clashes are listed in the output when the **Set pipe inverts** is selected on the **Drainage Network Editor**. If the output window is not visible then from the main menu select

Window->Output Window

and make sure it is selected.

The most common method to avoid the clash is to increase the **Pipe cover limit** for this pipe segment so that the pipe is pushed down. If the clash problem is above the pipe then the **Max pipe height** may be used and multiple pipes are selected.

This method is preferred over locking the inverts as this leaves more flexibility for aligning the inverts.

Once the invert levels have been reset the output window will indicate the final clearance.

After a pipe design run details of the service clash data will again be listed in the output window.

Drainage Design in 12d Drainage Design

12d has a sophisticated rational method hydrology and hydraulic grade line pipe design engine. In addition it has the capability to export this data to several other popular drainage packages. Regardless of the design method selected the drainage network in 12d is updated from the design so that drainage plans, long sections and manhole schedules can be quickly produced.

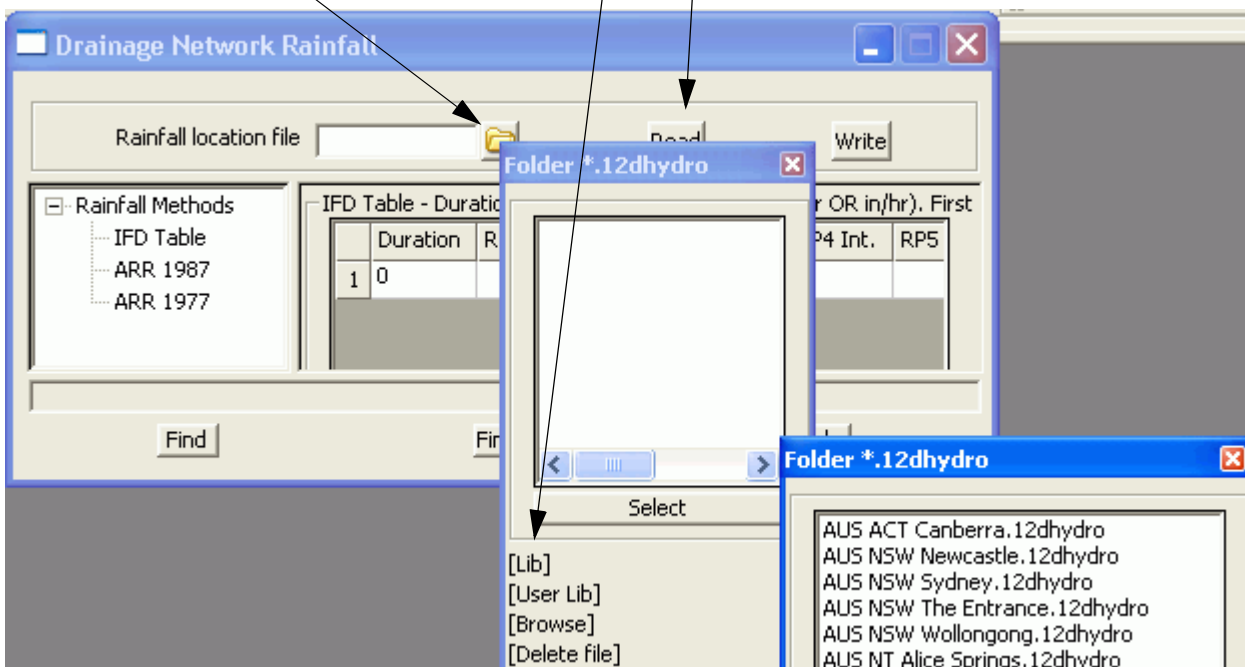

12d Rational Method Hydrology - Drainage Rainfall Editor

The **Drainage Rainfall Editor** is used to input rainfall IFD data using several methods. The data is stored in Meteorology files (each file is for a specific location) that can be shared between 12d projects. The data is edited using an editor similar to those used for the plot parameter files (ppf). Seven methods for entering/calculating the rainfall intensities are shown in the panel below. From the main menu select,

Design->Drainage-Sewer->Rainfall Editor

Data is entered using one (or more if desired) input methods and then saved by entering a **Meteorology file** name and selecting **Write**. The standard 12d system file search paths are used (project folder, user library folder and then library folder).

Select the folder icon and then walk right on the **Lib** item to display a list of sample files. Select a file the select **Read**. **YOU MUST SELECT THE READ BUTTON!**

IFD Tables

IFD tables are often available from meteorological services. The table input format follows. The first row is used to define up to 9 return periods and the following rows list the rainfall intensities for the duration entered in the first column.

Hint: to increase the size of the grid control select another method, ARR 1987 for example, and then select IFD table again.

Drainage Network Rainfall

Australian Rainfall and Runoff 1977 Method

The seven coefficients for each return period from ARR 1977 are entered in this table.

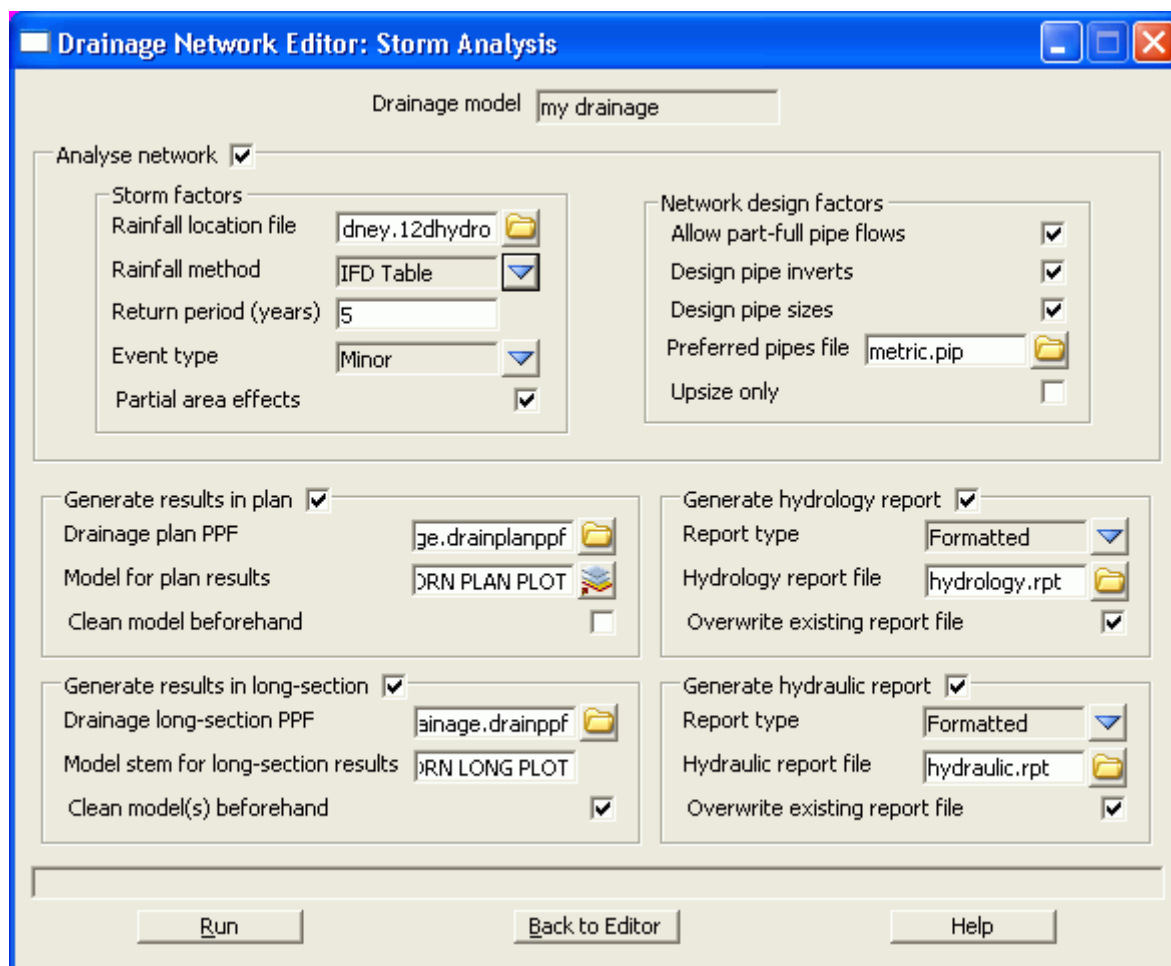

Drainage Network Design

The **Storm Analysis** button on the **Network Editor** executes the 12d drainage design, plots the drainage long section and plan annotation and prepares the hydrology and hydraulic design tables.

From the **Drainage Network Editor** select **Storm Analysis**. The following design panel will appear.

In general the **Analyse network** is always selected. If you only want to plot or create the reports then remove the tick.

Storm Factors

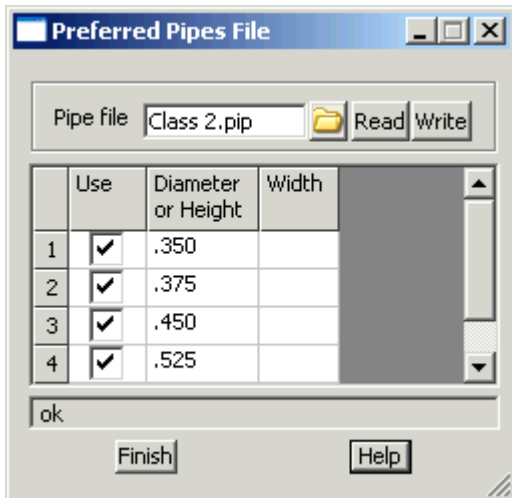

Select the folder icon on the **Rainfall location file** and then walk right on the **Lib** line to select one of the rainfall files in the 12d library. If the file has only one type of rainfall definition then the **Rainfall method** field will be completed. Otherwise select the **Rainfall method** desired. The valid **Return period** will depend of the method selected but you cannot extrapolate beyond your data.

Event type determines which set of design values (**minor or major**) will be used for this run. Enable the 12d rational method engine partial area calculations by selecting the **Partial area effects** box.

Network Design Factors

Selecting Pipe Sizes

These values control the values to be designed in the run. If **Design pipe sizes** is selected then a files containing the available pipe sizes must be supplied. The pipe sizes in this file are in the **Units** specified in the drainage network editor. To create a new file, enter the file name and then select the folder icon followed by the **Edit** line. The following panel will appear.

The diameters/heights are required and the width is optional to specify a box culvert.

YOU MUST SELECT THE WRITE BUTTON!

The **Upsize only** selection will stop pipes in the system from being reduced in the design. Regardless of this selection, the 12d design engine will not allow a smaller pipe to be selected in the downstream direction.

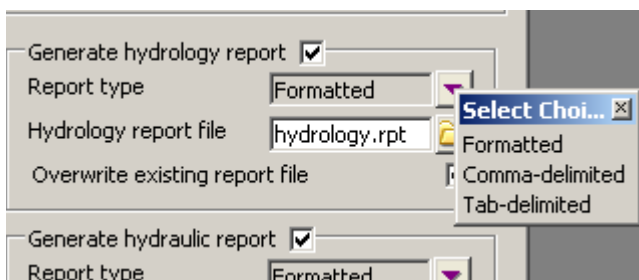

Generate Results in Plan

This selection automatically runs the drainage plot annotation function. A **Drainage plan ppf** must be entered and samples are supplied in the 12d library. A **Model for plan results** is required if this option is selected. The **Clean model before hand** tick box forces the model to be cleaned before the labels are created. When not selected a “Smart clean” is performed.

Generate Results in Long Section

This selection automatically runs the drainage long section plotter. A **Drainage long section ppf** is required and examples are found in the 12d library. A **Model stem for long section results** is required if this option is selected. In almost all cases the **Clean model before hand** tick box should be selected.

Generate hydrology report

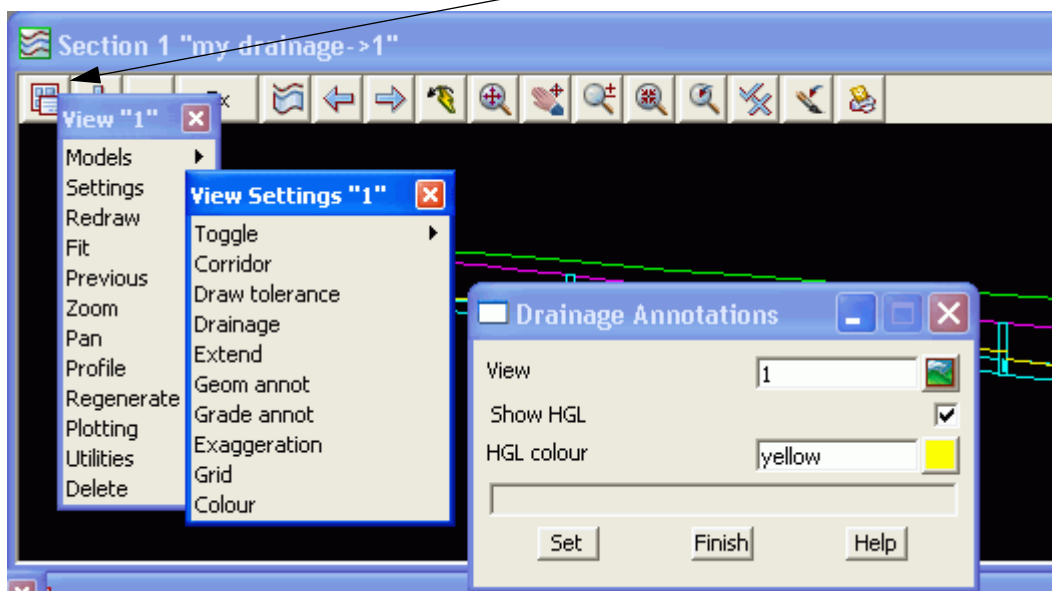

The **hydrology report** may be formatted for inserting into a 12d model/text editor (formatted) or spreadsheet (comma or tab delimited). In almost all cases **Overwrite existing report file** will be selected.

The Run Button and HGL data on the Section View

When the **Run** button is selected the discharges are calculated, the HGL check is performed and the pipes sizes and inverts are designed (if selected). The plan and long section drawings will also be updated with

the new data (if selected).

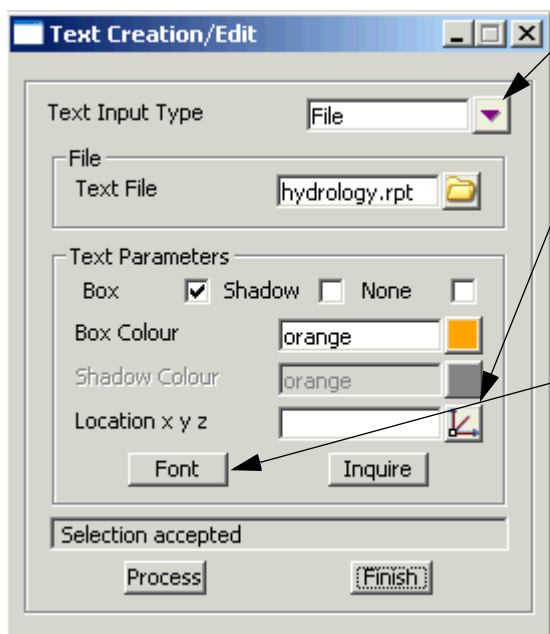

The HGL values will also be available on the 12d section views when profiling the drainage strings. The colour of the HGL line may be changed via the view's menu button then **Settings->Drainage**.

Importing Text into a 12d model

Formatted text may be inserted into a 12d model by selecting

Drafting->Text and Tables->Create edit paragraph text

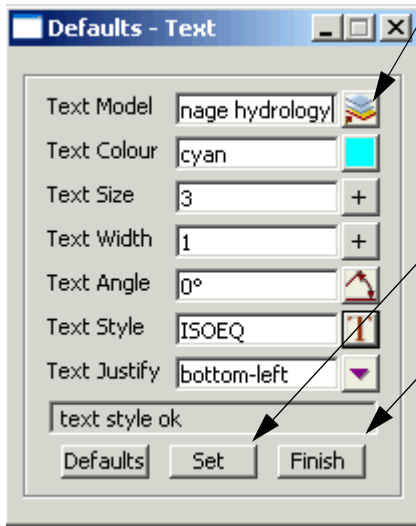

Change to **File**.

Select the folder icon and then pick the formatted text file. It will be displayed then select **Set**.

Next select the location in plan for the text.

The font selected must be a fixed space font or the data will not align properly.

Select the **Font** to display the following panel.

Enter a **Text Model** for the report.

The **Text Style** must be a fixed space font.

Select **Set** then **Finish**.

Now add the **Text Model** onto the

Generate hydraulic report

The **hydraulic report** may be formatted for inserting into a 12d model/text editor (formatted) or spreadsheet (comma or tab delimited). In almost all cases **Overwrite existing report file** will be selected.

If you want both the hydrology and hydraulic report in the same file, enter the same file name in both file fields but turn of the **Overwrite existing report file** for the hydraulic report.

Design Results

Results from the design runs are shown in several forms:

1. Hydrology and hydraulic reports
2. **Drainage plan annotations**
3. **Drainage longsections**
4. Hydraulic Grade line on the Section view
5. Output window data - Service/utility clashes

Samples of the hydrology and hydraulics report are shown below.

Drainage Data Input and Output to Spreadsheets

Spreadsheets are an effective method to manage the numerous variables urban drainage designers create in the modelling process. Spreadsheet data can be transferred to and from 12d in tab delimited files and stored within 12d as “user definable attributes”. These attributes are linked to the pit and pipes within a network. Drainage long section plots can display the pipe attributes in the “arrows” data area and pit attributes in the bubbles area. Drainage plan drawing can also show these pit and pipe attributes.

Drainage strings will be created if they do not exist in the model but manholes cannot be added to existing strings.

Spreadsheet to 12d update and create

Spreadsheet options

12d to spreadsheet transfers

This interface is accessed the **Import/Export** button on the Drainage **Network Editor**.

Spreadsheet to 12d transfers

This item is accessed from the **Import/Export** button on the **Drainage Network Editor**.

The following panel will appear.

Select **Import**

Select the **Spreadsheet clipboard** format.

The file field is ignored.

This is ignored on spreadsheet imports.

Select **Run** to update the drainage model.

Tab delimited, “12d drainage spreadsheet” format or “from to” format data must be on the clipboard in order to update a 12d drainage model or create a new model. These format are described below.

Updating an Existing Model

The data usually is generated by 12d using the **Export** option, pasted into a spreadsheet and then copied back to the clipboard so that 12d can be updated.

When 12d exports the drainage model to a spreadsheet it includes a column for the unique string identifier and a unique manhole identifier (unique to the drainage model not the 12d project). The names of the strings and manholes may be changed via the spreadsheet if these columns are present at import time.

If the manhole id column is not present, 12d will search the drainage model for a matching manhole name. When the manhole is a junction between drainage lines, only the trunk line will be the data updated.

Creating a New Model

It is possible to create a new string or an entire drainage network using this format. However, manholes cannot be added to an existing string. The entire drainage string must be created at once. Two formats are available, the “from-to manhole” format and the “12d drainage spreadsheet” format.

At present the network editor must select a drainage string to become active. Therefore, if you are not

adding strings to a network, you will have to create a drainage network with one “dummy” manhole. Select this one “dummy” manhole to activate the editor. After importing the data and the new drainage lines are created the “dummy” manhole may be deleted.

12d drainage spreadsheet Format

The top left cell in the clipboard data must be the text “12d” to specify this format. The minimum amount of data required to create a new string is the string name, manhole name, x and y coordinates. You can add as much additional data as you have available. This would include pipe diameters inverts etc. The manholes must be listed from upstream to downstream order. If the string is to join a trunk line, the junction manhole must be included for both the tributary and the trunk line.

An example file exists called **new_network.txt** is supplied in the library. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Set the **I/O Action** to **Import** and select **Run**. The new drainage lines will exist in the model currently being edited.

From-to Manhole Format

The top left cell in the clipboard data must be the text “from to” to specify this format. The minimum amount of data required to create a new string is the upstream pit name (*pit name), the downstream pit name (*ds pit name) and the x(x location) and y(y location) coordinates of the upstream pit. If the string is to join a trunk line, the junction manhole must be included for both the tributary and the trunk line.

An optional column for the manhole cover elev (cover elev) may be specified. Once the network has been created additional pipe and manhole data may be added using the “12d drainage spreadsheet” format described above.

An example file exists called **new_from_to_network.txt** is supplied in the library. It is shown below. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Enter a new model name in the **Drainage model** field and select paste. The new drainage model will now exist.

from to	pit	pit	pit	pit
*pit name	*ds pit name	x location	y location	cover elev

“12d drainage spreadsheet” Format

Each column of data is used for a 12d drainage variable or a user defined attribute. Each row represents a manhole and the downstream pipe (controlled by the direction of flow variable) within the drainage network. A sample is shown below.

12d	pit	pit	pit	pit	pit	pit
*string Name	*pit name	pit type	pit low ch invert	pit high ch invert	pit id	string id
text	text	text	real	real	integer	integer
E	E/1	SA2	28.108	28.108	1	67389
E	A/3	SA2	27.7559	27.7559	2	67389
D	D/1	SA2	27.3961	27.3961	3	68100

Duplicate Definitions

Strings Variables such as “direction” are may be defined for numerous manholes on the same string. Searching in a top down direction through the file, the last definition found for the string will be set.

Invert levels may be set via pipe data or pit data or combined. It is recommended that the user only use one method and not combine them. Both are exported so delete the ones you are not going to use. The variables are processed from left to right, so if duplicate definitions of an invert level or found the right most data will be set.

The format definition

- 1.Row1, column 1 must contain either “12d”, or “from to”. Therefore, the first column must be a 12d drainage variable (cannot be a user defined attribute).
- 2.Row 1. The text <pit> at the top of the column indicates the column contains a user defined pit attribute and similarly <pipe> indicates a user defined pipe attribute.
- 3.Row 2. This row contains the names of the 12d drainage variable names and the pit/pipe attributes. All names are case sensitive so be careful where you use capital letters. A list of 12d drainage variables is found below.

Names beginning with an asterix (*) will not be processed (except pit/string names when unique identifiers are present in the data). 12d drainage variables names beginning with an asterix indicate that this data was calculated at export time and cannot be read back into 12d (for example, pipe length, pipe grade and deflection angle).

Prefixing an user defined attribute name with “DELETE ” (no quotes, note the space after the DELETE) will cause the attribute to be deleted from all pits/pipes within the model.

- 4.Row 3. The text in this row define the type of attribute to be stored within 12d. The only valid choices are;

integer
real
text

If you want to change an attribute type you must delete the attribute and create it again. If you simply change the attribute type in the third row then that attribute will not be updated.

5. Blank lines may be inserted as desired.
6. You are not required to fill in all of the cells in the spreadsheets. Blank cells are ignored (you must use a space to remove all data from text attributes (the space will not be stored).
7. Pipe names are included in the data so that they can be changed but they are **not** used to identify the pipe. Pipe data will always be assigned to the pipe following the pit in the direction of **ascending** chainage. If flow directions is ascending then the pipe data will be for the downstream pipe. If the flow direction is descending then the pipe data will apply to the upstream pipe.

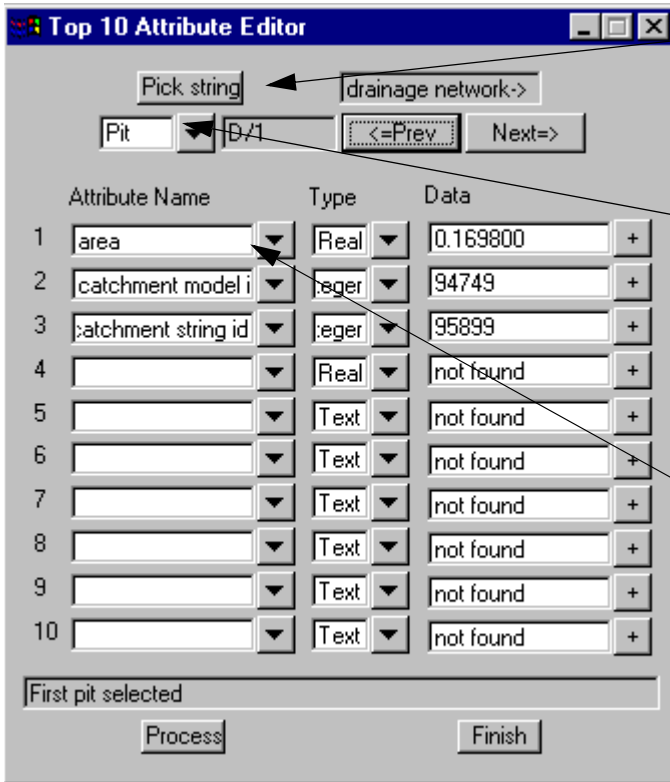

12d Drainage Variable Names

Manhole Variables	Pipe Variables	String Variables
*string Name	pipe name	direction
*pit name	pipe type	fs tin
pit type	low ch invert	ns tin
pit diameter	high ch invert	string id
pit low ch invert	diameter	
pit high ch invert	*length	
pit road chainage	*grade	
pit road name	low hgl	
*pit angle	high hgl	
*pit drop	pit hgl	
*pit depth	flow	
*pit chainage	velocity	
x location		
y location		
cover elev		
*fs elev		
*ns elev		
pit id		

Reviewing, Changing and Creating User Defined Attributes

The catchment data is stored within 12d as user defined attributes. These attributes are automatically created by 12d when required but you are free to change them or add more as desired. The attributes may be exported to a spreadsheet and edited and then imported back into 12d. To work with the user defined attributes within 12d select

Design=>Drainage-Sewer=>More=>Top 10 Attribute Editor.

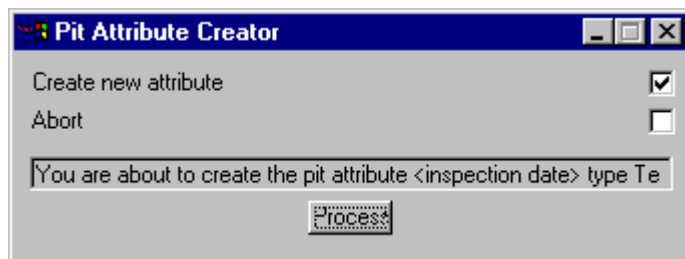

First Select **Pick** to select the string that contains the user attributes (the drainage string). The strings will be highlighted in white when they are selected.

All catchment data is store with the manholes in drainage strings. To access the manhole attributes, select the drop down icon and then select **manhole**. A circle will be drawn around the manhole selected. **Next** and **Prev** will now move you from manhole to manhole.

Select the drop down icon and then select the **Attribute Name** from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in.

They may not be defined for the manhole you are editing. **Not found** will be displayed in the **Data** field if the manhole does not have that attribute defined.

To change the value for the attribute enter the new value in the **data** field. If the attribute does not exist, deleting the **not found** text and adding data will create it. The message on the right will be displayed whenever you are creating a new attribute.

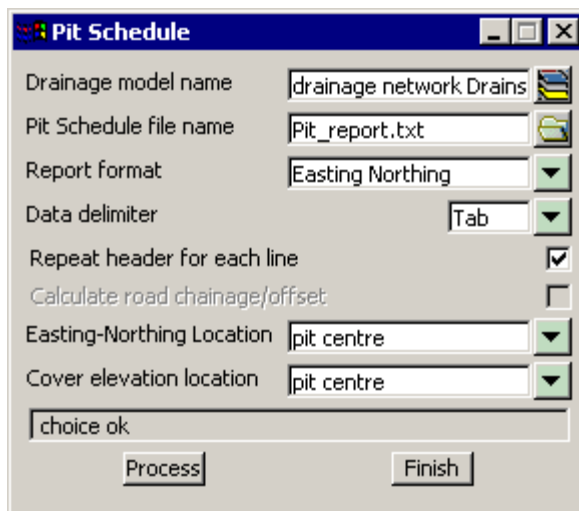

Manhole/Pit Schedules

Manhole/pit schedules or construction tables are generated in tab or space delimited formats.

This panel is accessed from the menu selection

Design => Drainage => More Drainage => Pit schedule

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model name <i>model containing the drainage strings</i>	input box	drainage network	
Pit schedule file name <i>file to be created</i>	input box	pit report	
Report Format <i>file format</i>	choice box	Road change...,Easting...	
Data delimiter <i>tab delimiters are best for spreadsheets and space for some text editors</i>	choice box	Tab, Space	
Repeat header for each line <i>when selected, the column headings will be printed each drainage line</i>	tick box	selected	
Calculate road chainage/offset <i>only used for road chainage-offset format. When selected, the road chainages and offset calculation panel will be displayed so that the this data can be updated before the report is generated. (see below)</i>	tick box	selected	
Easting Northing Location <i>easting northing data can be from the manhole centre or the x,y location on the road design string that the manhole has been linked to</i>	choice box	pit centre, road design string	
Cover elevation location <i>the cover level elevation can be from the manhole centre or the elevation on the road design string that the manhole has been linked to (if a link has been made then these values should be the same). Note that the road design string data is NOT calculated at this time. These are the vaules calculated from</i>	choice box	pit centre, road design string	

the Drainage Misc Utilities or the last drainage data export.

Process button

Create the pit report

Finish button

remove the panel from the screen

Notes:

The columns of data may be separated by spaces or a tab. (tab is used for spreadsheet transfers). The internal width and length data are retrieved from the **drainage.4d** file for the pit type specified. If you want a longer description for the pit then the type used inside 12d this can also be entered in the drainage.4d file. The remarks for each pit are entered as user defined pit attribute named **remarks** and may be set using the attribute editor (on the drainage menu) or via a spreadsheet.

Notes

The Set pit details must be run at least once to before printing the report. If the pits are moved or the designed strings changed then this option must re rerun.

The Road Chainage and Offset Pit Schedules use two user defined attributes for each pit. The first is **ctrl string** which identifies the string that the pit will be offset from and the second is **ctrl model** which contains the model name for the control string. These may be manually created/modified using a spreadsheet or the attribute editor.

The easting northing data obtained for the **road design string** option is obtained by dropping the manhole centre perpendicular onto the selected road design string. This data is stored as pit attributes **setout x** and **setout y**. It is calculated when the manhole cover levels are recalculated (drainage misc utilities and during drainage export (recalc level option must not be turned off)).

The cover elevation data obtained for the **road design string** option is obtained by dropping the manhole centre perpendicular onto the selected road design string and obtaining the elevation at this point. This data is stored as pit attribute **level z**. It is calculated when the manhole cover levels are recalculated (drainage misc utilities and during drainage export (recalc level option must not be turned off)).

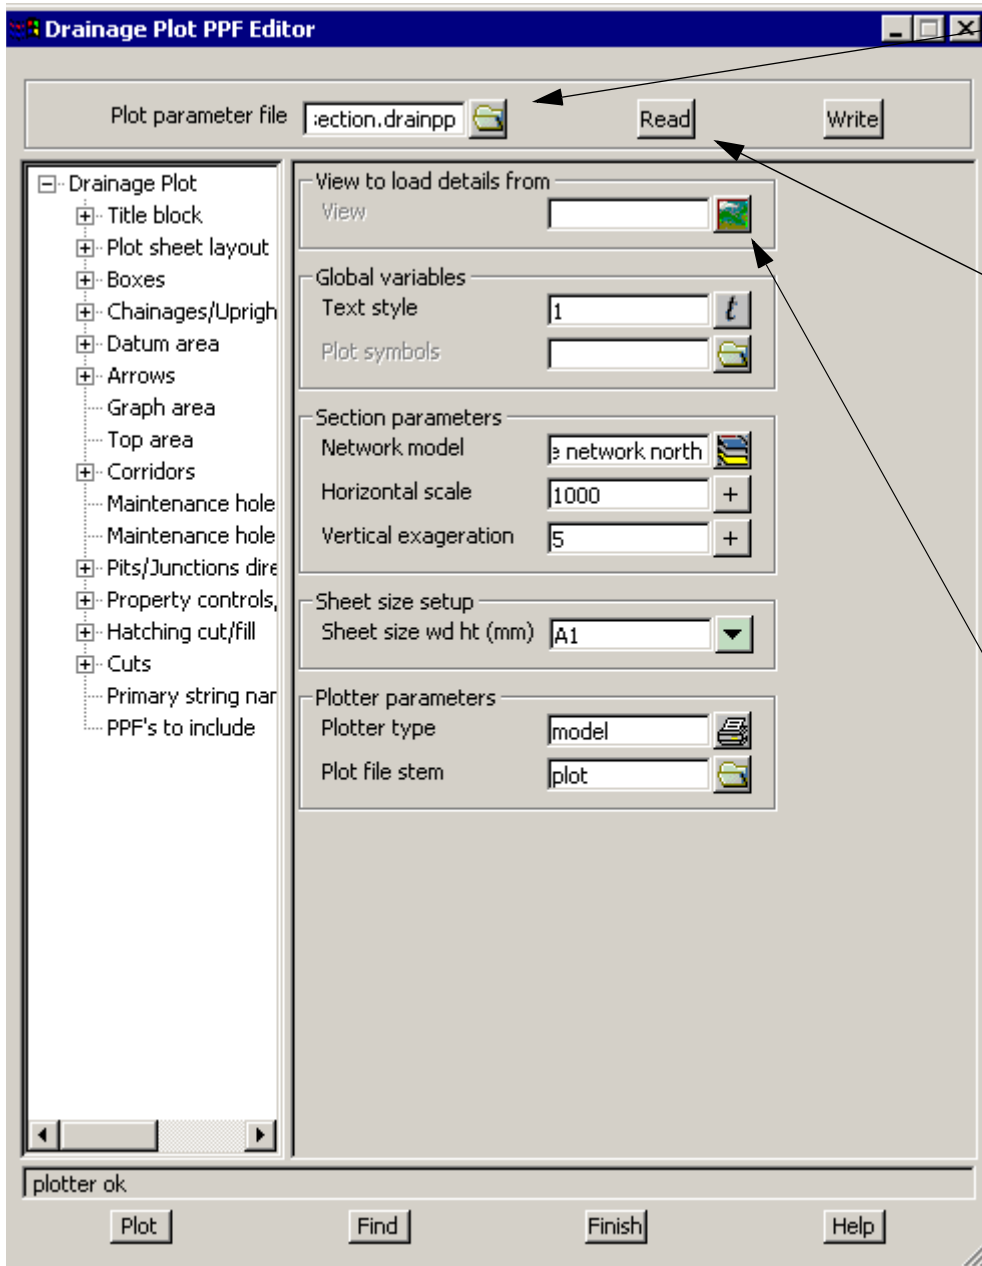

Long Section Plotting

Detailed description of the 12d drainage long section plotting may be found in the 12d Reference manual. The long section plots are customised using the drainage plot parameter files (drainppf). Title blocks, user defined text may be added and then plotted directly or to various file formats (dwg, dgn etc.). From the main menu

Design=>Drainage-Sewer=>Plots=>Longsections

See Also

manhole Schedules to set road chainage and name data

To access the drainppf files supplied select the icon and then walk right on **Lib** to select this drainppf file.

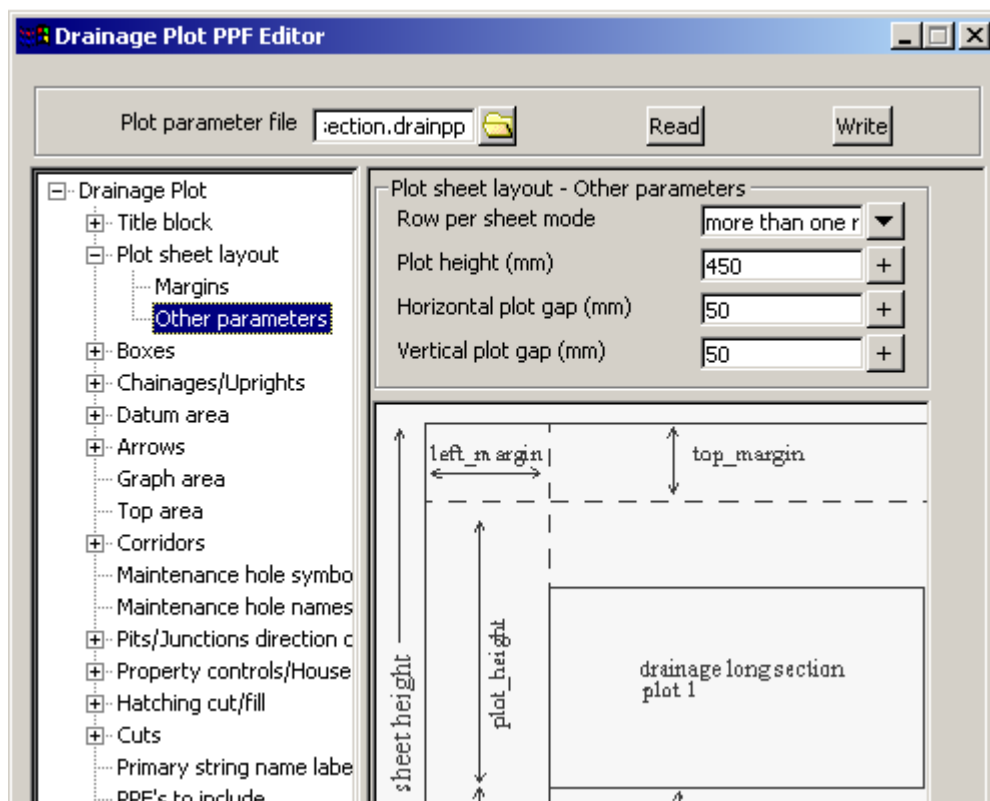

Select **Read**

Enter a new name for this drawing and select **Write**. This will save the setting we are about to make should you want to replot this long section.

This section view determines the additional models (such as services) to show plot. These are referred to as corridor models. The vertical exaggeration is also obtained from this view.

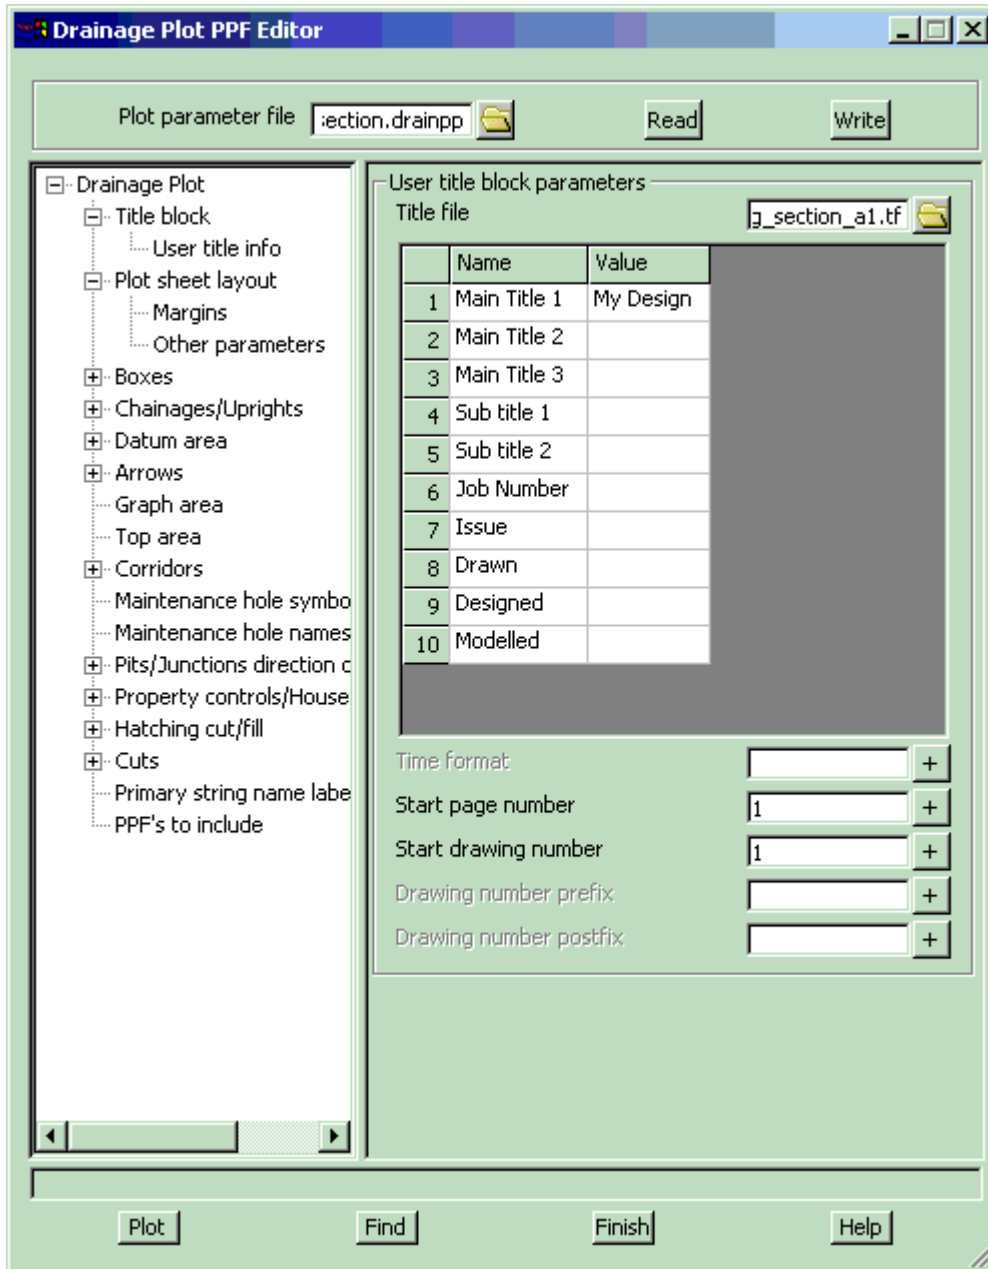

The **network model** field will be completed with the model of the string being profiled. If this is not your drainage network model then select it now.

When **Plotter Type** is set to model then **plot file stem** is the model name prefix for plots that will be created. The first sheet of plots will be in model **plot1**, the second in **plot2** etc.

The **plot height** determines how much room is left vertically for the actual plot. This specifies the total height of the plot. 12d then constructs the box area and arrow area on the bottom and then arrow area on the top. The amount left over is used for the long section itself.

To stop datum breaks from occurring increase this height, increase your plot scale or decrease your vertical exaggeration. If there is too much white space in the graph area then reduce this value.

The **+Drainage plot+title block+User title info** allow you to enter the text for the title block. The list displayed is retrieve from the **title file** selected above. Enter the data for the plot and then select **Write** to save the changed to the local drainppf file you entered earlier.

Select **Plot** and the plots will be send to the **plot file stem** entered. These models may be added (one at a time) to a plan view to inspect them before plotting to paper or exporting to other drawing packages.

If changes are to be made and then plotted again you must delete the drawings in the model. These models may be cleaned out using

Models->Clean

The asterisk may follow the plot file stem to clean all of the models at once. You will be shown the model list before they are cleaned.

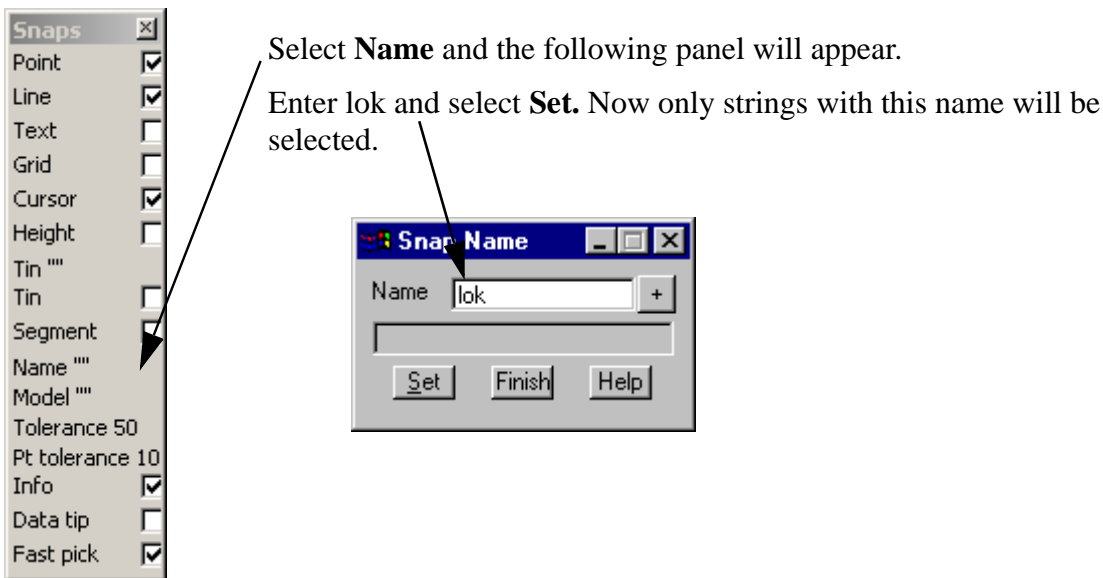

Working with Kerb/Lip Strings

The reference point for kerb inlet manholes is usually on the kerb lip string or a fixed distance off the string. The rest of the strings only complicate the picture so we will take copies of the kerb strings to be placed in another model. Isolating the kerb strings into a separate model and joining them together is the recommended way to work with them. This may take a few minutes but sometimes you have even less time than that. So first lets look at how to pick kerb strings quickly.

Picking kerb strings - name snap

Strings generated by 12d have specific names attached to them. The lip string is often called "lok". Therefore, if we could restrict our string selection to those strings named "lok" it would make placing the manholes very efficient. We are going to do this with the **Name snap**.

There are 3 types off snap tool bars available. Standard, vertical and horizontal. To obtain the standard snaps toolbar select, **Utilities=>Snaps=>Snaps** and the following snap toolbar will appear.

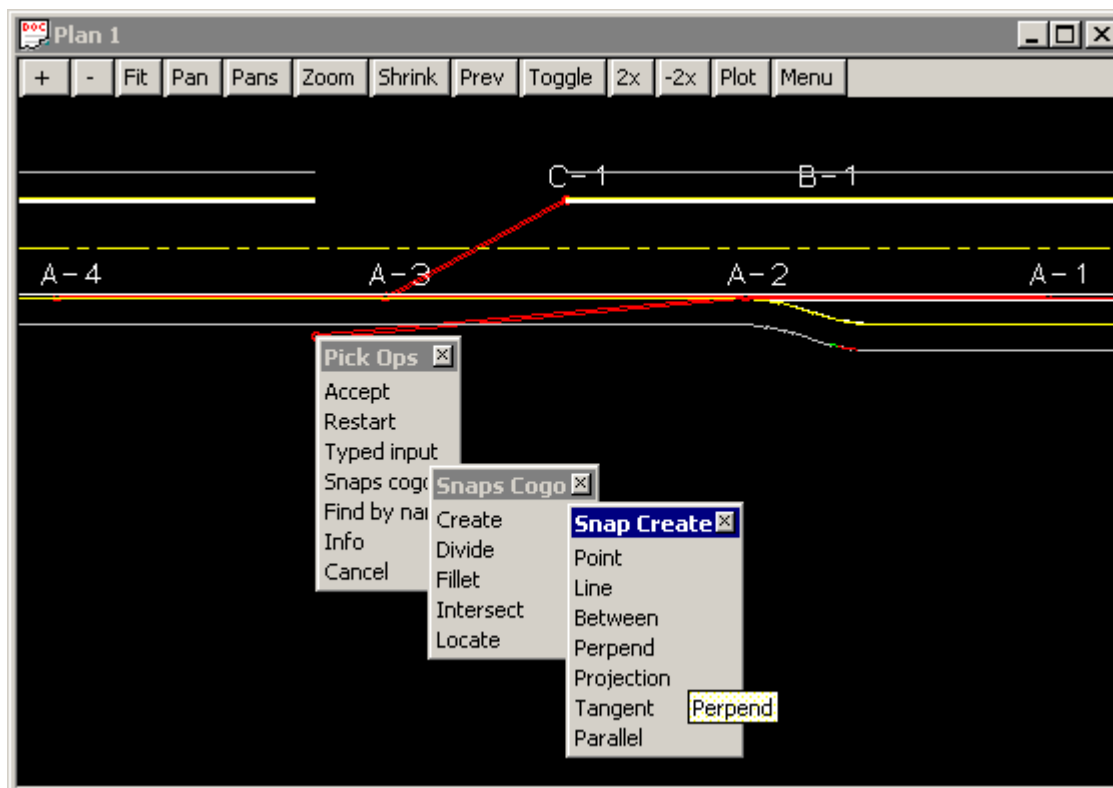

Leave the panel up to remind your erase the lok entry and select **Set** again so that you will once again be able to pick any string.

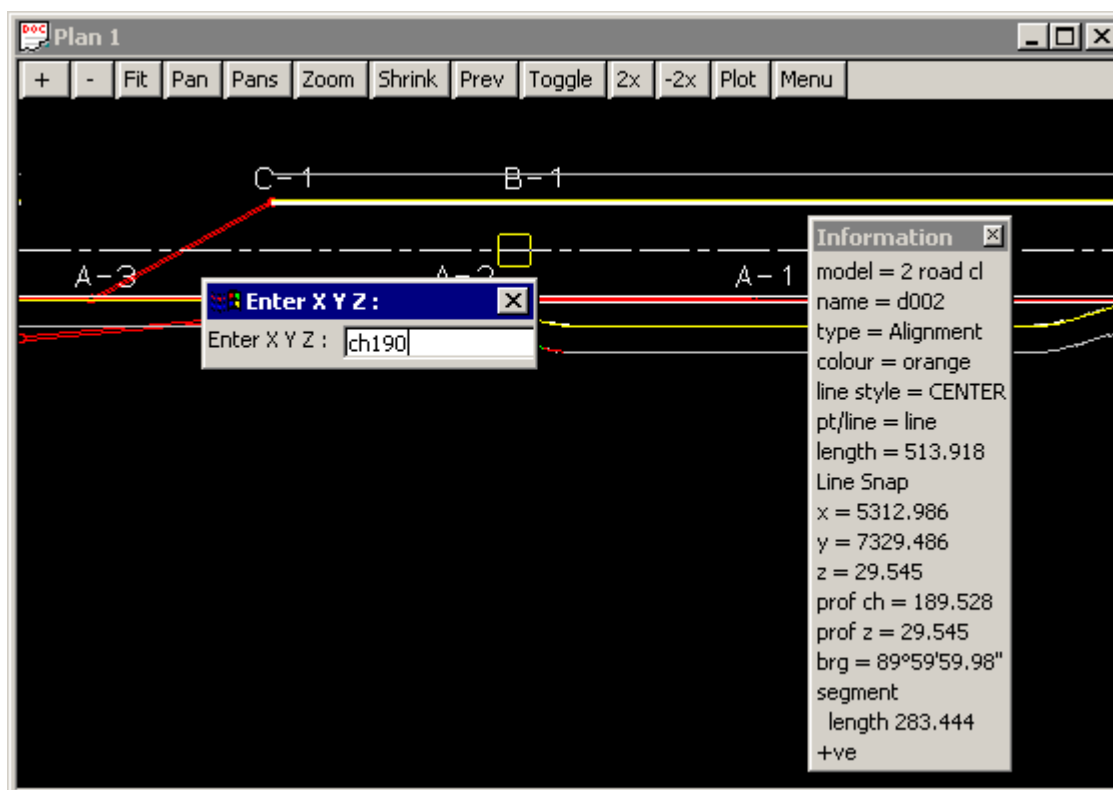

Placing a manhole at a Specific Control String Chainage

When appending or moving drainage manholes, the following steps will place the manhole at a specific chainage along the control string.

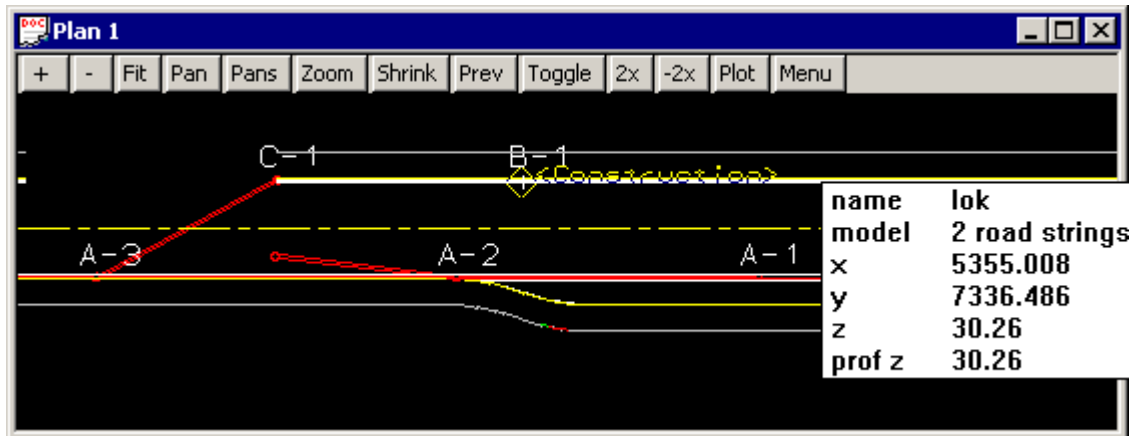

1. **RB** and then select **Snaps cog=>Create=>Perpend** from the menu. Messages indicating what to be done next are given in the bottom left corner of the 12d window.

2. **LB** select but **do not** accept the road centre line (control string).
3. To place the manhole across from chainage 2100 Type ch2100 then press enter.

4. **MB** accept the inserted point. This identifies the point on the control string. Next
5. **LB** select the lip line then **MB** accept. The construction point will be displayed on the lip line

6. **MB** accept the construction point to place the manhole.

Placing a manhole at a Specific Distance/Offset along the kerb string

When appending drainage manholes, the following steps will place the manhole at a specified distance along a string and if desired an offset.

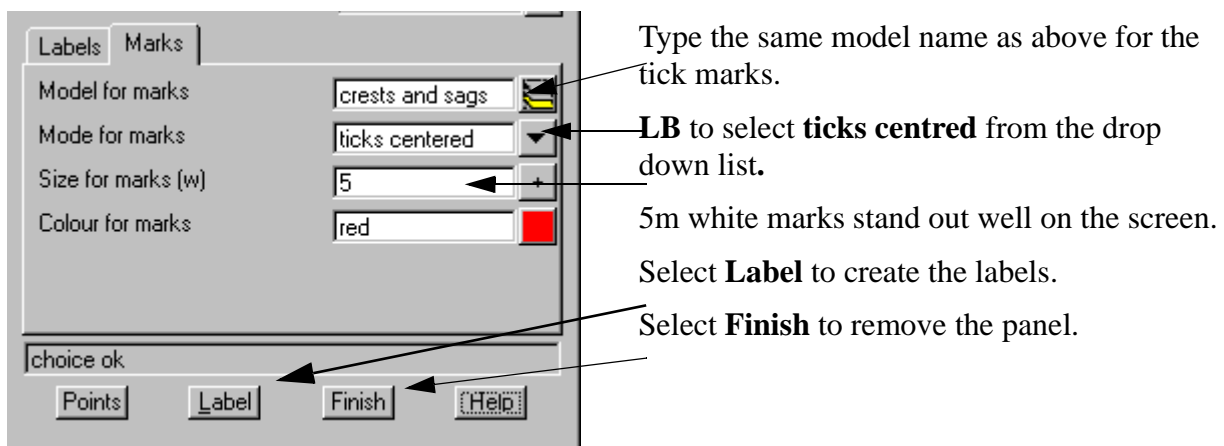

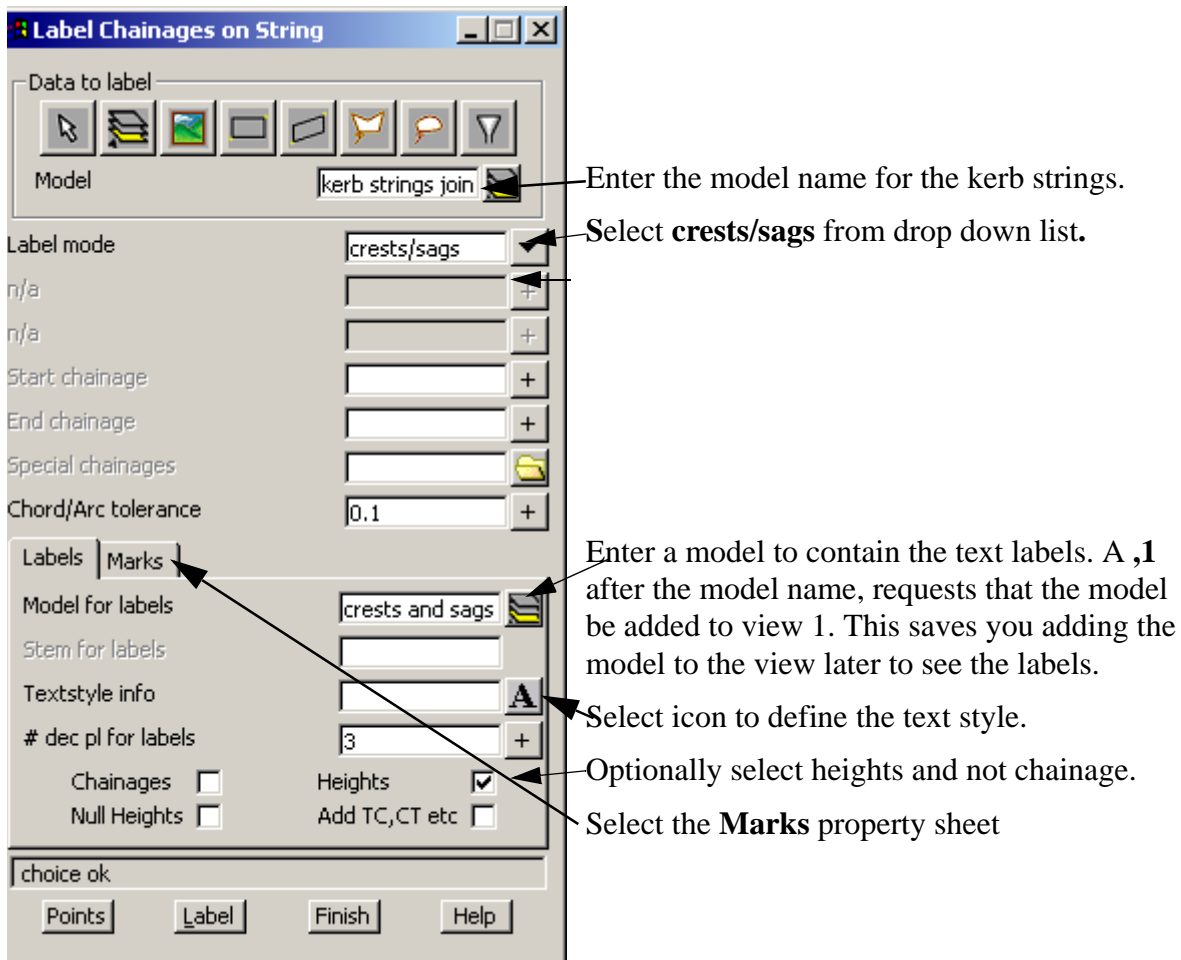

1. **RB** and then select Snaps cogo=>Locate=>Offset from the menu. Messages indicating what to be done next are given in the bottom left corner of the 12d window.
2. When you select the string to measure the distance along, do not click but rather drag in the direction you want to offset. Next **MB** accept
3. **LB** select then **MB** accept the control point to measure the distance from. (If this point is not on the string selected in step 2 the point will be dropped perpendicularly onto that string).
4. Type the distance along the string then press Enter (a negative value would go in the opposite direction to the drag in step 2).
5. Type the offset distance from the string then press Enter (positive is defined using a right hand rule method from the direction in step 2).
6. **MB** accept the construction point to place the manhole.

Locating Crests and Sag Points

This step will place tick marks at the crest and sag points of your kerb strings. It is an optional step but it will help ensure that a drainage manhole is always placed at SAG manhole locations.

If your road designer has given you kerb inverts strings split into numerous sections, use the “head to tail” feature described in section 4.2 above before using this section. The crests and sag locations along the design string can be identified using the selection

Strings =>Label => Chainages

To get a clear picture of what the kerbs look like in profile lets create a section view and profile the kerb string.

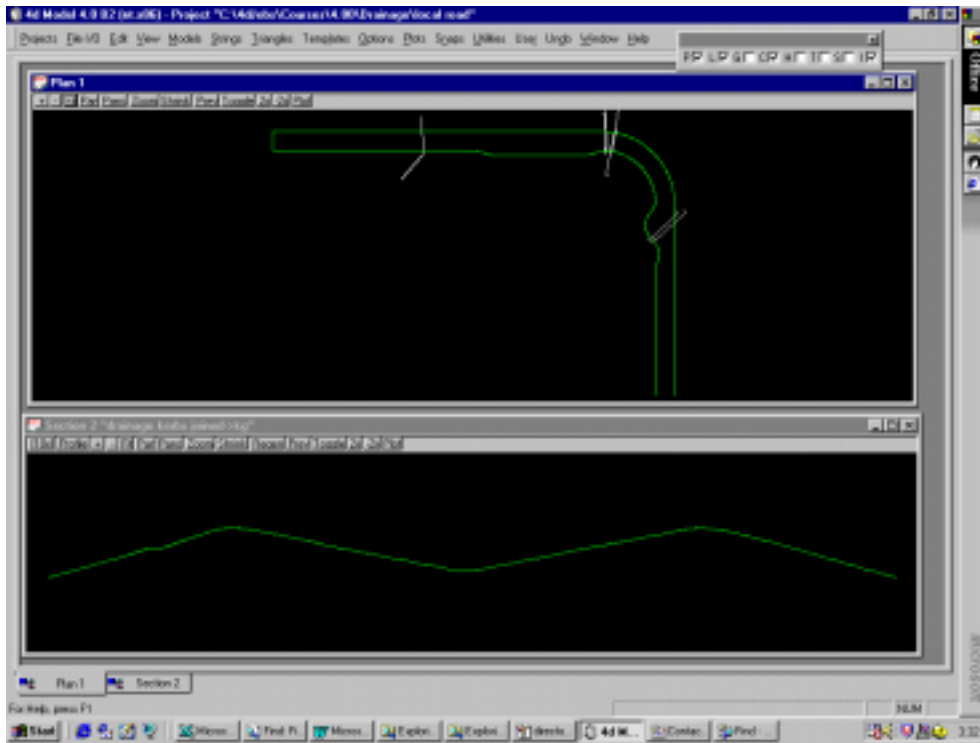

To obtain more working area, hide the **Output Window** (Window=>Output window).

From the main menu select,

View=>New=>Section View

Now Select Profile on the **section view title area** and then pick the kerb string in the plan view. Your screen

should now look like the following.

Place your pointer in the section view and notice how the cross in the plan view indicates your position in plan.

THE END

Advanced Stormwater Design - Introduction

The **Stormwater Design Course Notes** and this manual, the **Advanced Stormwater Design Course**, describe the functions and processes of the 12d drainage module.

The **Stormwater Design Course Notes** contain:

- sset drainage defaults and layout a drainage network,
- suse the powerful 12d drainage network editor to avoid service clashes, grade pipes, align oberts, minimise depth and many other design tools,
- sautomatically assign names to the pit/pipes in the network,
- sdesignate catchment areas and produce catchment plans,
- stransfer data to and from electronic spreadsheets to enable the user to easily review the data and add user defined data to the 12d pipe network. This data may include such data as pipe bedding types and trench width,
- screate pit layout schedules to export to spreadsheets or word processors for final formatting.
- sproduce long section drainage profiles including HGL data, flows, invert levels, service crossings
- screate plan drawings with pipe sizes, flows, manhole symbols, linestyles for pipe sizes, design parameters for manhole and pipes and user defined data
- slocate pits/manholes at exact chainage and offset locations

This manual, the **Advanced Stormwater Design Course**, is intended to describe the more advanced features 12d model drainage and discuss the customisation of the package. This will include

- s drainage trench exvavation volume calculations
- s pipe and manhole quantity calculation
- s customising the drainage.4d file
- sdesign or evaluate the drainage system using 12d Drainage or create input files for the XP SWMM/RAT2000, Micro drainage, Drains and PCdrain drainage design packages,
- sread the output from the drainage design packages (automatic if using 12d Drainage), update the drainage network and store the hydraulic data, such as hgl (hydraulic grade line) levels, peak pipe flows and pipe capacities,
- s pit inlet capacity calculations and over land flow
- s flooded width analysis
- s surcharge volumes at SAG pits
- s and detailed drainage plan labelling

Setup Files and Their Locations

The drainage module consists of the optional 12d Drainage engine, utilities, startup configuration files for RAT2000, XP SWMM and the 12d drainage configuration file (drainage.4d). Demonstration versions of Drains, RAT2000 and PCdrain have been included on the CD along with a copy of the ILSAX hydrology package. Manuals for the ILSAX program may be obtained from the Civil Engineering Department at the University of Technology Sydney.

All setup files have been configured for the training version. However, when you start working on real projects you may want to customise the drainage module. **More - Customising the drainage module**

The **drainage.4d** file contains pipe types (RCP, Class 2 etc.) and example pit inlet capacity tables for RTA (NSW Road and Traffic Authority) standard pits. Detailed pit type descriptions and internal pit dimensions can be included in this file to be inserted into your pit schedules. For PCdrain users there is a routine to read your gully pit file and include these pit types in 12d **More**.

See “The drainage.4d file” on page 2102.

REVIEW THIS DATA CAREFULLY! A detailed description of the pit inlet capacity tables in this file is given in “Pit Inlet Capacities” on page 2102. The **drainage.4d** file may be customised for any additional inlet capacity data you may have.

Starting with a Basic Drainage Network

These course notes assume that you have completed the Stormwater Design Course and that you have experience creating 12d model drainage networks with catchments areas. This course will begin with a completed drainage design found in the directory

\12djobs\courses\7.00\drainage\local road complete

Drainage Volume Calculations

Sample templates are included in the courses section of 12djobs (\12djobs\courses\7.00\drainage\pipe template.tpl). The templates from this template library may be added to your project using

Design=>Templates=>Utilities=>Input.

This routine calculates the excavation volume for all of the drainage strings in a model. Since templates are used for the calculations trench shapes can be customised by depth and over excavation for bedding materials can be included. Net area calculations to exclude pipe area is not supported.

Key points

1. One template for each pipe size (mm)
2. Carefully consider the tin selected.
3. Box culverts should have their own pipe type

A template must exist for each pipe size in the model (pipe size x 1000). For example a 0.3m pipe will require a template to exist named 300. A 0.5ft pipe would require a template named 500. Sample templates are included in the courses section of 12djobs (\12djobs\courses\7.00\drainage). These may be copied to your *.project directory and then added to your project using **Design=>Templates=>Utilities=>Add=>All all to project.**

The templates are run along the strings and the total volumes are reported. Volumes for each strings are given in the report file. An example follows.

```

----- BEGIN APPLY TEMPLATE REPORT -----
apply template to string report -

string      E
tin         design
separation  10.000
left template 375
right template 375
cut volumes and areas are negative
fill volumes and areas are positive

chainage-  -----sectional  information-----  -----intermediate  information----  -----accumulative
information-----
-----cut area --fill area -----cut vol ---fill vol  -cut volume-- -fill volume- -
--balance---

0.000      -1.434    0.000
           -0.771    0.000    0.000    0.000    0.000
0.550      -1.367    0.000
           -14.222   0.000    -0.771    0.000    -0.771
10.000     -1.642    0.000

20.000     -1.416    0.000
           -1.845    0.000    -30.286   0.000    -30.286
21.313     -1.393    0.000
           -0.794    0.000    -32.130   0.000    -32.130
21.863     -1.493    0.000
           -32.924   0.000    -32.924   0.000    -32.924

total cut      -32.924
total fill      0.000
balance        -32.924
ie excess of cut over fill  32.924

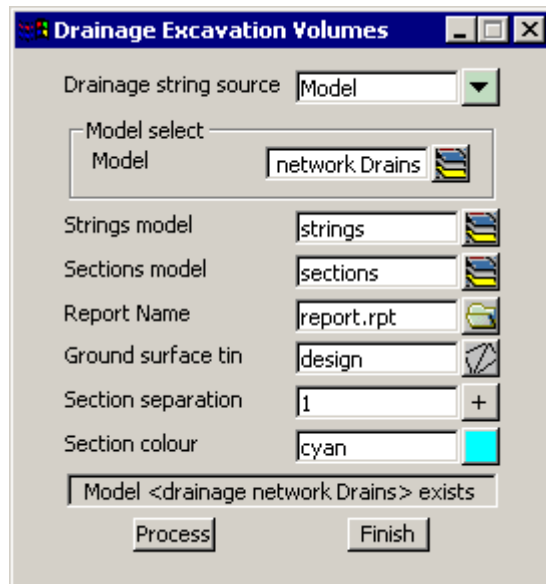

```

If a tin is created from these strings then volumes by depth can be determined using **Design=>Volumes=>Exact=>Tin to tin**

Usage

This panel is accessed from the menu selection

Design => Drainage => Reports => Excavation Quantities

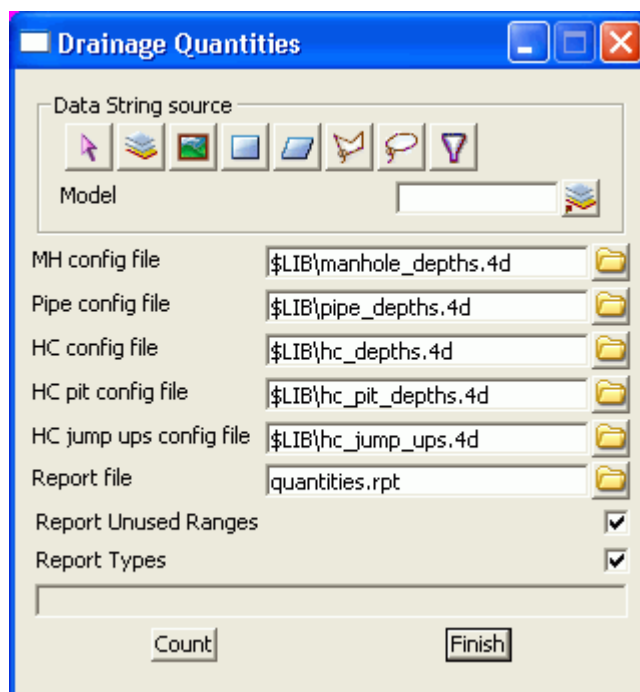

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
drainage string source <i>drainage string selection</i>	choice box	model	View,model,string
drainage model <i>Model to contain all of the pit and pipe network to be worked on.</i>	input box		
Strings model <i>Strings generated from the templates will be stored in this model</i>	model box		
Sections model <i>Sections generated from the templates will be stored in this model</i>	model box		
Report name <i>cut and fill volumes will ne sent to this report</i>	input box		
Ground Surface Tin <i>tins from which the volumes will be calculated</i>	tin box		
Section separation <i>distance between the sections</i>	real box		
Sections colour <i>Sections generated from the templates will be assigned this colour (strings colours are defined in the templates)</i>	colour box		

Network Quantities Report

This panel is accessed from the menu selection

Design => Drainage Sewer => Reports=> Network Quantities

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data String Source	Choice		
---------------------------	--------	--	--

usually the entire model is selected but view is also available for combining models

MH config file	file box		
-----------------------	----------	--	--

This file specifies the types and depth ranges for the manholes. Details of this file are contained below.

Pipe config file	file box		
-------------------------	----------	--	--

This file specifies the types and depth ranges for the pipes. Details of this file are contained below.

HC config file	file box		
-----------------------	----------	--	--

This file specifies the types and depth ranges for the house connections. Details of this file are contained below.

HC pit config file	file box		
---------------------------	----------	--	--

This file specifies the types and depth ranges for the HC pits. Details of this file are contained below.

HC jump ups file	file box		
-------------------------	----------	--	--

This file specifies the types and depth ranges for the house connections jump ups. Details of this file are contained below.

Report file	file box		
--------------------	----------	--	--

a sample report file is given below.

Report unused ranges tick box

*the depth ranges for the manhole/pipe/house connections are defined in the *.4d files. Selecting this option will cause the depth ranges in the file to be printed even if there are no manhole/pipe/house connections in these depth ranges (zero quantity values will be shown).*

Report types tick box

*Selecting this option will cause the manhole/pipe/house connection types used in the model types to be listed (even if quantities are not requested in the *.4d files). Since this is a complete of the type used in the model, the list informs the user what types have not been included in the quantity calculation.*

Count button

executes the option.

Finish button

removes the dialogue from the screen

The *.4d files listed above are contained in the 12d **library** directory. Each line is the file performs a count (count lines). No items are counted twice. Therefore, if an item is counted its type and then a count line is found the wild card is used for the type, the type already counted will not be included in the count.

The format for a count line is three or four values (space delimited) per line. Size is optional.

```
<type (from drainage.4d)> <size> <starting depth> <ending depth>
```

Notes:

All **types** with spaces in the name must be enclosed in quotes The wild card * may be used.

The **size** is optional and if omitted the all sizes will be counted in this group (do not use the * for a wild card).

The **starting depth** and **ending depth** are required for all count lines.

Sample count lines for manholes follow.

```
// sum concrete cover manholes is various ranges

"CONC COVER" 0.0 1.6
"CONC COVER" 1.5 3.0
"CONC COVER" 3.0 999.9 // this is expected to be zero
"CONC COVER" -999.0 0.0 // trap errors

// any that are not Concrete cover will be counted here

* 0.0 1.6
* 1.6 3.0
* 3.0 999.9
```

Manhole Quantities

=====

CONC COVER	0.00	1.60	13	16.506
CONC COVER	1.60	3.00	1	1.510
CONC COVER	3.00	999.9	0	0.000

total length = 18.016

Types Used

CONC COVER

Diameters Used

1.100

Since the **Report unused ranges** tick box was selected, these lines were printed even though there were no manholes in the data ranges.

This data results from selecting the **Report types** tick box.

Sample count lines for pipes follow.

```
// sum class 2 pipes by diameter and for various ranges

// count 375

2 0.375 0.0 2.0
2 0.375 2.0 5.0
2 0.375 5.0 999.

// count 450

2 0.450 0.0 2.0
2 0.450 2.0 5.0
2 0.450 5.0 999.

// count 525

2 0.525 0.0 2.0
2 0.525 2.0 5.0
2 0.525 5.0 999.

// count pipe sizes that were missed

2 * 0.0 2.0
2 * 2.0 5.0
2 * 5.0 999.

// count all other missed pipes

* 0.0 999.
```

Exporting to Drainage Design Software Packages

12d contains most of the data required for your drainage design packages. However, each packages has specific design variables that 12d does not have access too. The design process is intended to export your data from 12d to the design package, design the drainage system and then read the results back into 12d for your long sections.

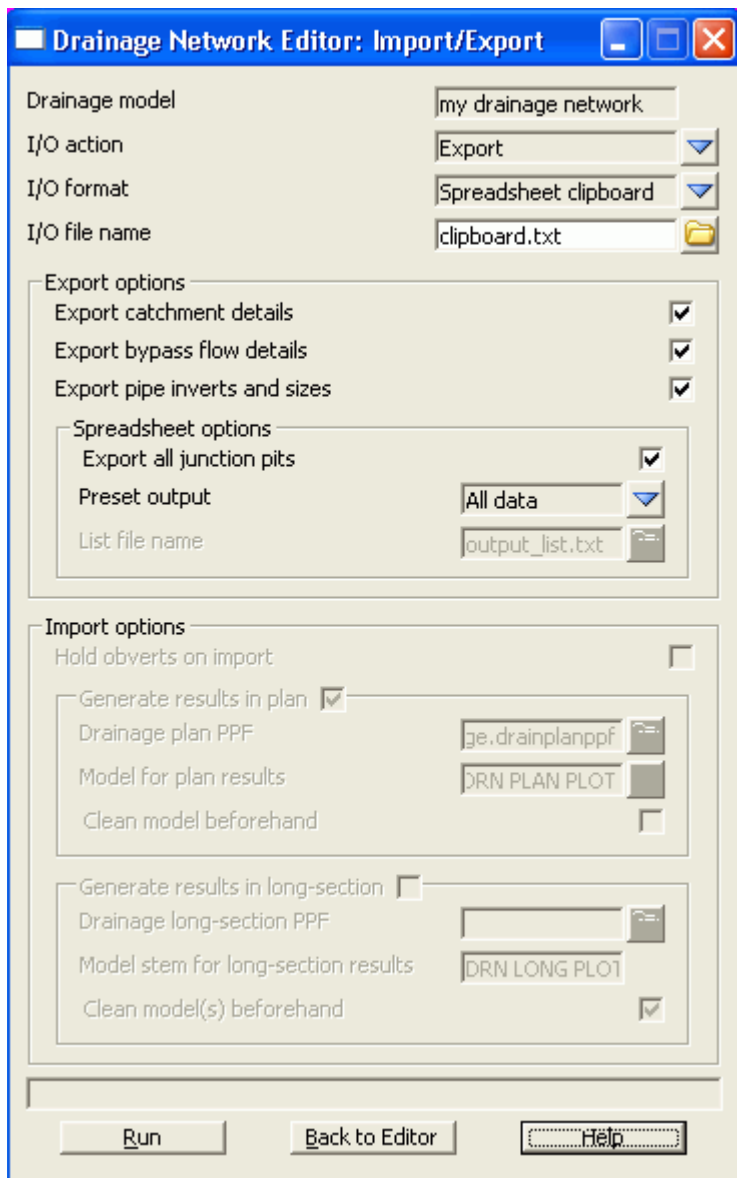

If pits/pipes are to be added/deleted from your network during the design process you are safest to add/delete the pit/pipe to 12d and to your design package separately.

Not recommended and as a poor alternative, you have the option of reading the results back into 12d, adding/deleting the pits/pipes and then exporting the data to a new drainage project in your drainage design software. **As 12d does not have access to all of the data in the design packages this method is not recommended!**

Some of the drainage design programs offer a third option that allows you to import data “on top of” an existing project thereby merging and over writing the existing data. Be sure to contact the drainage software supplier to obtain exact details of how the merging process is performed.

The interface is run by selecting **Import/Export** from the **Drainage Network Editor**

Design->Drainage-Sewer->Network Editor

The **Drainage model** is the model currently being edited. The **I/O action** determines if data is exported or imported and enables/disables many of the fields below.

The **I/O format** selects which external program the 12d is interfacing with. Some programs use the windows clipboard and others use files. If the clipboard is used the data will also be written to a file by 12d in case you need to take the data to another computer.

The **Export options** have slightly different effects depending on the **I/O format** (program) selected above. Therefore they will be discussed later with the various formats.

Export pipe diameters and inverts is generally select for existing systems only. If your design program will set invert levels and pipe sizes then turn this tick box off for new systems. Some design programs will require initial inverts and pipe sizes. In this case this box should be selected on the first export.

Export default catchment/pit parameters is generally selected for the first export. For subsequent exports turn this selection off and then only the catchment areas (if the model is supplied above) will be exported.

Drainage Data Input and Output to Spreadsheets

Spreadsheets are an effective method to manage the numerous variables urban drainage designers create in the modelling process. Spreadsheet data can be transferred to and from 12d in tab delimited files and stored within 12d as “user definable attributes”. These attributes are linked to the pit and pipes within a network. Drainage long section plots can display the pipe attributes in the “arrows” data area and pit attributes in the bubbles area. Drainage plan drawing can also show these pit and pipe attributes.

Drainage strings will be created if they do not exist in the model but manholes cannot be added to existing strings.

Spreadsheet to 12d update and create

Spreadsheet options

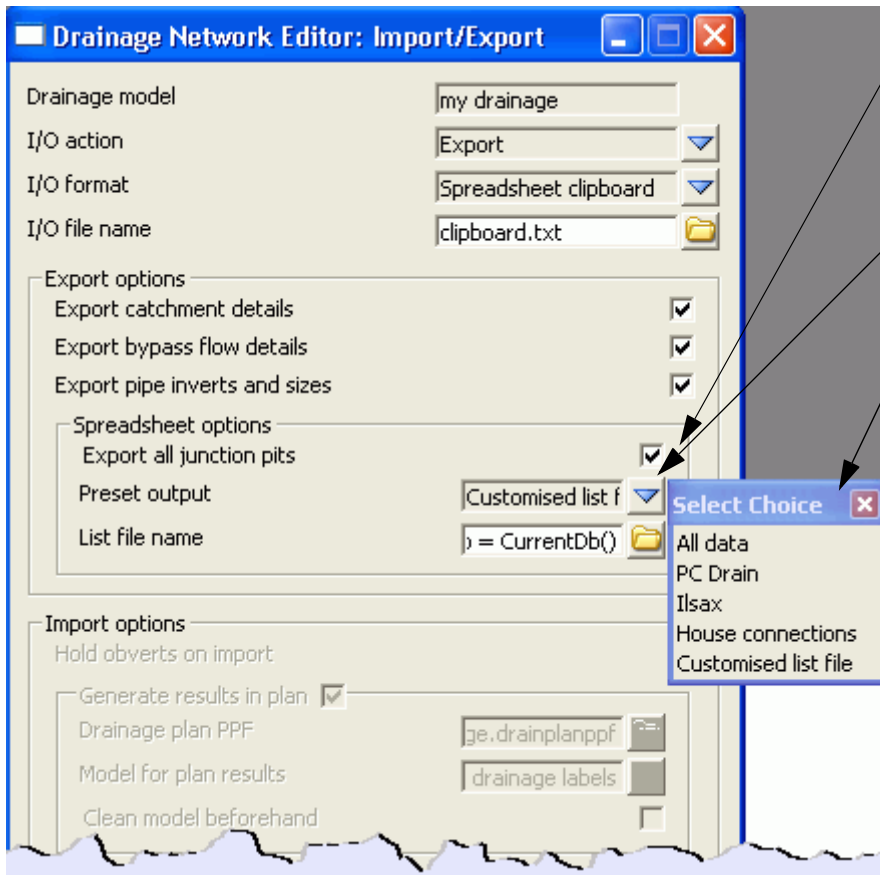

12d to spreadsheet transfers

This interface is accessed the **Import/Export** button on the Drainage **Network Editor**.

Options

The **Spreadsheet Options** section allows the user to define the amount of data exported.

Export all junction pits when selected will repeat the data for the junction pit at the end of each branch line.

Preset Output this choice box offers the following choices:

All Data: All of the 12d drainage string data and the user defined attributes will be exported to the clipboard in a tab delimited format. The 12d data names and the user defined attribute names will appear at the top of the spreadsheets columns.

ILSAX: For the ILSAX program, the spreadsheet column headings will change depending on the pipe and catchment indicators (P2 card) and the inlet type (P3 card). Therefore, use the ILSAX pipe editor macro to set up one pit/catchment for the type of data you wish to enter. Now when you export the pipe network data the column headings will include the names of the relevant parameters.

User defined below: The **Customised list file name** is used to define the drainage values, their order and format you desire.

The **customised list file** is a text file where each line contains a drainage variable or a spreadsheet IO command (blank lines are ignored unless preceded by the header command). The spreadsheet IO commands available are:

header	to define a line of text to be exported
blank	to leave a blank column in the output
pipe data	to specify the following user defined attributes are pipe data
pit data	to specify the following user defined attributes are pit data.
variable name	a 12d drainage variable names
factor	the following variable is multiplied by this factor

The simplest way to create your own customised tab delimited file is to set the **Preset Output** field to **All data** and leave the **customised list file name** field blank. Selecting **Set, Finish** and then **Copy** from the main dialogue. The data will be placed on the clipboard and a **customised list file**, named **output_list.txt** will be created containing the names of all of the drainage variables in the 12d model. Use a text editor to add/or delete the variable names, change their order and/or add spreadsheet IO commands. **Save the file with a new name!** The **output_list.txt** file is overwritten on every export.

A listing of a customised list file follows. Note the words in the header file have a "tab" between them so that they will be spaces across the spreadsheet columns.

```

header
Pipe Details
  header
  Name Length U/S IL D/S IL Slope(%) Class Dia I.D. Rough Pipe Is No. Pipes

  pit data
  *pit name

  pipe data
  *length
  low ch invert
  high ch invert

  factor
  100
  *grade

  pipe type

  factor
  1000
  diameter

```

After creating your customised list file, select **Options** again and change the **Preset Output** field to **User Defined below** and enter the new **customised list file** name that you saved above. Select **Set** then **Finish** and finally **Copy** to put the formatted data onto the clipboard.

The data can be pasted into a spreadsheet program for checking or additional formatting.

CUSTOM FORMATED DATA MIGHT NOT BE PASTED BACK INTO 12d!

The data must be in the “12d drainage spreadsheet” format to be read into 12d.

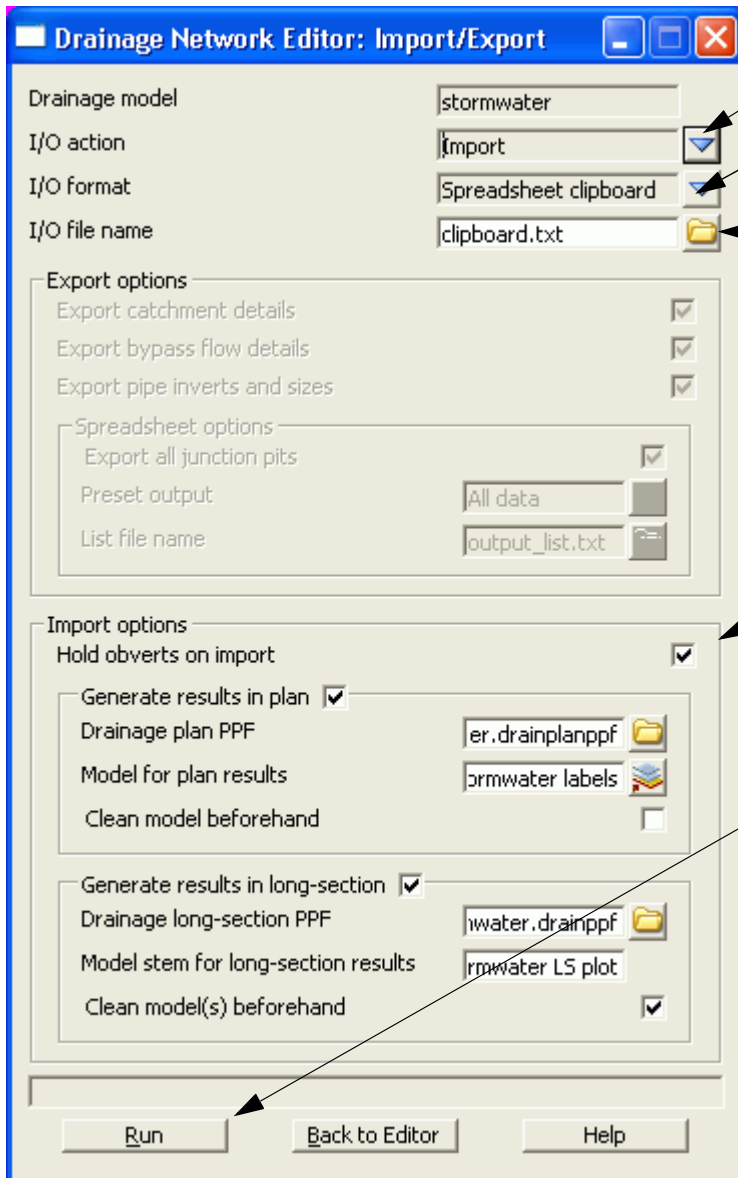

Caution with manhole names in the form 1-1 or 1/1. Some spreadsheets will interpret these values as dates. If you use these formats for your manhole names you will have to paste command them in once, format the columns that contain the manholes names as text data and then paste the information in again.

One final word on using the copy/paste commands in the Microsoft Excel program. The Paste Special command using the “Skip Blanks” option will allow you to copy a large block of 12d data (with blanks in it) on top your data so that your data is preserved where it coincides with the blanks. To use this option paste the data into a blank spreadsheet and then select copy again. The Paste special option with “Skip Blanks” will now be available.

Spreadsheet to 12d transfers

This item is accessed from the **Import/Export** button on the **Drainage Network Editor**.

The following panel will appear.

Select **Import**

Select the **Spreadsheet clipboard** format.

The file field is ignored.

This is ignored on spreadsheet imports.

Select **Run** to update the drainage model.

Tab delimited, “12d drainage spreadsheet” format or “from to” format data must be on the clipboard in order to update a 12d drainage model or create a new model. These format are described below.

Updating an Existing Model

The data usually is generated by 12d using the **Export** option, pasted into a spreadsheet and then copied back to the clipboard so that 12d can be updated.

When 12d exports the drainage model to a spreadsheet it includes a column for the unique string identifier and a unique manhole identifier (unique to the drainage model not the 12d project). The names of the strings and manholes may be changed via the spreadsheet if these columns are present at import time.

If the manhole id column is not present, 12d will search the drainage model for a matching manhole name. When the manhole is a junction between drainage lines, only the trunk line will be the data updated.

Creating a New Model

It is possible to create a new string or an entire drainage network using this format. However, manholes cannot be added to an existing string. The entire drainage string must be created at once. Two formats are available, the “from-to manhole” format and the “12d drainage spreadsheet” format.

At present the network editor must select a drainage string to become active. Therefore, if you are not

adding strings to a network, you will have to create a drainage network with one “dummy” manhole. Select this one “dummy” manhole to activate the editor. After importing the data and the new drainage lines are created the “dummy” manhole may be deleted.

12d drainage spreadsheet Format

The top left cell in the clipboard data must be the text “12d” to specify this format. The minimum amount of data required to create a new string is the string name, manhole name, x and y coordinates. You can add as much additional data as you have available. This would include pipe diameters inverts etc. The manholes must be listed from upstream to downstream order. If the string is to join a trunk line, the junction manhole must be included for both the tributary and the trunk line.

An example file exists called **new_network.txt** is supplied in the library. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Set the **I/O Action** to **Import** and select **Run**. The new drainage lines will exist in the model currently being edited.

From-to Manhole Format

The top left cell in the clipboard data must be the text “from to” to specify this format. The minimum amount of data required to create a new string is the upstream pit name (*pit name), the downstream pit name (*ds pit name) and the x(x location) and y(y location) coordinates of the upstream pit. If the string is to join a trunk line, the junction manhole must be included for both the tributary and the trunk line.

An optional column for the manhole cover elev (cover elev) may be specified. Once the network has been created additional pipe and manhole data may be added using the “12d drainage spreadsheet” format described above.

An example file exists called **new_from_to_network.txt** is supplied in the library. It is shown below. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Enter a new model name in the **Drainage model** field and select paste. The new drainage model will now exist.

from to	pit	pit	pit	pit
*pit name	*ds pit name	x location	y location	cover elev

B	A/5	SA2	26.0744	26.0744	19	192066

Duplicate Definitions

Strings Variables such as “direction” are may be defined for numerous manholes on the same string. Searching in a top down direction through the file, the last definition found for the string will be set.

Invert levels may be set via pipe data or pit data or combined. It is recommended that the user only use one method and not combine them. Both are exported so delete the ones you are not going to use. The variables are processed from left to right, so if duplicate definitions of an invert level or found the right most data will be set.

The format definition

1. Row1, column 1 must contain either “12d”, or “from to”. Therefore, the first column must be a 12d drainage variable (cannot be a user defined attribute).
2. Row 1. The text <pit> at the top of the column indicates the column contains a user defined pit attribute and similarly <pipe> indicates a user defined pipe attribute.
3. Row 2. This row contains the names of the 12d drainage variable names and the pit/pipe attributes. All names are case sensitive so be careful where you use capital letters. A list of 12d drainage variables is found below.

Names beginning with an asterix (*) will not be processed (except pit/string names when unique identifiers are present in the data). 12d drainage variables names beginning with an asterix indicate that this data was calculated at export time and cannot be read back into 12d (for example, pipe length, pipe grade and deflection angle).

Prefixing an user defined attribute name with “DELETE ” (no quotes, note the space after the DELETE) will cause the attribute to be deleted from all pits/pipes within the model.

4. Row 3. The text in this row define the type of attribute to be stored within 12d. The only valid choices are;

integer
real
text

If you want to change an attribute type you must delete the attribute and create it again. If you simply change the attribute type in the third row then that attribute will not be updated.

5. Blank lines may be inserted as desired.
6. You are not required to fill in all of the cells in the spreadsheets. Blank cells are ignored (you must use a space to remove all data from text attributes (the space will not be stored).
7. Pipe names are included in the data so that they can be changed but they are **not** used to identify the pipe. Pipe data will always be assigned to the pipe following the pit in the direction of **ascending** chainage. If flow directions is ascending then the pipe data will be for the downstream pipe. If the flow direction is descending then the pipe data will apply to the upstream pipe.

12d Drainage Variable Names

Manhole Variables	Pipe Variables	String Variables
*string Name	pipe name	direction
*pit name	pipe type	fs tin
pit type	low ch invert	ns tin
pit diameter	high ch invert	string id
pit low ch invert	diameter	
pit high ch invert	*length	
pit road chainage	*grade	
pit road name	low hgl	
*pit angle	high hgl	
*pit drop	pit hgl	
*pit depth	flow	
*pit chainage	velocity	
x location		
y location		
cover elev		
*fs elev		
*ns elev		
pit id		

Bypass Flow

Many of the design programs 12d exports to allow for bypass flow. Bypass flow involves the calculation of inlet capacity which is often based on the road grade upstream of the manhole.

The following steps are required to enable the export of bypass flow data and the required data is entered using the drainage **Network Editor**.

1. Set the manhole types to names that signify the inlet type in the program you are exporting to (**Type** on the **Pit->Main** tab).
2. Check that your grate level is correct (Setout z + **Setout to grate offset**)
3. Mark the manhole as a On grade or SAG inlet (**Inlet data** on the **Pit->Main** tab). On grade inlets capture the water as it passes the inlet while SAG inlet trap the water flowing in from both directions.
4. Draw an bypass flow string in the direction of flow so that it passes within 1 manhole diameter of the inlet. If flooded with calculations are to be done later, the bypass flow string should also be in the flow channel. Enter this model name (**Bypass flow model** on the **Global->Utility Models** tab). When bypass flow strings join they must join within 1 manhole diameter of a manhole.
5. Ensure a setout string is linked to the inlet so that the road grade may be calculated in its direction. If road crossfall is needed then the centre string is also required. These strings are specified using the (**Road design file** on the **Global->Utility Models** tab).
6. Press the **Set Pit Details** button. Road grades, crossfalls, ponding depths and bypass pits will now be found in the **Inlet data** section on the **Pit->Main** tab.

Drawing Bypass Flow Strings

The bypass flow string must be within 1. manhole diameter of the drainage pit in be considered on the bypass flow path. If the bypass flow string is to be used for flooded width calculations in the future, the string must also be drawn in the main flow area of the cross section.

Use the **CAD toolbar** to create the bypass flow paths. A unique name is required if you plan to calculated flooded widths after the analysis is done.

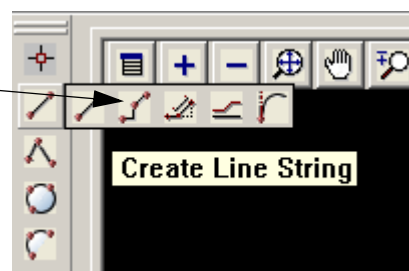

To use the **CAD toolbar** go to the **CAD data bar** and enter a string name and model name.

Select the line style (optional).

DRAG the **Create line** button and release at the **Create Line String** button.

When finished drawing the string press **ESC**.

Starting at the upstream end. LB select an insertion point and MB or press return to accept the selection. Continue this until you reach the end of the flow path. The string will not be shown in the new linestyle until the screen is redrawn. Press **ESC** to finish drawing the string. MB on the plan view title area to redraw the screen. The correct linestyle will now appear.

If you reach a sag pit location you may terminate the string or continue defining the bypass flow path for a surcharging event out of the sag location.

Set Pit Details - Calculate the Bypass Flow Data

Once the first 4 steps above are complete you are ready to calculate the bypass flow data. Select **Set Pit Details** and then select a manhole on a bypass flow string. The downstream pit will now show in the **Bypass pit** field.

If **Pit on grade** is selected and a setout string was found, the **Road grade** will appear in grey. You may override this value by selecting the tick box beside the value and entering your own value. If a road centre string was selected, the **Road xfall** field will also have a value.

If **Sag pit** was selected and a catchment string was selected in catchment set 1, the **Pond depth** would be displayed. The catchment string is draped onto the finish surface tin and the low point located. The **Pond depth** is calculated as

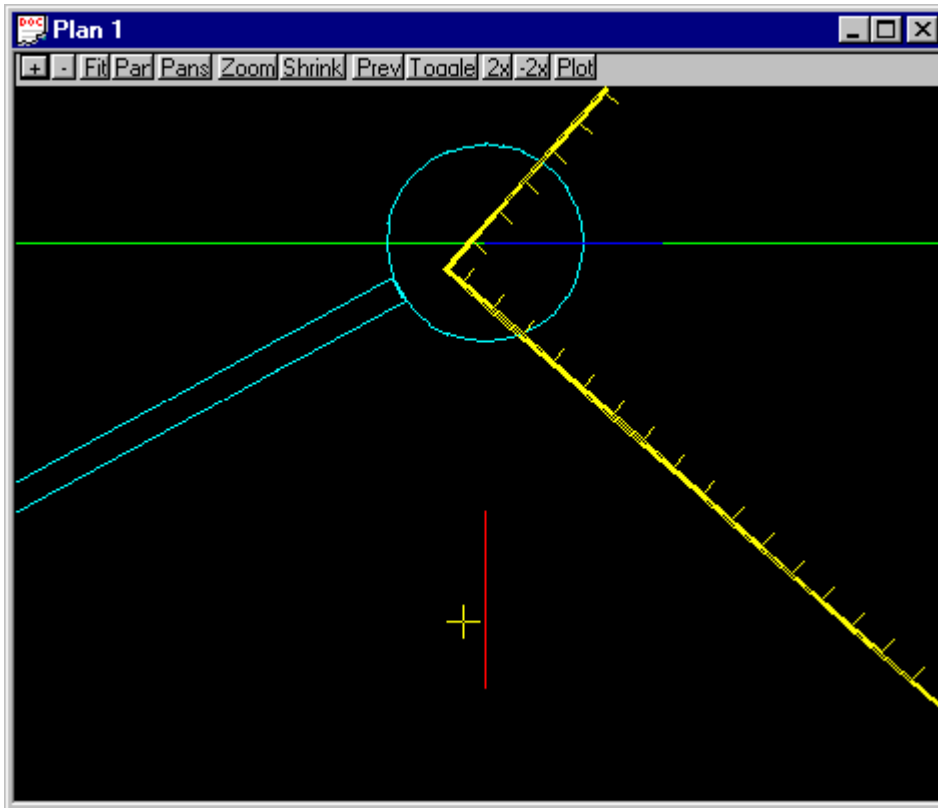

Pond depth = min level - (setout level + setout to grate offset).

Negative Ponding Depths

Negative ponding depths are usually caused by two errors in input. The first may be that the grate level is too high. Often this happens when the setout point is on the top of the kerb and no **Setout to grate offset** has been entered.

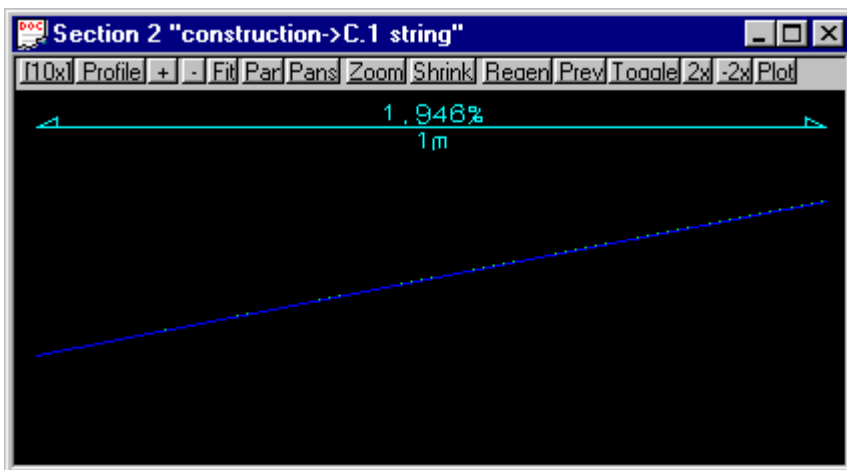

The second is that the catchment string has not been drawn around the crest of the catchment. The lowest section of the catchment string must be drawn carefully because it is the lowest point on the string that determines the overflow elevation. If in doubt, profile the catchment string with the design tin shown in the section view. Double check where the low point is.

12d adds verification strings in the **construction** model to confirm the locations where the road and crossfall have been measured. To check these strings add the **construction** model to the plan view. The following image shows a close up of the verification strings at a pit.

The blue line indicates where the road grade was measured and the red line indicates where the road cross fall was measured.

These are 3d super strings and therefore you may profile them in the section view. With the grades toggled on (check under **Toggle**) you can verify the slopes.

Note in the **Section View Title area** that the string is named “>string”. The work string indicates that it was created from string data and not from the tire

Important Notes

1. Pits with no pit type specified will not be processed by the overflow routine and the inlet capacity will be set to 100%.
2. For pits with road design string specified, the inlet capacity will be set to 100%.
3. If no bypass flow string is supplied for a pit, the inlet capacity is set to 100%.
4. If you have a problem with the inlet capacity factors (Drains Version 1 and ILSAX), check the calcu-

lated crossfall and grade.

Running PCdrain for Windows

Data is exchanged to and from PCdrain via the interchange (*.int) file. Gutter profiles and inlet type must be specified in PCdrain before the interchange file is read into PCdrain.

The data sent to PCdrain includes

- s manhole names and types, easting and northing data with surface levels
- s pipe deflection angles at manholes
- s finished surface profile along the centre line of the pipes
- s optional - crossing services - level, size and location along the pipes
- s optional - bypass manholes, road grades and SAG inlet ponding depths
- s optional - up to 2 catchment areas per manhole
- s optional - default catchment characteristics, k values and overland travel times
- s optional - pipe sizes and invert levels

PCdrain Requirements

Manhole names

The manhole name from 12d is assigned to both the structure and catchment name in PCdrain. These names cannot exceed 7 characters.

Manhole type

The 12d manhole type is transferred to the structure type in PCdrain. These names must match those specified in the PCdrain Inlet charts selected (**Data=>Inlet charts**). Select the desired inlet charts BEFORE importing the interchange file.

12d manhole types with an "S" in the name are treated by 12d and PCdrain as a SAG inlet pit. 12d will strip off all characters after the "S" before adding the ponding depth. If a catchment string in set #1 is available for the SAG pit then the ponding depth will be calculated. The 12d manhole type will remain unchanged. A typical example would be a manhole type "ITC" with the sag tick box on would become "ITC0.100" if a ponding depth of 0.1 was calculated.

Bypass Flow

When a catchment string is specified for the manhole, the maximum depth before bypass flow commences is calculated. The lowest point on the catchment string is determined by draping it onto the drainage strings tin. The maximum depth before bypass is calculated manhole setout level less the setout to grate offset less the lowest point on the catchment string.

PCdrain differentiates between manholes (no surface inflow) and gully pits via the 12d manhole type. The bypass flow strings can only be drawn within 1 manhole diameter of the gully pits. Keep the bypass flow strings away from the PCdrain manholes.

Catchments

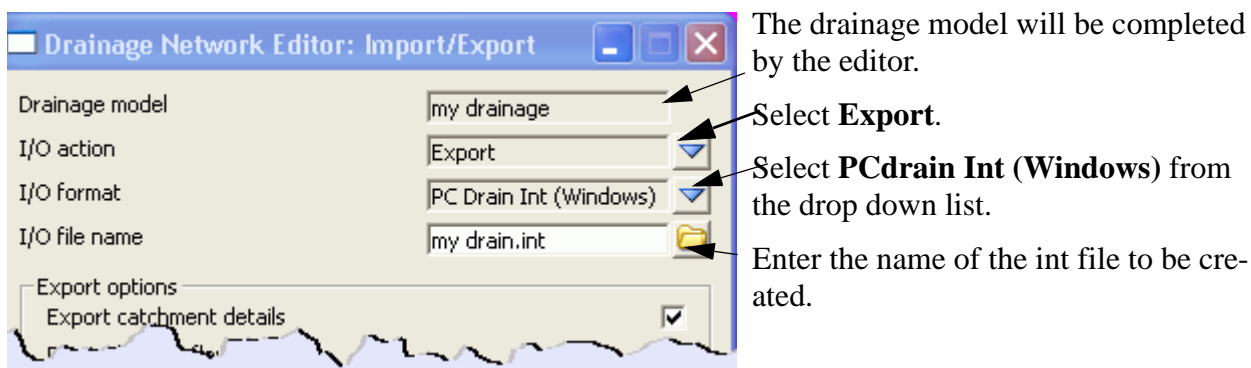

Again, since PCdrain differentiates between inlets and manholes (using the 12d manhole type), ensure that catchments are only drawn for gully inlet and NOT manholes.

12d to PCdrain

1. Export the data to PCdrain selected via the Network editor
Design=>Drainage-Sewer=>Drainage Network Editor

After selecting the drainage network, select the **Import/Export** button and the following dialogue will

appear.

Select the **Run** button and the interface file will be created.

2. Launch the PCdrain for Windows program. If you have a project set up with the design parameters, rainfall data, inlet charts and gutter profiles then open it now and skip to step 8. Otherwise continue with step 5.
3. The Design Parameters can be set as desired with the menu selection **Data=>Design Parameters**.
4. Select the rainfall data using the **Data=>Rainfall** menu selection.
5. Select the inlet charts using the **Data=>Inlet Charts** menu selection. The manhole types specified in 12d must be included in these settings. **More - PCdrain to 12d pit converter**
6. At least one gutter profile in PCdrain needs to be defined. These are set through the menu selection **Data=>Gutter Profiles**. The default gutter section name (**Road ID**) from 12d is **4d** and therefore it is recommended you create a profile with this name and your own description. If you have changed the profile names in 12d (through the spreadsheet interface or the Attribute editor) these new profile names will have to exist in PCdrain.
7. Save this file now so that you can retrieve it later if required. It can be used as a starting template for new jobs.
8. **File=>Import** from the menu. Select the file exported in step 1. The information from 12d may be viewed by selecting **Data=>Network** and then selecting the desired tabs.
9. The HGL level and the pipe elevation at the outlet should be set using the menu selection **Data=>Outlet**.
10. If you have not exported pipe data then the pipe size must be determined. Use the menu selection **Process=>Select Pipe Sizes**.

PCdrain data values

Some PCdrain data values are not available in the 12d network editor. Prior to an import from PCdrain, **initial export values** are used. On the first **import** from PCdrain, 12d attributes are created to hold the PCdrain variables for subsequent exports to PCdrain. These data values are usually changed in the PCdrain menus but may be changed in 12d using the Attribute editor.

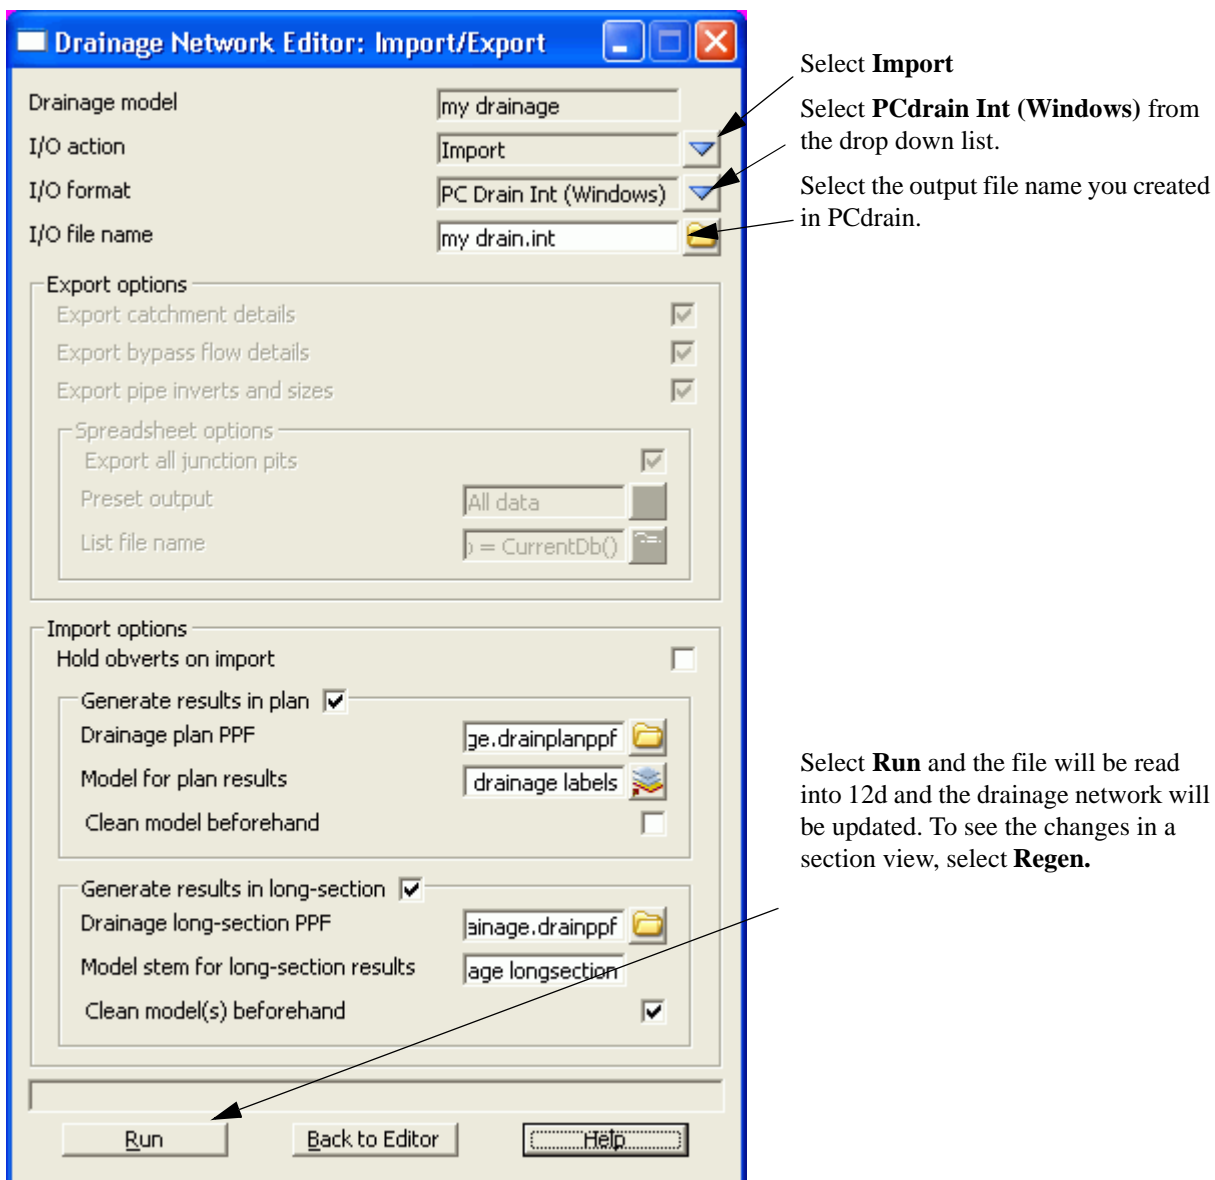

PCdrain	12d editor	12d attribute	initial export value
Kw	not available	kw	12d ku value
Minor Coef	Catch Set 1 - Pervious C (minor)	c minor pervious	default
Major Coef	Catch Set 1 - Pervious C (major)	c major pervious	default
Minor Coef2	Catch Set 2- Pervious C (minor)	c minor pervious2	default

PCdrain	12d editor	12d attribute	initial export value
Major Coef2	Catch Set 2- Pervious C (major)	c major pervious2	default
Tc overrider	Catch Set 1 - Pervious Tc (minor)	tc minor pervious	default
Length of overland flow	Catch Set 1 - Pervious length	catchment length pervious	default

PCdrain to 12d

Export the results to 12d using the **File=>Export** menu selection. Note the name of the interchange file you are creating as you will need to enter it inside 12d.

Return to 12d and select **Import/Export** from the network editor and the following dialogue will appear,

A listing of the data imported is stored on the 12d output window.

Manholes that have been specified as SAG inlets will have the ponding depth removed from the end of the PCdrain structure type before the data is stored as the 12d manhole type.

Running Drains - Version 2 & 3

Key Points

1. The Drains database (each project has its own) and the 12d database (drainage.4d) must be synchronised (**More**).
2. For bypass flow, 12d selects pit families for Drains in the following way

The users selects pit group in 12d and at export the pit group is scanned in the drainage.4d file using the road data to select the Drains pit families
3. Data is copied from 12d to the Windows clipboard and then pasted into Drains. 12d can not delete any objects in Drains, it can only add and update.
4. When updating 12d from Drains, always copy the DATA to 12d before the results. 12d will update the network but will not add or delete manholes.

Drains Interface Overview

The Drains program performs the rational and ILSAX hydrology calculations as well as hydraulic grade line calculations that determine pipe sizes and pipe invert levels.

The data sent to Drains includes

- s manhole names and types, easting and northing data with surface levels
- s finished surface profile along the centre line of the pipes
- s optional - bypass manholes, road grades/crossfalls and SAG inlet ponding volumes and depths. Pit family selection using road grade and crossfall data.
- s optional - composite catchment area create from three 12d areas per manhole
- s optional - default catchment characteristics, k values and overland travel times
- s optional - pipe sizes, type and invert levels

Data is copied from 12d to the Windows clipboard and then pasted into Drains (**Edit=>Paste data from spreadsheet**). 12d can not delete any objects in Drains, it can only add and update.

The Drains menu selection **Run=>Design** is used to design the network. Once the drainage network has been designed in Drains the updated design data (**Edit=>Copy data to spreadsheet**) and/or the hydraulic results (**Edit=>Copy results to spreadsheet**) are sent back to 12d via the clipboard.

Always copy the DATA to 12d before the results as the results are deleted inside 12d with every update of the data!

A demonstration version of the Drains program is included on the 12d distribution CD in the directory

Other_Software\Drains

The version is limited in the number of pits allowed.

Synchronising the Drains database and the drainage.4d file.

The Drains database and the 12d drainage.4d file must be synchronised as follows.

All Cases	
Drains database	drainage.4d
Pipe type	Pipe type entries
Only if bypass flow is required	
Drains database	drainage.4d
Pit family	12d manhole group with road data to lookup Drains pit family
Overland route database	One default value set (not in drainage.4d)

Every Drains file begins with a default database and uses that database for the life of the project. This database must be synchronised with the **drainage.4d** file in 12d to ensure the Drains pit families, pit sizes, pipe types and overflow route types.

The following 5 steps will help ensure 12d is synchronised with Drains. More details are given in the sections below.

1)Export the Drains database from your Drains file

Inside Drains select **Project=>Overflow Route database**. Then select **OK** and then **YES**. This will cause Drains to export the database to the file "Drains Connection Data.txt".

2)Create a drainage.4d file from the Drains file

- s From the 12d menu select **Design->Drainage-Sewer->More->Drains to drainage.4d**.
- s Select **Read Drains database**,
- s review the Drains pit families list to identify the character (usually a comma or -) that separates the pit group from the road data and then enter it in the **Pit group separator** field.
- s Check the **12d pit groups** and if they are acceptable
- s select **Create drainage.4d**. The Drains database dump file is copied to the 12d working folder and a drainage.4d file is created in the 12d working folder.
- s **More details below**.

3)Edit the drainage.4d file

From the 12d menu select **Design->Drainage-Sewer->More->Edit drainage.4d**. Select **Find** then edit from the file **more info** button. Set the road grade and crossfalls for the 12d manhole groups.**More details below**.

4)Restart 12d

From the 12d menu select **Project->Restart**.

5)Set the Overflow shape, Update Manhole and Pipe type.

A single global overflow route shape can be specified in 12d via the following routine and then it can be modified in the Drains program. The import operation of the interface will read modified values and store them so that the next export operation will export the modified values.

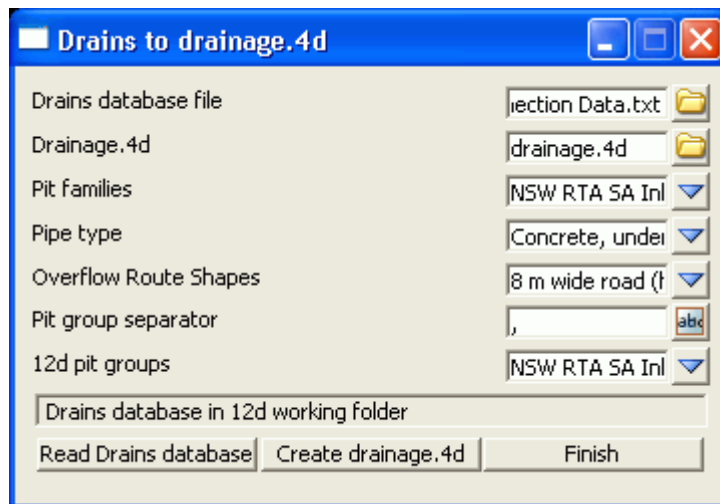

If the network has already been created, using manhole and pipe types that no longer exist in the drainage.4d file, they will have to be updated before the export to Drains can occur. You may update them using the drainage network editor or you may set **all** of the manhole and pipes types to **one value** using this

routine. Later you may change them individually using the **Drainage network editor**.
 From the 12d menu select **Design->Drainage-Sewer->More->Drainage io defaults**.
More details below.

Drains to drainage.4d file

Position of option on menu: Design =>Drainage-Sewer =>More=>Drains to drainage.4d

On selecting the Drains to drainage.4d option, the Drains to drainage.4d panel is displayed.

Key Points

1. Select **Read Drains database (12d will search the usual locations for the Drains database)**
2. Review the Drains pit families list to identify the pit group separator and then enter it in the **Pit group separator** field. **PRESS THE ENTER KEY!**
3. Check the **12d pit groups** and if they are acceptable select **Create drainage.4d**.

The Details

The Drains database dump file **Drains Connection Data.txt** is copied into the 12d working folder and read. The choices for the **Pit families**, **Pipe types** and **Overflow Route Cross Section Shapes** are loaded into the panel. The user must select a **Pit group separator** to separate the road grades and crossfalls from the pit family names. The resulting **12d Pit Groups** will be calculated and displayed in the choice box. **Create drainage.4d** will create a **drainage.4d** file that may then be edited to specify the road grade and crossfall threshold values. Once the file is created you may review/edit it by selecting the **More Info** icon then **Edit** on the **Drainage.4d** field. The **Overland route shapes** are not exported to the drainage.4d file and are presented for your information only.

YOU MUST RESTART 12D FOR THE NEW DRAINAGE.4D FILE TO BECOME ACTIVE!

Field Description	Type	Defaults	Pop-Up
Drains database file	file	Drains Connection Data.txt	

You must update this file from Drains before each use of this panel. Inside Drains select Project=>Overflow Route database. Then select OK and then YES. This will cause Drains to export the database to the file "Drains Connection Data.txt".

*Selecting **Enter** in this field or selecting **Read Drains database** will cause the panel to search for the*

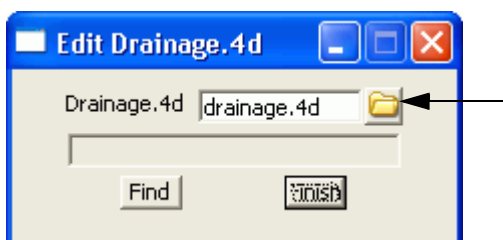

database dump in the folders **C:\Program Files\Drains\Program** and **C:\Program Files\Drains\Demo\Program**. If the Drains program is installed in another folder then you must browse for the file. After reading the file choice boxes below will be populated. Drains Connection Data.txt will be copied into the 12d working folder.

Drainage.4d	file	drainage.4d
<i>The drainage.4d will be created in the 12d working folder unless otherwise specified. It will only be used for 12d projects in this folder.</i>		
Pit families	choice	Drains pit families
<i>These are the Drains pit families that will be exported to the drainage.4d file. The 12d pit groups will be created from this list.</i>		
Pipe type	choice	Drains pipe types
<i>These are the Drains pipe types that will be exported to the drainage.4d file.</i>		
Overflow Route Shapes	choice	Drains Route Shapes
<i>These are the Drains Route Shapes and are for information only.</i>		
Pit group separator	input	
<i>These characters will be used to remove the road grade crossfall data from the Pit families above. The data before this character will become the 12d pit groups. Press Enter or select Read Drains database to create a new list of 12d pit groups.</i>		
12d pit groups	choice	12d pit groups
<i>These are created from the Pit family list above by deleting all text after the Pit group separator. This should delete all of the road grade and crossfall information from the pit group names.</i>		
Read Drains database	button	
<i>Searches for the Drains database (see general description above) and populates the choices fields.</i>		
Create drainage.4d	button	
<i>Create a local copy of the drainage.4d file.</i>		

Editing the Drainage.4d file

Position of option on menu: Design =>Drainage-Sewer =>More=>Edit drainage.4d

On selecting the Edit drainage.4d option, the Edit drainage.4d panel is displayed.

Select the **Find** button to search the 12d path for the current **drainage.4d** file. Select the **More info** button and then **Edit** to edit the file.

The drainage.4d file contains Manhole and Pipe commands. 12d also uses the Manhole commands to specify a manhole group by using the prefix "group". Details follow.

Pit Families and Manhole Groups

Version 2+ of the Drains clipboard interface uses a **pit family** to describe the kerb shape. Optionally, the Drains pit families also have the road crossfall and/or grade attached as a suffix to the name with a special character between them (pit group separator). Therefore there may be many pit families that have the same kerb shape but different road grades and cross falls. All of these pit families with the same prefix are brought together in 12d as a **manhole group**.

An example manhole group is the drainage.4d file is shown below. The 12d group is called **NSW RTA Pits** and 12d uses the road grade to select which pit family should be sent to Drains. In this example the road crossfall would not be used in selecting the pit family.

The **pit group separator** is a "-". This character separates the pit group from the road data.

It is up to the user to decide the grade when the next pit family should be used. In this case the threshold value for the gutter grade is set midway between the published values of the inlet curves. For example at a gutter grade of 2% 12d starts sending the **NSW RTA Pits - 3% slope** pit family.

This pit families listed on the right must match exactly with those in the Drains pit database.

```
Manhole "group NSW RTA Pits" {
//   cross fall, gutter grade, cap1, cap2, cap3, cap4pit family
//4d   0,      1,   0,   0, 0.0, 1.0      NSW RTA Pits - 1% slope
//4d   0,      2,   0,   0, 0.0, 1.0      NSW RTA Pits - 3% slope
//4d   0,      4,   0,   0, 0.0, 1.0      NSW RTA Pits - 5% slope
//4d   0,      6,   0,   0, 0.0, 1.0      NSW RTA Pits - 7% slope
//4d   0,      8,   0,   0, 0.0, 1.0      NSW RTA Pits - 9% slope
}
```

An example with crossfalls follows.

```
Manhole "group NSW RTA Pits" {
//   cross fall, gutter grade, cap1, cap2, cap3, cap4
//4d   1,      1,   0,   0, 0.0, 1.0      NSW RTA Pits - 1% crossfall, 1%
slope
//4d   1,      3,   0,   0, 0.0, 1.0      NSW RTA Pits - 1% crossfall, 3%
slope
//4d   1,      5,   0,   0, 0.0, 1.0      NSW RTA Pits - 1% crossfall, 5%
slope
//4d   1,      7,   0,   0, 0.0, 1.0      NSW RTA Pits - 1% crossfall, 7%
slope
//4d   1,      9,   0,   0, 0.0, 1.0      NSW RTA Pits - 1% crossfall, 9%
slope

//4d   3,      1,   0,   0, 0.0, 1.0      NSW RTA Pits - 3% crossfall, 1%
slope
//4d   3,      3,   0,   0, 0.0, 1.0      NSW RTA Pits - 3% crossfall, 3%
slope
//4d   3,      5,   0,   0, 0.0, 1.0      NSW RTA Pits - 3% crossfall, 5%
slope
//4d   3,      7,   0,   0, 0.0, 1.0      NSW RTA Pits - 3% crossfall, 7%
slope
//4d   3,      9,   0,   0, 0.0, 1.0      NSW RTA Pits - 3% crossfall, 9%
slope
```

}

The Drains pit family names must match the names in the last column EXACTLY!

Manhole Types and Pit Sizes

Each Drains pit family has several pit sizes. The Drains pit sizes link to the 12d manhole types and therefore all Drains pit sizes should exist in the 12d drainage.4d file.

The pit size will be read back from Drains into 12d as the pit type so that it can be placed on the drainage long sections and pit schedules.

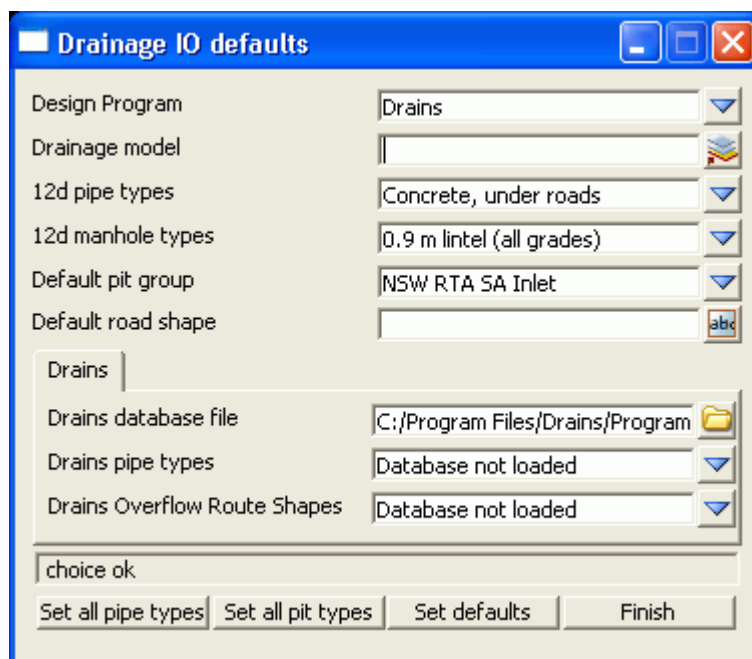

Pipe Types

The pipe type selected in 12d must exist in the pipe database inside Drains. Simple “2” for class 2 or “RCP” do not exist in Drains.

Setting the Overflow Route, the Pit and Pipe types

Position of option on menu: Design =>Drainage-Sewer =>More=>Drainage IO Defaults

On selecting the Drainage IO Defaults option, the Drainage IO Defaults panel is displayed.

The routine changes ALL of your manhole and pipe types in a model to a single value. If you have changed your drainage.4d file after creating your drainage network, the manhole and pipe types you originally selected may no longer be valid (i.e. in the drainage.4d file).

Field Description	Type	Defaults	Pop-Up
Design Program	choice	Drains	Drains,PCdrain
<i>The drainage model to be updated.</i>			
Drainage model	file		
<i>The drainage model to be updated.</i>			
12d pipe types	choice		values from drainage.4d

Set all pipe types will set all pipes in the model to this value

12d manhole types choice values from drainage.4d

Set all pit types will set all manholes in the model to this value

Default pit groups choice values from drainage.4d
*manhole definitions in the drainage.4d file that have **group** as a prefix are included.*

Default road shape choice values from drainage.4d
*type the desired name or if using Drains select the desired shape from the **Drains Overflow route shapes**.*

Drains Tab

Drains database file file

*pressing enter in this field will start a search for the Drains database dump. The search path is the specified folder, C:\Program Files\Drains\Program then C:\Program Files\Drains\Demo\Program. If the file is found the choice fields below are populated. **It is highly recommended that this file be in the 12d working folder.***

Drains pipe types choice 1 values from Drains file

*the pipe types are retrieved from the last Drains database dump. Changing this value will update the **12 pipe types** above.*

Drains Overflow Route Shapes choice values from Drains file

*the overflow route shapes are retrieved from the last Drains database dump. Changing this value will update the **Default road shape** above.*

Set all pipe types button
all pipe types in model are set to this value

Set all pit types button
all pit types in model are set to this value

Set defaults button
*the defaults for the **Drains Overflow Route Shapes** and **12d pit group** are set*

Finish button
removes the panel

Drains Version 2+ Requirements

Manhole Names

The 12d manhole names cannot be more than 9 characters long. 12d uses 2 additional characters to the manhole name at export time create names for the pipes, overflow routes and catchments. For example manhole "A-1" will have a bypass route "F A-1", a catchment "C A-1" and a downstream pipe "P A-1".

Bypass Flow (Overland Flow Routes)

There are 3 requirements for Drains bypass flow.

1. Select **Default pit group** (Network editor->Defaults->Pits->Pit group). The Drains and 12d databases must be in sync.

2. Bypass strings in the **Bypass route model** specified (Network editor->Global->Utility Models->Bypass flow model. For more details see **Bypass Flow**.)
3. Road grade and crossfall calculated (Network editor->Global->Utility Models->Road design file)

The overland flow strings are not allowed to pass through the outlet pit on the network.

SAG Inlet Calculations

SAG inlets are manholes where the water ponds at the surface rather than flowing past. If a SAG inlet has a catchment string the overflow depth and volume are calculated. The catchment string from Set #1 is draped onto the design tin and the lowest point is found on the draped string (stored as a 12d pit attribute **overflow level**). The storage volume inside the string up to this point is measured and stored as a 12d pit attribute **overflow volume from level**. The pit cover level and **Setout to grate offset** are subtracted from the lowest point on the catchment string to determine the Max Ponding Depth.

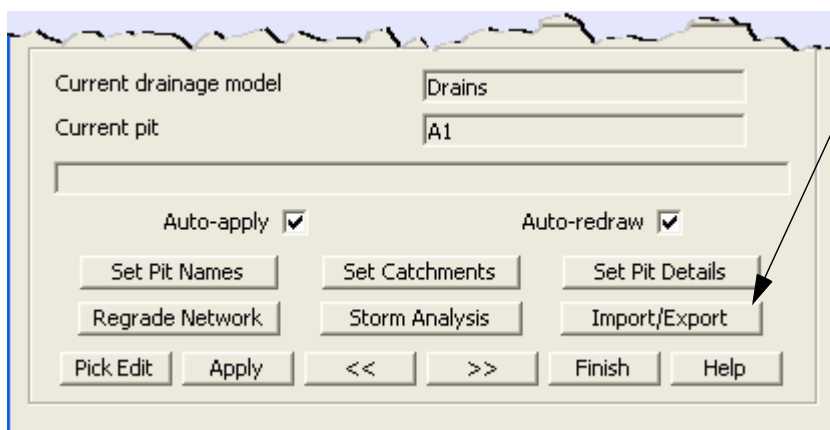

Results

Drains exports the maximum data from all of the rainfall events analysed. Therefore, ensure you analyse only the rainfall events desired before copying the results to the clipboard. To verify the data that is being sent to 12d, copy the data into a spreadsheet so you can view it there first. The pit sizes selected in Drains will be stored in 12d as the manhole type. Therefore the pit sizes in Drains should exist as manhole types in the drainage.4d file. If pit families are changed in Drains the pit group in 12d will be updated by search for the pit family in the drainage.4d file.

12d to Drains

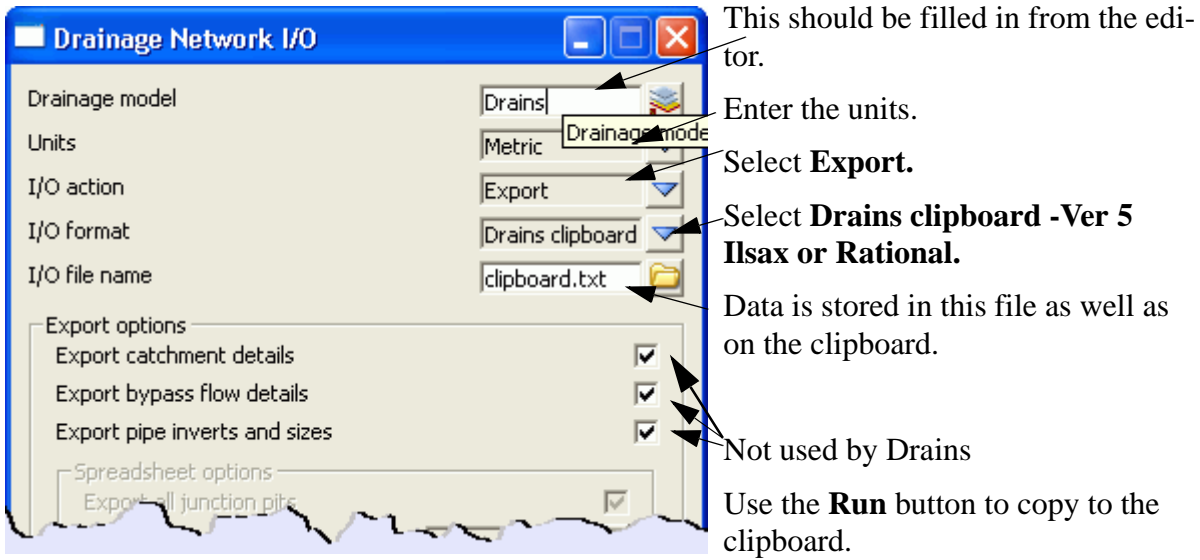

Setup your drainage network models and ensure they have been assigned pit names.

1. Copy the data to the clipboard

From the Drainage network editor select the **Import/Export** button.

The following interfaces dialogues will appear.

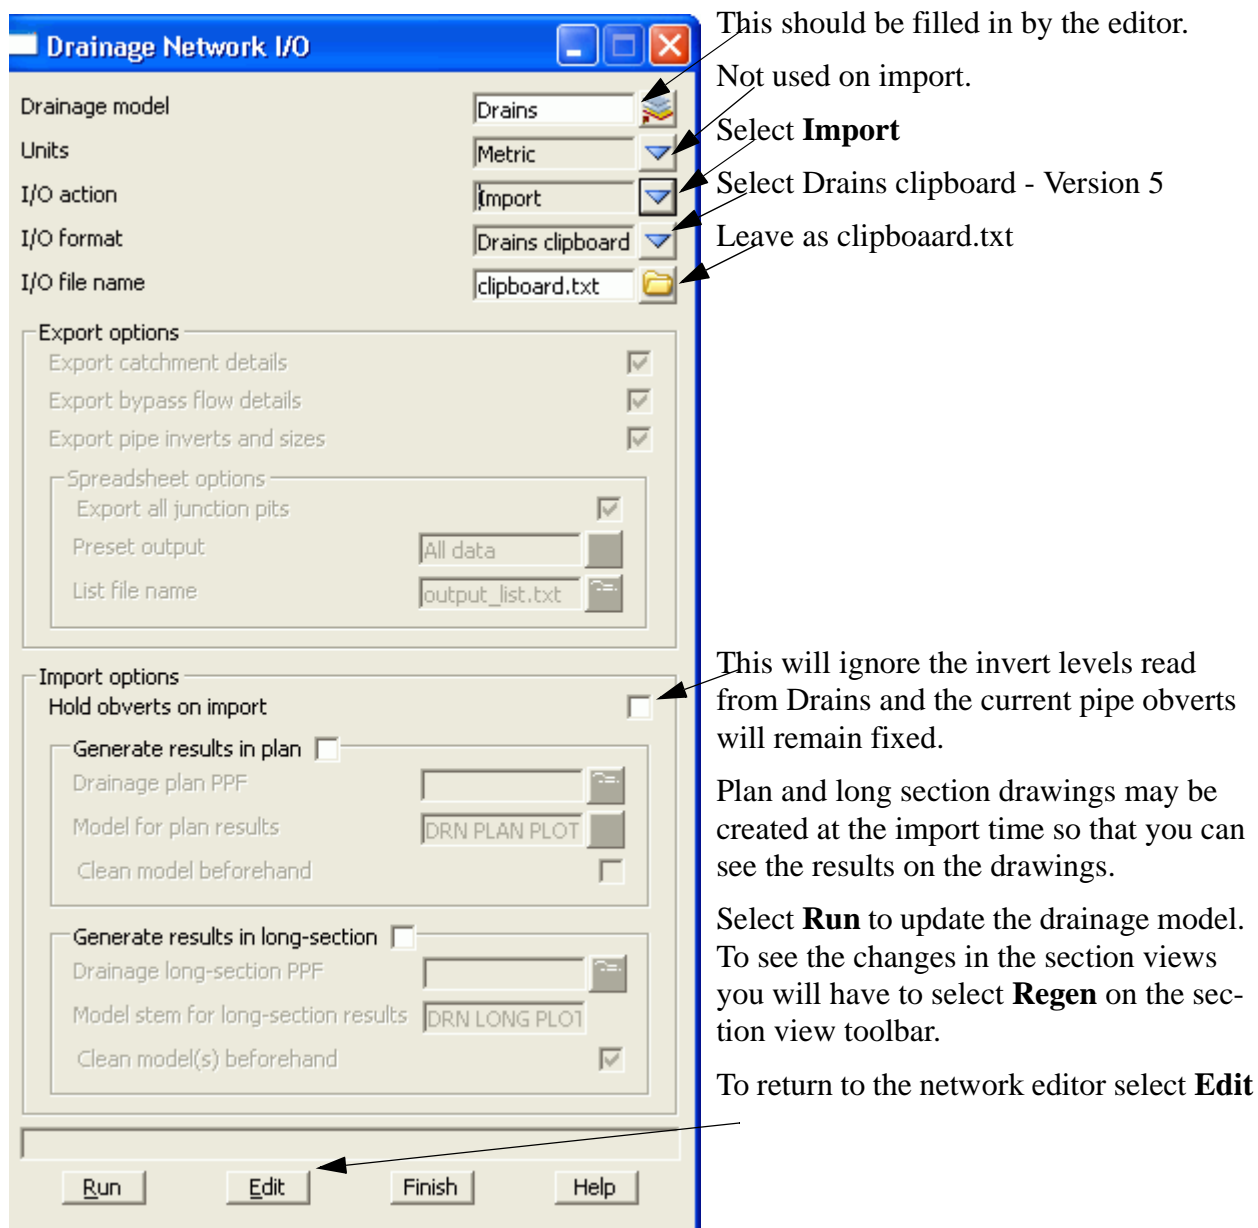

2. From within the Drains program select **Edit =>Paste data from spreadsheet**. If you paste the data into a Drains project that has a hydrological model and rainfall data already defined the project will be ready to run.
3. Use the Drains Run=>Standard design to design your pipe sizes and invert levels. The Run=>Advanced Design will select the size of the manholes as well.

Drains to 12d Update

The following steps are required to update the 12d model with the Drains hydraulic results and changes to the pipe sizes and inverts.

1. To update the pipes and invert levels in 12d, select **Edit->Copy Data to Spreadsheet** from the Drains menu.
2. From within the 12d Drainage network editor select **Import/Export**.

IMPORTANT: THE DATA MUST BE PASTED BEFORE THE RESULTS!

12d erases the hydraulic and hydrology data when the physical data is updated. Therefore, always paste the data before the results.

Running XPSWMM and RAT2000

The drainage design with all three of the XP software programs follows the same methodology. The process is substantially automated with the XP-SWMM program so that the XPX file is automatically read by XP-SWMM and automatically created when leaving XP-SWMM.

Drainage design with XP programs includes the following steps.

1. 12d creates an XPX file that is read by the XP programs.
2. The XP program is then run in the design mode to determine the pipe sizes and invert levels.
3. If bypass and overland flows are to be modelled then the inlet capacities need to be defined and then run the XP program in the Full Analysis Model.
4. The XP program creates an XPX file for 12d to import.

XP Program Requirements

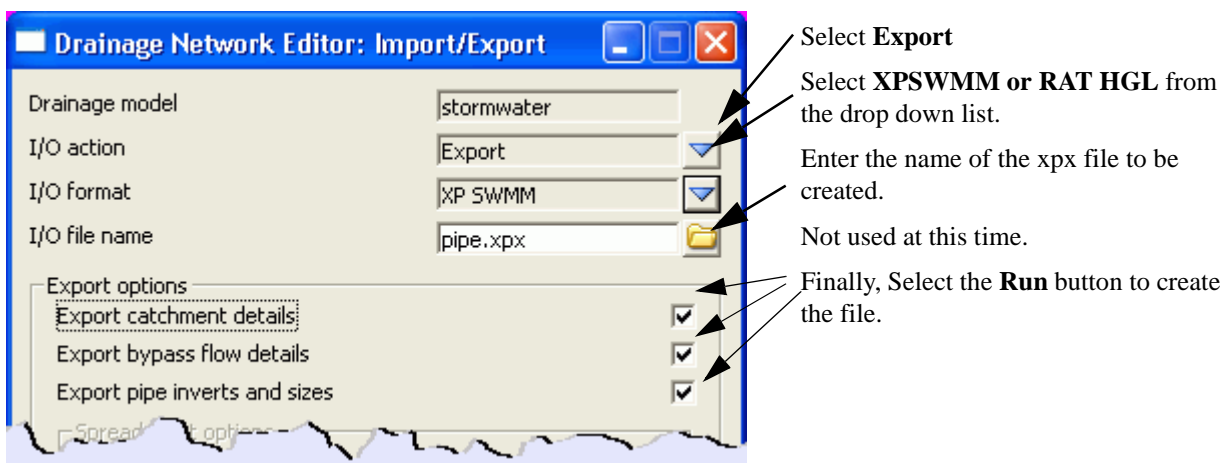

12d to the XP Programs

The x,y pit layouts and the cover/surface levels are obtained from your drainage network while the catchment and overland flow data comes from the models specified in the drainage interface dialogue.

The steps required to transfer the data to the XP programs are as follows.

1. Setup your drainage network models.
2. To create the XPX file for XP programs start the Drainage Network Editor and select **Import/Export**

The following interfaces dialogues will appear.

If exporting to RAT-HGL the following dialogue will appear.

If you are using old versions of RAT-HGL (1996 or earlier) select use **Local** otherwise select **4D units** (eastings and northings).

Select process.

3. The XP SWMM program will automatically startup and load the XPX file.

From within RAT-HGL, either select **File =>New** and follow the input prompt or load a file that contains all of the pit inlet rating curves, hydrological and design data without a pipe network. Many users

have such RAT-HGL files setup so as to streamline the design process.

The xpx file for RAT2000 will have the file startup.xpx added to it so that you may include all the startup global data that you require. The

Fixed inlet capacities and rating curve names indicating road grade and crossfall may be set in the **drainage.4d** file. The format for these names is pit name-crossfall-road grade (ex SA2-3-4). These curves must exist in this file.

4. To read in the pipe file created above, select **Special =>Import Data** and select the xpx data file. Warnings will be given stating that several fields are inactive. This is expected as more data is sent to RAT-HGL than is needed at this time. Select the **Close Square** on the Help title area and the pipe network and catchments should now appear on the screen.
5. If you want RAT-HGL to redesign you network, change the analysis mode to Design mode by selecting **Special=>Job Control** and **Select Design mode**. Do not do this if you want to analyse the network you layed out in 12d (used for existing systems).
6. Select the rainfall events to design/analyse and the **LB** (twice) on **OK** to return to the layout. Now select the outlet and enter the starting tailwater levels.
7. Now you can run RAT-HGL (**Special =>Solve**).

XP Programs to 12d

Once you have your design finished, the following steps are required to update your 12d model. Your design may contain several return periods in the analysis (Rp1 to Rp7) but 12d reads only the results from Rp1. The following table is taken from the RATHGL output file (*.out extension) and the results indicated are read back into 12d via the xpx file.

HGL PIPE NETWORK ANALYSIS SUMMARY RETURN PERIOD 5 YEARS
PROJECT:12d DRAINAGE LAYOUT

```

In addition to the results, the following input data is read back into the 12d model so that it may be exported back to RATHGL in the future (if required). 100% of your RATHGL data is not included in the XPX formats and the contents of the XPX file will depend upon your design mode. Therefore, use caution if you read an XPX file into an existing RATHGL model and check your data once inside RATHGL.

1. From within RAT-HGL, produce an XPX file for 12d to read by selecting **Special=>Export Data** and following the default prompts.
2. From within 12d, select the **Import/Export** button on the Drainage Network Editor. The following panel will appear.

Select **Import**.

Select to select **RATHGL** or **XP-SWMM**.

Select the file name specified in step 1

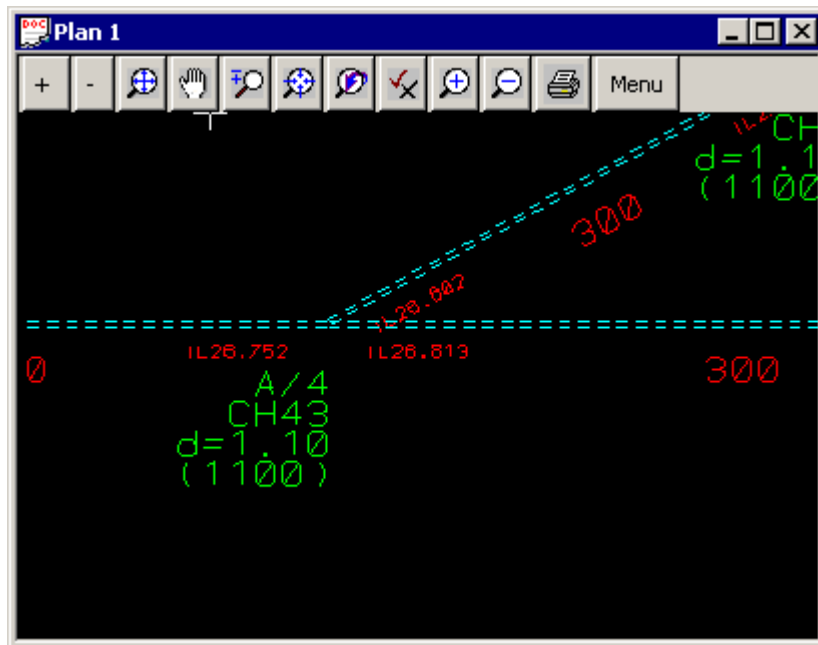

Select **Run** to update the drainage model and import hydraulic/hydrological results.

Detailed Drainage Plan Drawing

12d drainage has the capability to create detailed drainage plan drawings with the following features:

- s create symbols at the manholes and the type of symbol is controlled by the manhole type (given when you create the manhole).
- s draw lines with line styles to represent pipe sizes
- s create text labels for manhole types
- s create text labels for pipe diameters and inverts
- s create text labels for house connection types, invert levels and chainages
- s indicate direction of flow on pipes.

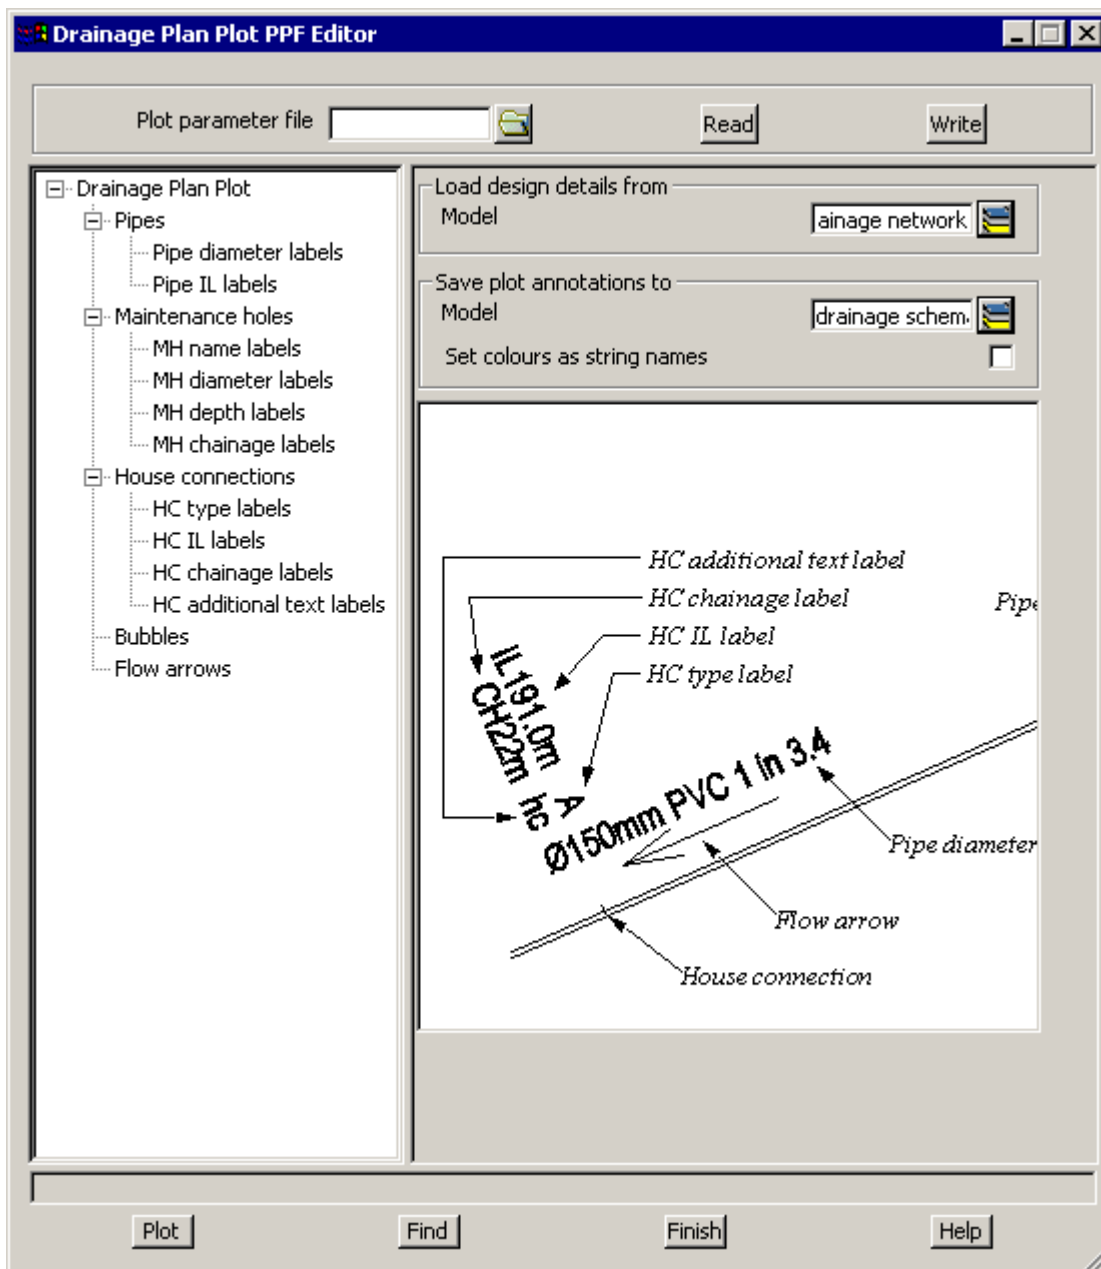

An example is shown below

Usage

This option is accessed from the menu selection

Design => Drainage-Sewer => Plots => Plan Annotations

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Plot parameter file	file box		
----------------------------	----------	--	--

Optional - no dpf is required. The default settings will create a schematic drainage drawing. A custom dpf may be selected if desired.

Load design details from	model box		
---------------------------------	-----------	--	--

data source for drainage strings to be labelled

Save plot annotations to	model box		
---------------------------------	-----------	--	--

labels to be created are stored here, Undo will remove the labels created

set colour as string name? tick box

when selected the string colour will be used for the string name (to be used for DWG/DXF export using map files)

Plot button

Creates the labels in the model specified

Find button

used to locate plot parameter input boxes using Version 5 plot parameter names

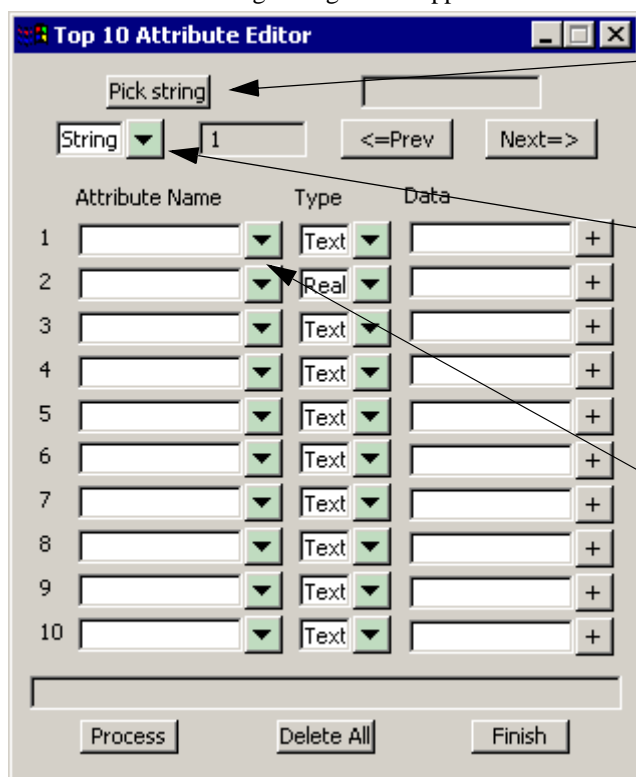

IMPORTANT! to turn off any data change the text height to zero.

Reviewing, Changing and Creating User Defined Attributes

The catchment data is stored within 12d as user defined attributes. These attributes are automatically created by 12d when required but you are free to change them or add more as desired. The attributes may be exported to a spreadsheet and edited and then imported back into 12d. To work with the user defined attributes within 12d select

Design=>Drainage-Sewer=>More=>Top 10 Attribute Editor.

The following dialogue will appear.

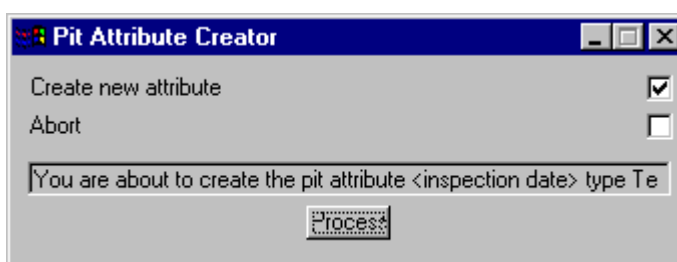

First Select **Pick** to select the string that contains the user attributes (the drainage string). The strings will be highlighted in white when they are selected.

All catchment data is store with the pits in drainage strings. To access the pit attributes, select the drop down icon and then select **Pit**. A circle will be drawn around the pit selected. **Next** and **Prev** will now move you from pit to pit.

Select the drop down icon and then select the **Attribute Name** from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in.

They may not be defined for the pit you are editing. **Not found** will be displayed in the **Data** field if the pit does not have that attribute defined.

To change the value for the attribute enter the new value in the **data** field. If the attribute does not exist, deleting the **not found** text and adding data will create it. The message on the right will be displayed whenever you are creating a new attribute.

The drainage.4d file

The drainage.4d file controls many of the settings for the pit and pipes types inside 12d. This section details the format of the drainage.4d file. Changes to this model take effect only after 12dmodel has been restarted.

The original **drainage.4d** file is found in the “program file\12d\12dmodel\7.00\set_ups” directory. **Do NOT** change this file. Copy it into “program file\12d\12dmodel\7.00\user” directory and edit it there. Files in the user directory are used by preference and they are never over written by a 12d update.

```
Manhole "SA2" { // internal pit size data (width, length)
//SIZE 100, 200
//DESC "2m lintel - grate and side entry"
// pit inlet capacities from Mathematical Description of Pit Entry Capacities Feb 1992
// cross fall, gutter grade, cap1, cap2, cap3, cap4
//4d 1, 1, 0, 0, 0.230, .621
//4d 1, 3, 0, 0, 0.225, .604
//4d 1, 5, 0, 0, 0.215, .577
//4d 1, 7, 0, 0, 0.200, .538
//4d 1, 9, 0, 0, 0.235, .593

//4d 3, 1, 0, 0, 0.495, .819
//4d 3, 3, 0, 0, 0.270, .568
//4d 3, 5, 0, 0, 0.290, .599
//4d 3, 7, 0, 0, 0.400, .727
//4d 3, 9, 0, 0, 0.330, .649

//4d 5, 1, 0, 0, 0.540, .793
//4d 5, 3, 0, 0, 0.480, .747
//4d 5, 5, 0, 0, 0.460, .744
//4d 5, 7, 0, 0, 0.450, .729
//4d 5, 9, 0, 0, 0.420, .704
```

The format of the entries is as follows.

1. All lines are to be blank or begin with //. This is not the normal 12d convention.
2. //SIZE indicates the values to be read and stored in the user defined pit attributes **pit internal width** and **pit internal length** when the pit schedule macro is run. A comma is used to separate the two values.
3. //DESC indicates that the following quoted text will be read and stored in the user defined pit attribute **pit type description** when the pit schedule macro is run.
4. The pit inlet capacity table data must begin //4d and commas are used to separate the data (comma delimited).
5. SAG pit names must begin with the 3 letters SAG.
6. The sample data provided is taken from the paper, “Mathematical Description of Pit Entry Capacities”, Feb 1992, by Geoffrey O’Loughlin *et al.*

Pit Inlet Capacities

The pit inlet capacity tables contained within the **drainage.4d** file are used by the drainage design packages in different ways but with a common philosophy. An example entry may be found in the section

“The drainage.4d file” on page 2102

On grade pits

Crossfall data must never decrease moving down the table while the gutter grade data must increase for a constant crossfall. When the tables are being read, the next set of capacity factors will not be used until the crossfall and grade are equal to or exceed the values in the tables. The factors are not interpolated!

Drains and ILSAX

The cap1, cap2, cap3 and cap4 values are used to describe the inlet capacity of the pit as described in their user manuals.

RAT-HGL

If cap2, cap3 and cap4 are all equal to zero then a fixed inlet capacity equal to cap1 will be exported to RAT-HGL. If the sum of these three values is greater than zero then a pit type will be created in the format of **pit_type-crossfall-roadgrade**. For example SA2-3-2 for a SA2 pit with a road crossfall of 3% and a road grade of 2%. A rating curve with this name will have to exist inside RAT-HGL. 12d has no way of transferring the rating curve itself into RAT-HGL.

PC Drain

Similar to RAT-HGL, PC Drain has its own rating curves defined internally. The road grade is sent as a separate piece of data to PC Drain so that the pit inlet capacity may be determined.

SAG Inlets

Sag inlets always have a manhole type that begins with the three letters SAG or for PCdrain they end in a S. Sag pits contain only one line of data and an example follows.

```
Manhole "SAG3" {
// pit inlet capacities from Mathematical Description of Pit Entry Feb 1992
// if zeros are entered Sc1 and Sc2 then calculated crossfalls (if available) are used for
Drains and ILSAX
// Sc1 and Sc2 and the slope upstream on the overflow path is used for S11 and S12
//      Sc1      ,      Sc2      ,      S11      ,      S12      ,      lintel length,      max depth
//4d      3.0,      3.0,      0.5,      0.5,      3,      .150
}
```

Special conditions exist for each of the following programs.

Drains and ILSAX

RAT-HGL, RAT 2000 and XP SWMM

No direct means of specifying SAG pits has been established. A fixed inlet capacity before bypass begins can be calculated and entered with the format of an on grade pit. Cap1 would represent the inlet capacity with cap2, cap3 and cap4 being set to zero.

PC Drain

PC Drain places a suffix code in the pit type to specify that the pit is a SAG pit. For example an 9S0.03 indicates that pit type 9 is a sag pit and the maximum depth before bypassing is 30mm.

Flooded Width Analysis and HEC RAS

The Calculate Flooded width procedure creates cross sections along the **bypass flow** paths and then calculates the flooded width at each section using Manning’s normal depth calculations. A HEC-RAS project (same name as the bypass flow string) is also created for each line. The flooded width is indicated on each section as a blue line if it is less than a user defined width and a red line if the flooded width exceeds the limit. Details of the calculations such as the velocity, depth, wetted perimeter and slope can be exported to a spreadsheet for further analyse (velocity times depth calculations for example). The discharges imports from the urban stormwater design packages are shown in the following table.

Design Program	Discharge Event
PCdrain Drains	Minor ARI Maximum flow event analysed
ILSAX	Maximum flow event analysed
RAT HGL	First return period analysed

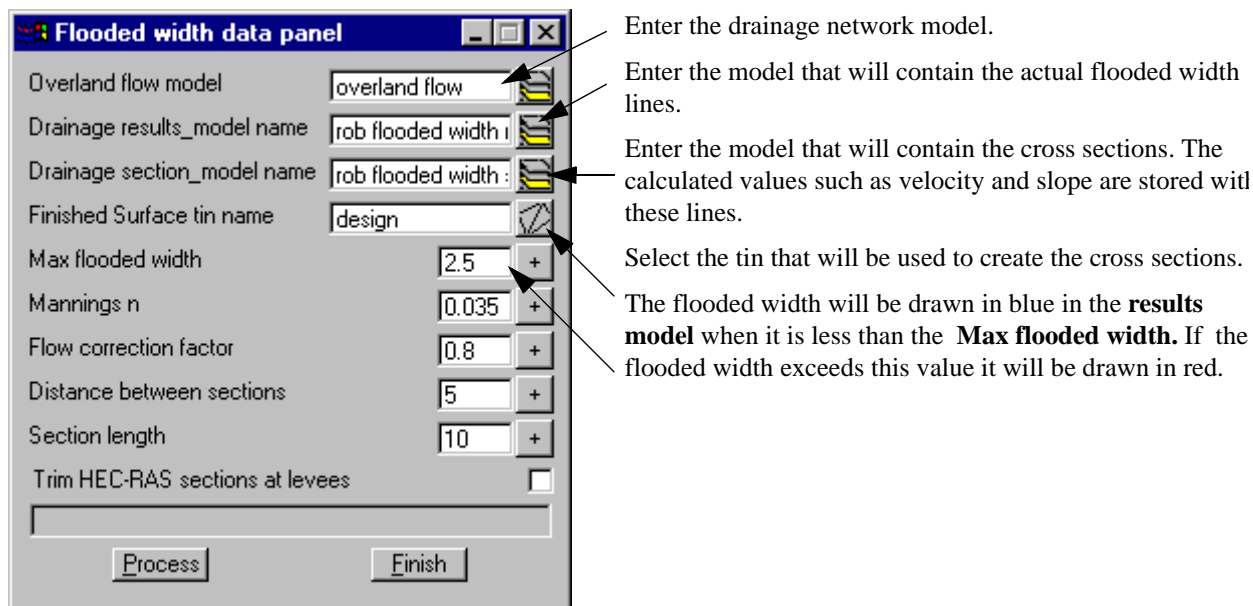

The user defines the length of these sections and the interval at which they are to be spaced. 12d calculates the normal flow depth interpolating the pit approach and bypass flows from the hydrology models (ILSAX, Drains, PC Drains or RAT HGL). The cross sections are taken perpendicular to the flow line and the slope is for the normal depth calculations is determined using the distance along the flow line and the change in elevation between the two lowest points in the primary flow channel. The flow line need not intersect the low points on the section but the flow line does mark the primary flow channel. If the depth of the flow exceeds the banks of the primary channel, then all adjacent flow channels will be considered as active flow area.

Limitations where overland flow lines join

Where overland flow lines converge at a manhole, 12d does not know the flow split between the 2 approaching paths. Therefore, 12d uses the total flow from all lines as the flow at the manhole for each line. This may overestimate the flooded width along the flow lines at these points.

Limitations at SAG pits

The flow width are not shown adjacent the sag inlets. The depth of flow due to ponding and the approach flow coming from several directions may overestimated flooded width in these areas. Therefore not flood depths are caclulated approaching SAG inlets.

Manning's n is the n value to be used in the normal depth calculations.

The **Flow correction factor** is the factor described in ARR 1987 for calculating depths of flow in gutter channels.

Distance between sections specifies the interval at which cross sections and therefore flooded width will be calculated along the flow path.

Section Length defines the length of each cross section. The cross section will be centred on the overland flow path.

Trim HEC-RAS sections at levee is used for super critical flow calculations in HEC-RAS. If you plan to do super critical flow calculations then check this box. A levee point is the crest in the cross section found as you move away from the flow line location. If a levee point is encountered then the section is trimmed here. This is a feature because HEC-RAS has problems with cross sections with levees.

Cross Sections and Discharges

The analyse flooded width will proceed along each flow path and identify every pit on the line. Cross sections will be constructed in the model with the length and interval entered in the input dialogue. These cross sections may be plotted using the main menu selection **Plot=>X plot=>X plot**. The **Sort Sections** must **not** be selected for these sections to be plotted.

Discharges will be determined for each cross section by pro-rating the discharge dependant on the distance between the pits. The bypass discharge will be taken from the upstream pit and the approach discharge of the downstream pit.

12d will give warning messages in the output window when it encounters the following conditions and these messages will be stored as string attributes on the flooded width strings. Descriptions of these messages follow.

Inverts do not go downhill

12d locates the lowest point (adjacent to the flow line without moving over a local crest) on each cross section to calculate the slope between the cross sections. This message indicates that the downstream minimum elevation is higher than the upstream minimum elevation.

Sometimes flow lines will go uphill. If you have specified an overflow from a SAG location then the flow line will go uphill until it crosses the overflow crest.

If the flow line is not supposed to be going uphill at this section, check to see where the flow line intersects the cross section located upstream of the one identified in the warning message. If it is in a local sag point

that is not the lowest point on the section, move the flow line.

The program will use a slope of 0.5% to calculate a width at this location. This results in very wide flooded width sections to draw the user's attention to the problem area.

Vertical Walls Assumed at the Ends of the Cross Sections

If the depth of flow exceeds the ground surface elevation at the ends of the cross section a warning message the warning message shown above is shown. The cross sections causing the warning follows.

The vertical wall is placed at cross section chainage -20. Note that the flow line is always at chainage 0

Drainage Overflow Areas from Volumes

This option is used to graphically display the overflow storage volume at a sag pit. The following pit attributes must exist for the flood extents to be calculated.

overflow volume	value greater than zero required.
sag pit	must be equal to 1.
catchment model id	set by labelling catchments
catchment string id	set by labelling catchments

The maximum storage volume is read from the drainage pit attribute "overflow volume". This may be entered manually using the **Attribute Editor** or it will be created when data is read from the drainage design programs Drains or XP SWMM design programs.

This routine locates the lowest point on the catchment string by draping the string on the tin specified and adds the overflow limit specified to this value. This becomes the **overflow limit**.

The volume at this level is calculated and the compared to the **overflow volume** read from the user defined attribute. If the overflow volume is less than the volume in the catchment then the routine iterates to find the flood level for the overflow volume.

If the overflow volume is greater than the volume in the catchment, the results depend of the **Use overflow limit** tick box.

If the box is selected, the **overflow limit** (calculated above) is reported at the flood level in the catchment.

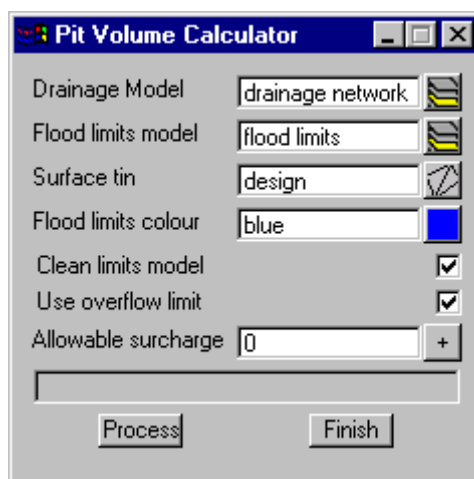

If the tick box is not selected the routine iterates to find the flood level where the storage equals the **overflow volume** read. This option allows the user to see the maximum flood level should the catchment low point become blocked.

Drainage overview

Usage

This panel is accessed from the menu selection **Design => Drainage Sewer => More=>Calc pit overflow areas**

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model	model box		

all pits in this model that have a non zero "overflow volume" and "sag pit" set to 1 will be processed

Flood limits model model box
flood limits strings will be created in this model

Surface Tin tin box
ground surface tin used to calculate the volumes and flood limits

Flood limits colour colour box
flood limits strings will be created using this colour

Clean limits model tick box
*if selected all strings in the **Flood limits model** will be deleted before the calculations commence.*

Use overflow limit tick box
*if the elevation calculated from the storage volume is higher than the lowest point on the catchment string then the **allowable surcharge** value below will be added to the lowest point on the catchment string and this elevation will be used to determine the flooding limits*

Allowable surcharge real box
*this value is used only if **Use overflow limit** is ticked. Its purpose is described in the field above.*

Process button
executes the option.

Finish button
removes the dialogue from the screen

Drainage Utility Program

utilities_panel

Position of option on menu: Design => Drainage-Sewer =>More => Misc. utilities

The Drainage utility program contains functions to significantly reduce the time required to perform drainage tasks. These tasks include

Assign Pit names

To use the export routines, every pit in 12d must have a pit name. This selection automatically creates the pit names for the entire model or selected strings. Examples of pit names are 1,2,3... A1,A2,A3....Pit 3-A, Pit 3-B.

Reset pit cover levels

This selection sets the cover levels for the manholes to the design tin or design strings. The user will be prompted for each manhole to select a tin level, a string level (if a design string model is supplied) or keep a manually set level. The tin/string/manual selection will be stored and the levels reset now and whenever the pit/pipe interfaces exports the data (unless this last option has been manually turned off).

Regrade pipe levels

The selection applies the default grading rules (cover level) to reset the pipe invert levels for the entire network. Manhole cover levels are not changed during this function

Label Catchments and Label drainage network

This selection quickly creates labels for a drainage and catchment plan. The pits are labelled with their name, the pipes with their diameters and the catchments with their area and the pit they drain to. These labels must be updated using this selection whenever the catchment or network is changed. To turn off the automatically drawn pit names in the current view select **Menu=>Settings=>Text=>Toggle** and select the drainage model.

Analyse Flooded Width

This is the only hydraulic calculation that takes place in 12d. The normal depth along the bypass flow paths is calculated using discharges imported from hydrology/hydraulic packages including spreadsheets. This flooded width is drawn to scale at intervals along the bypass flow path and colour coded (blue if less than a specified limit and red if greater than the limit).

Drainage overview

Usage

This panel is accessed from the menu selection

Design => Drainage-Sewer => More => Misc. utilities

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

drainage model	input box		
<i>Model to contain all of the pit and pipe network to be worked on.</i>			

catchment area model	input box		
<i>Model to contain the catchments strings for the Drainage Model above</i>			

Assign pit names	button		
<i>This button launches a dialogue for setting the names for the pit and pipes in the network model.</i>			

design tin	tin box		
<i>This optional field allows the user to specify a new tin for the surface levels of the pits. If you are using road grade and cross fall for pit inlet capacity it is preferable leave this blank and to link the pits to a string using the design model field below. If some or all of the pits are linked to strings in the design model below, they will still use the strings selected. more about design strings</i>			

design model	model box		
<i>This model contains the strings for the pit cover levels (the string directions are also used for road grade and cross fall). If this model is changed you will be prompted to select new strings to link the pits to. more about design strings</i>			

Reset pit cover levels	button		
-------------------------------	--------	--	--

This button will reset the pit levels to the design strings in **design model** or to the tin specified in **design tin** above. The first time this is selected you will be prompted to choose whether to set the pit cover level to the design tin or the a string in the design model. **more about design strings**

Regrade pipe levels button

The selection applies the default grading rules (cover level) to reset the pipe invert levels.

network labels model model box drainage labels network

Model to contain the network labels for the **Drainage Model** above. This model is cleaned out each time **Label drainage network** is selected.

catchment labels model model box drainage labels catchment

Model to contain the catchment labels for the **Catchment Area Model** above. This model is cleaned out each time **Label catchments** is selected

catchment units choice box ha, acres

Conversion factors of 10,000 will be used for ha and 43560 for acres. Not that not all design packages support both units.

text parameters input box

Select the + to access the text parameters (colour, size, alignment etc.) for the text created with **Label Catchment** or **Label drainage network**

label catchments button

This selection creates labels indicating the catchment name and area in the units specified above.

CAUTION: If you change you catchment strings or rename you pits you must run this routine to update the labels.

label drainage network button

This selection creates labels indicating the pipe size and pit name for the network model.

CAUTION: If you change you change the pipe sizes or rename you pits you must run this routine to update the labels.

analyse flooded width button

This selection launches the dialogue for analysing the flood along bypass flow paths. The bypass flows must be imported from your design package/spreadsheet before running this selection.

[drainage_utilities_panel_assign_pit_names](#)

Set Pit Names

The **Set pit name** selection names the pits and pipes for the drainage model (both pits and pipes can be named). Three numbering schemes are available:

drainage strings names are used as the prefix followed by the pit number (ex A-1)

drainage strings names are used as the suffix followed by the pit number (ex 1/A)

the pits are sequentially numbered. (ex 1,2,3....)

The names can have pre-text added to the beginning of the pit name and a separator between the string name and the pit number (/ - etc.) if desired.

Design Program Notes:

PCdrain users: Since catchments contain only 3 characters do not use separators. Using the letters A-Z for strings and numbers 1-99 will give you 26 strings and up to 99 pits on each string. Using the numbered stem works very well in PC Drain.

Micro Drainage users: Pits and pipes are numbered separately in Micro drainage. The pipes must use the numbered sequence with the most upstream pipes numbered with the smallest numbers. Number of digits must be set to 3.

ILSAX users: You must use alphabetic characters for your string names and no more than 3 characters

See Also

- Drainage overview

Usage

The selection is found on the drainage **network editor** and is accessed through the main menu by selecting

Design=>Drainage-Sewer=>Drainage Network=>Drainage=>Network editor

Select the **Set Pit Names button** and the following panel will appear.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model	Model box		drainage model from main dialogue
Naming Method	Choice box		
		<i>Pit num - String name</i> for string A manhole 1 the name is IA	
		<i>String name - Pit num</i> for string A manhole 1 the name is AI	
		<i>Sequential numbering</i> the strings names are sorted alpha-numerically and the manholes are numbered starting at First pit number	
Pre text	input box		
		<i>this text will precede the pit name (ex Pit A01)</i>	

String/pit separator input box

the character that separates the string name from the pit number. For example if pit names A/01, A/02 etc. where desired a "/" would be entered. You may omit the separator if none is desired.

First Pit Number integer box

the starting pit number on the drainage lines. For drainage strings with the flow direction set as descending chainage the first pit is the junction pit.

Min digits in pit numbers integer box

a non zero value will pad the pit numbers with leading zeros. (ex if 2 is entered, pit 1 is not A/1 but rather A/01)

Reverse numbering order tick box

*Unselected, pit **First pit number** is at the low chainage end of the line. Selected, pit **First pit number** is the second pit from the high chainage end of the line.*

Number pits tick box

the pits are assigned names. This allows the pit and pipes to be names differently.

Number pipes tick box

the pipes are assigned names. This allows the pit and pipes to be names differently.

Run button

name the pits/pipes. The pit at the high chainage of the string is not labelled. The only time you will need to name this pit is when it is the outlet from the system.

Back to Editor button

return to the network editor.

Help button

display this page.

file name input box

*Required file to be read or written to. If a clipboard format is chosen for **import/export format** above then the data will also be written to this file on a **Copy** selection*

catchment area model input box

*Optional model to contain the catchments strings for the **Drainage Model** above. Also see **Designating Catchment Areas***

catchment units <c> input box ha, acres

Conversion factors of 10,000 will be used for ha and 43560 for acres. Not that not all design packages support both units.

catchment characteristics modelinput box

Optional strings in this model will be used to define the catchment slope and width (XP SWMM only)

bypass flow model input box

*Optional model to contain the bypass flow strings for the **Drainage Model** above. Also see **Creating Bypass Flow Strings***

road design string model input box

*Required if **bypass flow model** is specified above. Also see **Pit Inlet Capacity, road grade/crossfall and Bypass routes***

services model input box

Optional if the strings in this model cross the drainage network the crossing data (drainage chainage, invert elevation and thickness) will be sent to the design package

additional services model list (file)input box

Optional if your services lie in more than one model then enter a text file name here and then select edit from the fields file icons. Type the names of all of the service models and then save the file.

project description input box

Optional this description will be sent to the design program

export pipe diameters and invertstick box

*Select this tick box to export the pipe diameters and inverts. see also **Quick Check Lists for Drainage***

Design Software

export default catchment/pit parameter stick box tick

*selected all default catchment parameters are exported
not selected only catchment area is exported if **catchment area model** is specified above. see also
Quick Check Lists for Drainage Design Software*

Options button

several calculations are preformed before all exports. Advanced users may turn some off for large models (100's of pits). The option to re-link your pits to new design strings is also included here.

More options

Write/Copy button

*This will create/over write the file specified above in **file name**. If **Copy** button is present the data will also be placed on the windows clipboard as Tab delimited text.*

Read/Paste button

***Read** will read the file specified above in **file name**. **Paste** read the data from the windows clipboard. Both selections will update the drainage strings in the model specified above in **drainage model**. If the **Spreadsheet clipboard** import is selected and the strings are not present in the model they will be created.*

Options

[Drainage_interfaces_panel](#) Drainage calculation options

Selecting the Options button brings up the dialogue to the left. Additional choices may be present at the bottom of the dialogue depending on the **Import/Export Format** that you selected on the main dialogue.:

Catchment areas when selected the catchment areas are linked to the drainage pits and the areas recalculated. See also **Designating Catchment Areas**

Re-link pits to road strings-tin when selected a dialogue for each pit will be presented asking which design string or tin to link the pit to. See also **Selecting design string or tin**

Calculate bypass flow routes when selected will calculate the downstream bypass pit, road grade and crossfall and inlet capacities. See also **Pit Inlet Capacity, road grade/**

crossfall and Bypass routes

Calculate now will calculate the selected option immediately and return the user to the main dialogue.

Set will set the options but no calculations will be performed until a **Write** or **Copy** is selected from the main dialogue.

Finish removes the panel from the screen.

Presenting Water Level Results

How to for Rivers

Rivers beta menu

River Interface Models

The River interface strings are split into different models depending on the strings function. Also the string names are used to define names of entities such as cross sections and reservoirs when they are exported. Following is a list of the river interface string types:

River strings

Source strings

Reservoir Strings

Spill Strings

River Strings

The river centre line and bank are defined by the strings in the **River strings** model.

The centre line string is used to

- s measure the centre line distance between the sections,
- s mark to zero chainage (or starting chainage) on the cross section, and
- s if automatic source strings are created they will be perpendicular to this string
- s **define culvert locations** and sizes (XP SWMM only)

The left and right bank strings are used to

- s measure the bank distances between the sections and
- s mark the cross section chainage where the conveyance (usually roughness) changes

The names of the strings must be **left bank**, **right bank** and **centre line river name, reach name** (centre may be spelled center).

The left bank is on the left side of the river looking downstream and the right bank is on the right (looking down stream). These strings need not touch each other and may extend from one river reach to another.

HEC RAS and UNET

The centre line string must begin at the downstream end of the river. The modelling convention for these programs is to have the low chainage at the downstream end. You may use super, 2D,3D or alignment strings in this model. If you put other strings in this model you will receive warning messages saying that these strings will not be used.

Each reach of the river **MUST** have its own centre line string and they must "touch" each other to create a river confluence.

A sample of a river strings model for **HEC RAS** with one confluence is shown below. The line style for the centre line is not required. It is used only to show the direction of the centre line string.

Notes:

left bank strings are shown in red, right bank in blue and centre line strings in yellow and green. The line style for the centre line strings is *Drainage_4D->Flow line*. This is not required but shows the direction of the string. The string labels were created with Strings->Label->User->Label strings with names.

Centre line string direction is very important!

HEC RAS, UNET, XP SWMM

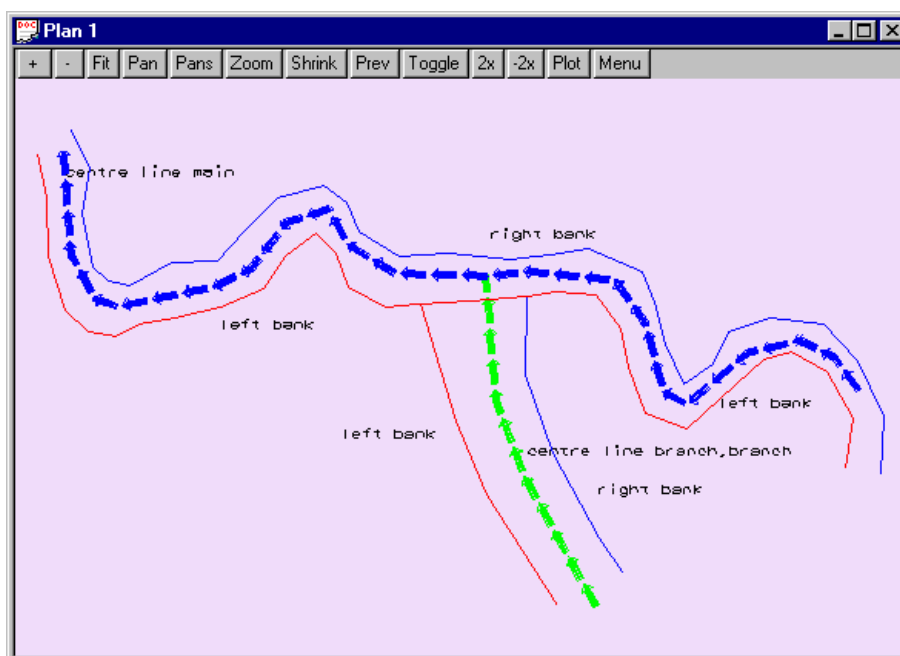

start at the **DOWN**stream end of the river

ISIS and Mike 11

start at the **UP**stream end of the river

ISIS and MIKE11

The centre line strings are drawn starting **upstream** for the ISIS and Mike 11 programs.

Source Strings

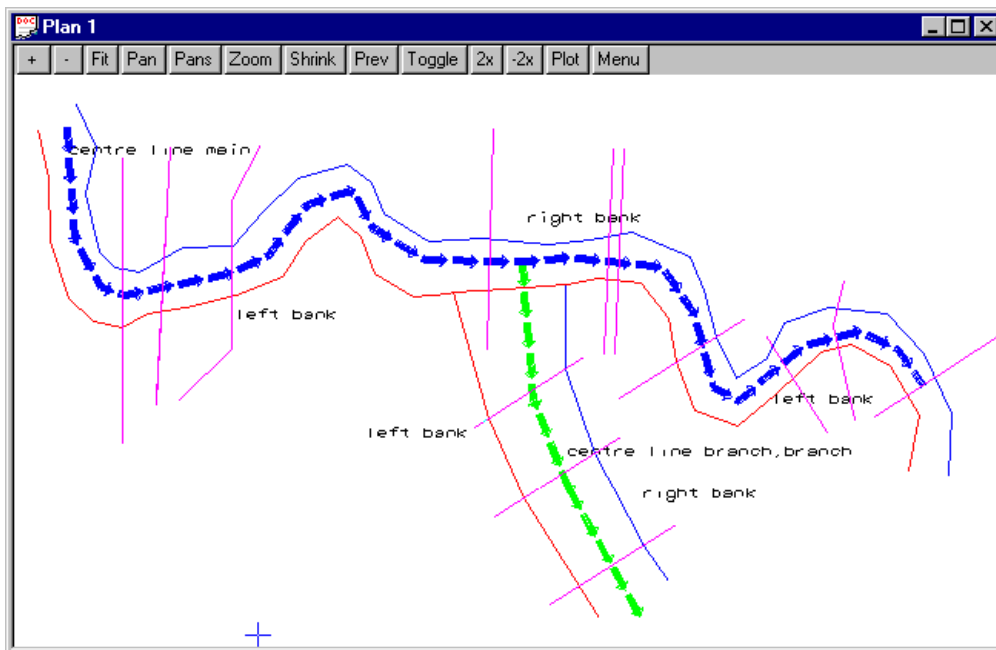

Cross sections are created at the location of the **source strings**. These source strings are initially created at a user defined spacing and section length using any one of the river interfaces writers. The user may alter these sections as desired. These may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The **Create source strings** tick box on the interface panel must **NOT** be selected to use the customised strings.

A quick way to manually create 2 point string is via the CAD tool bar.

A sample of source strings (shown in magenta) is presented below. The source strings may run in any direction except for Mike11. In Mike11, the cross sections will be created in the same direction as the source strings. For all other interfaces the low chainage will be used for the left bank (section viewed looking downstream).

Reservoir Strings

The **reservoir strings** may define inline reservoirs or offline storage. The elevation of the first point on the string sets the maximum level to be used in the stage storage curve. 12d will determine the minimum level inside the reservoir string and then calculate the volumes at a 1m (2 foot for imperial units) increment. The default increment may be changed by creating a string attribute "stage increment" (see **stage increment**).

Inline reservoirs are "touched" by centre line strings both upstream and downstream. Offline storage areas

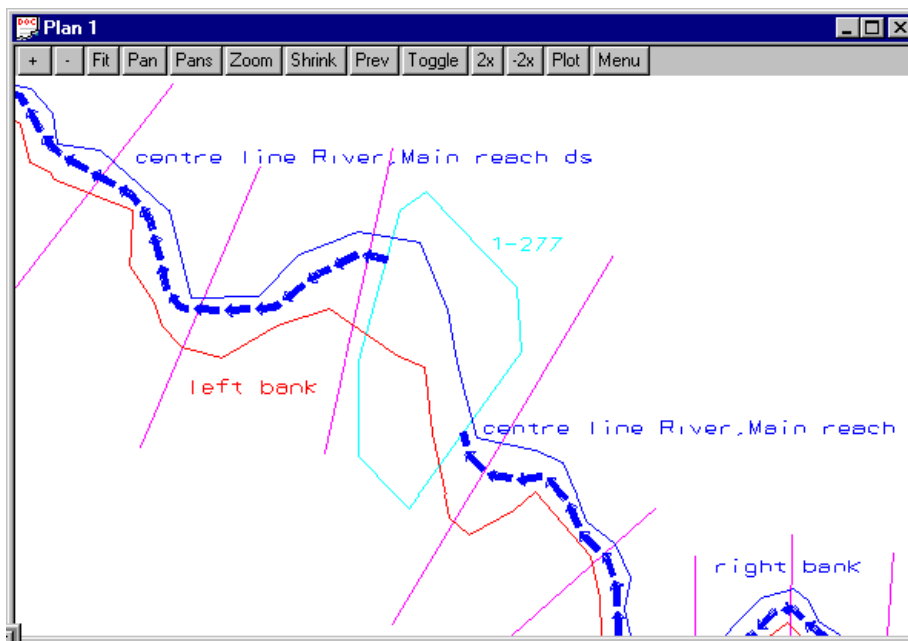

are linked to the cross sections via **Spill strings**.

Other features of the reservoir strings are

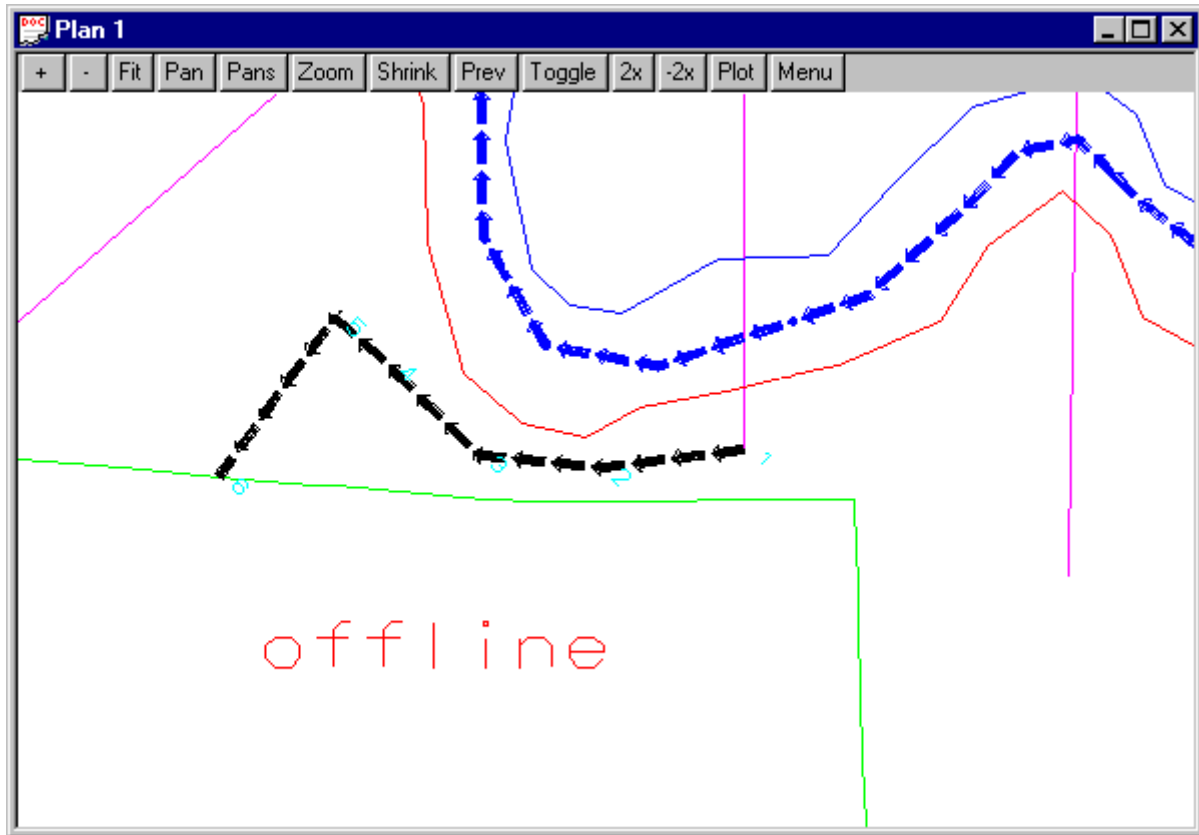

Auto height

XP SWMM catchment parameters

A sample drawing showing an inline reservoir in cyan (1-277) follows. Note that the river centre line touches the reservoir string both upstream and downstream. The left and right bank strings may continue straight through the reservoir.

A sample drawing of an offline reservoir follows (the reservoir string is shown in green). Note that the spill string (black) starts at the source string (point 1), then follows the section line to be cut and exported (points 2 to 5) and ends by touching the off line reservoir string at point 6. The rivers strings do not touch the offline storage strings.

Spill strings

Spill strings are strings that link offline storage areas to a cross section (see drawing above). The string must begin by "touching" the source string and then proceed to the first point on the spill section. During the export the first point will NOT be exported as part of the spill section. After defining the end of the spill section the last point on the string must "touch" the reservoir string. Again this last point will NOT be exported as part of the spill section.

The default roughness for the spill section is the "left n" from the main export panel, the default slope is 0.5% and the default length is 100. See the manual setting table for **manual override settings**.

Define Culvert Locations

12d allows culverts to be included as a segment of a super string. The **XP SWMM** rivers interface allows culverts in 2 models. In the spill string model, a two point superstring may cross a spill string to indicate a culvert through the embankment. In the river string model a segment of the river centre line may be marked as a culvert. If a source string crosses the same segment than a multi-link with both the culvert and the natural section will be exported.

Adding a Culvert to a super string

1. **Super strings only!**
Convert string to a super string (if required)
Strings->Convert
2. **Mark the ends of the culvert.**

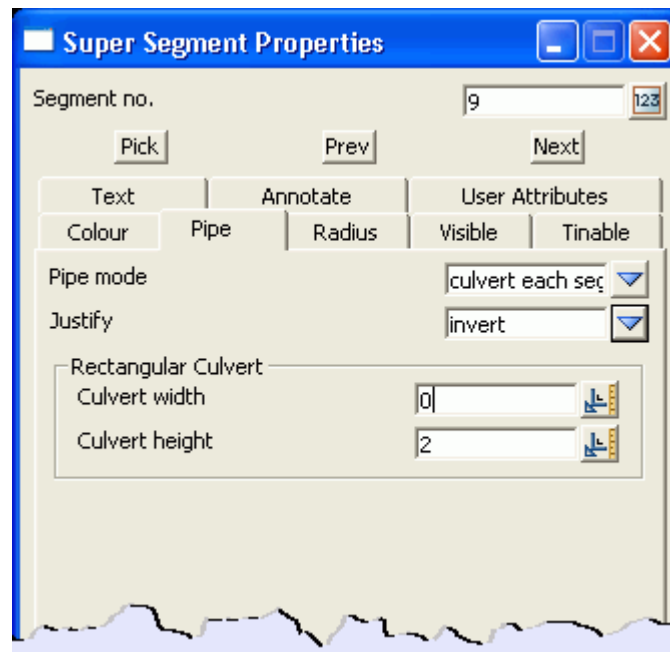

Add a vertex at the upstream and downstream end of the culvert (Toggle vertices on if desired)

String->Points Edit->Insert

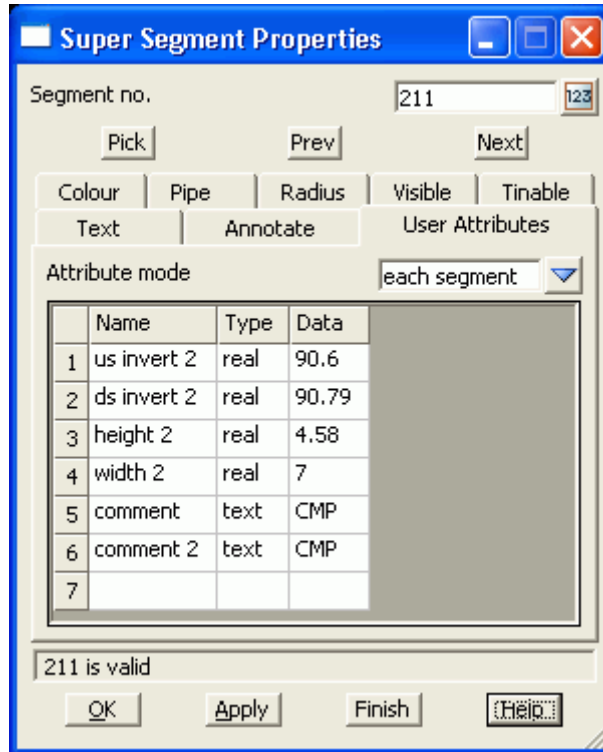

3. **Mark the segment as a culvert or pipe**

Use the super string segment editor to set the culvert data.

Strings->Properties->Segments (all) and change Segment properties to use **culvert each segment** (box) or **pipe each segment** (round). Note that if there is one box culvert on the centre line then all must be box culverts. If you need pipes and box culverts combined, set the width to zero for pipes. Also set the Justify mode to indicate the type culvert levels you wish to specify.

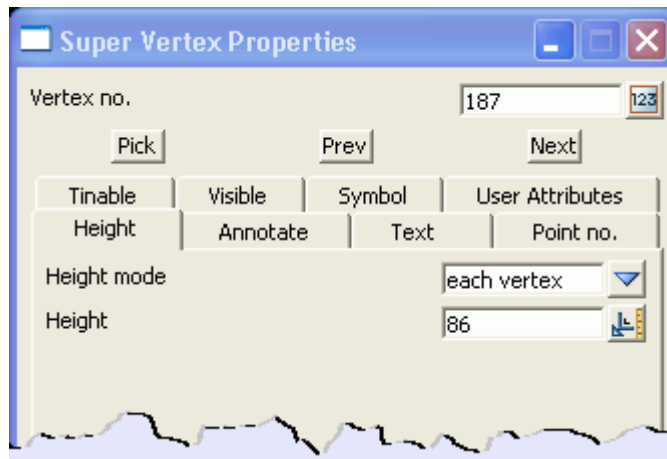

If there are two (max is 7) culverts at this location that have different inverts or sizes add the following user defined attributes to the segment. The comment attributes are printed by the Culvert Table routine and are used to label the culvert as well. If there are a number of identical culverts, the attributes "number of pipes" (integer) can be set to a value greater than 0. Additional attributes to customise the culvert are listed at the end of this section. Default mannings n are 0.024 for pipes (corrugated metal) and 0.012 for box (concrete).

4. **Set the upstream and downstream levels**

Select a vertex at the end of segment, ensure the **height mode** is **each vertex** and set the height. Use the **Next** or **Prev** button to move to the other end of the culvert and set its height as well.

Culvert Segment Attributes

Purpose	Attribute Name	Type	Typical Data Value
Culvert entrance loss	entrance loss	Real	0.5
Culvert exit loss	exit loss	Real	1.0

Purpose	Attribute Name	Type	Typical Data Value
Culvert length	length	Real	8.0
Multiple identical culverts	number of pipes	Integer	2

Culvert Table

Culvert_table_panel

Position of option on menu: Design=>Rivers=>XP SWMM interface=>Culvert table

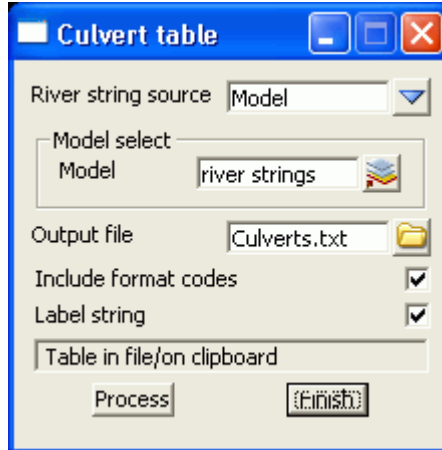

This option is used to create a table of the culverts created along the centre line of the river and to label the invert levels and comment for the first culvert on each segment (some segments may include attributes for more than on culvert). A sample is shown below.

chainage	Number	US Inver	DS Inver	Height	Width	Quantity	X location	Y location	Comment	Segment
Centre line center line 1										
88444	1	125.28	124.95	11	7	1	683236	1389459		705
87269	1	127.58	127.24	6		1	683059	1390605	72/cmp	695
85983	1	123.13	123.72	6		1	682871	1391834	inv-72/cm	682
84317	1	124.15	123.47	6		1	681757	1392779		666
84317	2	124.59	125.15	6	0	1	681757	1392779	6ft cmp	666
83854	1	123.07	123.28	5		1	681319	1392820	60 inch cc	659
83854	2	123.54	123.42	5		1	681319	1392820	60 inch cc	659

- Read HECRAS Interp sections
- Read HEC2 Data
- How to for Rivers
- Frequently Asked Questions (Rivers)

Exporting to HEC-RAS

The HEC-RAS project is created from a surface tin (representing the river bed and overbanks) and a model containing strings identified by their names “left bank”, “right bank and the name prefix, “centre line”. Any additional strings in the specified model will be ignored (warning messages will be given when you run the macro that any additional strings are being ignored). The low chainage (often zero) of the centre line strings must be at the downstream end of the reaches.

Cross sections are created at the location of the **source strings**. These source strings are initially created using the HEC-RAS option at a user defined spacing and section length. The user may alter these sections as desired. These may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The **Create source strings** tick box on the interface panel must **NOT** be selected to use the customised strings.

Presenting HEC-RAS Results in 12d

After the HEC-RAS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the HEC-RAS results. These strings are then triangulated to create a water surface tin from which the water level boundaries are determined. These results can then be shown in plan, long section, cross section and in 3D perspectives.

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The HEC-RAS panel for creating the HEC-RAS project follows.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

INPUT MODELS

River strings model Model box

*Model containing the centre line, left bank and right bank strings. **The centre line strings must begin downstream and proceed upstream.** The name of the river may follow the words “Centre line “ (note the ending space). For example the centre line string may be named “Centre line Parramatta River, downstream reach”. The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.*

Confluences are modelled by a using a separate string for all reaches. Thus a system with a branch is modelled with three strings. The branch will be one string and the main reach will have a downstream string and an upstream string. The reaches must touch at the confluence.

The distance from the start of the upstream strings to the first cross section is used to model the confluence length.

The left and right bank strings need not be separate strings (see figure below).

Source string model Model box

New source strings will be created in this model or existing source strings are contained in the model. See **Create source strings** tick box below.

Rename Source Strings Tick box not selected

If selected the source strings will be a name using the chainage along the river centre line. The **number of decimals** and the **Centre line chainage factor** (ft to miles or m to km) are specified below.

Centre Line Chainage Factor Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Number of decimals Real box

When **Rename source strings** is selected, the source strings name will have the specified number of decimals.

CREATE SOURCE STRNGS OPTIONS

Create Source Strings Tick box not selected

When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modified. On the **Strings->Points Edit** menu you will find the selections **Move** (to move the end points), **Insert** (to insert additional points).

Distance between sections Real box

The distance between the cross sections. At present no check is made for overlapping cross sections around river bends.

Section Length Real box

The length of the cross section with zero chainage at the mid point.

CROSS SECTION DATA

Cross section model Model box

The cross sections created and exported are stored in this model.

Surface Tin (not the model) Tin box

Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).

Levee Tolerance Real box

If the surface level drops more than this amount while moving away from the channel centre line then the crest is marked as a levee. A value of zero means that no levees are marked.

Delta Y tolerance Real box

This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. The filtered (smoothed) and original sections are kept for comparison. **The final water**

tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.

STARTUP DATA

Manning's n Real box

Manning's n values for the left, right and centre channel sections.

Discharge Real box

This discharge is used at the upstream end of all reaches. If you have multiple river branches, you can set the flow for each branch inside HEC-RAS or inside 12d. This can be changed at each section See manual settings

Units Choice box

This selection will set the default units for the project being created.

Project file name Input box

The HEC-RAS project name. Remember HEC-RAS (2.0 or earlier) is limited to 8 characters only. If the total path name is too long HEC-RAS will not analyse the project.

HEC-RAS Read Panel

Rivers_hecras_panel HEC-RAS Interface Reader

Position of option on menu: Design=>Rivers=>HEC-RAS interface=>Read HEC-RAS reports

After the HEC-RAS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the HEC-RAS results. These strings are then triangulated to create a water surface tin.

Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The HEC-RAS read panel follows.

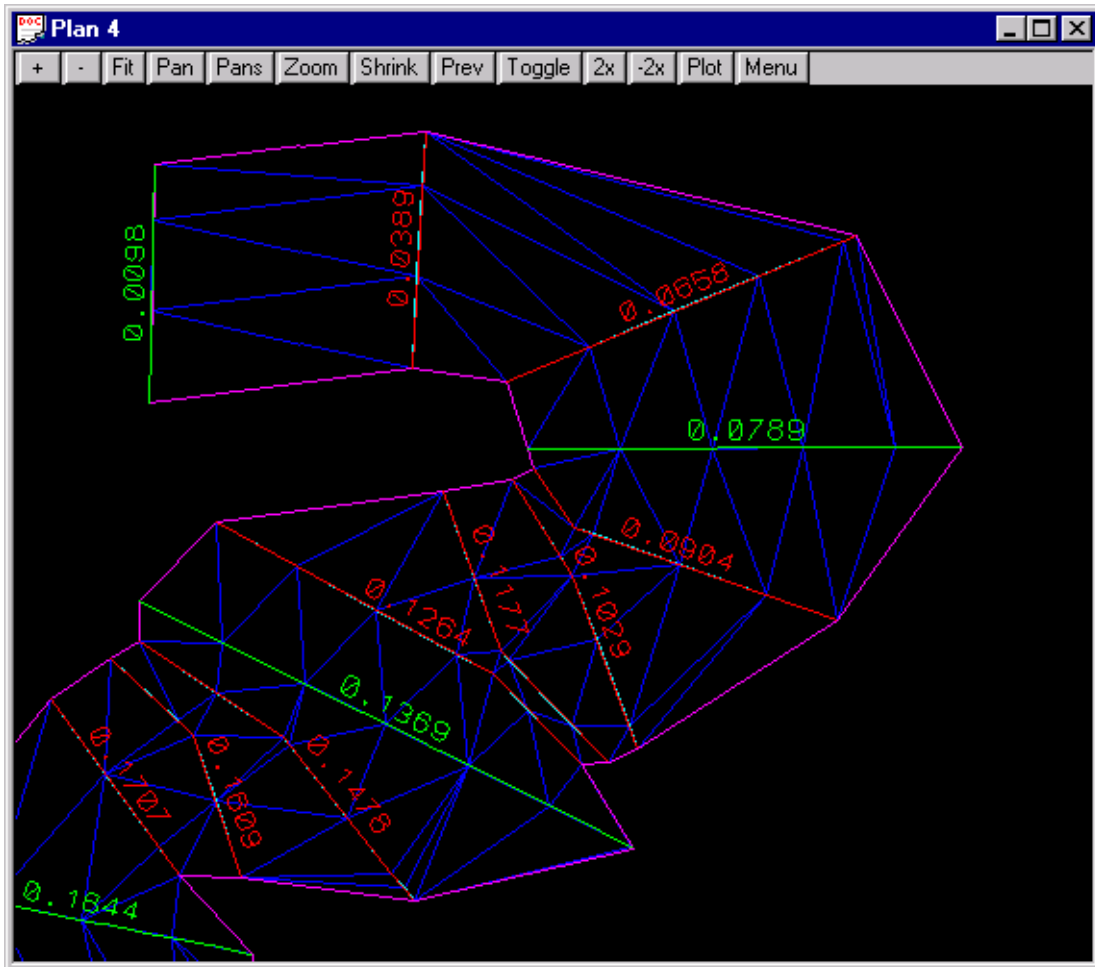

EXISTNG DATA

River strings model Model box

The river strings model specified in the write panel.

Cross Section model Model box

*The cross section model specified in the write panel. This must be specified but is only used when reading the *.rep file types (see **File format** below). The interface will search the string names in this model for the cross sections specified in the HEC-RAS report. A match is successful if the HEC-RAS cross section chainage and the string name are within the tolerance specified below in **Chainage tolerance**.*

Shape string model Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Ground surface tin Tin box

*If a **boundary string model** is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the **boundary string model** field.*

File format Choice box

The GIS format should be used in most cases. The rep format is used for reading the HECRAS report files with the "Standard Table 1" selected in HECRAS.

HEC-RAS report file name File box

The HEC-RAS report file (GIS format) is created using the HEC-RAS menu selection

File=>Export GIS data

The HEC-RAS report file (REP format) created using the HEC-RAS menu selection

File=>Generate Report

The report must include the Standard Table 1.

RESULTS DATA

Water surface tin model Model box

The model to contain the new water surface tin.

Water surface tin Tin box

The name of the water surface tin to be created.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

PARAMETERS

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Centre line chainage factor Model box

*This data is only required if the **Shape string model** is used. The shape string names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.*

Chainage Tolerance Real box

This is the tolerance used when the cross section chainage from the HEC-RAS report is compared with the cross section string names. A value of 0.00001 is excellent if you have not altered the cross section names in 12d or HEC-RAS.

However, if you have altered chainage names then you may have to increase the value of the tolerance. Suppose the tolerance is set to 0.001 and the water level for section 0.056 is read from the HEC-RAS report file. The interface will search for the first string with a name between 0.055 and 0.057. If you chose to great of a tolerance then more than one water level result will match a 12d cross section and a warning message will be given.

If you have one specific cross section that you would like to have a different tolerance set for (maybe only one section is giving you troubles), use the Attribute Editor

(Strings->User->Attribute Editor), select the cross section string and create a real type attribute named tolerance set to the tolerance desired.

Import cross sections (GIS file)

Rivers_hecras_gis_panel

Position of option on menu: **Design=>Rivers=>HEC-RAS interface=>Import cross sections (gis file)**

This option is used to import HEC RAS cross sections are HEC RAS interpolated cross section into 12d model. Note that the imported cross sections will be given the X,Y coordinates used in the HECRAS project.

Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

The source strings define the location where cross sections are cut from the ground surface TIN. A node is created in XP-SWMM at this location and the cross section shape is used to the next downstream node (no cross section is created at the most downstream source string).

The centre line and overbank channel lengths are measured in the downstream direction. XP SWMM link and node input panels are displayed below with the relationship to the 12d model described.

tion

XP SWMM Conduit Data

The slope of the conduit/link is calculated by assuming that its invert matches vertically with the invert of the downstream link. The overflow levels at the nodes are calculated by determining the lowest of the bank levels for the upstream and downstream links. The least of the overflow depths at the nodes is then used as the link diameter.

Usage

The XP-SWMM panel for creating the XP-SWMM project follows.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

River strings model	Model box		
----------------------------	-----------	--	--

*Model containing the centre line, left bank and right bank strings. **The centre line strings must begin downstream and proceed upstream.** The name of the river may follow the words "Centre line " (note the ending space). For example the centre line string may be named "Centre line Parramatta River, downstream reach". The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.*

The left and right bank strings need not be separate strings (see figure below).

Source string model	Model box		
----------------------------	-----------	--	--

*New source strings will be created in this model or existing source strings are contained in the model. See **Create source strings** tick box below.*

Create Source Strings	Tick box	not selected	
------------------------------	----------	--------------	--

When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modi-

fed. On the **Strings->Points Edit** menu you will find the selections **Move** (to move the end points), **Insert** (to insert additional points).

- Distance between sections** Real box
The distance between the cross sections. At present no check is made for overlapping cross sections around river bends.
- Section Length** Real box
The length of the cross section with zero chainage at the mid point.
- Cross section model** Model box
The cross sections created and exported are stored in this model.
- Centre Line Chainage Factor** Real box
The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.
- Number of decimals** Integer box
The cross section names are created with this many decimals. CAUTION XP SWMM only allows 10 characters for the names and each link name begins with "Lx-" That leaves 7 characters for the chainages.
- Surface Tin (not the model)** Tin box
Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).
- Levee Tolerance** Real box
Not implemented in XP-SWMM.
- Manning's n** Real box
Manning's n values for the left, right and centre channel sections.
- Delta Y tolerance** Real box
*This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. The filtered (smoothed) and original sections are kept for comparison. **The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.***
- Discharge** Real box
*This discharge is used at the upstream end of all reaches. If you have multiple river branches, you can set the flow for each branch inside XP-SWMM or inside 12d. This can be changed at each section **See manual settings***
- Units** Choice box
This selection will set the default units for the project being created.
- Project file name** Input box
*The XP-SWMM *.xp name to be created or updated. An xpx file will also be created using this name to*

transfer the data.

After selecting the **Process** button the cross section strings will be created and exported to a xpx file (using the project file name as the stem. **Never included ".xpx" in the project file name**) The xpx file will be over written without any warning. This is only used as a temporary transfer file.

12d needs to know where XPSWMM program and the XP SWMM working directory are. The system file that contains these locations is called XPSWMM.4d. (See **System file path** for its location). The file contents are as follows:

Line 1 the XP SWMM working directory
 Line 2 the full path to the XP SWMM program
 Line 3 the destination of the hydro.ini file when it is created

IMPORTANT: include the final "\" on lines 1 and 3.

The **XPSWMM.4d** file as supplied follows;

```
c:\xps\xp-swmm\work\  

c:\xps\xp-swmm\xpswmp32.exe  

c:\xps\xp-swmm\  

```

Next 12d will check for an XP project in your XP SWMM work directory (project file name + ".xp"). If it does not exist the file **Master_rivers.xp** will be copied from the **System file path** to your XP SWMM working directory. If a wp file already exists in your working directory you will see the following options dialogue.

The default is to update the wp file. Nodes and links in the file with the same names as in the export will be updated. If they do not exist they will be added. The import will NOT delete any nodes or links inside XP SWMM. This option is often used to merge rivers data with urban drainage data.

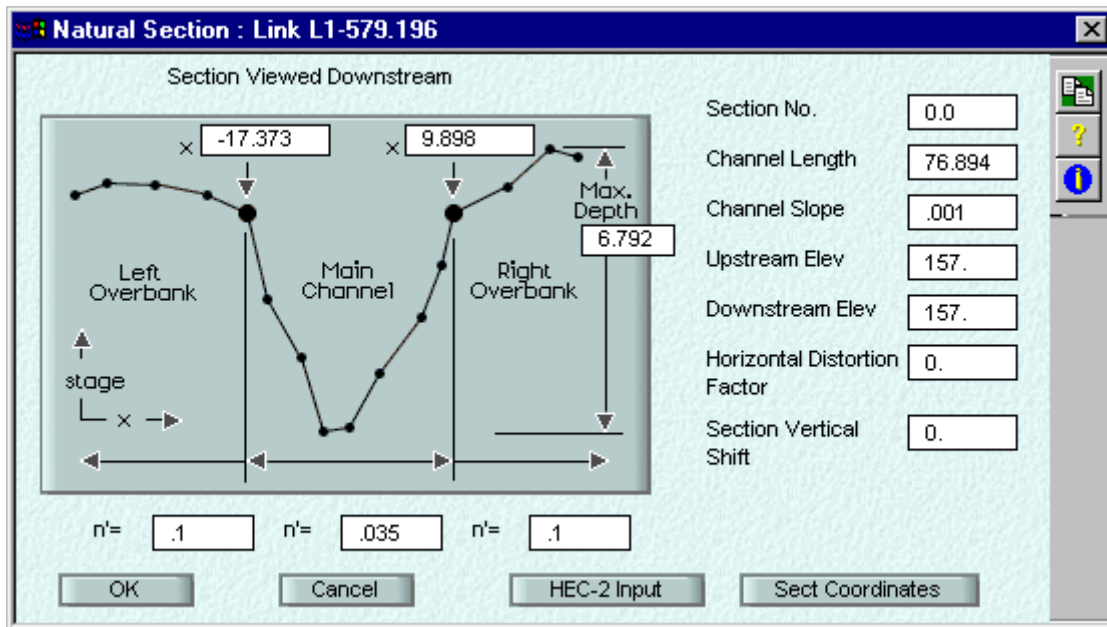

The over write option will copy the Master_river.xp file into the working directory and over write the existing file.

In either of the two cases the xpx file will be imported after XP SWMM has started. When you exit your XP SWMM session regardless of whether or not you save the XP file the XPX file will be exported over writing the original export file from 12d.

Your third option if not to run XP-SWMM at all and work with the XPX file as you see fit.

Export Details

The following diagram displays how the values from 12d are exported to XP-SWMM

At every source string location a node is created in XP-SWMM. The cross section geometry is then used for the downstream reach and is exported looking in the downstream direction.

The node name is **set manually** or calculated inside 12d by obtaining the centre line chainage at the intersection with section string. This value is divided by the **Centre line chainage factor** and rounded to the **Number of decimals** specified in the 12d export dialogue box. This value is then prefixed with the reach index followed by a dash. The downstream link name is set to the node name prefixed with "L". If you are planning to merge the river file with an XP SWMM drainage network then you will want to manually set the node names to the drainage pit names for the most upstream and most downstream source strings.

When selecting the **Number of decimals** in the 12d export dialogue, ensure that the total link name generated does not exceed the XP limit of 10 characters.

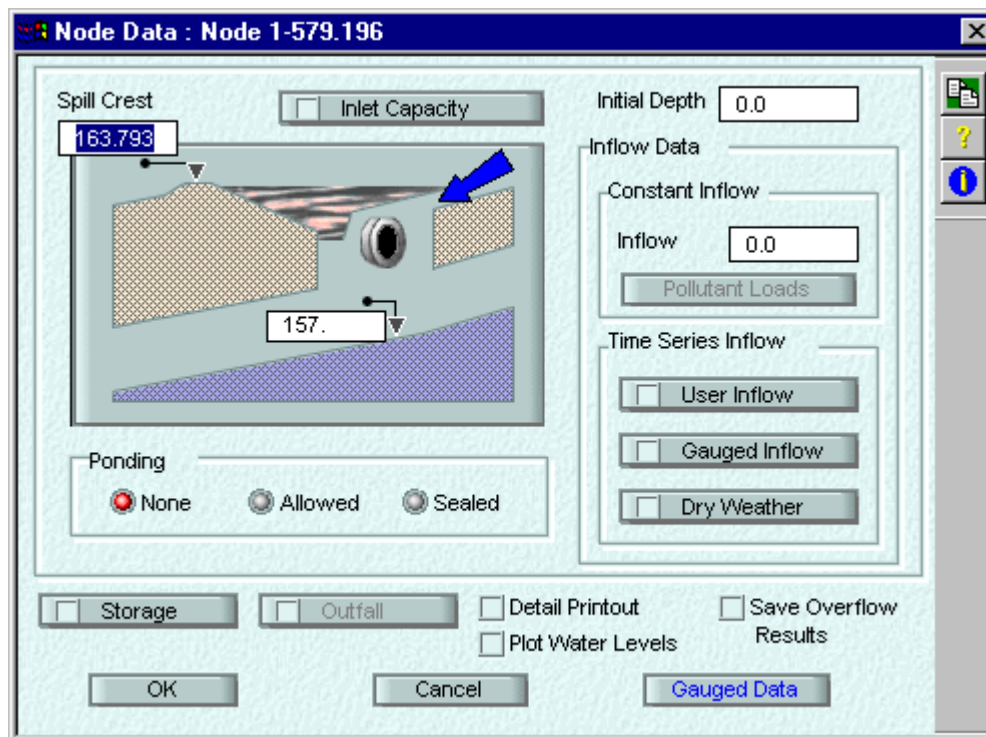

The section number variable is not exported to XP-SWMM.

Where the centre line cross the section in 12d is marked as zero chainage in XP-SWMM. The left overbank (-17.373) and the right overbank (9.898) are determined by the intersection of the left and right bank strings with the section. The n values are the values that are entered in the 12d export dialogue box. The maximum depth is calculated by subtracting the lowest elevation from the greatest elevation for both this cross section and the downstream cross section. The minimum of the two values is used.

The channel length is determined by subtracting the downstream section's centre line chainage from the current section centre line chainage. The **Centre line chainage factor** is **NOT** used in this calculation.

Upstream elevation is obtained by calculating the minimum elevation at the current section and the downstream elevation is the same value for the downstream cross section. The channel slope is calculated using these elevations and the channel length above.

The horizontal distortion factor and section vertical shift are set to zero. A section coordinate point is generated every time the source string crosses a 12d triangle edge, at the centre line and the left/right bank locations.

The spill crest level at the node is set to the maximum level on the cross section. Constant inflow is zero unless the node is the most upstream section on the reach or the flow value for the source string has been set manually see manual settings.

Hydrology Data

Hydrology data may be exported to the runoff layer of XP SWMM for both the reservoir strings and the source strings. There are 2 requirements to enable the hydrology.

Key Points

1. If you plan to use storage areas, you need to draw reservoir strings (all in one model) and each should have a name (to become the XP SWMM node name).
2. You must create a file named "hydrology.txt" and store it in the project working folder. This file will contain the default xpx variable names. These defaults may be overridden using the same xpx variable name as a string attribute on the source/reservoir string (see format below).
3. The reservoir or source string must have an integer string attribute named "xpx r rfcmnt" with a value greater than 0 (max of 5). Use the Strings->Properties->Attributes or Strings->User->Attribute Editor to create/change this attribute.
4. Total area for the reservoir strings is calculated at each export time.

Hydrology.txt file format

The file is tab delimited and each line consists of three pieces of data: the XPSWMM variable name, the default value, and the type of data (integer, real or text).

You enter the xpx variable name

Any of these default values may be specified using a string attribute on the reservoir or source string. The attribute name must be of the same type as defined in the hydrology.txt file. If data for a second XP SWMM catchment is desired add a " 2" to the end of the attribute name. Up to 5 catchments are allowed in XP SWMM.

A sample hydrology.txt file follows:

```
// SCS hydrology screen

R_CN      85      real
R_TC      60      real
R_SHF     256     integer
R_SHAPE   0       integer

R_IADEPTH 0.04    real
R_IAFRACT 0.2     real
R_IA      1       integer
CNTLS     5       integer
R_FSCS    1       integer

// sub catchment screen

R_RAINSEL "SCS Type II FL Mod."text
R_INFILSEL      ""text
R_GWTAG  0      integer

// runoff node screen

R_WAREA  1.      real
R_WIMP   1.      real
R_WIDTH  1.      real
R_WSLOPE 1.      real
```

Attribute name format for string attributes.

The attribute name is the XP variable name prefixed by "xpx " with the underscore character in the xpx variable replaced by a space. For example the xpx variable "R_RAINSEL" would be set using the attribute name "xpx R RAINSEL".

Exporting River Junctions

River junctions are defined by the intersection of the centre line strings in 12d. The cross section immediately downstream of the intersection becomes the junction node. It is used as the downstream cross section for all upstream branches. The channel length for the last link on the tributary is set to the distance the centre line string extends beyond the cross section. The distance downstream along the main branch is **NOT INCLUDED!**

XP-SWMM Read Panel

[Rivers_xpswmm_panel XP-SWMM Interface Reader](#)

Position of option on menu: Design=>Rivers=>XP SWMM interface=>Read XP SWMM xpx results file

After the XP-SWMM analysis is complete and the XP-SWMM program is closed the water level data is written to an xpx file that 12d will read. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the XP-SWMM results. These strings are then triangulated to create a water surface tin.

Create XP-SWMM files
 Presenting Water Level Results
 How to for Rivers
 Frequently Asked Questions (Rivers)

Usage

The XP-SWMM read panel follows.

River strings model Model box

The river strings model specified in the write panel.

Cross Section model Model box

*The cross section model specified in the write panel. The interface will search the string names in this model for the cross sections specified in the XP-SWMM report. A match is successful if the XP-SWMM cross section chainage and the string name are within the tolerance specified below in **Chainage tolerance**.*

Shape string model Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Centre line chainage factor Model box

*This data is only required if the **Shape string model** is used. The shape string names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.*

Ground surface tin Tin box

*If a **boundary string model** is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the **boundary string model** field.*

XP-SWMM report file name File box

*The XP-SWMM *xpx* file created automatically created when closing XP-SWMM or via the XP-SWMM menu selection*

File=>Export Data

Water surface tin model Model box

The model to contain the new water surface tin.

Water surface tin Tin box

The name of the water surface tin to be created.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Chainage Tolerance Real box

This is the tolerance used when the cross section chainage from the XP-SWMM report is compared with the cross section string names. A value of 0.00001 is excellent if you have not altered the cross section names in 12d or XP-SWMM.

However, if you have altered chainage names then you may have to increase the value of the tolerance. Suppose the tolerance is set to 0.001 and the water level for section 0.056 is read from the XP-SWMM report file. The interface will search for the first string with a name between 0.055 and 0.057. If you chose to great of a tolerance then more than one water level result will match a 12d cross section and a warning message will be given.

If you have one specific cross section that you would like to have a different tolerance set for (maybe only one section is giving you troubles), use the Attribute Editor

(Strings->User->Attribute Editor), select the cross section string and create a real type attribute named tolerance set to the tolerance desired.

MIKE11 Interface

Mike11_interface

Position of menu: **Design=>Rivers=>Mike11 interface**

The MIKE 11 interface creates the MIKE 11 project files including *.bnd11, *.hd11, *.nwk11, sim11 and the cross section data text file (to be imported into *.xns11). Water levels are read back into 12d where they may be viewed in a 3D perspective view, on cross sections and on river profiles. Plan drawings easily identify extents of flooding and all data can be plotted onto engineering drawings.

The Mike11 walk right panel is,

- Frequently Asked Questions (Rivers)

Exporting to MIKE 11

The MIKE 11 project is created from a surface tin (representing the river bed and overbanks) and a model containing river centre line strings (identified by the name prefix, "centre line"). The low chainage (often zero) of the centre line strings must be at the upstream end of the reaches.

Cross sections are created at the location of the **source strings**. These source strings are initially created using the MIKE 11 option at a user defined spacing and section length, imported from drawing packages or manually created in 12d. The user may alter these sections as desired. They may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The Create source strings tick box on the interface panel must NOT be selected to use the customised strings.

Presenting MIKE 11 Results in 12D

After the MIKE 11 analysis is complete the maximum water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the MIKE 11 results. These strings are then triangulated to create a water surface tin.

How the water level boundaries are determined

MIKE 11 Write Panel

Rivers_mike11_panel Mike11 Interface Writer

Position of option on menu: **Design=>Rivers=>Mike11 interface=>Create Mike11 files**

The MIKE 11 interface creates the MIKE 11 project files including *.bnd11, *.hd11, *.nwk11, *.sim11 and the cross section data text file (to be imported into *.xns11). Water levels are read back into 12d where they may be viewed in a 3D perspective view to easily identify extents of flooding.

MIKE 11 Read Panel

Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

12d creates most of the files necessary to run MIKE11. The exception to these are the time series files (both water level and discharge data). The simulation file created assumes that these files will have the same name as the centre line strings used in 12d. For example, if you name your centre line string *centre line Major River* then your time series files will be named *Major River-H.DFS0* for the tail water conditions and *Major River-q.dfs0* for your discharges.

The *.bnd11, *.hd11, *.nwk11 and *.sim11 files are created by appending 12d data to default data found in the following files.

cross_sections.4d

hd11-end.4d

hd11-header.4d

nwk11-header.4d

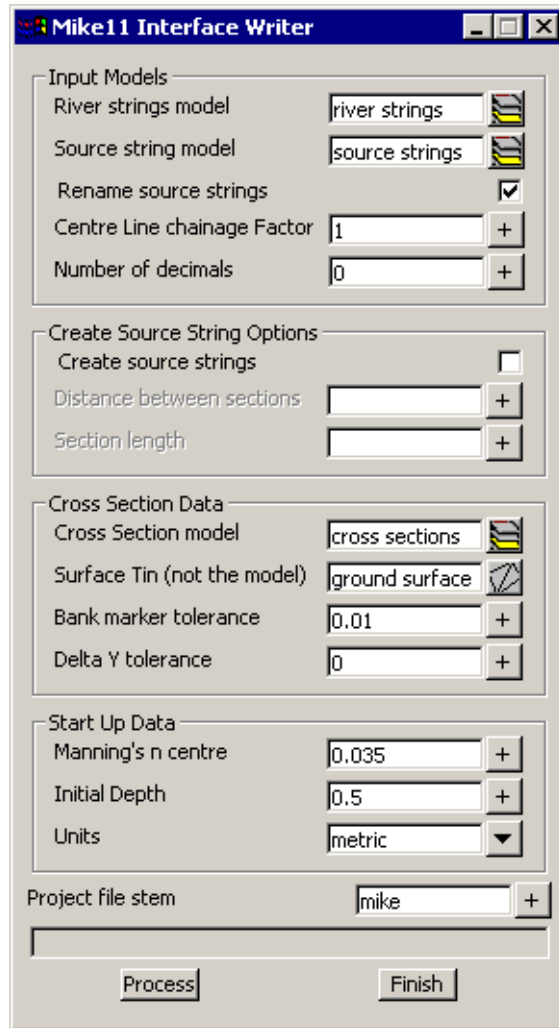

nwk11-options.4d

sim11-header.4d

sim11-period.4d

The user need not modify these files unless they would like to change the default values used when first creating the MIKE11 project. If you plan to modify these files, they are found in the 12d *setups* directory. Before modifying they should be copied to the 12d *user* directory (global defaults) or into the current project directory if they are project specific.

The MIKE 11 panel for creating the MIKE 11 project follows.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

River strings model	Model box		
----------------------------	-----------	--	--

*Model containing the river centre line strings. **The centre line strings must begin upstream and proceed downstream.** The name of the river must follow the words “centre line “ (note the ending space). The name of the river may follow the words “Centre line “ (note the ending space). For example the centre line string may be named “Centre line Parramatta River, downstream reach”. The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.*

Confluences are modelled by a using a separate string for all reaches. Thus a system with a branch is modelled with three strings. The branch will be one string and the main reach will have a downstream string and an upstream string. The reaches must touch at the confluence.

Source string model	Model box		
----------------------------	-----------	--	--

*New source strings will be created in this model or existing source strings are contained in the model. See **Create source strings** tick box below.*

Create Source Strings	Tick box	not selected	
------------------------------	----------	--------------	--

When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modified. On the **Strings->Points Edit** menu you will find the selections **Move** (to move the end points), **Insert** (to insert additional points).

Distance between sections Real box

The distance between the cross sections. At present no check is made for overlapping cross sections around river bends.

Section Length Real box

The length of the cross section with zero chainage at the mid point.

Cross section model Model box

The cross sections created and exported are stored in this model.

Centre Line Chainage Factor Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Surface Tin (not the model) Tin box

Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).

Bank Marker Tolerance Real box

If the surface level drops more than this amount while moving away from the channel centre line then the crest is used as a Bank Marker. A value of zero means that no bank marks are created.

Delta Y tolerance Real box

This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. **The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.**

Manning's n Real box

Manning's n values for the channel sections.

Initial depth Real box

This depth is added to the minimum elevation on the cross section and is used as the starting water level for the cross section.

Units Choice box

This selection will set the default units for the project being created.

Project file name Input box

The MIKE11 project name. All of the MIKE11 files will begin with this name and the appropriate extensions added.

Running MIKE11

Three steps are required to run MIKE11 with the files 12d creates.

1. Create you time series files.
2. Inside MIKE11, create a new cross sections file and import the cross sections.
3. Open the simulation file, and load the network file to have the grid points calculated.

Creating Time Series Files

Your time series files must be named with the prefix of the river string name. For example if your centre line string in 12d was named *centre line Major River* your time series files need to named *Major River-H.DFS0* for the tail water conditions and *Major River-q.dfs0* for your discharges.

The standard time series dates are from 12:00 to 12:30 on 01 January 2000 with a one minute time step. If other periods are desired, you can either change the file *sim11-period.4d* in the 12d library before running the interface or change the dates inside MIKE11 after you read in the data. **DO NOT USE THE ORIGINAL FILES! Copy the file you are changing into the 12d user directory and modify it there. 12d will look for the file here first.**

Importing Cross Sections

From the MIKE11 main menu select **File->new** and then under Mike11 select **cross sections** from the dialogue box.

From the main menu select **File->Import->Import Raw data & Recompute**. Select the *.txt file with the **Project file stem** you specified in the 12d-Mike11 Write Panel. Now save this file with the same **Project file stem** (MIKE11 adds the .xns11 extension).

Calculating Grid Points

From the main menu select **File->Open** and select the *.sim11 file with the **Project file stem** you have specified in 12d. On the **Input** tab property sheet select **Edit** beside the **Network** file. Press **Ctrl+T** to take you into the table editing mode and then select the **Grid Points** tab property sheet. On the sheet select **Generate Grid Points** and then save the file.

You should now get the “Green lights” on the **Start** property sheet of the simulation file editor.

MIKE 11 Read Panel

[Rivers_Mike11_panel Mike 11 Interface Reader](#)

Position of option on menu: Design=>Rivers=>Mike11 interface=>Read Mike11 results (max)

After the MIKE 11 analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the MIKE 11 results (maximum water level).

Water levels are interpolated to create water level strings at the shape string locations. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach. These strings are then triangulated to create a water surface tin.

The MIKE11 executable file, *res11read.exe* must be found in the directory *c:/mikezero/bin* so that 12d can read the Mike11 binary data files.

 How to for Rivers
 Frequently Asked Questions (Rivers)

Usage

The MIKE 11 read panel follows.

The fields and buttons used in this panel have the following functions:

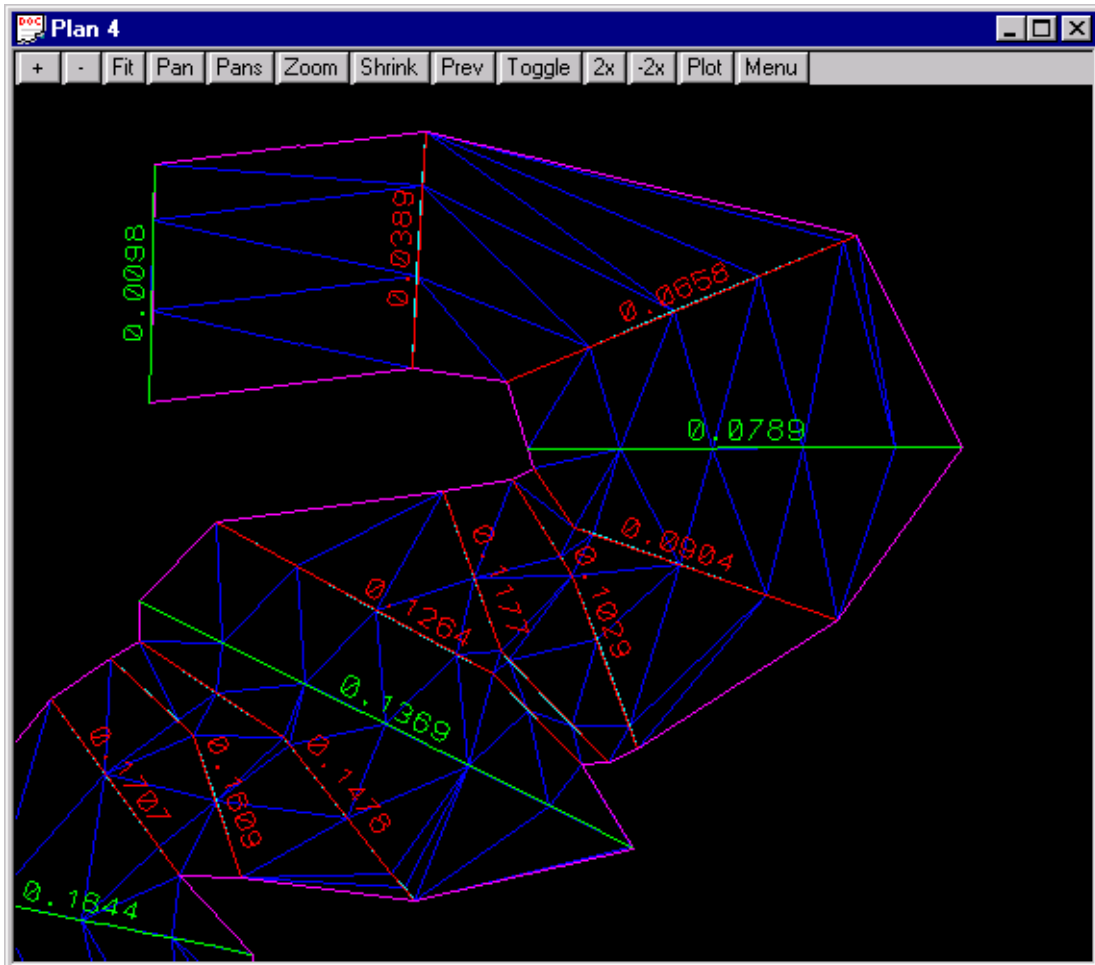

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

River strings model	Model box		
----------------------------	-----------	--	--

The river strings model specified in the write panel.

Cross Section model	Model box		
----------------------------	-----------	--	--

*The cross section model specified in the write panel. The interface will search the string names in this model for the cross sections specified in the MIKE 11 report. A match is successful if the MIKE 11 cross section chainage and the string name are within the tolerance specified below in **Chainage tolerance**.*

Shape string model Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Centre line chainage factor Model box

*This data is only required if the **Shape string model** is used. The shape string names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.*

Ground surface tin Tin box

*If a **boundary string model** is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the **boundary string model** field. Super tins cannot be used for this function. A composite tin is required for the tin-tin intersect.*

MIKE 11 report file name Input box

This is the binary data file that will be converted to an ASCII text file and read by 12d. The maximum water levels at each cross section will be extracted from the file.

Water surface tin Tin box

The name of the water surface tin to be created.

Water surface tin model Model box

The model to contain the new water surface tin.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Centre Line Chainage Factor Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Chainage Tolerance Real box

*This is the tolerance used when the cross section chainage from the MIKE 11 results file is compared with the cross section string names. If a **Centre line chainage factor** of 1 is used a value of 0.1 is appropriate. If a **Centre line chainage factor** of 1000 or 5280 is used a **Chainage** tolerance of 0.00001 is more appropriate.*

However, if you have altered chainage names then you may have to increase the value of the tolerance. Suppose the tolerance is set to 0.001 and the water level for section 0.056 is read from the MIKE 11 report file. The interface will search for the first string with a name between 0.055 and 0.057. If you chose to great of a tolerance then more than one water level result will match a 12d cross section and a warning message will be given.

If you have one specific cross section that you would like to have a different tolerance set for (maybe only one section is giving you troubles), use the Attribute Editor (Strings->User->Attribute Editor), select the cross section string and create a real type attribute named tolerance set to the tolerance desired.

How the water level boundaries are determined

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above). Note that water levels are extended when the shape strings are in a junction area or past the end of a reach. can be created to

create a water surface (shown in blue above) to follow the river.

The water surface is draped over the ground surface and the boundary strings (strings defining the edges of the water surface – shown in yellow above) are created. They may be used to trim the water surface or shade your ground surface tin for flood inundation mapping. Boundary strings also include islands! Shading the river bed blue, in a 3D perspective view, is an effective way to show the water level extents and still view the shape of the river bottom (it has the effect of very clean water that you can see through!).

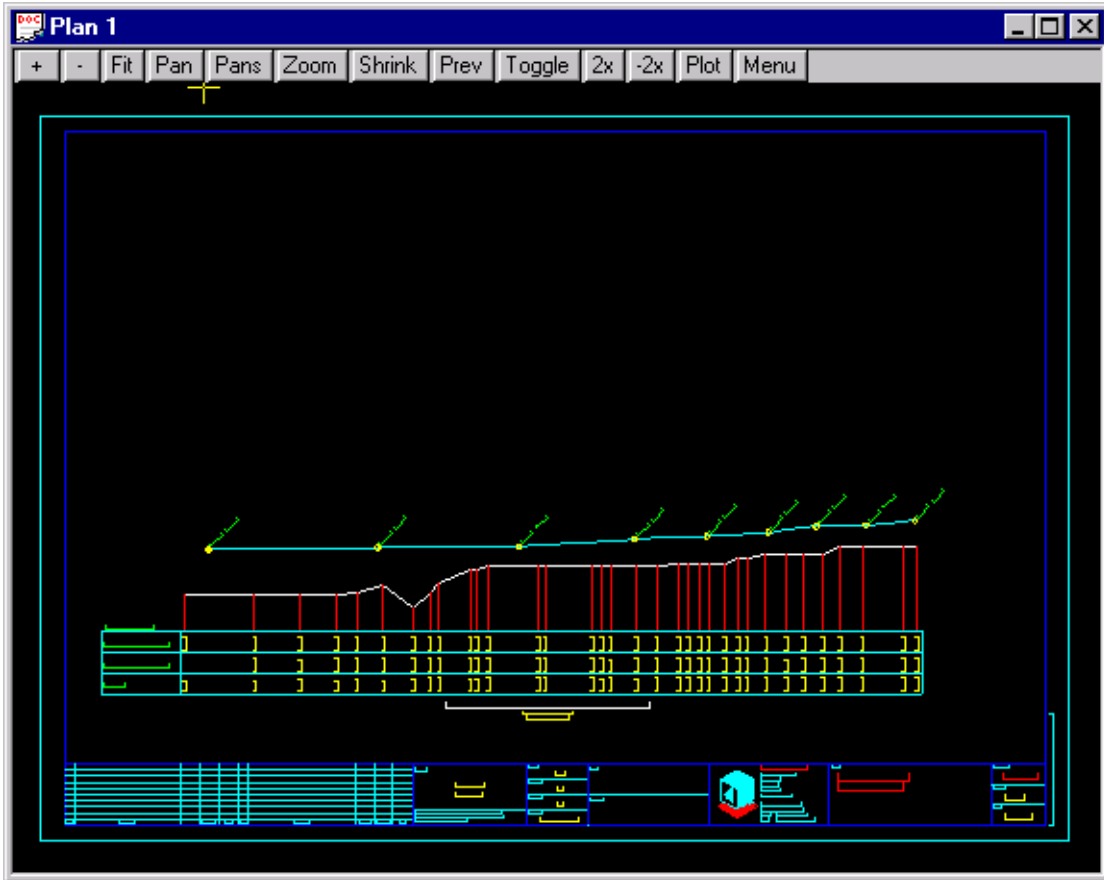

Sample Presentations and Drawings

The water surface may be

- s •contoured (elevation),
- s • depth contours created,
- s • water surface coloured by depth (shown above),
- s • cross sections plotted
- s • and longitudinal profiles drawn (shown below).
- s •All of these results can be plotted complete with your customised drawing sheets.
- s •Finally, you may walk down the water course in the perspective view (and record this to an Windows AVI file).

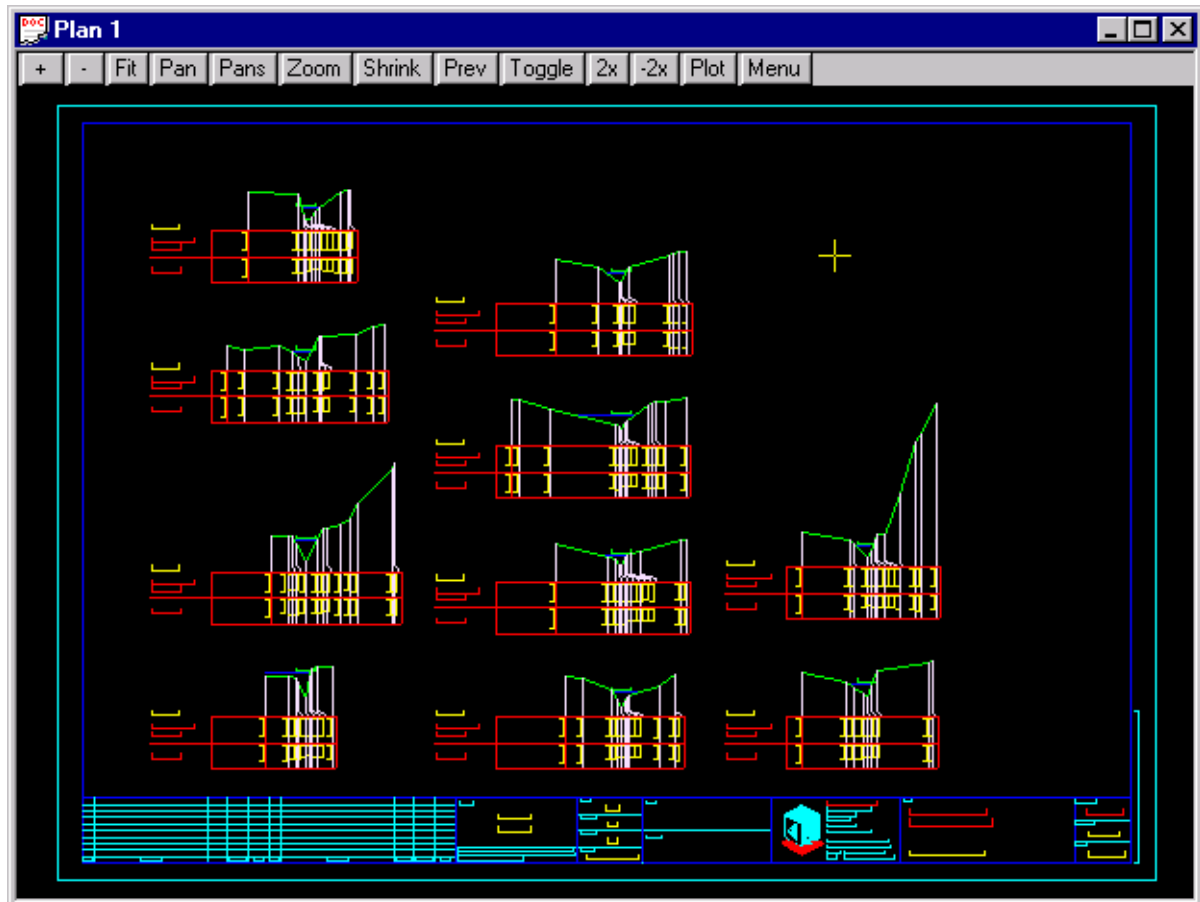

Close up view of cross section labels with water levels

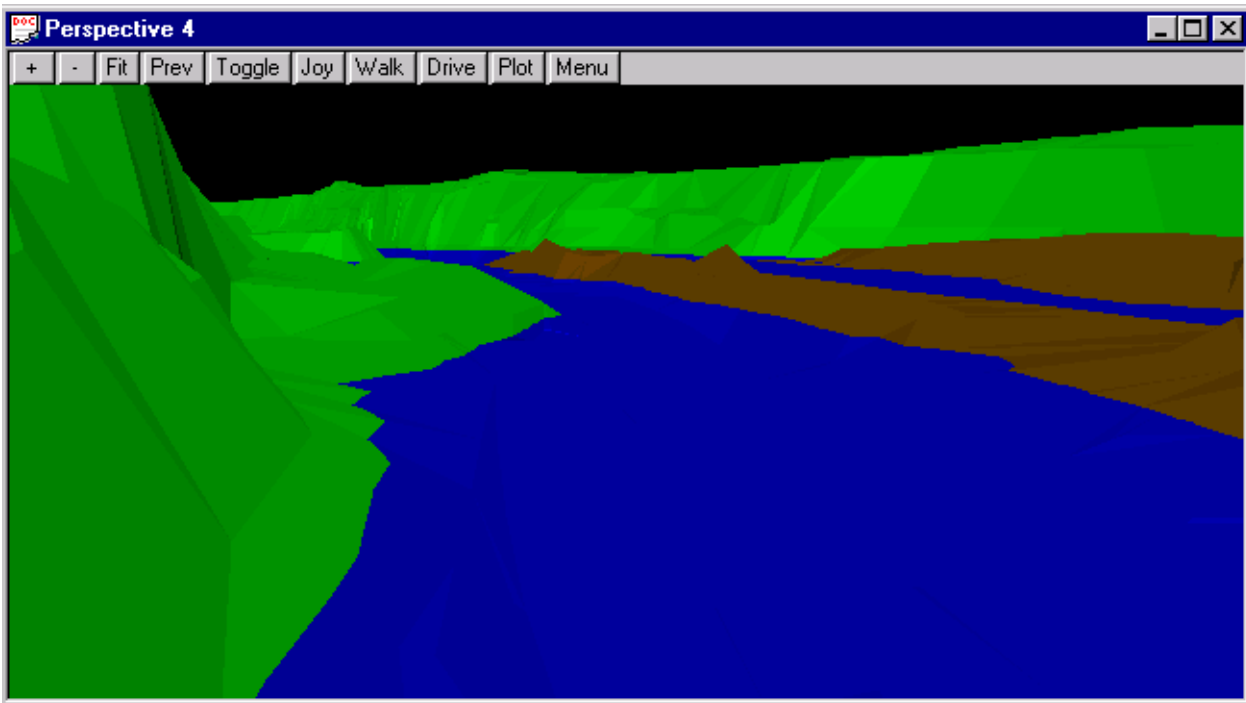

Plan 1	
DATUM RL154.000	
RIVER CENTRELINE LEVEL	155.500
100 YEAR WATER LEVEL	
change	0.000

Close up of text (user chooses wording, size, colour, text style etc.)

The tin created can be viewed in a perspective view and sections taken where desired. A sample perspective view follows.

Example of cross sections long sections and depth colouring see the HEC-RAS Interface topic.

Defining the Water Surface Boundaries

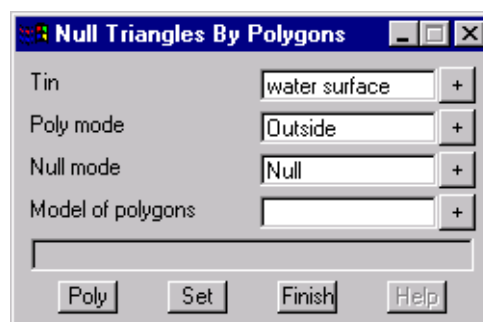

The water surface and its boundary is created by 12d. The first step is to trim the water surface back to the boundary strings. Since the water boundary does not generally form a closed polygon (the left and right river boundaries will need to be joined at one end of the river) use the **Strings=>Strings Edit=>Join** to connected strings.

If the water surface reached the edges of you cross sections then there will be numerous breaks in the boundary string. The best solution is to extend the cross sections and/or add additional shape strings. If it is not a major error in modelling then the break in the boundary can be joined using the **Strings=>Strings Edit=>Join**.

If boundary strings are created outside that water level boundaries they should not be used in this area. Boundary strings should only be used inside the area defined by your water level results.

Trimming the Water Surface Tin and Islands

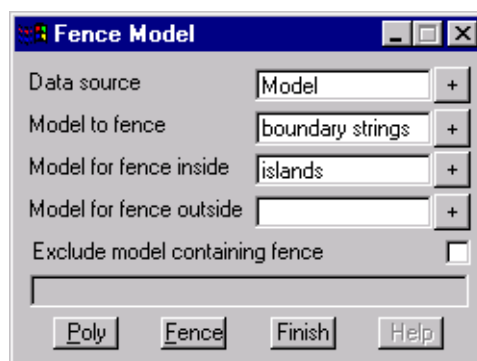

Use the **Triangle=>Null=>by polygons** selection to null triangles inside the polygon you have created above.

Select your water surface tin and change the **Poly mode** to **Outside**. Now select the **Poly** button and pick the boundary string. The triangles outside the polygon will now be nulled.

If you have some islands in the model then change the **Poly mode** to **Inside** and select the islands.

If you have numerous islands, say more than 10 it may be easier to copy all of the islands into one model using the fence command (Utilities->Fence->Fence).

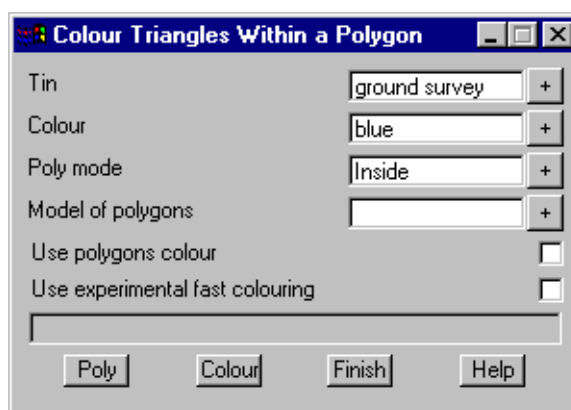

The **Model to fence** is the boundary strings model and the **Model for fence inside** is the new model to contain the islands. The **Exclude model containing fence** should not be ticked. Select **Poly** and then pick the boundary string. All of the islands inside the boundary string will not be copied to the islands model.

Colouring the Ground Surface with Flood Zones

The boundary strings can also be used to colour the ground surface. Colouring the river bed blue is an effective way to show the water level extents and still view the shape of the river bottom (the effect of very clean water that you can see through!).

First, define the water surface boundaries (see above). Next re-triangulate the ground tin so that it includes the boundary string model (**Triangles=>Edit=>Tin**). Next select **Triangles=>Colour=>Colour within polygon**. The following panel will appear.

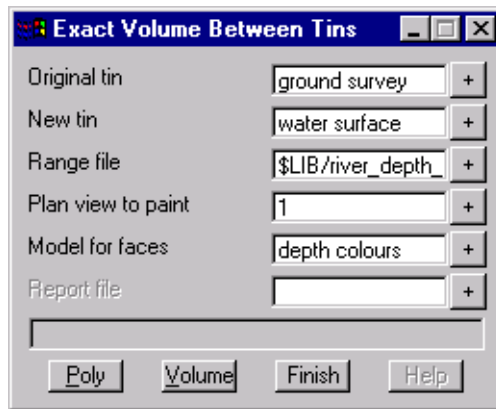

Select your ground tin and the desired colour. Next select the **Poly** button and pick the boundary string to be coloured inside. If islands exist change, change the colour (to a ground colour) and then select the island string.

Colour by Depth

The water surface can be coloured by depth. This function calculates the depth between the water surface and the ground surface and creates "faces" of different colours. The colours to be used are specified in a depth range file. This option requires the purchase of the Volumes Option

From the main menu select Options->Volumes->Exact->Tin to tin.

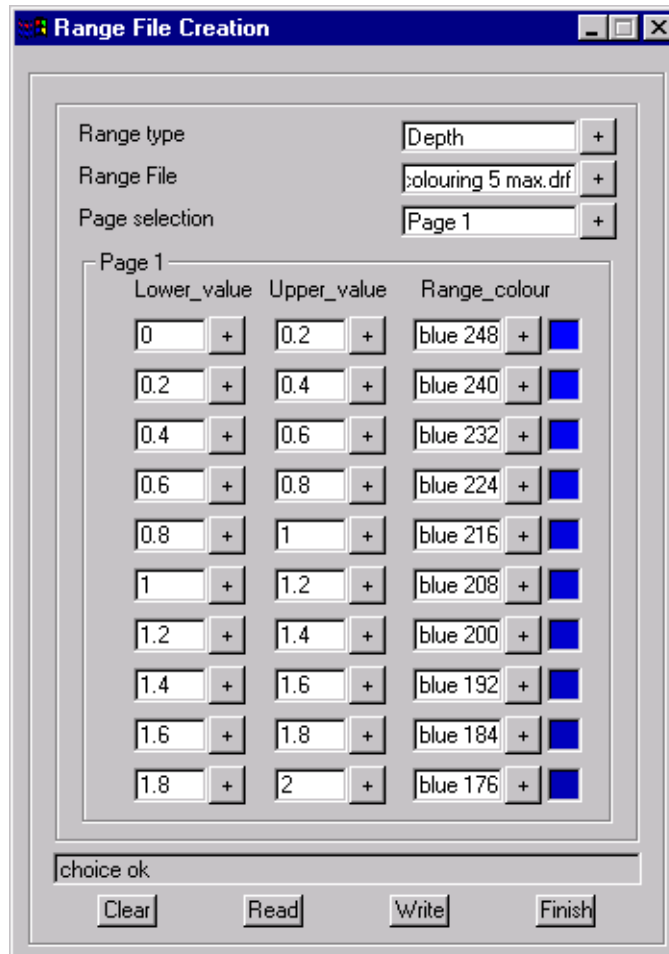

Original tin this is your ground survey tin

New tin this is your water surface tin

Range file two range files are supplied. One with a range from 0 to 5 and another from 0 to 50. The library contains a spreadsheet the can quickly create other range files or you may edit the using the built in range editor.

To use the built in range file editor select + beside you range file then **edit**.

You may change the range value and the colours as desired. Be sure to select **Write** to save the changes before selecting **Finish**.

See also Range File Creation

Plan View to paint you can paint a current view without saving the face data. This is a good option if you wish to take a quick look at the depth colours in one area.

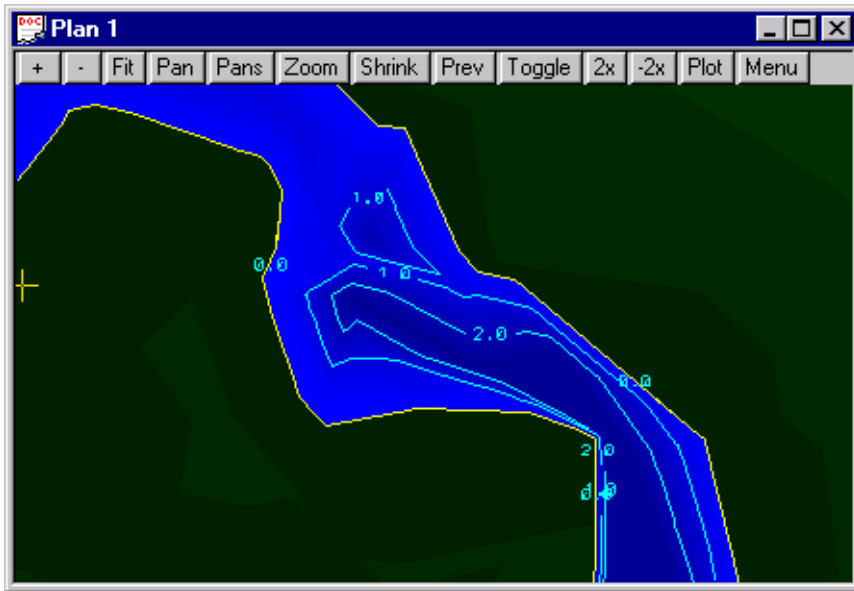

Model for faces the faces can be stored in a model. Note that faces consume a great deal of hard disk space. Therefore you may consider colouring one area at a time using the **Poly** option.

Poly If your water surface tin is very large than you may want to only colour a portion of the tin. You must create a polygon (Strings->Create->2d) and then pick this polygon. When your select **Volume** only the area inside the polygon will be coloured.

Volume select this button to colour the surface.

Depth Contours

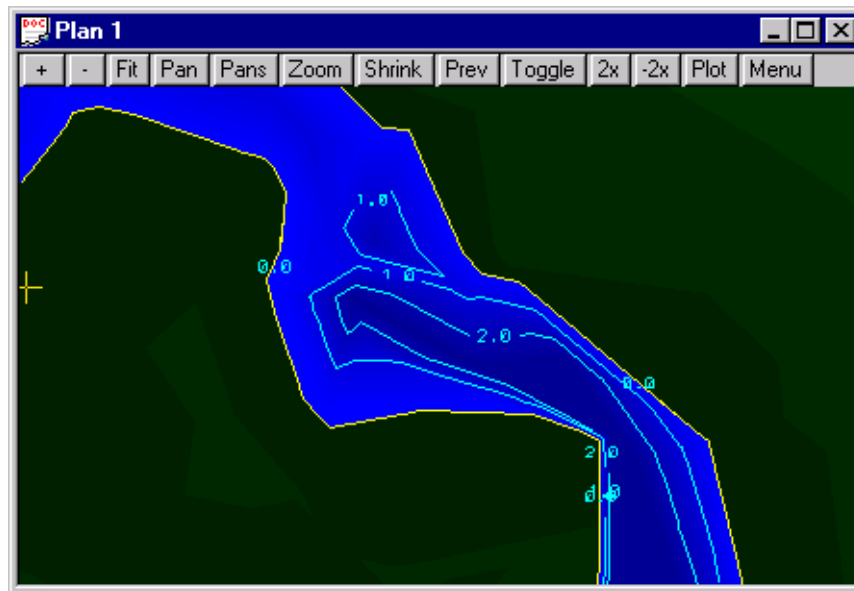

Once you have the tin coloured by depth you might want to add depth contours. From the main menu select **Options->Tin->Analysis->Depth Contours**. This option requires the purchase of the tin Analysis module.

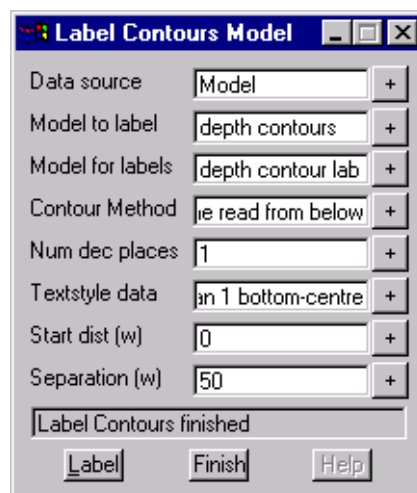

Depth Contours	
Original tin	ground survey +
New tin	water surface +
Model for depth strings	depth contours +
Colour for cut strings	red +
Colour for zero strings	yellow +
Colour for fill strings	cyan +
Start level	0 +
End level	10 +
Interval	1 +
2d/3d strings	2d +
finished	
<input type="button" value="Calculate"/> <input type="button" value="Finish"/> <input type="button" value="Help"/>	

- Original tin** this is your ground survey tin
- New tin** this is your water surface tin
- Model for depth strings** this is the model for your depth contours
- Colour for cut strings** this must be selected but we will not use this colour
- Colour for zero strings** the zero string will be the same as our boundary strings
- Colour for fill strings** this is the colour for the depth contours
- Start level** enter a zero for this value
- End level** enter a level greater than the greatest depth
- Interval** enter the contour interval as desired
- 2d/3d strings** 2d strings
- Calculate** this will create your contour strings

Adding Values to the Contours

Since there are numerous ways to label the contours it is performed as a separate step. From the main menu select **Strings->Label->Contours**.

Contour method the example above uses *Line removal and Centred line read from below*.

This copies the contour lines themselves and inserts a break in the line.

Start distance this is usually left as zero. It changes the start point for the first label on each contour.

Separation this determines the spacing of the contour labels.

Colour the ground surface by elevation

With the water surface coloured by depth, you may want to colour the ground surface by elevation.

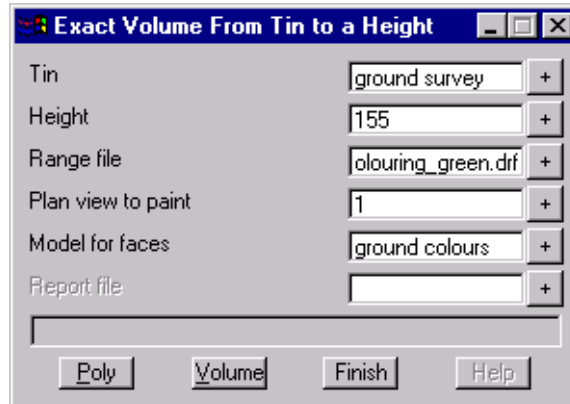

This colouring may be done from either From the main menu select **Options->Volumes->Exact->Tin to height** or **Triangles->Colour->Tin height colour**.

Options->Volumes->Exact->Tin to height

Options->Volumes->Exact->Tin to height requires the purchase of the Volumes module. First select **Triangles->Tin info** from the main menu and then select you ground surface tin. You will want to copy the minimum z level from this pane.

Tin Information			
Tin	ground survey +		
x min	42407.034	x max	43076.368
y min	36815.276	y max	37563.525
z min	155	z max	234.074
Points	2459	Tris	4912
information retrieved			
Info Calc Extent Finish Help			

Now from the main menu select **Options->Volumes->Exact->Tin to height**

Select your ground surface to colour and enter the minimum elevation (from above) into the **Height** field. The **Range file** “*\$LIB/ground_colouring_green.drf*” is found in the library.

Plan View to paint you can paint a current view without saving the face data. This is rarely used in this case

Model for faces the faces can be stored in a model. Note that faces consume a great deal of hard disk space. Therefore you may consider colouring one area at a time using the **Poly** option.

Poly If your ground surface tin is very large than you may want to only colour a portion of the tin. You must create a polygon (Strings->Create->2d) and then pick this polygon. When your select **Volume** only the area inside the polygon will be coloured.

Volume select this button to colour the surface.

UNET Interface

UNET_interface

Position of menu: Design=>Rivers=>UNET interface

The UNET interface creates the *.cs file. Water levels are read back into 12d where they may be viewed in a 3D perspective view to easily identify extents of flooding.

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The UNET read panel follows.

The screenshot shows the 'UNET Interface Reader' dialog box. It is organized into three sections:

- Existing data:**
 - River strings model: river strings
 - Cross Section model: cross sections
 - Shape Section model: shape sections
 - Centre Line chainage Factor: 1
 - Ground Surface tin: ground surface
 - UNET results file name: unet.txt
- Result data:**
 - Water Surface tin: water surface
 - Water Surface tin model: tin water surface
 - Water level results model: water levels
 - Boundary strings model: boundary strings
- Parameters:**
 - Chord length: 10
 - Chainage tolerance: 0.0001

At the bottom of the dialog, there is a checkbox labeled 'is valid', a 'Process' button, and a 'Finish' button.

The UNET file format consists of a line number, section name and elevation separated by at least 1 space. An example follows:

```
1 0.25 118.24
2 0.50 118.25
3 0.75 118.30
4 1.00 118.40
```

ISIS Interface

ISIS_Interface

Position of menu: Design=>Rivers=>ISIS interface

The ISIS interface creates *.dat input file. Water levels are read back into 12d where they may be viewed in a 3D perspective view to easily identify extents of flooding.

- Frequently Asked Questions (Rivers)

Exporting to ISIS

The ISIS project is created from a surface tin (representing the river bed and overbanks) and a model containing **river strings** identified by their names "left bank", "right bank and the name prefix, "centre line". Any additional strings in the specified model will be ignored (warning messages will be given when you run the macro that any additional strings are being ignored). The low chainage (often zero) of the centre line strings must be at the upstream end of the reaches.

Cross sections are created at the location of the **source strings**. These source strings are initially created using the ISIS option at a user defined spacing and section length. The user may alter these sections as desired. These may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The **Create source strings** tick box on the interface panel must **NOT** be selected to use the customised strings.

Reservoir Strings are 2d strings that define the extents of the reservoir. The volume is calculated in increments of 1 or the value set in the attribute **stage increment** for this string. The volumes start from a level with zero volume to the level set for the 2d reservoir string.

The **reservoir strings** may define inline reservoirs or offside storage. Inline reservoirs are "touched" by centre line strings both upstream and downstream. Offline storage areas are linked to the cross sections via **spill strings**.

Spill strings are 2d strings that link offline storage areas to a cross section. The string must begin by "touching" the source string and then proceed to the first point on the spill section. During the export the first point will NOT be exported as part of the spill section. After defining the end of the spill section the last point on the string must "touch" the reservoir string. Again this last point will NOT be exported as part of the spill section.

Presenting ISIS Results in 12d

After the ISIS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the ISIS *.zsr file. These

strings are then triangulated to create a water surface tin from which the water level boundaries are determined. These results can then be shown in plan, long section, cross section and in 3D perspectives.

More details

ISIS Write Panel

Rivers_isis_panel ISIS Interface Writer

Position of option on menu: Design=>Rivers=>ISIS interface=>Create ISIS file

The ISIS interface creates the ISIS project files ready to open and run. This includes the project, plan, flow and geometry files. Water levels are read back into 12d where they may be viewed in a three dimension perspective view to easily identify extents of flooding.

Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The ISIS panel for creating the ISIS project follows.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
River strings model	Model box		

*Model containing the centre line, left bank and right bank strings. **The centre line strings must begin downstream and proceed upstream.** The name of the river may follow the words "Centre line " (note the ending space). For example the centre line string may be named "Centre line Parramatta River, downstream reach". The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.*

Confluences are modelled by a using a separate string for all reaches. Thus a system with a branch is modelled with three strings. The branch will be one string and the main reach will have a downstream string and an upstream string. The reaches must touch at the confluence.

The distance from the start of the upstream strings to the first cross section is used to model the confluence length.

The left and right bank strings need not be separate strings (see figure below).

Source string model Model box

New source strings will be created in this model or existing source strings are contained in the model. See **Create source strings** tick box below.

Create Source Strings Tick box not selected

When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modified. On the **Strings->Points Edit** menu you will find the selections **Move** (to move the end points), **Insert** (to insert additional points).

Distance between sections Real box

The distance between the cross sections. At present no check is made for overlapping cross sections around river bends.

Section Length Real box

The length of the cross section with zero chainage at the mid point.

Storage strings Real box

These 2d strings define the extents of the storage area. For more details see **Reservoir strings**.

Spill strings Real box

These 2d strings define the location to cut the spill section and start end points define the cross section and reservoir, respectively. For more details see **Spill strings**

Cross section model Model box

The cross sections created and exported are stored in this model.

Centre Line Chainage Factor Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Number of decimals Integer box

The cross section names are created with this many decimals. CAUTION XP SWMM only allows 10 characters for the names and each link name begins with "Lx-" That leaves 7 characters for the chainages.

Surface Tin (not the model) Tin box

Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).

Bank Marker Real box

Not currently implemented in ISIS

Delta Y tolerance Real box

This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross

section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. The filtered (smoothed) and original sections are kept for comparison. **The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.**

Manning's n Real box
Manning's n values for the left, right and centre channel sections.

Initial depth Real box
Not currently implemented in ISIS.

Discharge Real box
This discharge is used at the upstream end of all reaches. If you have multiple river branches, you can set the flow for each branch inside ISIS or inside 12d. This can be changed at each section **See manual settings**

Units Choice box
This selection will set the default units for the project being created.

Project file name Input box
The ISIS project name. The extension ".dat" will automatically be added for you.

ISIS Read Panel

[Rivers_isis_panel ISIS Interface Reader](#)

Position of option on menu: Design=>Rivers=>ISIS interface=>Read ISIS results

After the ISIS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the ISIS results. These strings are then triangulated to create a water surface tin.

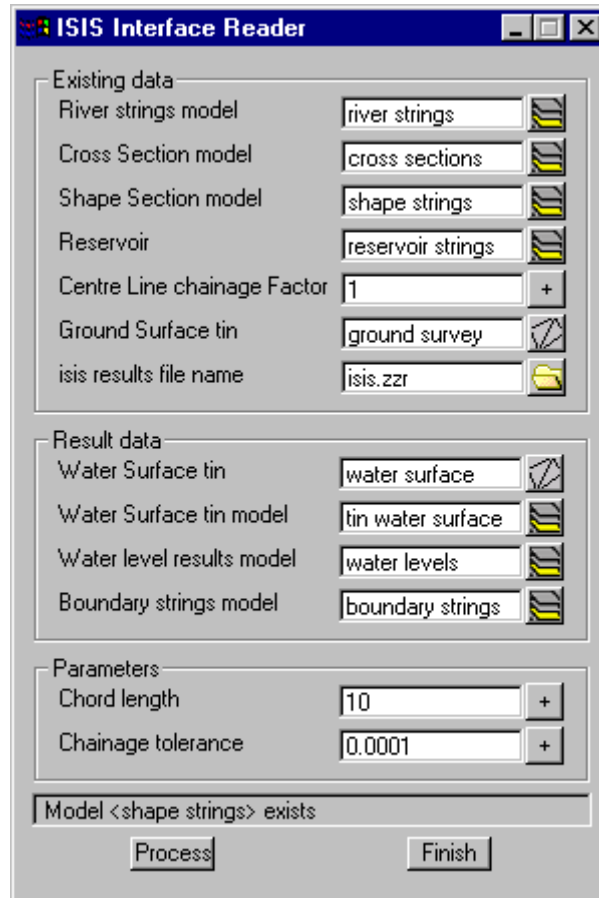

[Rivers_isis_panel_beta ISIS Interface Reader](#)

See also

- ISIS Interface overview
- Create ISIS files
- Presenting Water Level Results
- How to for Rivers
- Frequently Asked Questions (Rivers)

Usage

The ISIS read panel follows.

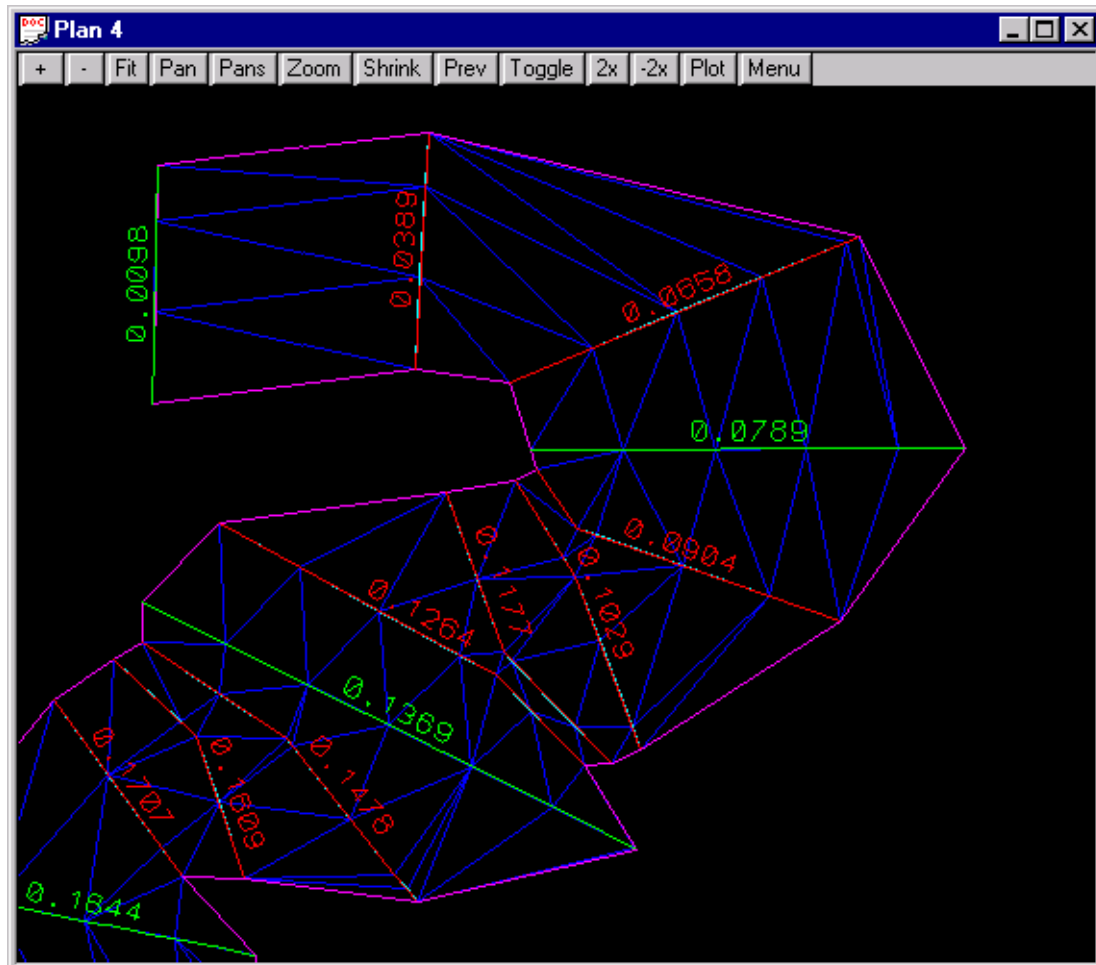

River strings model Model box

The same river strings model specified in the write panel. The river strings are used to sort the cross section and the shape strings. The left and right bank strings are used to check the direction of the strings.

Cross Section model Model box

The same cross section model specified in the write panel. The interface will match the ISIS label and the string name (without the "SECT "). If the ISIS labels were created by 12d then an exact match should result.

*However, if the ISIS file was not created by 12d, the file can still be mapped by manually creating cross section strings (2d or 3d strings). See **Mapping non 12d and historical water level data**.*

Shape string model Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Reservoir Model box

*Reservoir strings are assigned elevations from the ISIS zsr file. This model is the same as the **storage area stings** specified in the write panel.*

Centre line chainage factor Model box

*This data is only required if the Cross sections have been manually created and have no names yet. See **Mapping non 12d and historical water level data**.*

ISIS results file name File box

The ISIS zsr file is automatically generated by ISIS.

Ground surface tin Tin box

*If a **boundary string model** is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the **boundary string model** field.*

Water surface tin model Model box

The model to contain the new water surface tin.

Water surface tin Tin box

The name of the water surface tin to be created.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Chainage Tolerance Real box

*This tolerance is not used for the standard 12d cross section names. However, if the cross section names have been created manually and they can be converted to a real number then this is the tolerance used to match the cross section label from the ISIS report to the cross section string names. A value of 1.0 to 10. is common. See **Mapping non 12d and historical water level data** for more details.*

A sample of the *.zsr file that is read by 12d follows.

A sample of the zsr file that is read follows.

Maxima and minima of all variables from
time 0.000 hours to time 30.000 hours

maxima of all variables

Label12	Flow	Stage	Froude no	Velocity	Umode	Ustate	
WY201013	y	0.470	87.305	0.033	0.076	7.916	0.000
WY202013	y	0.470	87.288	0.162	0.297	2.335	0.000
WY203013	y	0.470	87.054	0.682	0.794	4.000	0.800
WY204013	y	0.470	86.804	0.671	1.002	0.562	0.000

How to for Rivers

This section lists specific tasks for the rivers interface. Worked examples are contained in the courses directory of 12jobs and training manuals are found in the documentation directory on the 12d model distribution CD.

Change manual override settings for river strings via attributes

ragg write this Export/import string attributes to a spreadsheet

Manually set a cross section name

Specify a local inflow at a cross section

Change the stage increment for reservoir strings

Boundary Strings are broken. How do I stop this?

Manual Override settings

Many of the automatic settings can be overridden using string attributes via the **String Attribute Editor**. To use the editor

1. Select the river or source string to add/edit the attribute for
2. In the **Attribute Name** column use the selection list to find the attribute to change. If it is not listed then type the attribute name into one of the boxes.
3. Change the attribute **Type** to Integer/Real/Text as required
4. Type the attribute value into the **Data** field (erase the **not found** if required).
5. Select **Process**, **Next**, **Previous** or **Pick string**. Selecting **Finish** will NOT save the attribute.

You will be prompted that you will create a new attribute if you have typed in a new attribute for that string

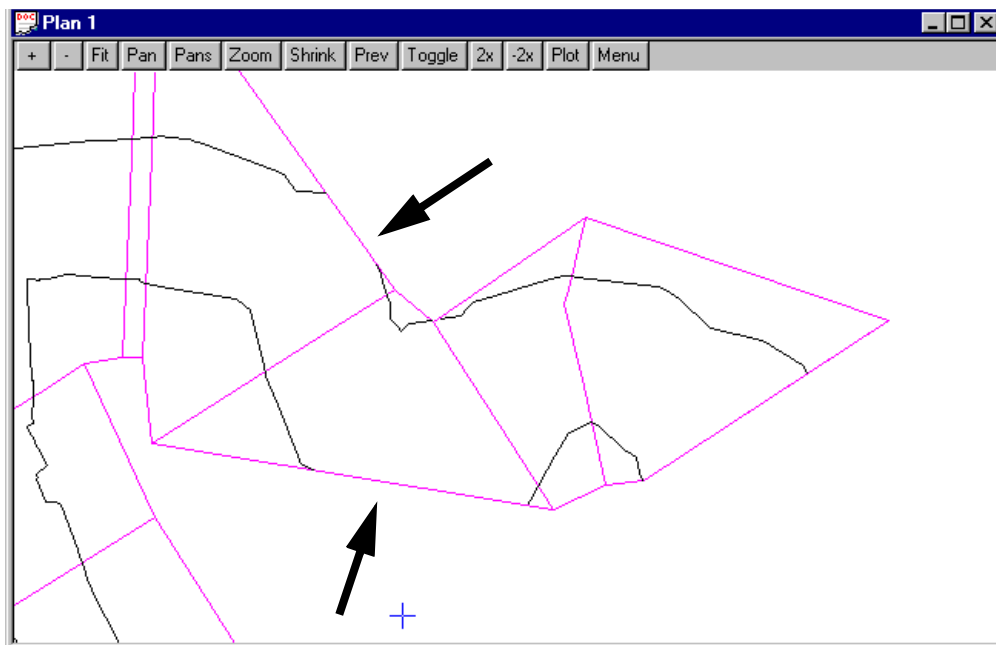

Purpose	String Type	Attribute Name	Type	Typical Data Value
Node/cross section name	source strings	node name	Text	A1
Set a local inflow for this section	source string	flow	Real	10.2
Storage curve increment	storage area strings	stage increment	Real	1.0
Water level string tolerance when comparing numeric string names to data file names	cross sections before importing	tolerance	Real	0.01
Custom n values	source strings	left n, right n, centre n	Real	0.03
Culvert n value	centre line and culverts in spill	roughness	Real	.013
Culvert entrance loss	centre line and culverts in spill	entrance loss	Real	0.5
Culvert exit loss	centre line and culverts in spill	exit loss	Real	1.0

Purpose	String Type	Attribute Name	Type	Typical Data Value
Culvert length	centre line and culverts in spill	length	Real	8.0
Multiple identical culverts	centre line and culverts in spill	number of pipes	Integer	2
Chanel length of a spill string	spill strings	length	Real	30
Channel roughness	spill strings	roughness	Real	0.02
Channel slope %	spill strings	slope	Real	0.5

Export/import string attributes to a spreadsheet

Boundary Strings are broken. How do I stop this?

The boundary strings will be broken into sections when the boundary string goes outside the area defined by the cross sections. See below

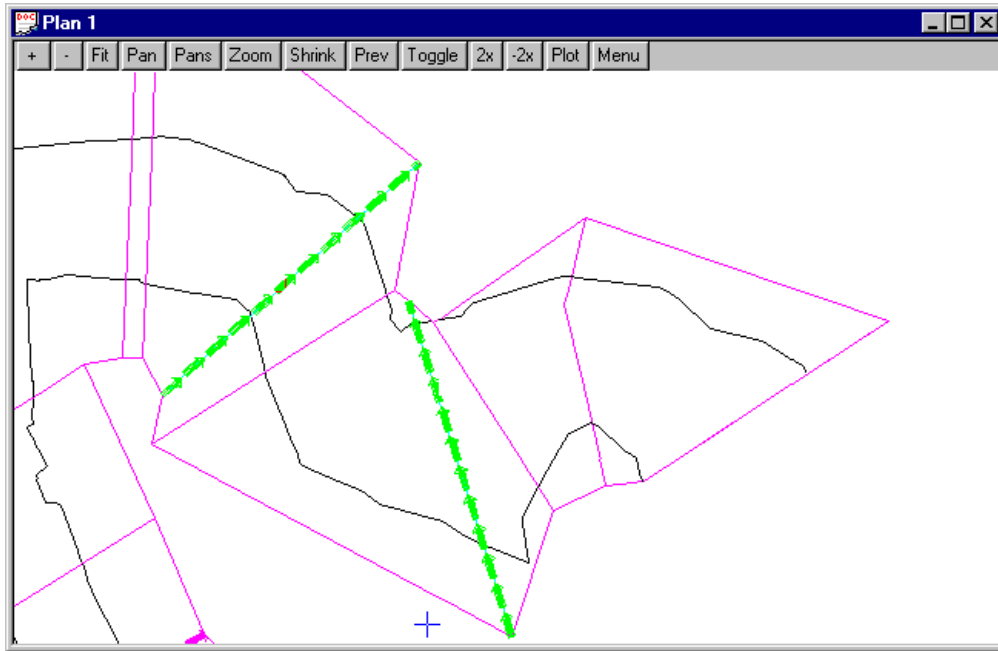

In these two cases the water level has not exceeded the extents of the cross sections but the boundary strings (black) has gone outside the limits of the water level strings (magenta). **Shape strings** are used to expand the area of the water levels between the sections. The water level assigned to the shape string is a linear interpolation between the upstream and downstream cross section water levels. The interpolation is prorated using the distance along the centre line of the river.

Important! water levels are extended when the shape strings are in a junction area or past the end of a reach.

Shape strings are 2d strings. The direction is not important except for Mike11 models. For Mike11 they must be in the same direction as the cross section strings (usually left bank to right bank). The following

drawing shows the boundary string when 2 shape strings have been added (green).

Mapping non 12d and historical water level data

12d can map water levels from river engineering models that were not created by 12d. If the water level results are in the standard HECRAS GIS, HECRAS report, ISIS zsr, UNET, XP SWMM xpx or Mike11 binary file then the standard 12d readers can be used. If the data is historical or not in any of the standard format the **River Mapper** feature can be used.

River Mapper

[Rivers_mapper_panel_beta River Mapper](#)

Position of option on menu: **Design=>Rivers=>River Mapper**

River cross section water level data in a text file may be mapped and displayed using the 12d River Mapper interface. 2d strings are created by the user with the plan shape of the cross sections. 12d assigns water levels from a text file to these strings. These strings are then triangulated to create a water surface tin.

[Rivers_mapper_panel River Mapper](#)

See also

[Presenting Water Level Results](#)

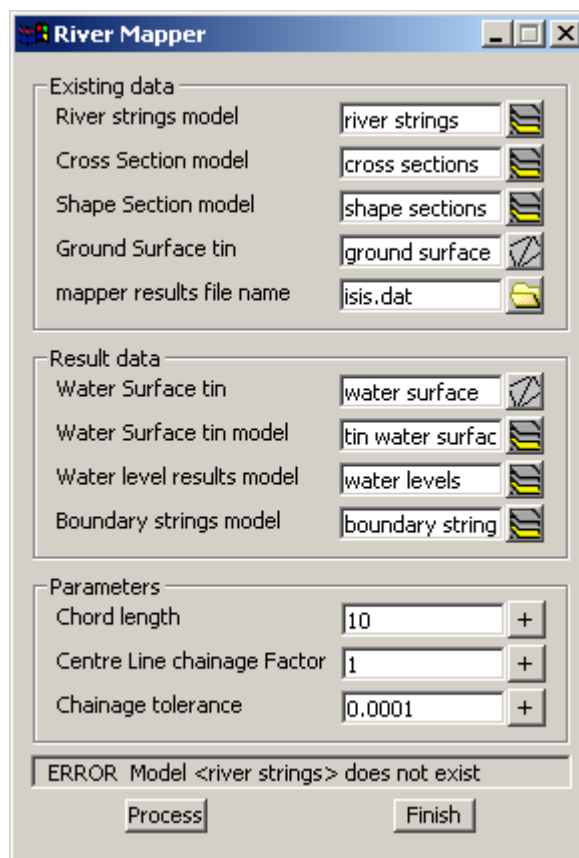

[How to for Rivers](#)

[Frequently Asked Questions \(Rivers\)](#)

Usage

The steps are as follows:

1. Create the **river strings** (centre line, left bank and right bank).
2. Create 2d **source strings**. Use your name for the cross section as the string name. 12d will match the water levels in the file to this string using the name as the key. If you do not assign a name the interface will assign names to strings according to the chainage along the centreline and the value of **.Centre line chainage factor**.
3. From the **Design->Rivers** menu select **River Mapper**.
4. Fill in the fields in the dialogue for the rivers strings (step 1 above) and the cross sections (step 2 above).

River strings model Model box

The river strings model specified in the write panel.

Cross Section model Model box

*The cross section model specified in the write panel. The interface will search the string names in this model for the cross sections specified in the HEC-RAS report. A match is successful if the HEC-RAS cross section chainage and the string name are within the tolerance specified below in **Chainage tolerance**.*

Shape string model Model box

For meandering rivers, the cross sections may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings can be created (automatically or manually) to create a water surface to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Centre line chainage factor Model box

If you assigned the source/cross section string a name in Step 2 this field is not used. Otherwise, the centre line chainage and the Centre line chainage factor are used to name your source string/cross sections in 12d. The cross sections will be named in the same units as the 12d data if a Centre line chainage factor of 1 is specified. If your existing data uses cross section names in your data file are in kilometres and your 12d data in meters, you will want to use a Centre line chainage factor of 1000. If your existing data cross section names are in miles and your 12d data is in feet then a Centre line chainage factor of 5280 would be used.

Mapper results file name File box

The report is a tab (or space) delimited text file (usually created by a text editor or spreadsheet). The format is

cross section name <tab> water level elevation

each section name with its water level must be on a separate line. For example.

<i>Section A</i>	<i>2.31</i>
<i>Section B</i>	<i>2.32</i>

If the names contain letters (abc..) then the section name must match the 12d string names exactly (case sensitive). If the names are real numbers than a tolerance for the matching (global and string specific) can be set (see parameters).

12d System Path

When looking for system files 12d first checks your local project directory (the directory that hold the *.project folder), and then the system folders. Unless you have changed these folders in your env.4d file the path is first "program files\12d\12dmodel\5.00\user" and then "program files\12d\12dmodel\5.00\set_ups". In summary:

1. local project directory (the directory that hold the *.project folder)
2. program files\12d\12dmodel\5.00\user
3. program files\12d\12dmodel\5.00\set_ups

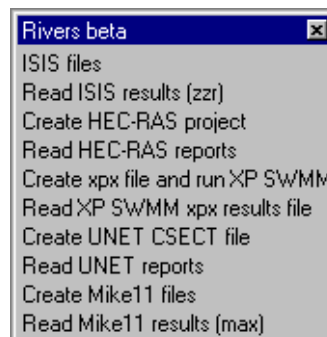

Never modify the files in set_ups. Copy them to the user directory and make your changes there. Here they are safe from being changed during future 12d updates. The only time you will want files in the local project directory is when you have some project specific data. Master_drainage.xp and Master_rivers.xp are good examples of such cases.

More on System files
Attribute Editor

Rivers beta menu

Rivers_beta

The Rivers beta menu contains the latest beta test versions of the Rivers interfaces. These versions will have the newest features in 12d but they will also be under testing. They should not be used unless you have read an signed a 4d Solutions beta test site agreement.

FAQ Rivers

XP SWMM does not start or gives errors when starting from 12d

20 Pipeline

pipeline

Position of menu: Design =>Pipeline

The Pipeline option is used to place large diameter pipelines.

The pipeline is very similar to an alignment string in that it is defined by separate horizontal and vertical geometries.

The major differences between a pipeline and an alignment is that a pipeline has a diameter and normally uses circular curves in the vertical geometry rather than the parabolic curves used for alignments.

The pipeline is entered by placing the invert (bottom) of the pipe. Hence in a plan view, the horizontal geometry places the centre of the pipeline. The vertical geometry of the pipeline is for the invert (bottom) of the pipeline.

Note

A **pipeline** string is not the same as a **pipe** string. A **pipe** string is only a 3d string with a diameter.

The Pipeline walk-right menu is

For the option <i>Create</i> , go to the section	"Create" .
<i>Editor</i>	"Editor" .
<i>Defaults</i>	"Defaults" .
<i>Plots</i>	"Plots" .
<i>Reports</i>	"Reports" .

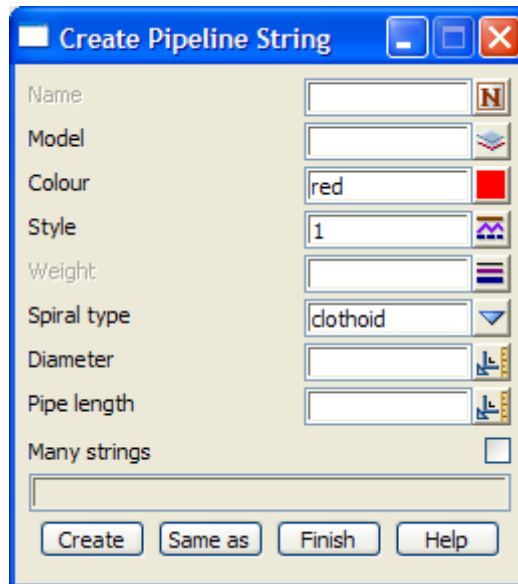

Create

create_pipeline_string

Position of option on menu: Design =>Pipeline =>Create

The Create option is used to produce **new** pipelines. If a pipeline string already exists, the Edit option is used to modify it.

On selecting the Create option, the **Create Pipeline String** panel is displayed.

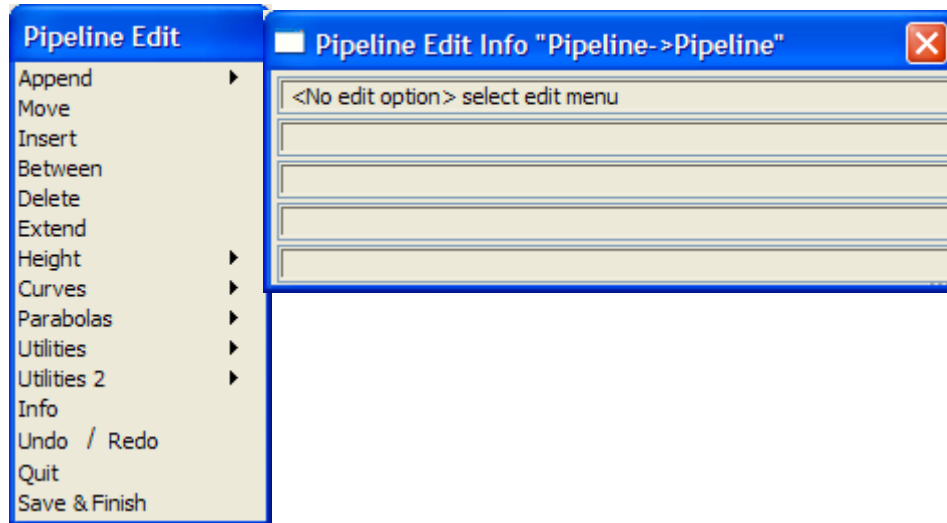

To create a new pipeline string, the pipeline's name, model, colour, style, spiral type and pipe diameter, plus the standard length of pipes used to make up the pipeline are entered into the appropriate fields and the **Create** button selected.

As for a 3d string, to create a new pipeline string with some of the **same** name, colour, model, style etc. **as** an existing string (not necessarily a pipeline), the **same as** button is chosen and the appropriate string selected.

The **Create Pipeline String** panel is then removed and the Pipeline Edit menu and Pipeline Edit Info panel fired up.

The Pipeline Edit menu contains all the options for creating/editing a pipeline string. The **Pipeline Edit Info** panel contains information areas.

The Pipeline Edit menu and **Pipeline Edit Info** panel are

As for an alignment string, to create a new pipeline string the user selects the **Append=>HIP's** option from the Pipeline Edit menu and start placing points in a plan view.

Since the Pipeline Edit menu and **Pipeline Edit Info** panel are the same as those used when editing a pipeline string, the options will be discussed in the following sections under the pipeline Edit option.

For information on pipeline editing, please continue to the section "Pipeline Editor" .

Editor

Position of option on menu: Design =>Pipeline =>Editor

This is the same option as Editor from the Strings walk-right menu on the 12d Model menu.

The string editor is used to modify any 12d Model strings. After selecting the Editor option, the **Edit String** panel is placed on the screen to record any error messages.

The option is already in the **Pick** mode (the **Pick & Edit** button only needs to be selected if the pick was cancelled) and the user simply picks and accepts the string to be edited.

From the picked string's type, the editor is able to determine the edits that apply to the string and list them in the string's Edit menu.

If a pipeline string is selected, the Pipeline Edit menu and **Pipeline Edit Info** panel (as shown in the previous section) are placed on the screen.

The individual edit operations for a pipeline string will now be discussed in detail.

Please continue to the next section "Pipeline Editor" .

Pipeline Editor

[pipeline_edit_info](#) [pipeline_edit](#)

Position of option on menu: Design =>**Pipeline** =>Editor

A pipeline string is defined by specifying both the horizontal and vertical geometry of the invert (bottom of the pipeline) as separate operations.

The horizontal geometry consists of a series of (x,y) points (called horizontal intersection points) and circular curves applied to the intersection points.

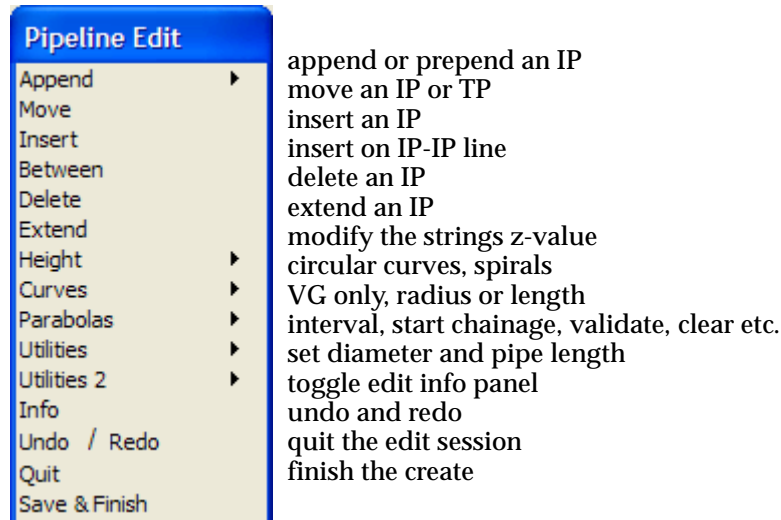

Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points (called vertical intersection points) and circular curves applied to the vertical intersection points.

The horizontal geometry is usually defined in a plan view and the vertical geometry in a section view. Hence the pipeline string editor can edit information for the string on both plan and section views.

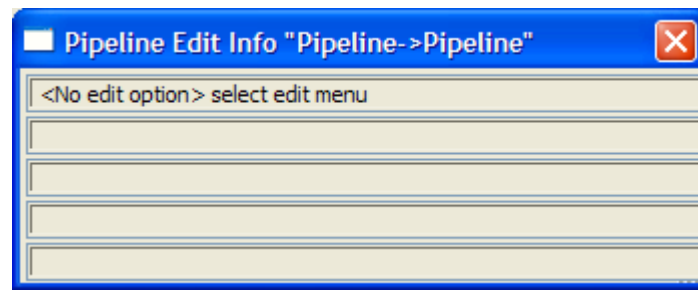

Note: the string can only be edited on a section view if the string is also profiled on the section view.

On selecting a pipeline string the Pipeline Edit menu and Pipeline Edit Info panel are placed on the screen.

The Pipeline Edit menu is

and the **pipeline edit info** panel is

To edit the selected pipeline string, simply select the required edit option from the list of all possible edits in the pipeline edit menu.

The edit is **cancelled** by selecting the cancel option. The edited string is restored to its pre-edit state and the option terminated.

The edit is **finished** and the new string placed in the given model when the finish option is chosen. The edit option then terminates.

When either quit or finish is selected, a **yes-no-cancel** panel is displayed and the user must confirm the selection.

The **pipeline edit info** panel is used to display information and messages during editing of the pipeline string.

The main message area indicates the purpose of the mouse buttons at each step.

Message area 1 displays the current pipeline edit option and message area 5 indicate the next step in the edit option.

Message areas 2 and 3 are used to display information about the string as the cursor is moved near the string and the string points. For example, for the closest IP, the (x,y,z) position and radius of the IP is displayed in area 2, and in area 3 the bearing-in, bearing-out and deflection angle for the adjacent IPs.

Message area 4 displays the cover above the pipeline and the vertical, horizontal and combined joint deflection.

Most of the options are identical to the edit options for an alignment string and will not be discussed in detail again. The options that are only applicable to a pipeline string will be fully described.

Append

HIPs

In a plan view, the `append=>HIPs` option is used to create the first horizontal point in a new pipeline string, to append a new horizontal intersect point to the end of the string or to prepend a new horizontal intersection point to the beginning of the string. The horizontal geometry is for the centre of the pipe in plan.

VIPs

In a section view, the `append=>VIPs` option can be used to create and edit the vertical geometry of the picked string if the string is a primary string on any section view. This can be achieved by using either the `VG edit` or the `profile` option from the section view `View ops` menu. The vertical geometry is for the invert (bottom) of the pipe.

The `append` option is the same as `append` for an alignment string and will not be described further.

Move

The `move` option can be used for moving individual horizontal and vertical intersection and tangent points.

The option acts on the horizontal geometry if the point to move is selected in a plan view, or the vertical geometry if the point to move is selected in a section view.

The `move` option is the same as `move` for an alignment string and will not be described again.

Insert

The `insert` option is designed to place a new intersection point in a string between two adjacent horizontal or vertical intersection points (note that the inserted point does not have to be on the line joining the two intersection points).

The `insert` option is the same as `insert` for an alignment string and will not be described again.

Between

The `between` option is similar to the `insert` option except the inserted point **does** have to be on the line joining the two intersection points. To accomplish this, the cursor position is automatically projected onto the IP-IP line to give the new IP point position.

The `between` option is the same as `between` for an alignment string and will not be described again.

Delete

The `delete` option is used to delete horizontal or vertical intersection points from the string.

The `delete` option is the same as `delete` for an alignment string and will not be described again.

Extend

The `extend` option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

The `extend` option is the same as `extend` for an alignment string and will not be described again.

Height

The height option is used to modify the height of a vertical intersection point in the string.

The height option is the same as height for an alignment string and will not be described again.

Curves

curves

The curves option allows the user to add circular curves of a given radius to a either horizontal or vertical intersection points.

The curve option is the same as curve for an alignment string and will not be described again.

Parabolas

parabolas

The parabolas option is for adding parabolic curves to the **vertical geometry**.

For pipelines, circular curves are normally used on vertical curves.

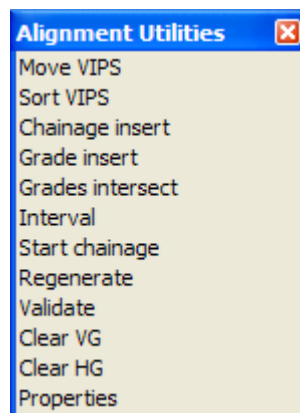

The parabolas option is the same as parabolas for an alignment string and will not be described again.

Utilities

alignment_utilities

The utilities walk-right menu contains a number of useful miscellaneous option for the pipeline string. The menu is

Each of these options is the same as for an alignment string and will not be discussed again.

Utilities 2

pipeline_utilities

The utilities 2 walk-right menu contains options to modify the diameter of the pipeline and to set the standard length of the pipes used to construct the pipeline.

The utilities 2 walk-right brings up the pipeline utilities menu:

Diameter

The diameter option is used to change the diameter of the pipeline string.

After selecting the option, an enter value typed-input box is displayed on the screen containing the pipeline's current diameter.

The new diameter is entered into the typed-input box, terminated with <return>.

The typed-input box then disappears and the option terminates.

Length

The length option is used to change the length of the standard pipe used to construct the pipeline string.

The length of the pipes used in constructing the pipeline string is used for calculating joint deflections along the pipeline.

After selecting the option, an enter value typed-input box is displayed the pipeline's current standard pipe length.

The new length is entered into the typed-input box, terminated with <return>.

The typed-input box then disappears and the option terminates.

Info

The pipeline edit info panel is toggled **on/off** by the info option in the pipeline edit menu.

Quit and Finish

Even after points are created for the new string, the create process can be **aborted** by selecting the quit option from the pipeline edit menu. The option then terminates and **no** string is created.

The create process is completed and the new string created and placed in the given model when the **finish** option is chosen from the pipeline edit menu.

When either the finish or quit option is selected, a **yes-no-cancel** panel is displayed and the user must confirm the selection.

Defaults

pipeline_defaults

Position of menu: Design =>Pipeline =>Defaults

The defaults menu sets default depth to tin and joint deflection angle.

The default walk-right menu is

Depth to Tin

pipeline_tin_defaults

Position of option on menu: Design =>Pipeline =>Defaults =>Depth to tin

On selecting the tin option, the **pipeline tin defaults** panel is displayed.

This panel is for setting the default terrain tin which is used to calculate the cover above the pipeline.

Joints

pipeline_joint_defaults

Position of option on menu: Design =>Pipeline =>Defaults =>Joints

On selecting the joints option, the **pipeline joint defaults** panel is displayed.

This panel is for setting the maximum joint deflection for the individual pipes that make up the pipeline.

Plots

pipeline_plots

Position of menu: Design =>Pipeline =>Plots

Currently the plots menu contains only one option and it is used for producing longsection plots of major pipelines.

The plots walk-right brings up the pipeline plots menu:

This option will now be described in more detail.

Please continue to the next section "Longsections".

Longsections

plot_pipeline_network plot_pipeline_network_margins plot_pipeline_network_title

Position of option on menu: Design =>Pipeline =>Plots

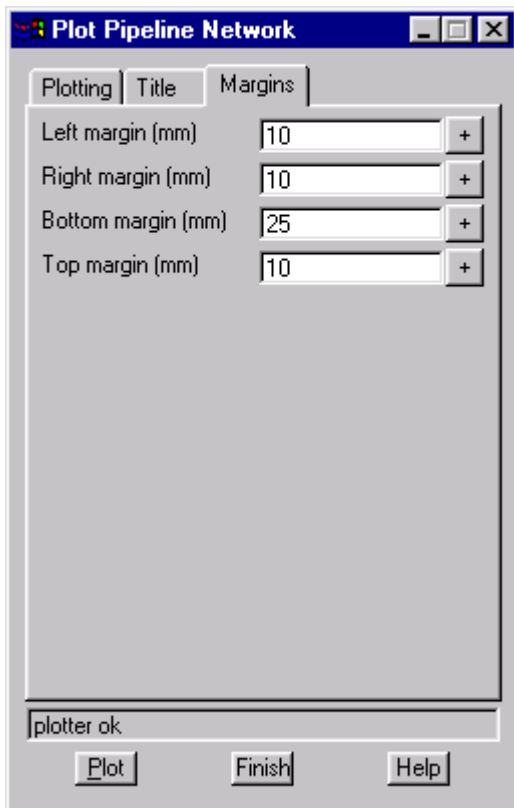

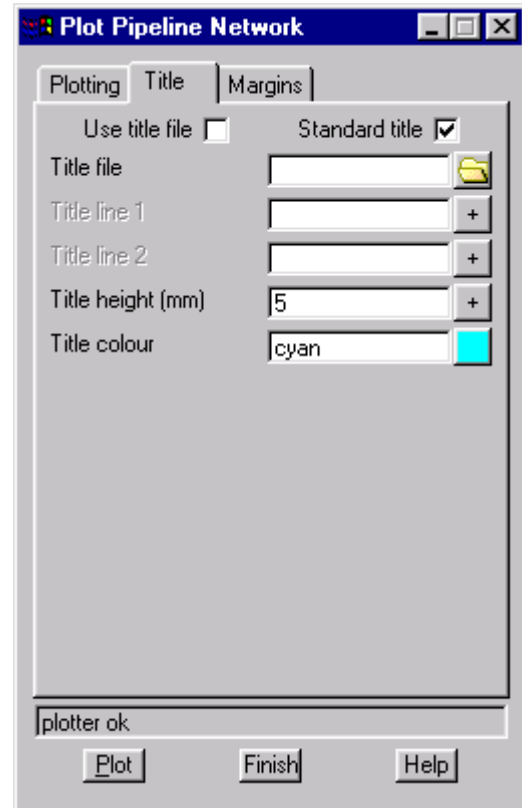

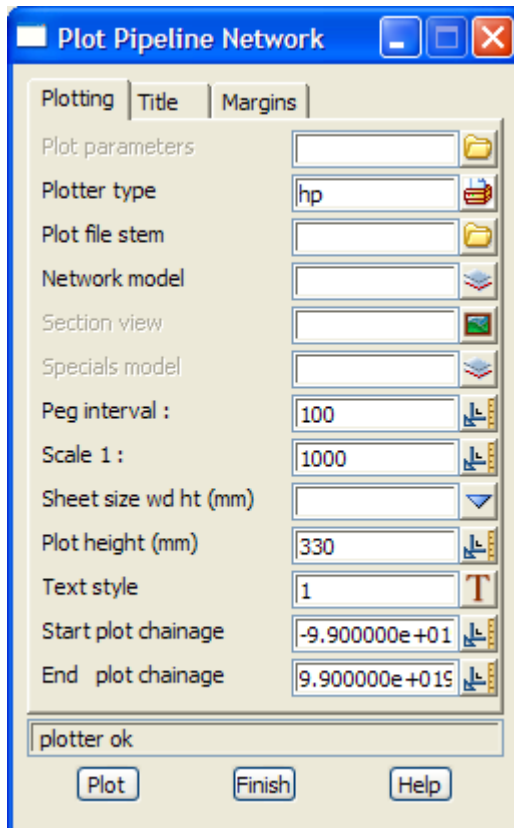

The longsections option is used to generate longsection plots for all the pipeline strings in a given model.

Given the plot sheet size and the horizontal and vertical scales, the longsections for the pipelines are plotted starting at the top of the sheet and moving across the sheet. Once one row is full, if there is room the plot moves down the page and begins a new row. When a plot sheet is full, a new plot sheet is automatically begun.

The pipeline plots include

- ▲ the horizontal and vertical joint deflection at any vertical intersection points which have no curves on them
- ▲ the natural surface height and chainage at any pegs or positions from the specials model, plus the invert level and depth to pipe at the position
- ▲ for any services which cuts the pipeline, the name, diameter, invert level, the distance along the pipeline of the cutpoint plus the invert level and depth of the invert for the pipeline and the cut point.

After selecting the Longsections option, the **Plot Pipeline Network** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters <i>file of plot parameters used for extra control of the long section plot.</i>	input		*.ppf
Plotter type <i>format for the plot output.</i>	input	hp	hp, dxf, postscript etc.
Network model <i>the model containing the pipelines to be plotted.</i>	input		
Section view <i>the section view to be used to define the vertical exaggeration, corridor widths, tins to section through, services models to section etc.</i>	input		
Plot file stem <i>since more than one plot page may be produced, the plot file stem plus a plot page sequence number followed by .plt is used as the plot file names.</i>	input		
Specials model <i>model of text strings which are used as extra labels for the plots.</i>	input		
Peg interval <i>if the specials model is blank, the pipelines are labelled with the text peg at the peg interval along the pipeline.</i>	input	50	
Scale 1: <i>horizontal scale for plotting the pipeline long sections. The vertical exaggeration is taken from the section view given in the section view field.</i>	input		
Sheet size wd ht (mm) <i>if non-blank, the width and height values in millimetres (separated by space) or the name of a user defined sheet size. If blank, the sheets size is calculated to fit the long section plot.</i>	input		available sheet sizes
Pipeline line ht (mm) <i>the maximum allowable height for a longsection plot for a pipeline line. Datum breaks are applied to any part of the longsection that will not fit into the pipeline line ht.</i>	input		
Start plot chainage <i>If blank, the start chainage of the pipelines is used; if non blank, the plots start at this chainage for each pipeline.</i>	input		
End plot chainage <i>If blank, the end chainage of the pipelines is used; if non blank, the plots finishes at this chainage for each pipeline.</i>	input		
Plot <i>write out the pipeline longsection plots for the pipelines in the model given in the network model field.</i>	button		

The fields and buttons for *margin* tab:

Left/right margin (mm) 10.0

the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0

the bottom/top margin between the sheet and the plotting area inside the sheet.

The fields and buttons for the *title* tab:

Use title file tick-cross

if tick, a user defined title block file is used.

Use Standard title tick-cross tick

if tick, the standard border and two lines of title are placed on the bottom of the plot

Title file input *.tf

*if non-blank and use title file is set to **tick**, then the file given in this field is used to generate a user defined title block for the plot.*

Title line 1/2 input

first/second line of title information

Title height (mm) input 5

height (in millimetres) to draw the characters in the two lines of title information.

Title colour input cyan available colours

colour used for the border and the title information.

For a description of the pipeline plot parameters, please go to the section “Pipeline Plot Parameters” .

Pipeline Plot Parameters

The **pipeline plot** option is used to make special long section plots for a **network** of pipeline strings.

Some of the look of the pipeline long section plot can be controlled from the **plot pipeline network** panel itself, however a wider selection of control parameters is available by using a pipeline long plot, plot parameter file.

The pipeline long section plot parameters are placed in a file with ending **.ppf**.

Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash // is considered to be a comment.

The set of all parameters for the pipeline long section plot is enclosed within a set of curly brackets {} with the header

```
pipeline_long_plot "plot set name"
```

before the curly brackets.

That is,

```
pipeline_long_plot "plot set name" {
    plot parameters
    one per line
}
```

If there is more than one pipeline_long_plot parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as section_x_plot in the same file.

The other sets will be ignored when doing a pipeline long section plot.

Plot Sheet Layout

The plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The overall size of the plot sheet is given by either a defined sheet size, or by the width and height of the plot given in millimetres and separated by one or more spaces.

```
sheet_size          text          // sheet name, or
                    "mm mm"      // sheet size: width height
```

The sheet size name and width and heights can be specified by the user in a file named sheet_sizes_definitions which is in the normal set up areas, or is pointed to by the environment variable

```
SHEET_SIZES_4D     file          // file of plotter sheets sizes
```

The long plot is then positioned within the plot sheet by giving the margins

```
left_margin        mm
right_margin       mm
top_margin         mm
bottom_margin      mm
```

The (left_margin,bottom_margin) defines the left hand corner position of the long plot on the plot sheet.

The right_margin and top_margin need not be set and if missing, will be calculated from the other plot parameters defining the plot layout.

The pipeline long section plot will break an individual plot up if it doesn't fit across the sheet. There can be one or more rows of plot on the same sheet.

The top row is done first, followed by the second top row, then the third and so on until the bottom row. If there is only one row, it is considered to be the bottom row.

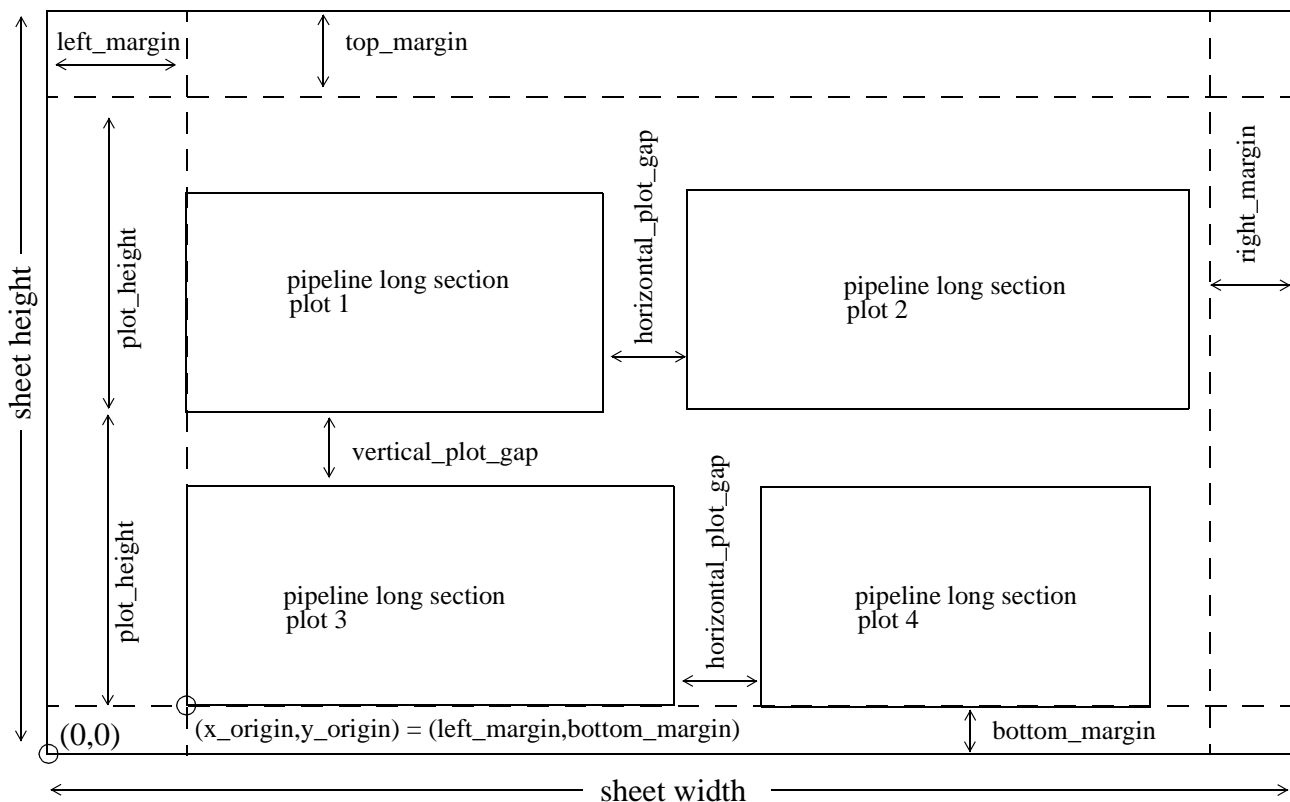

When a sheet is full, a follow on sheet is created.

As soon as one pipeline string is completed, the next pipeline string in the network model is plotted beginning on the same row as the previous pipeline string and with a horizontal gap of size `horizontal_plot_gap` between the plots. If there is not enough room on the row to start the next plot, it will begin on a new row.

The position of the left hand bottom corner of the first plot in the bottom row is given by the parameters, `left_margin` and `bottom_margin`.

If there are two or more rows of plots, the position of the first plot in each row is given by adding multiples of the $(\text{plot_height} + \text{vertical_plot_gap})$ to the `bottom_margin`.

<code>network_model</code>	<i>text</i>	// model of pipeline strings
<code>left_margin</code>	<i>mm</i>	// Position of the left hand bottom
<code>bottom_margin</code>	<i>mm</i>	// corner of first plot in the bottom row.
<code>only_one_line</code>	0	// more than one row on a sheet
	1	// only one row of plot on a sheet
<code>plot_height</code>	<i>mm</i>	// total height of a plot row. It doesn't
		// includes the <code>vertical_plot_gap</code> .
<code>horizontal_plot_gap</code>	<i>mm</i>	// gap between plots on same row
<code>vertical_plot_gap</code>	<i>mm</i>	// gap between rows of plots

The pipeline long plot itself consists of seven areas. From the bottom up, they are boxes, below datum, bottom stagger, graph, top stagger, arrow 4 area and top.

The **boxes area** is where the chainages and various values for the pipeline strings are labelled.

The **below datum area** is a region between the boxes area and the datum line.

The **bottom stagger area** is where the upright line staggers occur before going up from the boxes area to the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.

The **top stagger area** is where the upright line staggers occur above the graph area.

The **arrow 4 area** is an extension of the uprights above the top stagger area to allow for the drawing of arrows where the arrows go between the staggered uprights above the graph area.

The **top area** is an annotation area above the arrow 4 area (the top of the plot) and is used for pegs and deflection angles.

Apart from information labelled in the boxes and top areas, the pipeline long section plot can place arrows between ips for other information such as

- (a) pipe grade
- (b) vertical geometry
- (c) horizontal geometry

Also the chainages where services cross the pipeline line are automatically labelled.

Chainages, Staggering and Uprights

For the pipeline plot, the labelling of pipe invert levels, pipe invert, depth to invert, pipe grade and natural surface level are done at the chainages:

- (a) pegs given by the `peg_interval`
- (b) horizontal and vertical deflection points
- (c) points in the specials model
- (d) crossing services

The points in the specials model are projected onto the pipeline string and the chainages used for labelling. If the point is a 4d string, then the text at the point is used as a text label at the top of the plot.

The peg interval and specials model are given by the parameters

```
peg_interval      world-units    // distance between pegs
specials_model    text           // model name
```

Uprights, or leader lines, are drawn from the values at the bottom of the plot to the top of the plot for cases (a), (b) and (c), or to the crossing service in the graph area for case (d).

If the text values are placed at the real chainage positions at the bottom of the plot, text overwriting can easily occur if the chainages are very close together.

To prevent such overwriting, the text can be **staggered**.

That is, if the text is going to overwrite a previous text value, the next text value is actually moved along until there is no overwriting.

Since the text is no longer at the correct chainage position, the uprights to the pegs and services start at the text position and then bend back to the correct chainage position on the plot. The region where the bending occurs is called the stagger area.

For the pipeline plot, there is an area below the graph where the uprights bend backwards from the staggered text position to the real chainage position (bottom stagger area).

There is a second area above the graph where the uprights bend forwards from the real chainage position to the staggered text position (top stagger area).

Hence annotation above the top stagger area will line up with the staggered values below the bottom stagger area.

The stagger area below the graph area is defined by

```
stagger_height_1    mm           // distance from the top of datum to the
// start of the staggers
stagger_height_2    mm           // distance over which stagger occurs
stagger_gap_bottom  mm           // distance from end of staggers to the
// bottom of the graph area
```

The stagger area above the graph area is defined

```
stagger_gap_top     mm           // distance from top of the graph area to
// the start of the staggers
stagger_height_3    mm           // distance over which stagger occurs
stagger_height_4    mm           // distance from end of staggers to the
// bottom of above upper staggers area
```

The distance to be left for text to avoid overwriting is:

```
horizontal_text_gap mm           // minimum distance to leave for text
// after peg values
services_text_gap   mm           // minimum distance to leave for text
// after service values
```

When staggering occurs, it is possible for the values area to be longer than the graph area.

For the uprights that are drawn from the text to the pegs, specials and services:

```
line_colour         colour       // colour of uprights to the pegs and
// specials
service_line_colour colour       // colour of upright to the crossing
// services
service_text_colour colour       // colour of the name of the service.
service_text_size   mm           // size of the service text.
```

```
service_il_text_size mm           // size of the service invert level text.
```

service_il_textstyle *text* // textstyle of the service il text
service_il_text_colour *colour* // colour of the service il text

Label vertical geometry:

v_g_text_size *mm* // size of the vertical geometry text
v_g_textstyle *text* // text style of the vertical geometry text
v_g_text_colour *colour* // colour of the vertical geometry text

Label horizontal geometry:

h_g_text_size *mm* // size of the horizontal geometry text
h_g_textstyle *text* // textstyle of the horizontal geometry text
h_g_text_colour *colour* // colour of the horizontal geometry text

Label pegs:

peg_text_size *mm* // size of the peg label
peg_textstyle *text* // text style of the peg label
peg_text_colour *colour* // colour of the peg label

Label special chainage:

chainage_special_text_size *mm* // size of the special chainage text
chainage_special_textstyle *text* //textstyle of the special chainage text
chainage_special_text_colour *colour* // colour of the special chainage text

Boxes Area

The pipeline string values of chainage, invert level, depth to pipe invert or depth to top of pipe, grade and natural surface level can be labelled in the pipeline long section plot with one line of title, and the actual values given at the chainage of each peg in the pipeline string.

The **titles** for the string values, are drawn in the **titles area** of the **boxes area** and the values are drawn in the **values area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

title followed by the **values** along the string.

Each row is surrounded by lines to form a box.

The **titles area** for the left plot in the bottom row starts at the co-ordinate (left_margin, bottom_margin) and each row is begun by adding the distance (plot_height + vertical_plot_gap) to the bottom_margin.

The width of the title box is given by the **plot_title_width** parameter and the height of each box is given by **plot_title_height**.

plot_title_width	<i>mm</i>	// width of the label boxes.
plot_title_height	<i>mm</i>	// height of each box
box_titles_x	<i>mm</i>	// the distance between the left of the // title box and the title

The **values area** starts at the end of the label area and the values text is written at right angles to the bottom of the boxes.

The colour of the box line work is given by:

plot_title_line_colour	<i>colour</i>	// colour of the lines in the boxes
------------------------	---------------	-------------------------------------

A default text size and colour can be specified for the title text, and the size and colour of the values. These can be overridden by parameters (given later in this section).

plot_title_text_size	<i>mm</i>	// size of label text in boxes
plot_title_text_colour	<i>colour</i>	// colour of label text in boxes
text_size	<i>mm</i>	// size of value text
text_colour	<i>colour</i>	// colour of values in boxes

The width of the **values** area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

The total width of the boxes area is the width of the labels area plus the width of the values area which depends on the amount of staggering that occurs.

The order of drawing and labelling the boxes from the bottom up is

- (a) chainage values
- (b) natural surface heights
- (c) pipe invert levels
- (d) depth to invert or depth to top of pipe
- (e) grade of pipeline

The text, size, textstyle and colour for the title text and values text for each box can be set by:

(a) pipeline string chainages

```

plot_title_chainage_name    text           // label for chainages box
chainage_title_text_size   mm             // size of chainage title text in boxes
chainage_title_textstyle   text           // the textstyle of chainage title text in boxes
chainage_title_text_colour colour        // colour of chainage title text in boxes

chainage_text_colour       colour        // colour of chainage text in boxes
chainage_text_size         mm             // size of chainage text in boxes
chainage_textstyle         text           // the textstyle of chainage text in boxes
chainage_decimals         integer        // number of decimal places
// If > 0, trailing zeros are removed after
// the decimal point.
// If < 0, the absolute value is taken as the
// number of decimal places to report
// i.e. no trailing zeros are removed
    
```

(b) natural surface values

```

plot_title_surface_name    text           // label for the pipeline ns value
ns_title_text_size         mm             // size of ns title text in boxes
ns_title_textstyle         text           // the textstyle of ns title text in boxes
ns_title_text_colour       colour        // colour of ns title text in boxes

ns_text_colour             colour        // colour of ns text in boxes
ns_text_size               mm             // size of ns text in boxes
ns_textstyle               text           // the textstyle of ns text in boxes
ns_decimals                integer        // number of decimal places
// If > 0, trailing zeros are removed after
// the decimal point.
// If < 0, the absolute value is taken as the
    
```

```
// number of decimal places to report
// i.e. no trailing zeros are removed
```

(c) pipe invert values

```
plot_title_invert_name  text    // label for the invert level
il_title_text_size     mm      // size of il title text in boxes
il_title_textstyle     text    // the textstyle of il title text in boxes
il_title_text_colour   colour  // colour of il title text in boxes

il_text_colour         colour  // colour of il text in boxes
il_text_size          mm      // size of il text in boxes
il_textstyle          text    // the textstyle of il text in boxes
il_decimals           integer // number of decimal places
                        // If > 0, trailing zeros are removed after
                        // the decimal point.
                        // If < 0, the absolute value is taken as the
                        // number of decimal places to report
                        // i.e. no trailing zeros are removed
```

(c) depth to invert or depth to top of pipe

```
depth_mode            0        // if 0, depth to invert of pipe - default 0
                    1        // if 1, depth to top of pipe (cover)

plot_title_depth_name text    // label for depth of invert
depth_title_text_size mm      // size of depth title text in boxes
depth_title_textstyle text    // the textstyle of depth title text in boxes
depth_title_text_colour colour // colour of depth title text in boxes

depth_text_colour    colour  // colour of depth text in boxes
depth_text_size      mm      // size of depth text in boxes
depth_textstyle      text    // the textstyle of depth text in boxes
depth_decimals       integer // number of decimal places
                        // If > 0, trailing zeros are removed after
                        // the decimal point.
                        // If < 0, the absolute value is taken as the
                        // number of decimal places to report
                        // i.e. no trailing zeros are removed
```

(d) grade of pipeline

```
plot_title_grade_name text    // grade of pipe at the peg
grade_title_text_size mm      // size of grade title text in boxes
grade_title_textstyle text    // the textstyle of grade title text in boxes
grade_title_text_colour colour // colour of grade title text in boxes

grade_text_colour    colour  // colour of grade text in boxes
grade_text_size      mm      // size of grade text in boxes
grade_textstyle      text    // the textstyle of grade text in boxes
grade_decimals       integer // number of decimal places
                        // If > 0, trailing zeros are removed after
                        // the decimal point.
                        // If < 0, the absolute value is taken as the
                        // number of decimal places to report
                        // i.e. no trailing zeros are removed
```

Below Datum Area

The **below datum area** is the region between the boxes area and the arrow_1 area. The datum line is drawn at the top of the below datum area.

datum_title_text_size	<i>mm</i>	// size of datum title text and value
datum_title_textstyle	<i>text</i>	// textstyle of datum title text and value
datum_title_text_colour	<i>colour</i>	// colour of the datum title text and line

The size of the below datum area is

datum_gap	<i>mm</i>	// height of the below datum area
-----------	-----------	-----------------------------------

The datum value is placed above the datum line.

Since the datum value is automatically calculated to try and fit the plot vertically into the graph area, the datum value can change along the plot. When a datum change occurs, the new datum value is written on the datum line at the relevant chainage position.

The datum name, text size and colour are controlled by:

datum_text_size	<i>mm</i>	// size of datum title text and value
datum_textstyle	<i>text</i>	// textstyle of datum title text and value
datum_text_colour	<i>colour</i>	// colour of the datum title text and line

datum_name	<i>text</i>	// text to write before the datum value
datum_text_size	<i>mm</i>	// size of datum text and value
datum_colour	<i>colour</i>	// colour of the datum text and line

Graph Area

The **graph area** is the area where the actual plots of the pipeline strings are drawn.

The length of the graph area is determined by the length of the pipelines string to be plotted (given by the start and end chainages) and the horizontal scale (given by scale) of the plot.

scale	<i>value</i>	// 1:value - horizontal scale // The vertical scale is determined by the // horizontal scale and the vertical // exaggeration for the section view.
start_chainage	<i>value</i>	// “ “ means use start of pipeline strings
end_chainage	<i>value</i>	// “ “ means use end of pipeline strings

The vertical exaggeration is taken from the section view specified for the plot by the parameter:

view_name	<i>text</i>
-----------	-------------

The tins to be sectioned through by the pipeline strings and any service models and corridor settings for the graph area are also taken from the specified section view.

The height of the graph is calculated by subtracting the height of the first five areas (i.e. don't include the top area) from the plot height.

If the plot will not fit horizontally into a row on the sheet, then the plot will be broken at an appropriate peg and the plot continued on another row.

Datum breaks at pegs are used to try and fit the plot vertically into the graph area but if the plot still cannot fit, then it will be truncated at the bottom.

The types of strings that can be drawn in the graph area of the pipeline long section plot are:

- (a) pipeline string the strings from the network model
- (b) tins sections of the pipeline string through any tins on the section view.
- (c) services parts of strings from any models on the section view that cut the

corridor for the section view.

The **colour** of the strings in the plot is the actual string colour for cases (a) and (c), the colour of the tin used for the section in case (b).

Arrow 4 Area

This is just an extension of the stagger lines before the top of the plot. It leaves an area that can be used for extra annotation after the plot is produced.

The height of the area is

```
plot_title_top_height    mm        // height of the arrow 4 area
```

Top Area

The **top area** is an annotation area at the top of the plot (above the arrow 4d area).

It can be used for peg names and horizontal and vertical deflection angles in the pipeline.

The height of the top area is given by

```
vertical_plot_gap        mm        // size of the top area. If it is not large
                           // enough, the text will overwrite the
                           // plot in the row above.
```

Change of Direction At Intersection Points

If there is a horizontal or vertical intersection point without a curve on it, the deflection angle at the intersection point is drawn in the top area.

The text is drawn at the distance **angle_text_offset** above the top of the plot and if there is more than one angle, they are spaced horizontally by the distance **angled_text_gap** to the right.

The size and colour of the deflections is given by `text_size` and `text_colour`.

```
angled_text_offset       mm        // distance of direction text above
                           // top of the plot
angled_text_gap          mm        // distance of direction text to the right
                           // of previous text.
angled_text_angle        value     // angle of direction text
```

Hatching Cut and Fill Areas

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins be hatched.

The parameters for labelling cuts and/or fill regions between tins are given by:

<code>hatch_original_tin_n</code>	<i>tin_name</i>	// tin_name for original surface
<code>hatch_new_tin_n</code>	<i>tin_name</i>	// tin_name for final surface
<code>hatch_cut_separation_n</code>	<i>mm</i>	// distance between cut hatch lines
	<i>0</i>	// don't do cut hatching
<code>hatch_cut_angle_n</code>	<i>degrees</i>	// angle in degrees of cut hatching
<code>hatch_cut_colour_n</code>	<i>colour</i>	// colour of the cut hatching
<code>hatch_cut_linestyle_n</code>	<i>linestyle</i>	// linestyle for cut hatching
<code>hatch_cut_draw_sides_n</code>	<i>1/0</i>	// 1 = draw sides of cut regions
<code>hatch_cut_draw_original_n</code>	<i>1/0</i>	// 1 = draw original tin in cut regions
<code>hatch_cut_draw_new_n</code>	<i>1/0</i>	// 1 = draw new tin in cut regions
<code>hatch_fill_separation_n</code>	<i>mm</i>	// distance between fill hatch line
	<i>0</i>	// don't do fill hatching
<code>hatch_fill_angle_n</code>	<i>degrees</i>	// angle in degrees of fill hatching
<code>hatch_fill_colour_n</code>	<i>colour</i>	// colour of the fill hatching
<code>hatch_fill_linestyle_n</code>	<i>linestyle</i>	// linestyle for fill hatching
<code>hatch_fill_draw_sides_n</code>	<i>1/0</i>	// 1 = draw sides of fill regions
<code>hatch_fill_draw_original_n</code>	<i>1/0</i>	// 1 = draw original tin in fill regions
<code>hatch_fill_draw_new_n</code>	<i>1/0</i>	// 1 = draw new tin in fill regions

Notes

- cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- cut hatching is turned off by setting `hatch_cut_separation_n` to 0.0.
fill hatching is turned off by setting `hatch_fill_separation_n` to 0.0.

Labelling Cuts of Pipeline Through Strings in a Model

The cuts that the pipeline string makes through any strings in user given models can be automatically labelled on the long section plots.

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the

- (a) top of the boxes on the long section
- (b) height value of the cut string
- (c) height of the primary string
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note:

Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings.

For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

Text justification refers to the actual position and is given by

“top-left”	“top-centre”	“top-right”
“middle-left”	“middle-centre”	“middle-right”
“bottom-left”	“bottom-centre”	“bottom-right”

A choice of six special symbols and/or or any 12d symbols can be drawn at the cut point.

The special 12d Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are

Up to twenty five (25) separate models of strings can be cut and labelled.

Parameters for Labelling Where the Pipeline Cuts Strings in a Model

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose name matches the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

The parameters for selecting and labelling the *n*'th set (where *n* can be from 1 to 25) of cuts of the design string with the strings in the model are given by:

```
cuts_n_model      model_name      // model of strings to be cut
```

The selection of the strings from the model *model_name* whose cut points are to be labelled is all the strings whose name satisfies the name mask *cuts_n_mask*:

```
cuts_n_mask      name_mask      // strings to check for cuts
                                     // and if a cut occurs,
                                     // parameters show how to
                                     // label the cut
```

where *name_mask* is a text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.

For example

```
or
           cuts_1_mask      "ke*"
cuts_1_mask      "?bank*"
or, if both masks are required,
           cuts_1_mask      "ke* ?bank*"
```

If *cuts_n_mask* is missing, then all strings in the model are used. This is equivalent to *name_mask* being "*".

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the design string, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the *n*'th set.

The parameters for drawing a **symbol** at the cut points are

```
cuts_symbol_n_mode  0      // cross
                   1      // up from centre of box
                   2      // up and down from centre of box
                   3      // square
                   4      // triangle, base at bottom
                   5      // circle
                   6      // use a 12d symbol
```

0 + 1 | 2 | 3 □ 4 △ 5 ○
predefined symbols for cut_symbol_n_modes 0 to 5

If *cuts_symbol_n_mode* is 6, then the 12d symbol is given by

```
cuts_symbol_n_style  plotsymbol // 12d symbol to draw at cut
```

Important Note

The plot symbol of name *plotsymbol* is defined in the file given by:

- (a) the parameter *plot_symbols* in the ppf file

plot_symbols filename

or if *plot_symbols* is not defined, then

(b) in the file pointed to by the environment variable PLOT_SYMBOLS_4D
 PLOT_SYMBOLS_4D filename // default plotsym.4d

or if *PLOT_SYMBOLS_4D* is not defined, then

(c) in the file *plotsym.4d*
 which is searched for in the standard set up file sequence

If none of the above files are defined, or if the symbol does not exist in the above files, then it will be searched for in the standard 12d symbols file which is:

(d) either pointed to by the environment variable SYMBOLS_4D
 SYMBOLS_4D filename // default symbols.4d
 or if the environment variable SYMBOLS_4D does not exist, in the file, *symbols.4d*

The position of the symbol is given by:

cuts_symbol_n_position 1 // above point height value
 3 // above top of boxes
 100 // to primary string
 101-500 // to tin1 or tin2 etc.

The symbol can be adjusted by the parameters:

cuts_symbol_n_x mm // offset adjustment to position
 cuts_symbol_n_y mm // height adjustment to position
 cuts_symbol_n_angle degrees // rotation about point
 cuts_symbol_n_colour colour // colour of symbol

and for all values of *cuts_symbol_n_mode* other than 6:

cuts_symbol_n_size mm // size of symbol, 0 don't draw

The value of the **chainage** of the cut string can be labelled using the parameters

cuts_chainage_n_position1 // above cut strings height value
 3 // above top of boxes
 100 // to primary string
 101-500 // to tin1 or tin2 etc.

cuts_chainage_n_x mm // chainage adjustment to position
 cuts_chainage_n_y mm // height adjustment to position
 cuts_chainage_n_angle degrees // rotation about point
 cuts_chainage_n_size mm // size of text, 0 don't label
 cuts_chainage_n_colour colour // colour of text

cuts_chainage_n_textstyle text // textstyle of text chainage
 cuts_chainage_n_pre_text text // text before the chainage value
 cuts_chainage_n_post_text text // text after the chainage value

cuts_chainage_n_justification justification // justification of the text
 cuts_chainage_n_no_decimals integer // number of decimals in chainage

The value of a **height** at the chainage of the point can be calculated and labelled using the parameters

cuts_height_n_mode	1	// use height of cut point itself
	3	// use real world height of position // above boxes
	100	// height of primary string
	101-500	// use height of to tin1 or tin2 etc.
cuts_height_n_position	1	// at points position
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_height_n_x	mm	// chainage adjustment to position
cuts_height_n_y	mm	// height adjustment to position
cuts_height_n_angle	degrees	// rotation about point
cuts_height_n_size	mm	// size of text, 0 don't label
cuts_height_n_colour	colour	// colour of text
cuts_height_n_textstyle	text	// textstyle of text height
cuts_height_n_pre_text	text	// text before the height value
cuts_height_n_post_text	text	// text after the height value
cuts_height_n_justification	justification	// justification of the text
cuts_height_n_no_decimals	integer	// number of decimals in height

A **label** which can include the **name** of the cut string is drawn by using the parameters

cuts_label_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_label_n_mode	0	// don't include cut string name
	1	// include cut string name in label
cuts_label_n_x	mm	// chainage adjustment to position
cuts_label_n_y	mm	// height adjustment to position
cuts_label_n_angle	degrees	// rotation about point
cuts_label_n_size	mm	// size of text, 0 don't label
cuts_label_n_colour	colour	// colour of text
cuts_label_n_textstyle	text	// textstyle of text label
cuts_label_n_pre_text	text	// text before the string name
cuts_label_n_post_text	text	// text after the string name
cuts_label_n_justification	justification	// justification of the text

Title Block Information

The plot can have a standard 12d Model title block or a user defined title block.

The standard title block consists of a simple border around the plot and two lines of text in a box underneath the plot. For a user defined title block, all the line work and text is defined by the user.

Standard Title Block

For the standard 12d Model title block, there are extra parameters for two lines of text and text size and colour. The standard title block is turned on or off by the parameter *plot_border*.

<i>plot_border</i>	<i>yes/no</i>	<i>// yes plots a standard title block</i> <i>// default yes</i>
<i>title_1</i>	<i>text</i>	
<i>title_2</i>	<i>text</i>	
<i>title_text_size</i>	<i>value</i>	
<i>title_colour</i>	<i>colour</i>	

User Title Block

For the user defined title block, the title block drawing commands are kept in a file whose name is supplied by the user. The title block drawing commands are almost identical to the linestyle drawing commands and is given at the beginning of chapter Advanced Plotting.

Hence for a user defined title block, there are just two parameters - one to say a title block file is being used and the other to give the name of the title block file. The *plot_border* parameter should also be set to *no* so that the standard title block is not also drawn.

<i>use_title_file</i>	<i>yes/no</i>	<i>// yes draws the title block given in title_file</i> <i>// default no</i>
<i>title_file</i>	<i>filename</i>	
<i>plot_border</i>	<i>no</i>	<i>// turn off standard title block</i>

Some special plot parameters are used to pass information down to variables in a user defined title block

For example, inside the title block file it is possible to have run time user defined text variables. The actual text values for these text variables are passed down to the title block file from the plot parameter file via the parameters *user_text_n* ($n = 1, 2, \dots, 1000$)

<i>user_text_n</i>	<i>text</i>
--------------------	-------------

The special plot parameters are:

<i>time_format</i>	<i>text</i>	<i>// format for \$time</i>
<i>user_text_n</i>	<i>text</i>	<i>// where n = 1, 2, ... 1000</i> <i>// passed down to \$user_text_n</i>
<i>title_1</i>	<i>text</i>	<i>// passed down to \$title_1</i>
<i>title_2</i>	<i>text</i>	<i>// passed down to \$title_2</i>
<i>start_page_number</i>	<i>integer</i>	<i>// used as the starting value for</i> <i>// \$page_number. If missing,</i> <i>// \$page_number starts at 1.</i>
<i>start_drawing_number</i>	<i>integer</i>	<i>// added to \$drawing_number in title</i> <i>// block file. If missing,</i> <i>// \$drawing_number starts at 1.</i>
<i>drawing_number_prefix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_prefix</i>
<i>drawing_number_postfix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_postfix</i>

Parameters that Modify Fields In the Plot Pipeline Network Panel

A number of parameters match those in the **plot pipeline network** panel.

When the plot parameter file is first read, any parameters in the panel will be replaced by the values of any corresponding parameters from the parameter file.

However, if the parameter is subsequently modified in the panel, the panel value will be the value used for the parameter.

The plot parameters that also occur in the **plot pipeline network** panel are:

network_model	text	
plotter_type	text	
plot_stem	text	
view_name	text	// name of section view for tins, services, // vertical exaggeration etc.
specials_model	text	
peg_interval	world-units	
scale	value	
sheet_size	text	or "width height"
plot_height	mm	
start_chainage	world-units	
end_chainage	world-units	
left_margin	mm	
right_margin	mm	
top_margin	mm	
bottom_margin	mm	
plot_border	yes/no	
title_1	text	
title_2	text	
title_text_size	value	
title_text_colour	colour	
use_title_file	yes/no	
title_file	filename	

Reports

pipeline_reports

Position of menu: Design =>Pipeline =>Reports

The Reports walk-right menu contains reports for joint deflections along the pipeline and crest and sag points.

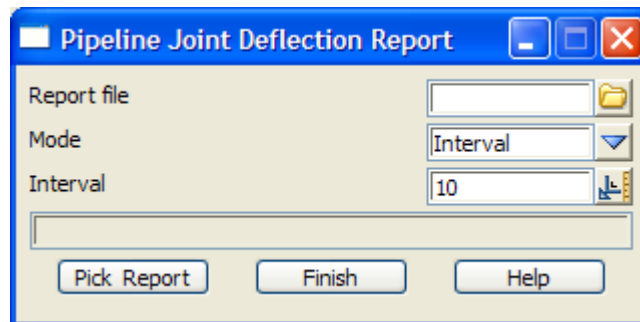

Deflection

pipeline_joint_deflection_report

Position of option on menu: Design =>Pipeline =>Reports=>Deflection

The deflection report gives the horizontal, vertical and combined joint deflections along the pipeline.

After selecting the Deflection option, the **Pipeline Joint Deflection Report** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Report file <i>name of the file for the report</i>	input		
Mode <i>if interval - reports the joint deflection at the interval given plus any horizontal or vertical intersection points without curves on them</i> <i>If critical - only reports points where the deflection is greater than the value given in the pipeline joint defaults panel.</i> <i>If summary - gives the maximum joint deflections</i>	input	interval	interval, critical, summary
Interval <i>the chainage distance between points along the pipeline where joint deflections are to be reported</i>	input	10	
Pick & Report <i>pick the pipeline string to report on.</i>	button		

Crest/Sag Points

Crest/sag points_reports

Position of option on menu: Design =>Pipeline =>Reports=>Crest/Sag Points

After selecting the Crest/sag points option, the **String Crest/Sag Points Report** panel is displayed.

This is the same option as the Reports=>Strings=>Crest/sag points in the main menu.

For each selected string, the string's crest/sag points are written to the report file given in the report file field of the panel.

21 Volumes

12d Model provides two distinct methodologies for calculating volumes; end area and exact.

In all cases the volumes are broken up into *cut* and *fill* volumes.

Definition of Cut and Fill

Cut is defined to be where ever the new surface or given height is **below** the original surface. That is, you have to **cut** to get from the original surface to the new surface. The sign of cut quantities is set via the **Cut volume sign** field from the **Default settings** tab of the Defaults panel (**Utilities=>Defaults**) and the default for *cut volume sign* is positive.

Fill is defined to be where ever the new surface or given height is **above** the original surface. That is, you have to **fill** to get from the original surface to the new surface. The sign of fill quantities is the opposite to the value for cut and cut is set via the **Cut volumes sign** field from the **Default settings** tab of the Defaults panel (**Utilities=>Defaults**). The default for fill is *negative*.

End Area and Exact Volumes

In the **end area** method, sections are *automatically* created through tins. From the sections, cut and fill areas for the sections and the cut and fill volumes between the sections are calculated. For more information on the end area volume calculations, go to the section “Theory of End Area Volumes”

For **exact** volumes, the volume between a tin and a plane or between two tin is determined by working out the exact geometrical shapes between the tins and summing their volumes. For more information on the exact volume calculations, go to the section “Theory of Exact Volumes”

It is often stated that exact volumes are more accurate than end area volumes. However, when the distance between sections is small in the end area volume calculations, the results are the same to any reasonable degree of accuracy.

The reason for having both methods available in **12d Model** is

- (a) to provide an independent check on the volumes produced
- (b) each method produces a different breakup of the volumes.

In the end area method, cut and fill volumes are produced on a section by section basis. This is needed for applications such as mass-haul calculations.

For the exact method, cut and fill volumes are easily calculated between different **depth** values.

This is useful for applications such as depth (isopach) analysis.

For both the end area and the exact method, 12d Model provides options to calculate the volume

(a) between a surface (tin) and a fixed height (z-value)

and

(b) the volume between two surfaces (tins) - an original surface (tin) and a new surface (tin).

NOTE: For the **end area volumes**, sections are automatically generated and used for the calculations. You do **not** need to generate the sections separately.

For more information on the end area volume calculations, go to the section “Theory of End Area Volumes” . For information on the end area options, please go to the section “End Area” .

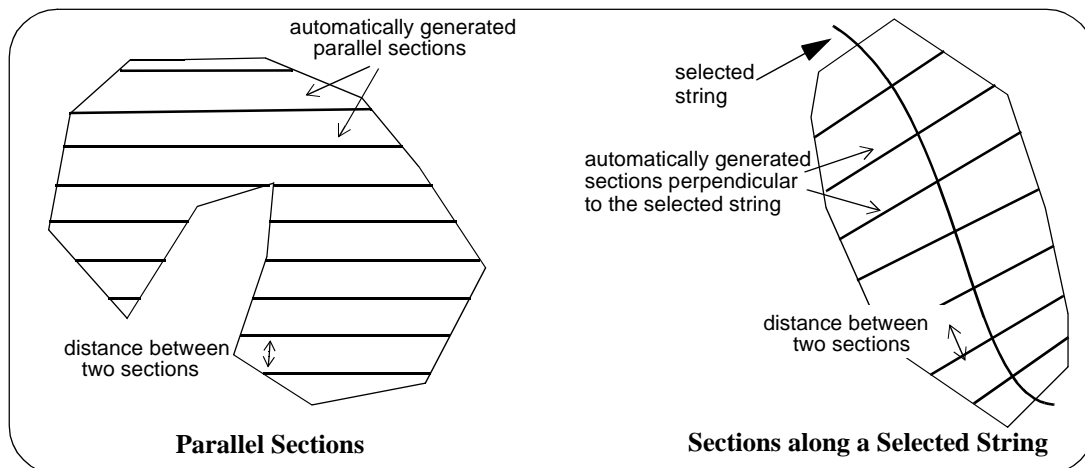

For more information on the exact volume calculations, go to the section “Theory of Exact Volumes” . For information on the exact volume options, please go to the section “Exact” .

Theory of End Area Volumes

In the **end area** method of calculating volumes, sections are automatically generated through the tins. For each section, cut and fill areas are calculated and then cut and fill volumes are calculated from the cut and fill areas. For the definition of cut and fill, please go to the section “Definition of Cut and Fill” .

For the end area method, **12d** Model provides options to calculate the volume between a surface (tin) and a fixed height (z-value) and the volume between two surfaces (tins).

In the **end area** methods of calculating volumes, sections can be generated through a tin or tins at either a *given angle* or at right angles to a **selected** string.

When using the **sections along a string** options, it is possible for a generated section to be broken into more than one part and a parameter exists to only use those sections that contain the selected string.

For each generated section, the *cut* and *fill* areas are calculated and then the volumes between the two sections using either the **average end** (see “Average End Area Formula”) or the **two section prismatic** methods (see “Two Section Prismatic Formula”).

NOTE: For the *end area volumes*, sections are automatically generated and used for the calculations. You do *not* need to generate the sections separately.

Average End Area Formula

Using the *Average End Area* method the *volume* between two *consecutive* sections is calculated by the formula

$$\text{Volume of cut between the two sections} = D \times (C1 + C2) / 2$$

where

D = distance between the two sections

C1 = area of cut for the first section

C2 = area of cut for the second section

The **Total cut volume** is the sum of the cut volumes between each pair of sections.

Similarly

$$\text{Volume of fill between the two sections} = D \times (F1 + F2) / 2$$

where

D = distance between the two sections

F1 = area of fill for the first section

F2 = area of fill for the second section

The **Total fill volume** is the sum of the fill volumes between each pair of sections.

Two Section Prismoidal Formula

The *two section prismoidal* method, as its name suggests, is a modification of the standard prismoidal method but it uses only two sections rather than the three sections required by the standard prismoidal method.

Using the *Two Section Prismoidal* method the *volume* between two *consecutive* sections is calculated by the formula

$$\text{Volume of cut between the two sections} = D \times (C1 + C2 + \text{Sqrt}(C1 \times C2)) / 3$$

where

D = distance between the two sections

C1 = area of cut for the first section

C2 = area of cut for the second section

The **Total cut volume** is the sum of the cut volumes between each pair of sections.

Similarly

$$\text{Volume of fill between the two sections} = D \times (F1 + F2 + \text{Sqrt}(F1 \times F2)) / 3$$

where

D = distance between the two sections

F1 = area of fill for the first section

F2 = area of fill for the second section

The **Total fill volume** is the sum of the fill volumes between each pair of sections.

For the definition of cut and fill, please go to the section "Definition of Cut and Fill" .

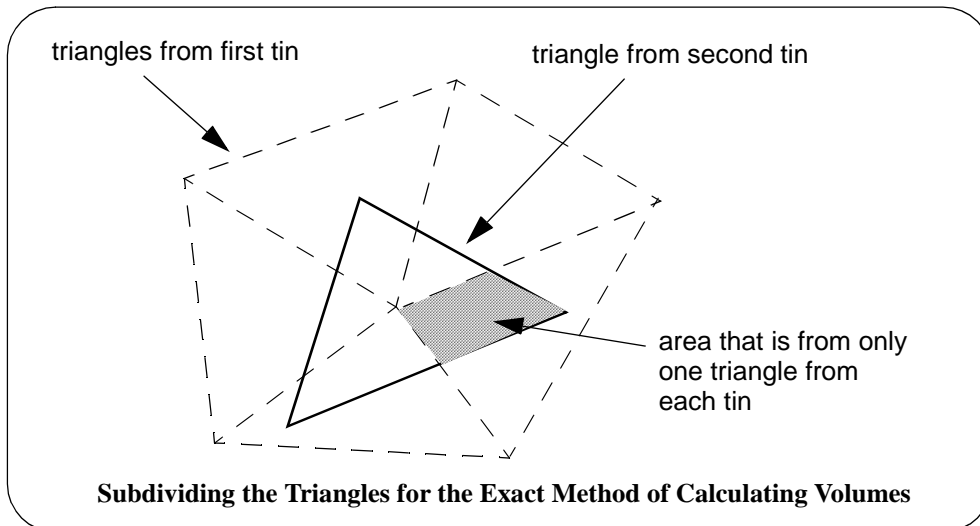

For information on the end area options, please go to the section "End Area" .

For information on the theory for exact volumes, please continue to the section "Theory of Exact Volumes" .

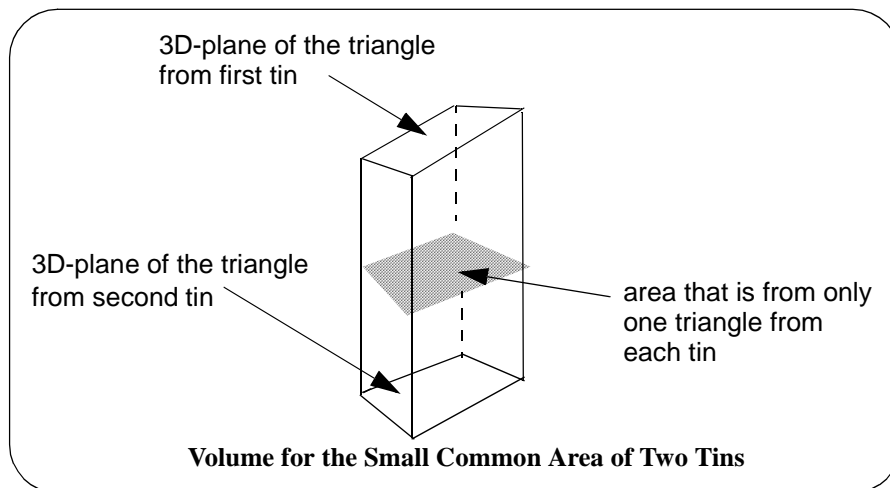

Theory of Exact Volumes

This method calculates the exact volume between two triangulated surfaces (tins), or between one triangulated surface and a plane of constant height.

The volumes are calculated by mathematically subdividing the triangles from both tins into areas that contain only one triangle from each tin.

In three dimensions, these areas represent well defined polygons with the plane of the triangle from one tin as its top and the plane of the triangle from the other tin as its bottom.

For each small area, the cut and fill volume between the two tins can be calculated exactly.

The total *cut* and *fill* volume between the two tin is simply the sum of the cut and fill volumes for each small area.

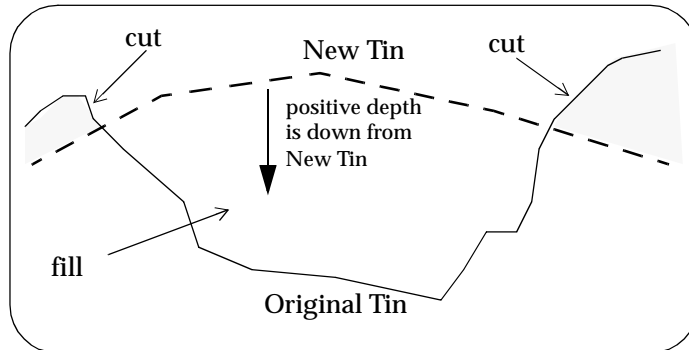

For the definition of cut and fill, please go to the section “Definition of Cut and Fill” .

For information on the exact volume options, please go to the section “Exact” .

The calculated volumes by the exact method can be produced and reported on over *user supplied depth ranges*. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the **volume totals** are **only** calculated for the **depths in the range file**. If the depth ranges **does not cover** the entire depth difference between the tins then the totals

which are the sum of the different depth ranges will **not** be the same as the volumes between the two tins.

For information on the theory for end area volumes, please go to the section "Theory of End Area Volumes" .

Volumes Menu

volumes

Position of menu: Design =>Volumes

12d Model provides two distinct methodologies for calculating volumes; end area and exact.

For information and the theory on both these methods go to the section "Volumes"

The Volume walk-right menu is

and each option in this menu will now be discussed.

For the option *End area*, please go to the section "End Area"

<i>Exact</i>	"Exact"
<i>Grid cell</i>	"Grid Cell"
<i>Stockpile</i>	"Stockpile"
<i>Tin to tin ht range</i>	"Tin to Tin by Height Range"
<i>Cut/fill text in poly</i>	"Create Cut/Fill Text Within Polygon"

End Area

end_area_volumes

Position of menu: Design =>Volumes =>End area

These volumes are calculated using the end area method. For more information on the end area volume calculations, go to the section “Theory of End Area Volumes” .

The options tin to height and tin to tin use parallel sections defined at a user supplied angle and separation distance, to calculate the end areas.

The options string tin to height and string tin to tin use sections defined at right angles to a user selected string, for their end area volume calculations. The distance between sections is supplied by the user.

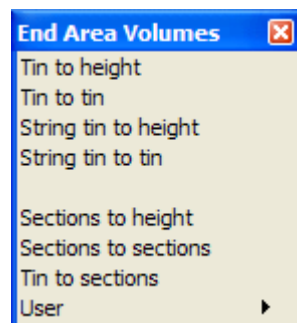

The options sections to height and sections to sections use sections already created to calculate volumes using end areas.

In all the volume options, the sections are restricted to a user defined polygon.

12d Model reports on the cut, fill and balance for each of the sections used in the calculations and also the total cut, fill and balance.

In the report, the sign for cut (negative or positive) is given by the cut volume sign from the **Defaults** panel (fill will have the opposite sign).

The end area walk-right menu is

end area volumes between surface and height
between surfaces
along string between surface and height
along string between surfaces

between a model of sections and height
between two models of sections
between a model of sections and a tin

Each option in this menu will now be described.

For the option *Tin to height*, please go to the section “Tin to Height” .

<i>Tin to tin</i>	“Tin to Tin” .
<i>String tin to height</i>	“String Tin to Height” .
<i>String tin to tin</i>	“String Tin to Tin” .
<i>Section to height</i>	“Sections to Height” .
<i>Section to sections</i>	“Sections to Sections” .
<i>Tin to sections</i>	“Sections to Sections” .

For more information on the end area volume calculations, go to the section “Theory of End Area Volumes” .

Tin to Height

end_area_volume_from_tin_to_a_height

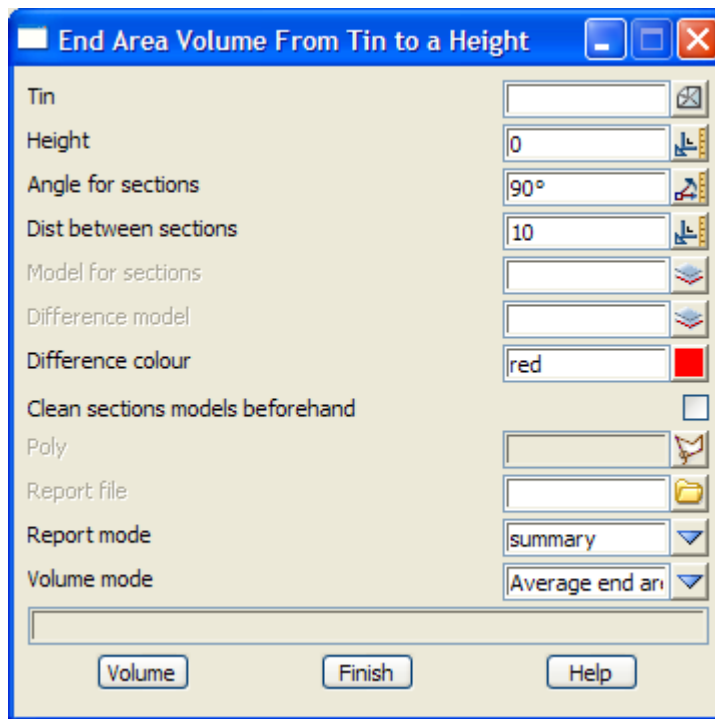

Position of option on menu: Design =>Volumes =>End Area =>Tin to height

The Tin to height option is used to find volumes between an existing surface and a user supplied height. The volumes can only be calculated within a user supplied polygon.

For more information on the end area volume calculations, go to the section “Theory of End Area Volumes” .

On selecting the tin to height option, the **End Area Volume From Tin to a Height** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the volume between it and a height (z value) will be calculated.</i>	input		available tins
Height <i>the volume is calculated between the tin and the value in this field.</i>	input		
Angle for sections	input	90.0	0,45,90

angle (in degrees) of the lines to section along.

Dist between sections	input	10.0	1,10,100
<i>distance between the lines to section along</i>			
Model for sections	input		available models
<i>if non-blank, the sections though the tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour as the tin. If blank, the sections are not kept.</i>			
Difference model	input		available models
<i>if non-blank, the sections which are the difference between the tin sections and the height are retained and placed in the model given in this field. If blank, the sections are not kept.</i>			
Difference colour	input		available colours
<i>colour for the difference sections strings</i>			
Clean sections models beforehand	tick box		
<i>if tick, the model of sections and difference sections are cleaned out before the option runs.</i>			
Poly	poly string-select		
<i>if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.</i>			
Report file	input		*.rpt
<i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>			
Report mode	input	summary	summary, full
<i>if full, the cut and fill details for every section are included. If summary, just the cut and fill totals are given.</i>			
Volume mode	choice box	Average end area	average end area, prismoidal - 2 sections
<i>the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to "Average End Area Formula"</i>			
Volume	button		
<i>The volume between the tin and the height (z-value) within the selected bounding polygon is calculated by the end area method. The sections through the polygon will be calculated along straight lines at the angle given by the angle field and at a separation given by the dist field. The sections are made against the tin given in tin field.</i>			

How to Use the Panel and Panel Messages

- (a) Select the bounding string by choosing **Poly** and picking the required string.
 - (b) Volume processing begins on selecting the **Volume** button.
 - Progress messages - sent to the panel message area
calculating volumes
 - Completion message - sent to the panel message area

Tin to Tin

end_area_volume_between_tins

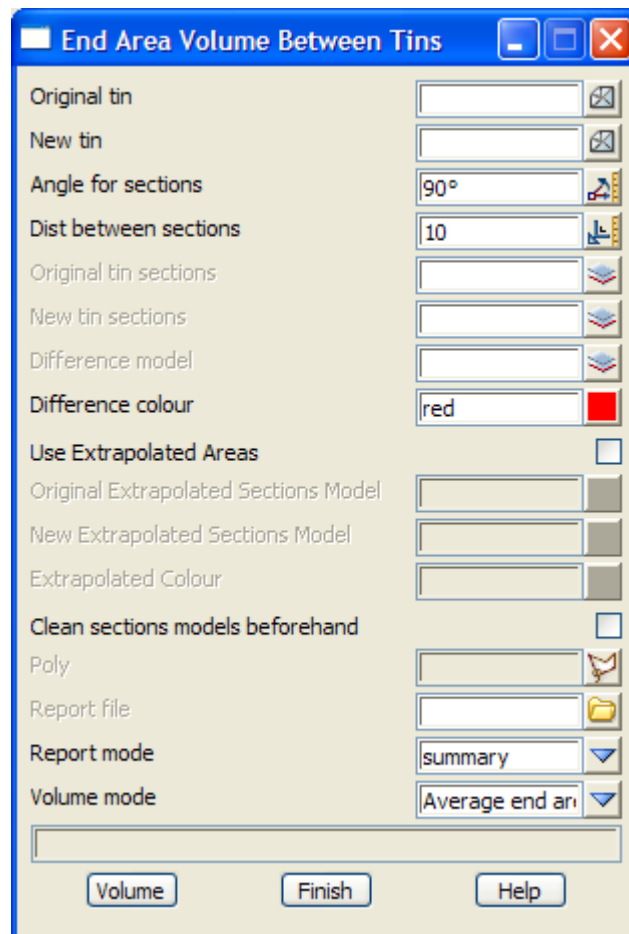

Position of option on menu: Design =>Volumes =>End Area =>Tin to tin

The tin to tin option is used to find volumes between an existing and a new surface. The volumes can only be calculated within a user supplied polygon.

For more information on the end area volume calculations, go to the section "Theory of End Area Volumes".

On selecting the tin to tin option, the end area volume between tins panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Original tin	input		available tins
<i>name of the original tin for determining volumes.</i>			
New tin	input		available tins
<i>name of the new tin for determining volumes.</i>			
Angle for sections	input	90.0	0,45,90
<i>angle (in degrees) of the lines to section along.</i>			
Dist between sections	input	10.0	1,10,100
<i>distance between the lines to section along</i>			
Original tin sections	input		available models
<i>if non-blank, the sections though the original tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour at the original tin. If blank, the sections are not kept.</i>			
New tin sections	input		available models
<i>if non-blank, the sections though the new tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour as the new tin. If blank, the sections are not kept.</i>			
Difference model	input		available models
<i>if non-blank, the sections which are the difference of the original and the new sections are retained and placed in the model given in this field. If blank, the sections are not kept.</i>			
Difference colour	input		available colours
<i>colour for the difference sections strings</i>			
Use extrapolated areas	tick box	not tick	
<i>if not tick, areas (and hence volumes) are only calculated where both sections exist. Hence the sections are limited to where both occur.</i>			
<i>If tick, when the sections are not the same length, the end points of the above and below sections are connected thereby extrapolating the smaller section. This method is not recommended since data does not exist.</i>			
Original extrapolated sections model	model box		available models
<i>if non-blank, the extrapolated sections created from the Original sections are placed in this model. If blank, the extrapolated sections for the original sections are not kept.</i>			
New extrapolated sections model	model box		available models
<i>if non-blank, the extrapolated sections created from the New sections are placed in this model. If blank, the extrapolated sections for the new sections are not kept.</i>			
Extrapolated colour	colour box		available colours
<i>colour for the extrapolated sections</i>			
Clean sections models beforehand	tick box		
<i>if tick, the model of sections and difference sections are cleaned out before the option runs.</i>			
Poly	poly string-select		
<i>if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.</i>			
Report file	input		*.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Report mode input summary summary, full

*if **full**, the cut and fill details for every section are included.*

*If **summary**, just the cut and fill totals are given.*

Volume mode choice box Average end area average end area,
prismoidal - 2 sections

the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to "Average End Area Formula"

Volume button

*The volume between the new and the original tins within the selected polygon string is calculated by the end area method. The sections through the polygon selected by **poly** will be calculated along straight lines at the angle given by the angle field and at a separation given by the dist field. The sections are made against the tins given by the original and the new tin fields.*

How to Use the Panel and Panel Messages

- (a) Select the bounding polygon string by choosing **Poly** and picking the required string.
- (b) Volume processing begins on selecting the **volume** button.

Progress messages - sent to the panel message area
calculating volumes

Completion message - sent to the panel message area
c cut volume f fill volume bal total (balance) volume

<esc> can be used to terminate the option during volume calculations.

String Tin to Height

volume_along_a_string_to_a_height

Position of option on menu: Design =>Volumes =>End Area =>String tin to height

The volume options already described calculate the volumes by forming parallel sections through the tin and then using the end area method between adjacent sections.

In many situations, the sections to be used are defined to be at right angles to a user selected string. This method is commonly used in road calculations.

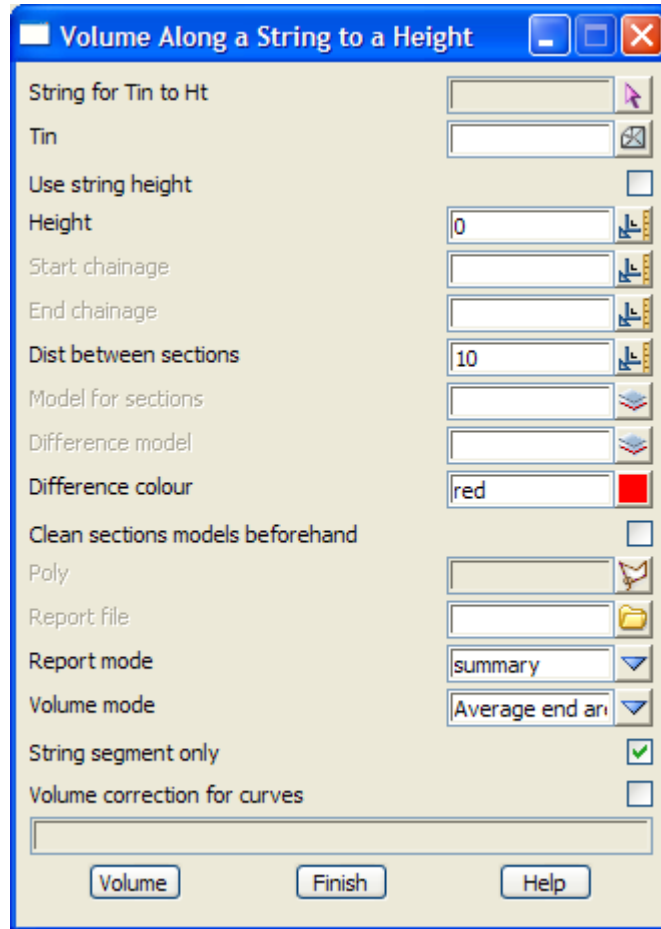

The options string tin to height and string tin to tin both use sections defined at right angles to a user selected string for the end area volume calculations. For both options, the volumes can only be calculated within a user supplied polygon.

It optionally uses the whole section within the polygon or only the part of the section that contains the string.

For more information on the end area volume calculations, go to the section "Theory of End Area Volumes" .

On selecting the string tin to height option, the **volume along a string to a height** panel is displayed.

The fields and buttons in this panel are used as follows.

Field Description	Type	Defaults	Pop-Up
String for Tin to Ht	string select		
<i>a string is selected to be used to define the sections used in the end area calculations. The sections are taken at right angles to this string.</i>			
Tin	input		available tins
<i>name of the tin for which the volume between it and a height (z-value) will be calculated.</i>			
Use string height	tick box		
<i>if tick, the height used for the area calculations is taken at each section from the user selected string. If not tick, the height given in the height panel field is used in the area calculations.</i>			
Height	input	0	
<i>if use string height is set to no tic, the volume is calculated between the tin and the value in this field.</i>			
Start chainage	input		
<i>if non blank, the chainage of the first section to use for volume calculations. If blank, start with the section with the lowest chainage.</i>			
End chainage	input		
<i>if non blank, the chainage of the last section to use for volume calculations. If blank, end with the section with the highest chainage.</i>			
Dist between sections	input	10	1,10,100

distance between the sections taken at right angles down the user selected string.

Model for sections input available models

*if non-blank, the sections though the tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour as the tin.
If blank, the sections are not kept.*

Difference model input available models

*if non-blank, the sections which are the difference between the tin sections and the height are retained and placed in the model given in this field.
If blank, the sections are not kept.*

Difference colour input available colours

colour for the difference sections strings

Clean sections models beforehand tick box

if tick, the model of sections and difference sections are cleaned out before the option runs.

Report file input *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Report mode input summary summary, full

*if full, the cut and fill details for every section are included.
If summary, just the cut and fill totals are given.*

Volume mode choice box Average end area average end area, prismoidal - 2 sections

the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to "Average End Area Formula"

String segment only tick-cross tick

*if tick, only the part of the section within the polygon that contains the selected string is used.
If not tick, the whole section within the polygon is used (see "Theory of End Area Volumes").*

Volume correction for curves tick box

if tick, volume corrections are made when going around curves.

Poly poly string-select

if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.

Volume button

The volume between the tin and the height (z-value) within the selected polygon is calculated by the end area method. The sections through the tin are calculated at right angles to the selected string at a separation given by the dist field. The section strings are placed in the model given in the model field.

How to Use the Panel and Panel Messages

- Select the bounding polygon string by choosing **Poly** and picking the required string.
- Select a string to define the sections string by choosing **String** button
- Volume processing begins on selecting the **volume** button.

String Tin to Tin

volume_along_a_string_between_tins

Position of option on menu: Design =>Volumes =>End Area =>String tin to tin

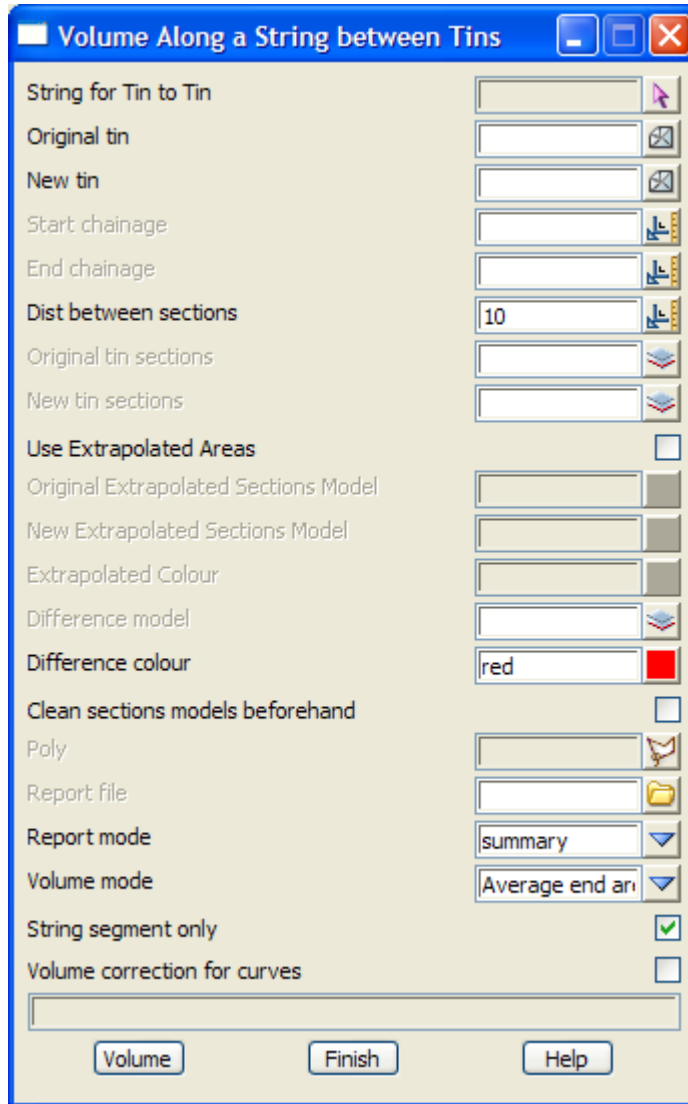

In this option, the sections generated for collating areas and volumes are defined to be at right angles to a *user selected string*. This method is commonly used in road calculations.

It optionally uses the *entire* section within the polygon or only the sections or part of sections that contain the user selected string.

For more information on the end area volume calculations, go to the section "Theory of End Area Volumes" .

On selecting the String Tin to Tin option, the **Volume Along a String Between Tins** panel is displayed.

The fields and buttons in this panel are used as follows.

Field Description	Type	Defaults	Pop-Up
String for tin to tin <i>the string for defining the sections used in the end area calculations. The sections are taken at right angles to this string.</i>	string select		
Original tin <i>name of the original tin for determining volumes.</i>	input		available tins
New tin <i>name of the new tin for determining volumes.</i>	input		available tins
Start chainage <i>if non blank, the chainage of the first section to use for volume calculations. If blank, start with the section with the lowest chainage.</i>	input		
End chainage <i>if non blank, the chainage of the last section to use for volume calculations. If blank, end with the section with the highest chainage.</i>	input		

Dist between sections	input	10.0	1,10,100
<i>distance between the lines to section along</i>			
Original tin sections	input		available models
<i>if non-blank, the sections though the original tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour at the original tin. If blank, the sections are not kept.</i>			
New tin sections	input		available models
<i>if non-blank, the sections though the new tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour as the new tin. If blank, the sections are not kept.</i>			
Use extrapolated areas	tick box	not tick	
<i>if not tick, areas (and hence volumes) are only calculated where both sections exist. Hence the sections are limited to where both occur.</i>			
<i>If tick, when the sections are not the same length, the end points of the above and below sections are connected thereby extrapolating the smaller section. This method is not recommended since data does not exist.</i>			
Original extrapolated sections model	model box		available models
<i>if non-blank, the extrapolated sections created from the Original sections are placed in this model. If blank, the extrapolated sections for the original sections are not kept.</i>			
New extrapolated sections model	model box		available models
<i>if non-blank, the extrapolated sections created from the New sections are placed in this model. If blank, the extrapolated sections for the new sections are not kept.</i>			
Extrapolated colour	colour box		available colours
<i>colour for the extrapolated sections</i>			
Difference model	input		available models
<i>if non-blank, the sections which are the difference of the original and the new sections are retained and placed in the model given in this field. If blank, the sections are not kept.</i>			
Difference colour	input		available colours
<i>colour for the difference sections strings</i>			
Clean sections models beforehand	tick box		
<i>if tick, the model of sections and difference sections are cleaned out before the option runs.</i>			
Report file	input		*.rpt
<i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>			
Report mode	input	summary	summary, full
<i>if full, the cut and fill details for every section are included. If summary, just the cut and fill totals are given.</i>			
Volume mode	choice box	Average end area	average end area, prismoidal - 2 sections
<i>the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to "Average End Area Formula"</i>			
String segment only	tick-cross	tick	

if **tick**, only the part of the section within the polygon that contains the selected string is used.
If **not tick**, the whole section within the polygon is used (see "Theory of End Area Volumes").

Volume correction for curves tick box

if tick, volume corrections are made when going around curves.

Poly poly string-select

if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.

Volume button

The volume between the original and new tins within the selected bounding polygon is calculated by the end area method. The sections through the tins are calculated at right angles to the selected string at a separation given by the dist field.

How to Use the Panel and Panel Messages

- (a) Select the bounding polygon string by choosing **Poly** and pick the required string.
- (b) Select the string to define the sections string by choosing **String for tin to tin**
- (c) Volume processing begins on selecting the **Volume** button.

Progress messages - sent to the panel message area

calculating volumes

Completion message - sent to the panel message area

c cut volume f fill volume bal total (balance) volume

<esc> can be used to terminate the option during volume calculations.

Sections to Height

end_area_volume_from_sections_to_a_height

Position of option on menu: Design =>Volumes =>End Area =>Sections to height

The Sections to height option is used to find volumes between sections that already exist (in a given model) and a user supplied height. The volumes can be restricted to be within a user supplied polygon.

Normally the **Sections to Height** method is not used since if the tin exists, the option

Design =>Volumes =>End Area =>Tin to height

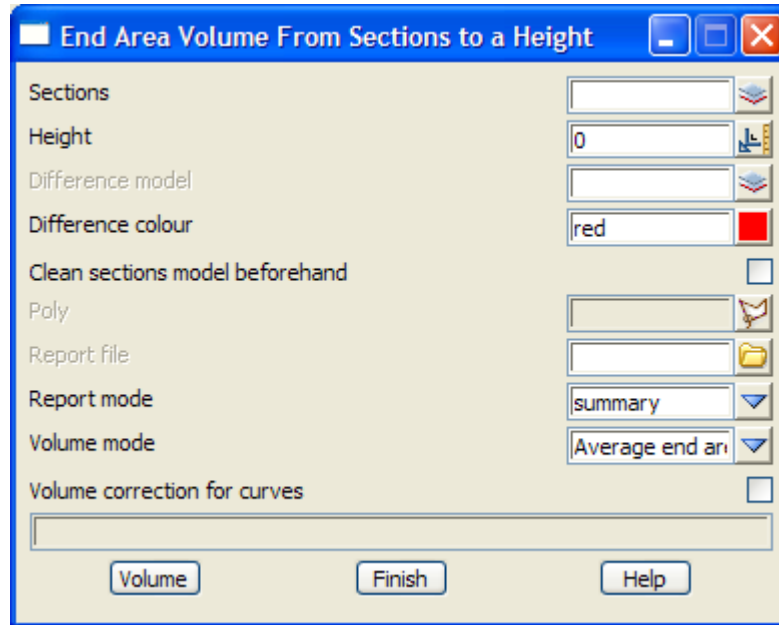

automatically generates sections through the tin at the required interval.

WARNING: The **Sections to Height** method can **not** be used when there are cases of two sections being on the same line.

For more information on the end area volume calculations, go to the section “Theory of End Area Volumes” .

On selecting the Sections to height option, the **End Area Volume from Tin to a Height** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Sections <i>name of the model containing the sections for which the volume between them and a height (z value) will be calculated.</i>	input		available models
Height <i>the volume is calculated between the sections and the value in this field.</i>	input		
Difference model <i>if non-blank, the sections which are the difference between the given sections and the height are retained and placed in the model given in this field. If blank, the sections are not kept.</i>	input		available models
Difference colour <i>colour for the difference sections strings</i>	input		available colours
Clean sections models beforehand <i>if tick, the model of sections and difference sections are cleaned out before the option runs.</i>	tick box		
Poly <i>if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.</i>	poly string-select		
Report file <i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>	input		*.rpt
Report mode <i>if full, the cut and fill details for every section are included. In summary, just the totals are given.</i>	input	summary	summary, full
Volume mode <i>the two methods in 12d for calculating volumes using areas of sections. For more information on each</i>	choice box	Average end area	average end area, prismoidal - 2 sections

method, go to “Average End Area Formula”

Volume correction for curves tick box

if tick, volume corrections are made when going around curves.

Volume button

the volume between the model of sections and the height (z-value) within the selected bounding polygon is calculated by the end area method.

<esc> can be used to terminate the option during volume calculations.

Sections to Sections

end_area_volume_between_sections

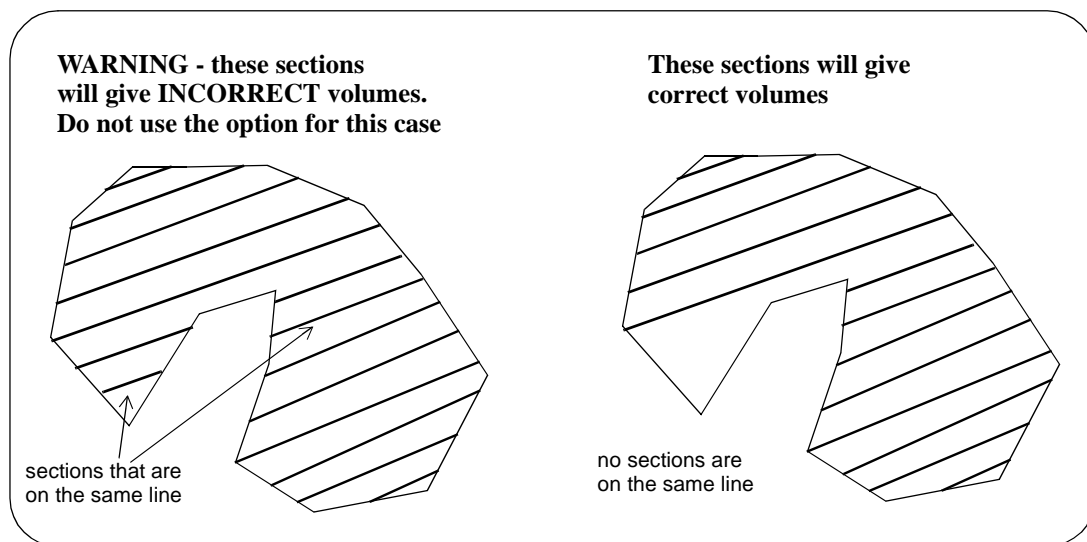

Position of option on menu: Design =>Volumes =>End Area =>Sections to sections

The Sections to sections option is used to find volumes between two models of sections. The volumes can be restricted to be within a user supplied polygon. Note that there needs to be matching sections in the two models of section.

Normally the **Section to Sections** method is not used since if the tin exists, the option

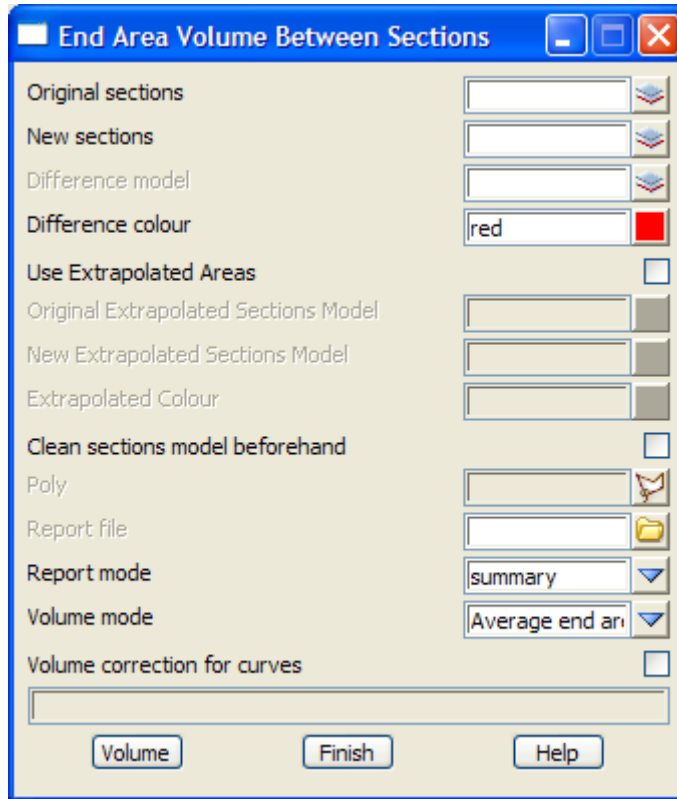

Design =>Volumes =>End Area =>Tin to tin automatically generates sections through the two tins at the required interval.

WARNING: The Section to Sections method can *not* be used when there are cases of two sections being on the same line.

For more information on the end area volume calculations, go to the section “Theory of End Area Volumes” .

On selecting the sections to sections option, the **end area volume between sections** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original sections <i>name of the original model of sections for determining volumes.</i>	input		available models
New sections <i>name of the new model of sections for determining volumes.</i>	input		available models
Difference model <i>if non-blank, the sections which are the difference of the original and the new sections are retained and placed in the model given in this field. If blank, the sections are not kept.</i>	input		available models
Difference colour <i>colour for the difference sections strings</i>	input		available colours
Use extrapolated areas <i>if not tick, areas (and hence volumes) are only calculated where both sections exist. Hence the sections are limited to where both occur. If tick, when the sections are not the same length, the end points of the above and below sections are connected thereby extrapolating the smaller section. This method is not recommended since data does not exist.</i>	tick box	not tick

Extrapolated colour colour box available colours

colour for the extrapolated sections

Clean sections models beforehand tick box

if tick, the model of sections and difference sections are cleaned out before the option runs.

Poly poly string-select

if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.

Report file input

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no file name is given, the report is not produced.

Report mode input summary summary, full

if full, the cut and fill details for every section are included. If summary, just the cut and fill totals are given.

Volume mode choice box Average end area average end area,
prismoidal - 2 sections

the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to "Average End Area Formula"

Volume correction for curves tick box

if tick, volume corrections are made when going around curves.

Volume button

The volume between the original model of sections and the new model of sections within the selected bounding polygon is calculated by the end area method.

<esc> can be used to terminate the option during volume calculations.

Exact

exact_volumes

Position of menu: Design =>Volumes =>Exact

These volumes are calculated by dividing the tins up into small prisms whose volumes can be calculated exactly. For more information on the exact volume calculations, go to the section "Theory of Exact Volumes"

In the exact volume options, the volumes calculations can be restricted to a user defined polygon or if no polygon is provided, the volumes will only be calculated for the regions where both the triangulations exist.

With the exact method, volumes can easily be calculated for depth bands from

(a) the given height to the tin for "tin to height" volumes

or

(b) the new tin to the original tin for "tin to tin" volumes.

Hence for the calculations, a range file can be supplied giving depth pairs and 12d Model will report the cut, fill and balance for each of the depth pairs and also the total of the cut, fill and balance for all the pairs.

In the report, the sign for cut (negative or positive) is given by the cut volume sign from the **default settings** panel (fill will have the opposite sign).

The range file consists of a list of depth ranges and colours, one set per line, in the format

```
lower_depth upper_depth depth_colour
```

This line represents all depths satisfying

```
lower_depth <= depth < upper_depth.
```

For **each range** in the file, the total cut and fill volumes for the depth range will be reported on, and the depth_colour can be used to colour all areas on a plan view satisfying the range.

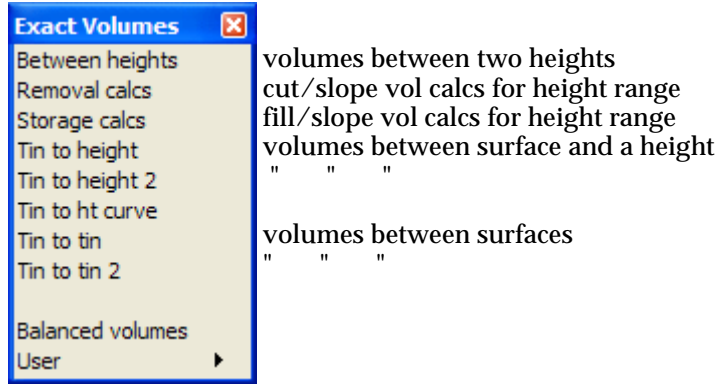

IMPORTANT NOTE - when a depth file is used, the volume totals are only calculated for the depths in the range file. If the depth ranges **does not cover** the entire depth difference between the tins then the totals which are the sum of the different depth ranges will **not** be the same as the volumes between the two tins or the volumes from a tin to a height.

Example of a Depth Range File

```
// depth range file
// format: lower_depth upper_depth colour_for_depth_range
// depth is measured positive down and negative up.

-20 -10 red // colour red where the depth is greater or equal to -20 and less than -10
-10 0 magenta // colour magenta where the depth is greater or equal to -10 and less than 0
0 10 green // colour green where the depth is greater or equal to 0 and less than 10
10 20 "dark green" // colour dark green where depth is >=10 and less than 20
```

The exact walk-right menu is

The options in this menu will now be described.

For the option *Between heights*, please go to the section “Between Heights”

<i>Removal calcs</i>	“Removal Calcs”
<i>Storage calcs</i>	“Storage Calcs”

Between Heights

exact_volume_between_heights

Position of option on menu: Design =>Volumes =>Exact =>Between heights

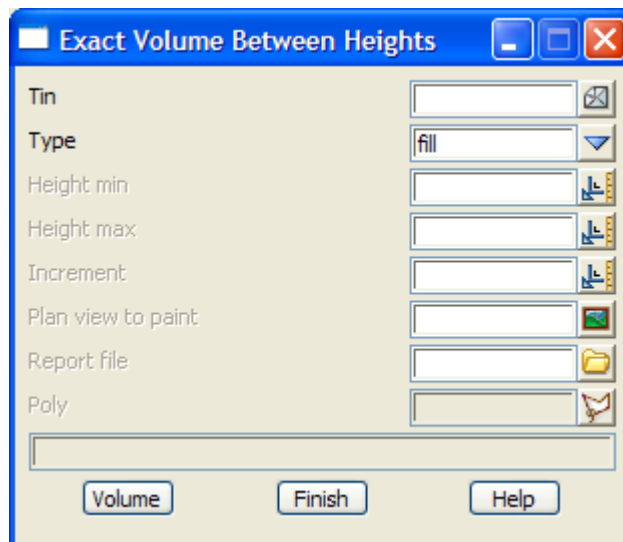

This panel is used to calculate the volume between two heights on a given tin.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

For more information on the exact volume calculations, go to the section “Theory of Exact Volumes”

On selecting the between heights option, the **exact volume between heights** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the volume between two heights will be calculated.</i>	input		available tins
Type <i>if fill, the fill volume between the two heights is calculated. If cut, the cut volume between the two heights is calculated.</i>	input	fill	cut, fill
Height min/max <i>volume is calculated between the height min and the height max values.</i>	input		
Increment	input		

the volumes between the height min and height max are reported on and is broken up into intervals given by the increment value.

Plan view to paint input available views

*if non-blank, the region used for calculations will be painted in the given plan view. The colour will be green if type is **fill**, or red if type is **cut**.*

Report file input *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly poly string-select

if selected, this string is used as the bounding polygon for the volume calculations.

Volume button

The volume between the height min and height max for the tin within the selected bounding polygon is calculated by the exact method.

<esc> can be used to terminate the option during volume calculations.

Removal Calcs

removal_calculations

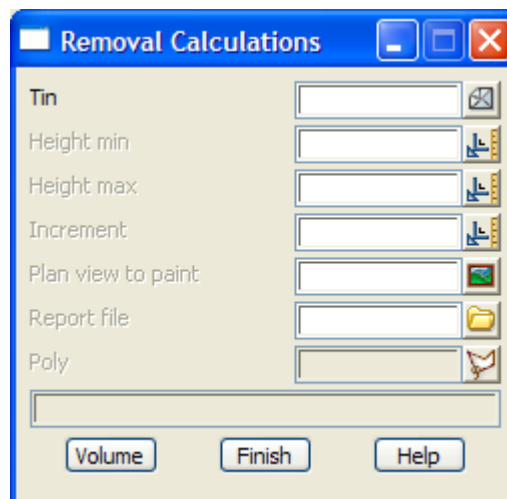

Position of option on menu: Design =>Volumes =>Exact =>Removal calcs

For a user specified range of heights, this option will calculate the cut volume from each height to a given tin, plus the plan and slope areas for the region of the tin exposed by cutting to the height.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

For more information on the exact volume calculations, go to the section “Theory of Exact Volumes”

On selecting the removal calcs option, the **removal calculations** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin used in the volume calculations.</i>	input		available tins
Height min/max <i>if non-blank, the minimum/maximum value of the height range to calculate volumes to. if blank, the tin's minimum/maximum z-value is used.</i>	input		
Increment <i>increment between the heights to calculate the volumes to.</i>	input		
Plan view to paint <i>if non-blank, the region used for calculations will be painted red in the given plan view.</i>	input		available views

max *range*.

<esc> can be used to terminate the option during volume calculations.

Storage Calcs

storage_calculations

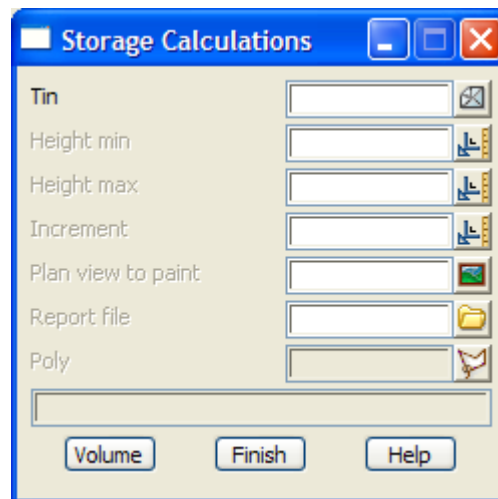

Position of option on menu: Design =>Volumes =>Exact =>Storage calcs

For a user specified range of heights, this option will calculate the fill volume from each height to a given tin, plus the plan and slope areas for the region of the tin covered by filling to the height.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

For more information on the exact volume calculations, go to the section “Theory of Exact Volumes”

On selecting the storage calcs option, the **storage calculations** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin used in the volume calculations.</i>	tin box		available tins
Height min/max <i>if non-blank, the minimum/maximum value of the height range to calculate volumes to. if blank, the tin's minimum/maximum z-value is used.</i>	input		
Increment <i>increment between the heights to calculate the volumes to.</i>	input	1	
Plan view to paint <i>if non-blank, the region used for calculations will be painted green in the given plan view.</i>	view box		available views
Report file <i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>	file box		*.rpt
Poly <i>if selected, this string is used as the bounding polygon for the volume calculations.</i>	poly string-select		
Volume <i>calculate the fill volumes from the tin to the height for the required heights in the height min and height max range.</i>	button		

<esc> can be used to terminate the option during volume calculations.

Tin to Height

`exact_volume_from_tin_to_a_height`

Position of option on menu: Design =>Volumes =>Exact =>Tin to height

This panel is used to calculate the volume between a tin and a given height.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

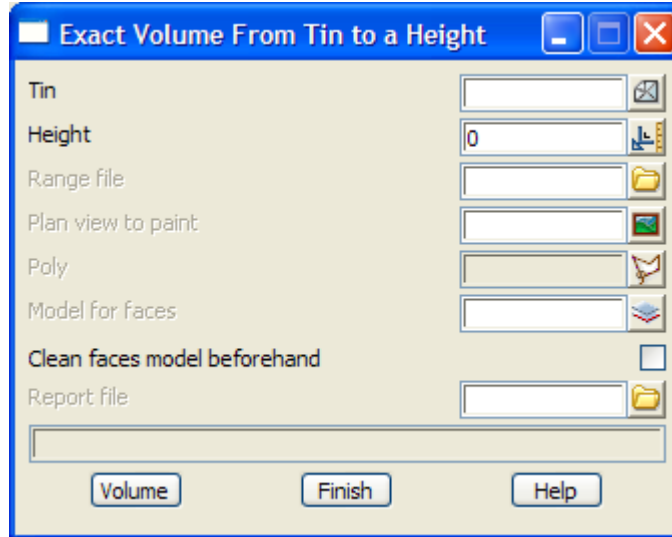

The calculated volumes can be produced and reported over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the **volume totals** are **only** calculated for the **depths in the range file**. If the depth ranges **does not cover** the entire depth difference between the tin and the height then the totals which are the sum of the different depth ranges will **not** be the same as the volume between the tin and the height.

For more information on the exact volume calculations, go to the section “Theory of Exact Volumes”

On selecting the tin to height option, the **Exact Volume From Tin to a Height** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the volume between it and a height (z value) will be calculated.</i>	input		available tins
Height <i>the volume is calculated between the tin and the value in this field.</i>	input		
Range file <i>if non-blank, the user supplied depth range file is used to split up the volumes report and define the depth colours used for painting a view.</i>	input		*.drf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the depth colours given in the range file.</i>	input		available views
Poly <i>if selected, this string is used as the bounding polygon for the volume calculations.</i>	poly string-select		
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	input		available models
Clean faces models beforehand <i>if tick, the model of faces is cleaned out before the option runs.</i>	tick box		
Report file <i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>	input		*.rpt

Tin to Height 2

[exact_volumes_to_height_2](#)

Position of option on menu: Design =>Volumes =>Exact =>Tin to height 2

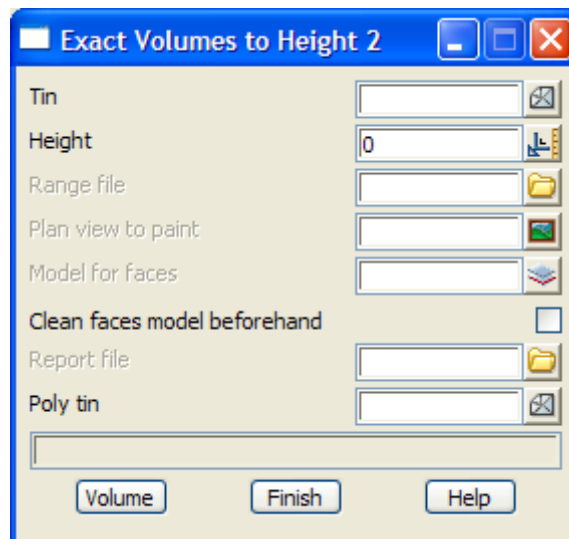

This panel is used to calculate the volume between a tin and a given height but the calculations are restricted to only the regions defined by another tin rather than to a polygon.

The calculated volumes can be produced and reported over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the **volume totals** are **only** calculated for the **depths in the range file**. If the depth ranges **does not cover** the entire depth difference between the tin and the height then the totals which are the sum of the different depth ranges will **not** be the same as the volume between the tin and the height.

For more information on the exact volume calculations, go to the section “Theory of Exact Volumes”

On selecting the tin to height 2 option, the **Exact Volume Height 2** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the volume between it and a height (z value) will be calculated.</i>	tin box		available tins
Height <i>the volume is calculated between the tin and the value in this field.</i>	input		
Range file <i>if non-blank, the user supplied depth range file is used to split up the volumes report and define the depth colours used for painting a view.</i>	input		*.drf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the depth colours given in the range file.</i>	view box		available views
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	model box		available models

Clean faces models beforehand tick box

if tick, the model of faces is cleaned out before the option runs.

Report file file box *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly tin tin box available tins

name of the tin to define the regions that the volume calculations are restricted to.

Volume button

The volume between the tin and the height (z-value) for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the tin and the height is calculated.

<esc> can be used to terminate the option during volume calculations.

Tin to Height Curve

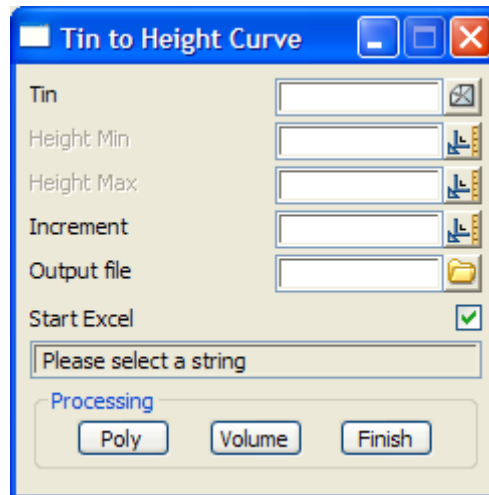

volume_tin_to_ht_curve_panel

Position of option on menu: Design =>Volumes =>Exact =>Tin to ht curve

This panel is used to calculate the volume between a tin between heights and writes out a report on the volumes.

For more information on the exact volume calculations, go to the section “Theory of Exact Volumes”

On selecting the Tin to ht curve option, the **Tin to Height Curve** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the volume between it and a height (z value) will be calculated.</i>	tin box		available tins
Height min <i>the start height for calculation volumes.</i>	input		
Height max <i>the end height for calculation volumes.</i>	input		
increment <i>the height increment.</i>	input		
Output file <i>the file for the volumes report.</i>	file box		
Start Excel <i>if tick, start Excel up with the report loaded into it.</i>	tick box	tick	
Poly <i>select the polygon which is used in plan only to restrict the area for calculating volumes over.</i>	select		
Volume <i>calculate the volume between heights differing by the given increment, and write out a report.</i>	button		

Tin to Tin

exact_volume_between_tins

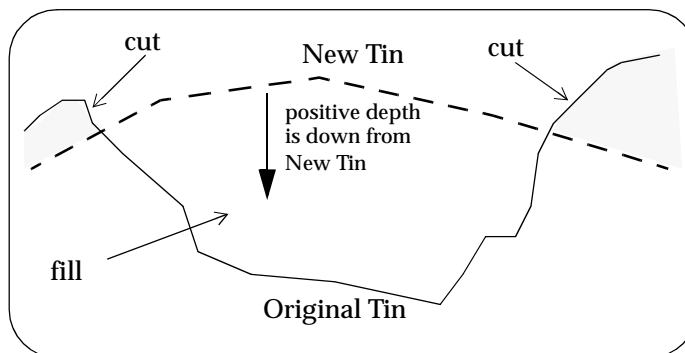

Position of option on menu: Design =>Volumes =>Exact =>Tin to tin

This panel is used to calculate the volume between two tins using the exact method.

The calculations can be restricted to within a polygon, or if no polygon is selected, the overlapping sections of the two tins is used.

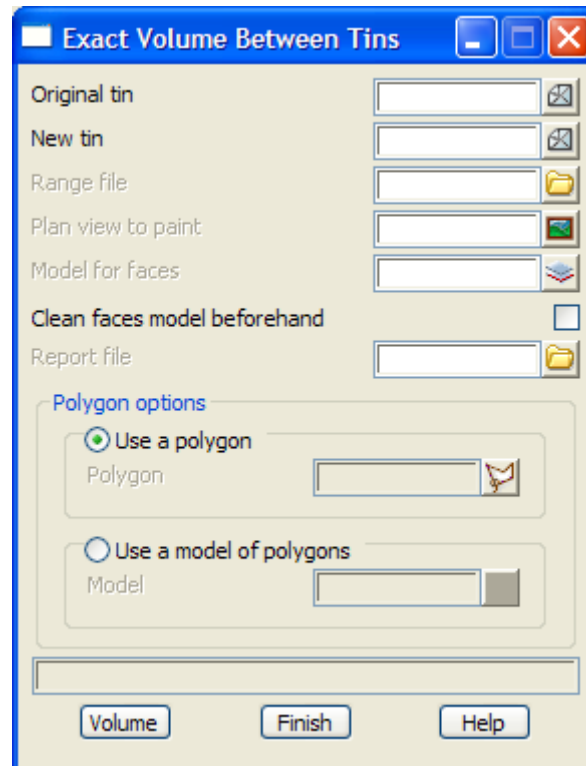

The calculated volumes can be produced and reported on over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the **volume totals** are **only** calculated for the **depths in the range file**. If the depth ranges **does not cover** the entire depth difference between the tins then the totals which are the sum of the different depth ranges will **not** be the same as the volumes between the two tins.

For more information on the exact volume calculations, go to the section “Theory of Exact Volumes”

On selecting the tin to tin option, the **Exact Volume Between Tins** panel is displayed.

Cut is defined to be where ever the new tin is **below** the original tin. Fill is defined to be where ever the new tin is **above** the original tin.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New Tin <i>name of the original/new tin for determining volumes.</i>	tin box		available tins
Range file <i>if non-blank, the user supplied range file is used to split up the volumes report and define the depth colours used for painting a view.</i>	input		*.drf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the depth colours given in the range file.</i>	input		available views
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	input		available models
Clean faces model beforehand <i>if tick, the model of faces is cleaned out before the option runs.</i>	tick box		
Report file <i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>	input		*.rpt

Polygon options

Use a polygon	radio button
Polygon	poly string select
<i>if Use a polygon is selected, then the selected string is used as the bounding polygon for the volume</i>	

calculations.

Use a model of polygons radio button

Model model box available models

if Use a model of polygons is selected, then this model is used and each string in the model is used as a bounding polygon and the volume calculated.

Volume button

The volume between the two tins for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the two tins is calculated.

<esc> can be used to terminate the option during volume calculations.

Tin to Tin 2

[exact_volume_between_tins_2](#)

Position of option on menu: Design =>Volumes =>Exact =>Tin to tin 2

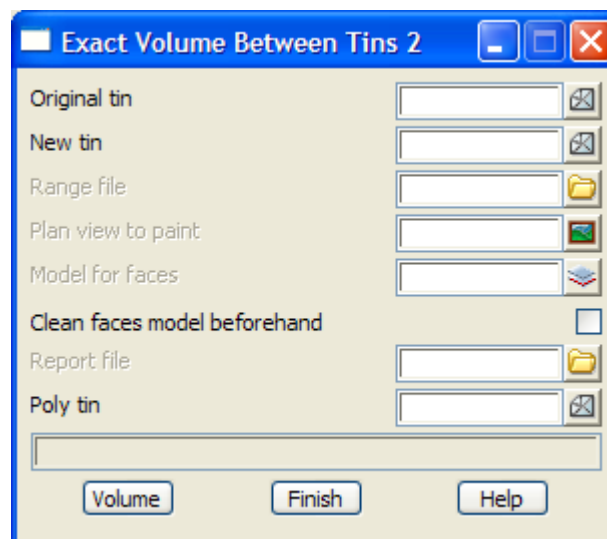

This panel is used to calculate the volume between two tins using the exact method but the calculations are restricted to only the regions defined by another tin rather than to a polygon.

The calculated volumes can be produced and reported on over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the **volume totals** are **only** calculated for the **depths in the range file**. If the depth ranges **does not cover** the entire depth difference between the tins then the totals which are the sum of the different depth ranges will **not** be the same as the volumes between the two tins.

For more information on the exact volume calculations, go to the section “Theory of Exact Volumes”

On selecting the tin to tin option, the **Exact Volume Between Tins 2** panel is displayed.

Cut is defined to be where ever the new tin is **below** the original tin. Fill is defined to be where ever the new tin is **above** the original tin.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New Tin <i>name of the original/new tin for determining volumes.</i>	tin box		available tins
Range file <i>if non-blank, the user supplied range file is used to split up the volumes report and define the depth colours used for painting a view.</i>	input		*.drf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the depth colours given in the range file.</i>	input		available views
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	input		available models
Clean faces model beforehand	tick box		

if tick, the model of faces is cleaned out before the option runs.

Report file file box *.rpt
name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly tin tin box available tins
name of the tin to define the regions that the volume calculations are restricted to.

Volume button
The volume between the two tins for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the two tins is calculated.

<esc> can be used to terminate the option during volume calculations.

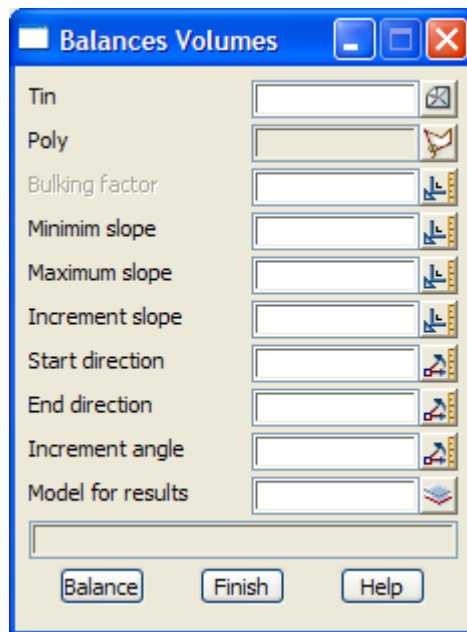

Balanced Volumes

balances_volumes

Position of option on menu: Design =>Volumes =>Exact =>Balanced volumes

This option is currently under development.

On selecting the Balanced volumes option, the **Balances Volumes** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
Balance	button		

Grid Cell

grdvol_panel

Position of option on menu: Design =>Volumes =>Grid cell

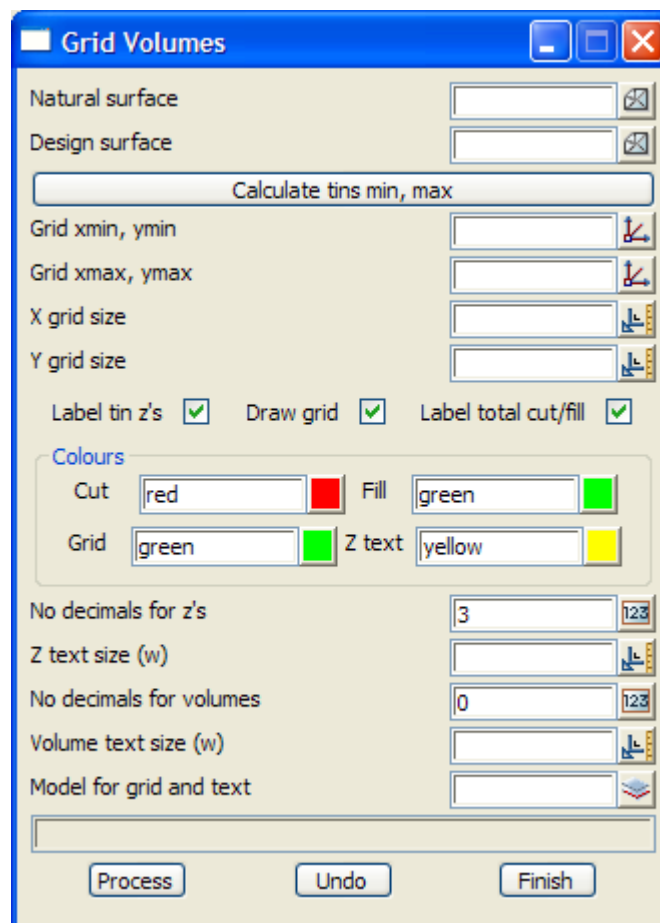

This panel is used to calculate the cut and fill volume between two tins using the exact method and then creating text for each rectangular cells of user defined sides covering the tins.

The rectangular cells (grid) can be drawn and the text of the cut and fill values for each grid cell and z-values at the cell corners. The total cut and fill can also be created at the bottom of the grid.

Cut is defined to be where ever the *design* tin is **below** the *natural surface* tin. **Fill** is defined to be where ever the *design* tin is **above** the *natural surface* tin.

For more information on the exact volume calculations, go to the section “Theory of Exact Volumes”

On selecting the grid cell option, the **grid volumes** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Natural surface/Design surface	tin box		available tins

name of the original/new tin for determining volumes.

Calculate tins min, max	button		
--------------------------------	--------	--	--

when selected, the minimum and maximum x and y values to define the grid cells are calculated and written to the grid x and y minimum and maximum panel fields.

Grid xmin xmax input
the minimum and maximum x values to define the grid cells. The two values are separated by one or more spaces.

Grid ymin ymax input
the minimum and maximum y values to define the grid cells. The two values are separated by one or more spaces.

X/Y grid size input
the X/Y size of the grid cell.

Label tin z's tick box tick
*if tick, create text values for the z-values from the tins for each of the grid cell corners. The natural surface z value is followed by a **N** and is placed above and to the right of the corner point. The design surface z value is followed by a **D** and is placed below and to the right of the corner point.*

Draw grid tick box tick
if tick, the grid is drawn.

Label total cut/fill tick box tick
if tick, label the total cut, fill and balance at the left hand bottom corner of the grid.

Cut/Fill/Grid/Z text colours colour box
colours to use for the cut, fill and z-values and the grid lines.

Num decimals for z's input 3
number of decimal places in the z values.

Z text size (w) input
size in world units for the text of the z values.

Num decimals for volumes input 0
number of decimal places in the cut and fill volumes.

Volume text size (w) input
size in world units for the text of the volumes.

Model for grid and text model box available models
model to place all the text and grid lines in.

Report file input *.rpt
name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Process button
calculate the grid volumes and grid lines.

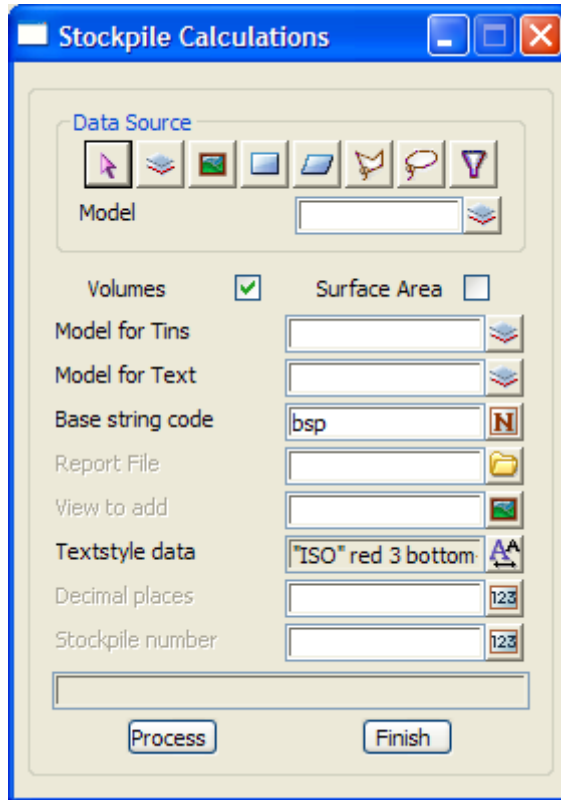

Undo button
undo the last set of text and grid lines created whilst the panel was up.

Stockpile

stockpile_vol_panel

Position of option on menu: Design =>Volumes =>Stockpiles

On selecting the Stockpile option, the **Stockpile Calculations** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source

data source for strings to create the stockpile.

Volumes

tick box

tick

if tick, calculate and report the volumes of the stockpiles.

Surface area

tick box

if tick, calculate and report the surface area of the stockpiles

Model for tins

Decimal places	number box	
	<i>number of decimal places for the volumes in the report.</i>	
Stockpile number	number box	
	<i>number of stockpile to use in the report.</i>	
Process	button	
	<i>calculate the volume and/or surface area of the stockpile.</i>	

Tin to Tin by Height Range

tin_to_tin_by_height_range

Position of option on menu: Design =>Volumes =>Tin to tin ht range

This option is used to calculate the cut and fill volume between two tins breaking the *cut* and *fill* volumes up by height ranges.

An approximate method is used which uses the z-value of the tin at a point as the representative of the height for a cell of user specified size "delta x" by "delta y" centred on the point. By making delta x and delta y small, the volumes become more accurate but the computation time increases.

Please note that the volume totals are **only** for the heights in the range file. If the height ranges don't cover the entire height difference, then the totals will not be the volumes between the two tins.

Cut is defined to be where ever the new tin is **below** the original tin. **Fill** is defined to be where ever the new tin is **above** the original tin.

In the volumes report, the sign for cut (negative or positive) is given by the cut volume sign from the **default settings** panel (fill will have the opposite sign).

The *height range file* consists of a list of height ranges and colours, one set per line, in the format

```
lower_height upper_height height_colour
```

This line represents all heights satisfying

```
lower_height <= height < upper_height.
```

For each range in the file, the total cut and fill volumes for the height range will be reported on. The colour is ignored in this option.

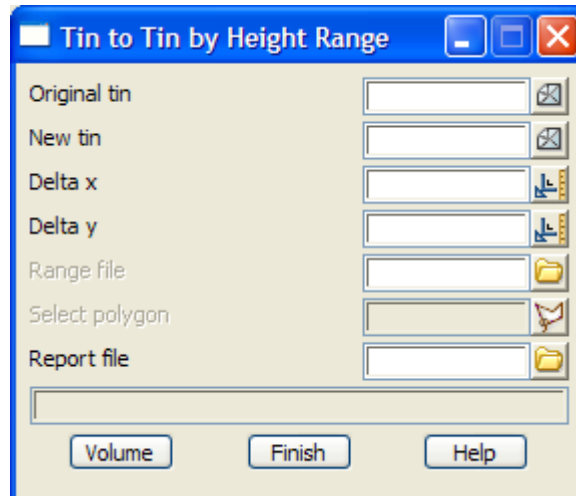

Example of a Height Range File

```
// height range file
// format: lower_height upper_height colour_for_height_range

110 120 green // colour green where the height is greater or equal to 110 and less than 120
120 220 "dark green" // colour dark green where height is >= 120 and less than 220
```

On selecting the tin to tin ht range option, the **tin to tin by height range** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New tin <i>name of the original/new tin for determining volumes.</i>	tin box		available tins
Delta x/Delta y <i>x/y size of the cell to consider to be of the height.</i>	input	1	
Select polygon <i>optional. If selected, the volumes are restricted to being inside this polygon.</i>	string select		
Range file <i>if non-blank, the user supplied height range file is used to split up the volumes report. Note that the volume totals are only for the heights in the range file.</i>	input		*.drf
Report file <i>if non-blank, the name of the file to contain the volume report. Note that the volume totals are only for the heights in the range file</i>	report file		*.rpt
Volume <i>calculate the volumes.</i>	button		

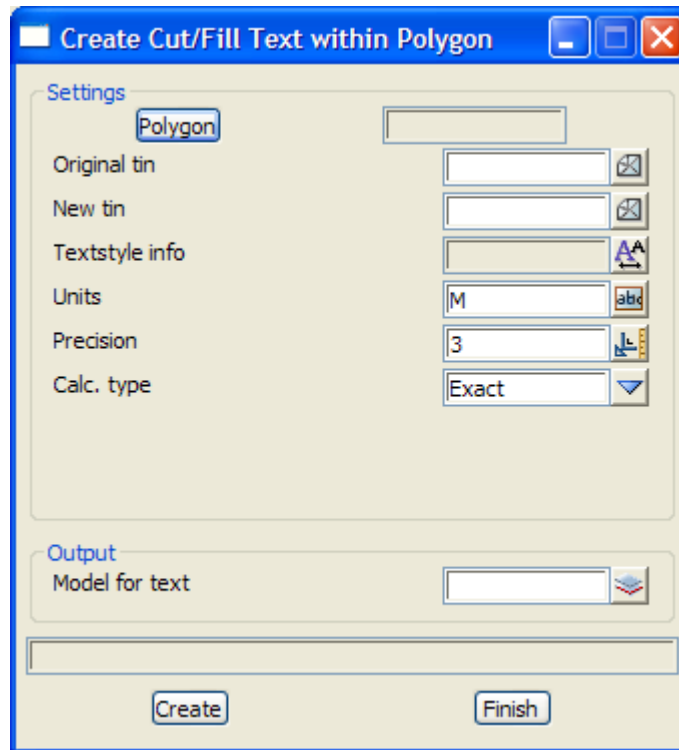

Create Cut/Fill Text Within Polygon

poly_text_volumes_panel

Position of option on menu: Design =>Volumes =>Cut/fill text in poly

This option is used to calculate the cut and fill volume between two tins within a polygon and writing the cut and fill values to a model. The Exact or End Area method can be used for the volume calculations.

Selecting Cut/fill text in poly brings up the **Create Cut/Fill Text within Polygon** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Polygon <i>the volumes are restricted to being inside this polygon.</i>	poly string select		
Original/New tin <i>name of the original/new tin for determining volumes.</i>	tin box		available tins
Textstyle info <i>textstyle info to use for the cut and fill text</i>	textstyle info box		
Units <i>text to place after the cut/fill values</i>	input		
Precision <i>number of decimal places to use for the cut/fill values</i>	input	3	
Calc. type <i>use either Exact or End Area for the volume calculations</i>	choice box	Exact	Exact, End Area

Angle	input	
	<i>angle for sections when End Area is used</i>	
Separation	input	
	<i>distance between sections when End Area is used</i>	
Model for text	model box	available models
	<i>model to place to cut and fill text in.</i>	
Create	button	
	<i>calculate the volumes and text.</i>	

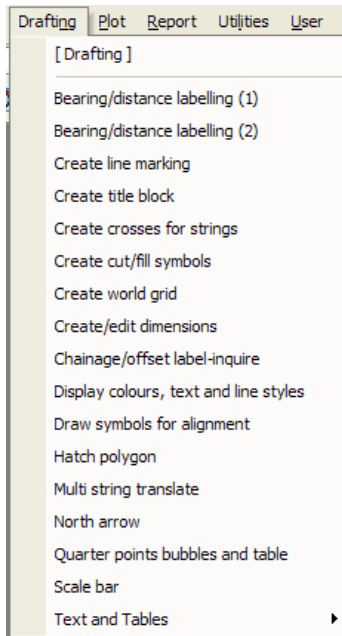

22 Drafting

drafting

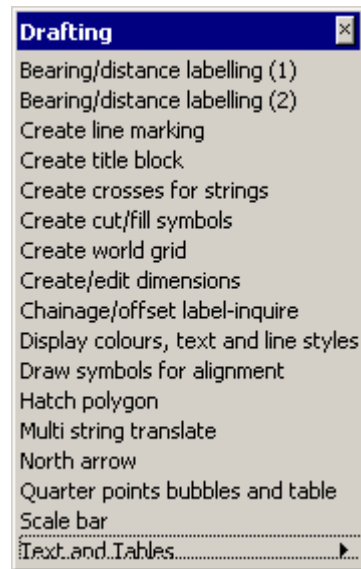

The drafting menu contains options to create data for plots.

The drafting menu is

on Main menu

on 12d Model menu and floating menu

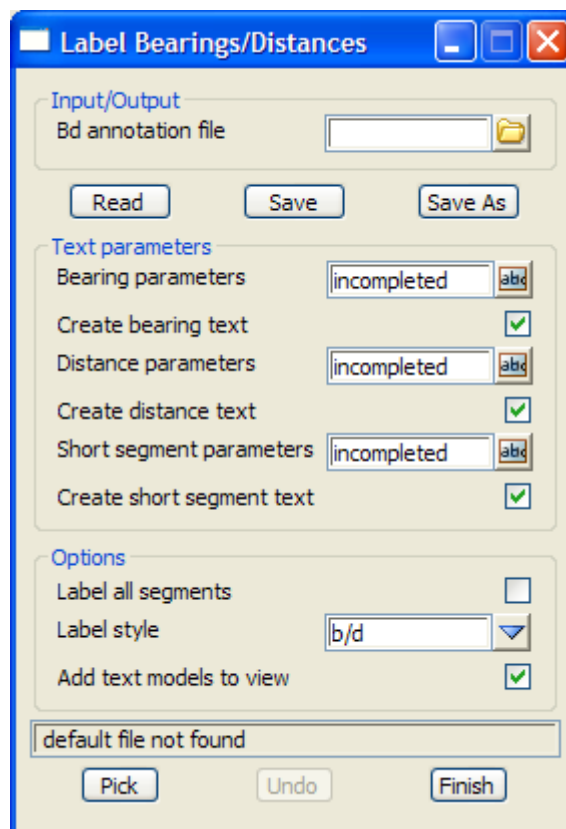

For the option <i>Bearing/distance labelling</i> ,	go to the section “Bearing/Distance Labelling”
<i>Create line marking</i>	“Line Marking” in the chapter “Views”
<i>Create title block</i>	“Create/Edit Title Block File” in the chapter “Plots”
<i>Create crosses for strings</i>	“Create Crosses at String Points”
<i>Create cut/fill symbols</i>	“Create Cut/Fill Symbols”
<i>Create world grid</i>	“Create World Grid”
<i>Create/edit dimensions</i>	“Create/Edit Dimensions”
<i>Chainage/offset label inquire</i>	“Chainage/Offset Label Inquire” .
<i>Display colours, text, linestyles</i>	“Display Colours, Textstyles and Linestyles” .
<i>Draw symbols for alignment</i>	“Draw Symbols for Alignment String”
<i>Hatch polygon</i>	“Polygon Hatching”
<i>Multi string translate</i>	“Text and Tables”
<i>North arrow</i>	“North Point Insertion”
<i>Quarter points bubbles and table</i>	“Setout Lip Line” in chapter “Survey”
<i>Scale bar</i>	“Scalebar”
<i>Text and tables</i>	“Text and Tables”

Bearing/Distance Labelling

bearing_dist_labelling_panel

Position of option on menu: Drafting =>Bearing/distance labelling

This option is used to label a selected line or arc segment with bearing, distance information and arc length information. If the line or arc length is below a given value, the label information is added to a short segment table.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
bd annotation file <i>file containing values for the text parameters.</i>	file box		*.bdf files
Read <i>read the file given in the "bd annotation file" field.</i>	button		
Save <i>save the current text parameter settings to the file given in the "bd annotation file" field.</i>	button		
Save as <i>save the current text parameter settings in a file.</i>	button		
Bearing parameters	input box	none/complete	bearing parameters

incomplete

*if none, don't label bearings.**If complete, all the bearing parameters have been set.**If incomplete, not all the bearing parameters have been set so the labels can't be created.***Create bearing text** tick box tick*if tick, bearings are labelled.***Distance parameters** input box none/complete bearing parameters

incomplete

*if none, don't label distances.**If complete, all the distance parameters have been set.**If incomplete, not all the distance parameters have been set so the labels can't be created.***Create distance text** tick box tick*if tick, distances are labelled.***Label all segments** tick box*if tick, all segments of the selected element are labelled.**If not-tic, only the selected segment is labelled.***label style** input box b/d, d/b, /bd b/d
/db, bd, db*defines how to label the bearing and distances. For example, d/b means distance above the line and bearing below the line. Bearing or distance is only labelled if the appropriate flags are set.***Add text models to view** tick box tick*if tick, all models containing text are added to the view containing the selected segment.***Minimum length** input box 0*if non-zero, then if the length of the segment is less than this value, then it is given a short segment number and added to the short segment table.***Next short segment no.** input box 1*the next number to use for short segments.***Pick** button*select the segment to be labelled.***Undo** button*undo the last set of created labels.*

Line Marking

Position of option on menu: Drafting =>Create line marking

This option creates a title block file from a model of data. It has already been documented as

View => Visualisation => Line marking

in the section "Line Marking" in the chapter "Views" .

Create Titleblock

Position of option on menu: Drafting =>Create title block

This option creates a title block file from a model of data. It has already been documented as

Plot => Create title block file

in the section "Create/Edit Title Block File" of the chapter "Plots" .

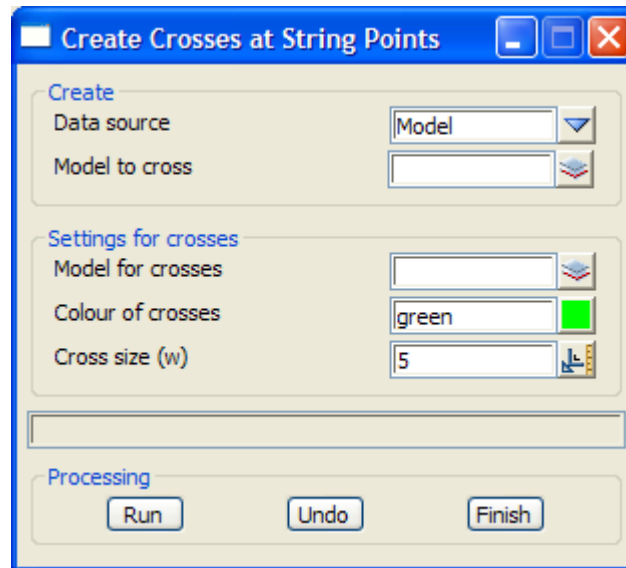

Create Crosses at String Points

create_cross_panel

Position of option on menu: Drafting =>Create crosses for strings

This panel is used to create crosses at the points of strings. The cross is made up of two 2d strings with the intersection of the two strings being the (x,y) position of the point in the string.

The option is mainly used to created crosses to send to packages that don't support a cross at a point.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>type of data source.</i>	data source	Model	String, Model, View
Model/View/String <i>data source to create crosses for.</i>	data source		
Model for crosses <i>model for the created crosses</i>	model box		available models
Colour for crosses <i>colour for the crosses</i>	colour box		available colours
Cross size (w) <i>size of the cross in world units.</i>	input box		5
Run <i>run the option</i>	button		

Undo button

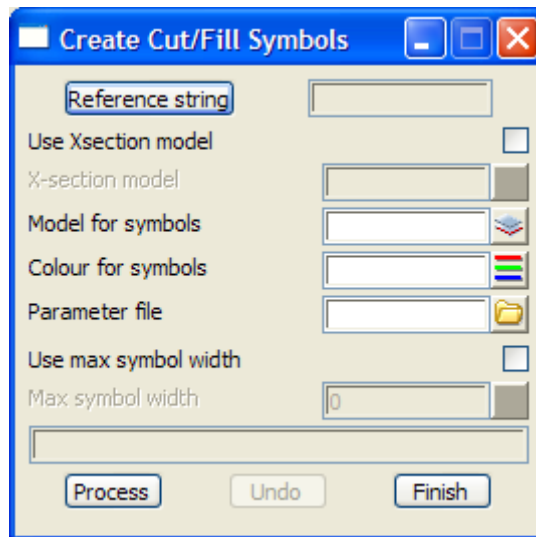

undo the last set of crosses created whilst the panel has been up.

Create Cut/Fill Symbols

tadpole_panel

Position of option on menu: Drafting =>Create cut/fill symbols

This option is used to create cut and fill symbols (tadpoles) between strings or the names of the points across x-sections. The choice of symbols and the points they go between is controlled by a parameter file.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Reference string <i>string used to define chainage and perpendicular</i>	string select		
Use x-section model <i>if tick, the points on the cross-sections in the model are used as the names to create symbols between.</i>	tick box		
X-section model <i>model of cross sections used if "Use X-section model" is ticked.</i>	tick box		available models
Model for symbols <i>model for the created cut-fill symbols</i>	input		available models
Colour for symbols <i>colour for the created cut-fill symbols</i>	Input		available colours
Parameter file <i>file specifying what symbols are drawn between what strings (or points on x-sections).</i>	input		
Use max symbol width <i>if tick, the symbols are only stretched to the maximum size given in the "Max symbol width" field.</i>	tick box		

Max symbol width input

maximum distance in world units to stretch the symbol.

Process button

Run the option.

Undo button

undo the last set of cut-fill symbols created by running the panel. The "Undo" function is lost once the option is finished.

Notes:

```
// Sample file for plotting symbols to denote cut/fill slopes
// All lines starting with // are comments. Blank lines are ignored
//
// The file layout is:

// ch_start ch_end ch_inc side str1  str2 symbol1 %1 symbol2  %2
//
// eg 110 150 10 L "trial1->c1" "trial->c2" tadpole 100 tadpole 50
//
// ch_start defines the start chainage
// ch_end defines the end chainage
// ch_inc defines the chainage increment
// side is one of L, R or LR (left, right, both)
// str1 is the name of the string (or point on x-section) to start tadpole
// str2 is the name of the string (or point on x-section) to end tadpole

// If strings are used, the string model name must be contained in the
// string definition i.e. in the format "model->string_name"
//
// The symbols drawn between the strings (or points) alternate between
// symbol1 and symbol2 and the symbols are drawn as the
// given percentages %1 and %2 respective of the distance
// between the strings (points).

// The symbol can be one of "
// tadpole      - predefined tadpole shape
// line         - predefined batter tick
// "model=xxxxx" - where model "xxxxx" contains 3d strings
//                defining the symbol shape. This is as per
//                user-defined batter symbols in 4D.
//                NB. only 3d strings are supported in the macro

// Example

0 700 10 LR "road str->c2" "road str->c3" tadpole 100 tadpole 50
0 700 10 LR "road str->c4" "road str->c5" line 90 line 50
0 700 10 LR "road str->f2" "road str->f3" "model=symbol" 100 tadpole 50
0 700 10 LR "road str->f4" "road str->f5" line 90 line 50
```

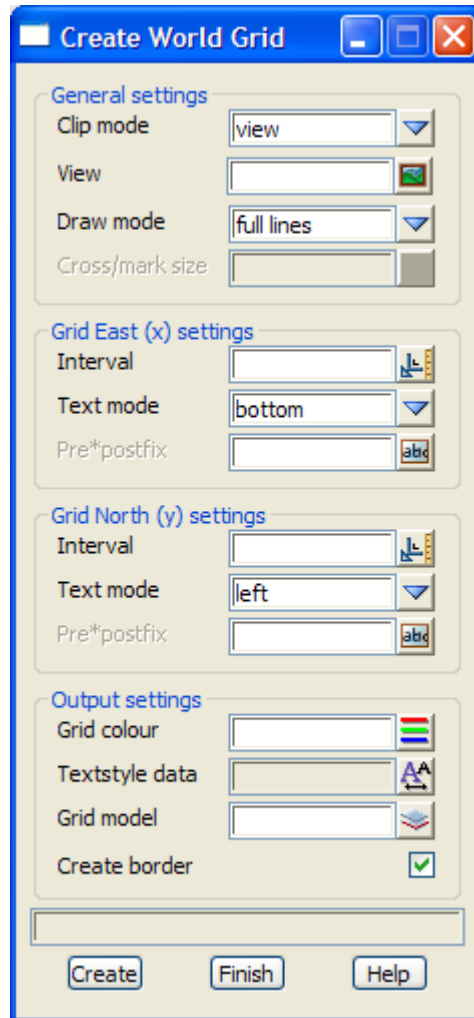

Create World Grid

create_world_grid

Position of option on menu: Drafting =>Create world grid

This option is used to create a grid, identical to the one drawn on a plan view, but in world units. This can then be output to CAD systems that do not allow grids to be easily created.

Selecting the Create world grid option, brings up the **Create World Grid** panel:

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Clip mode	choice box		rectangle, view
------------------	------------	--	-----------------

if 'rectangle', icons appear for drawing a rectangle, a rotated rectangle or selecting a plot frame. selecting the 'rectangle' and 'rotated rectangle' icons require the user to draw the rectangle to define the area to produce the grid for.

selecting the 'plot frame' icon requires the user to select a plot frame and the view area from the plot frame defines the area to produce the grid for.

If 'view', a View Box appears and a view is selected to define the area to produce the grid for.

Draw mode choice box full lines full lines, crosses, marks

the type of the grid being drawn - full lines, crosses or marks.

If full lines, then solid lines are drawn at the grid x and y spacing.

*If crosses, then crosses of size **cross/mark size** are drawn at the intersection of the grid x and y spacing.*

*If marks, then solid lines size **cross/mark size** are drawn at the beginning/end of the grid at the x and y spacing.*

Cross/mark size input

size in world units of the grid crosses/marks.

Grid East (x)

Interval input

the distance between the East (x) grid lines. If this value is zero, the x grid lines will not be drawn.

Text mode input bottom off,
top,
bottom,
top and bottom

the x (East) grid lines can be labelled with their x value. If the grid lines are labelled, the labels can be drawn on the top, the bottom or both ends of the x-grid lines.

Pre*postfix input

*prefix/postfix (pre*post) to be applied to the value of x (East). If pretext only, just give the text. If post text is required, precede it by a *. For example E*m will place E before the x value and m after the number.*

Grid North (y)

Interval input

the distance between the North (y) grid lines. If this value is zero, the y grid lines will not be drawn.

Text mode input bottom off,
top,
bottom,
top and bottom

the y (North) grid lines can be labelled with their y value. If the grid lines are labelled, the labels can be drawn on the top, the bottom or both ends of the y-grid lines.

Pre*postfix input

*prefix/postfix (pre*post) to be applied to the value of y (North). If pretext only, just give the text. If post text is required, precede it by a *.*

Output settings

Grid colour colour box available colours

colour for the grid lines.

Textstyle data textstyle box

height, angle etc. of the text for the grid labels.

Grid model model box available models

model for the grid lines and text.

Create border tick box

if tick, a rectangle around the area to create the grid for, is created.

Create button

create the grid according to the values given in the panel.

Create/Edit Dimensions

super_dim_panel

Position of option on menu: Drafting =>Create/edit dimensions

This option is used to create and edit dimensions.

This option is currently under development.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

read in an existing range file.

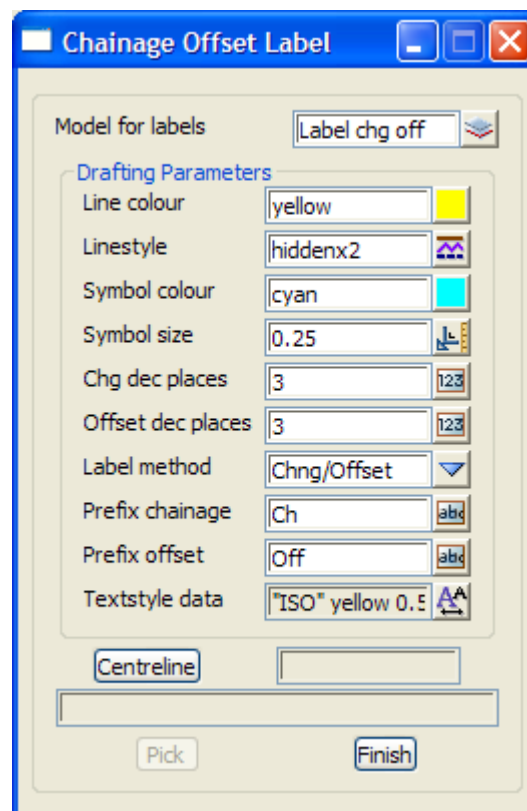

Write button
write out the data in the pages to the given range file.

Chainage/Offset Label Inquire

chainage_offset_panel

Position of option on menu: Drafting =>Chainage/offset label inquire

This option is used to calculate and label the perpendicular distance from a selected point to a selected centreline, and the chainage of the point dropped perpendicularly onto the centreline.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

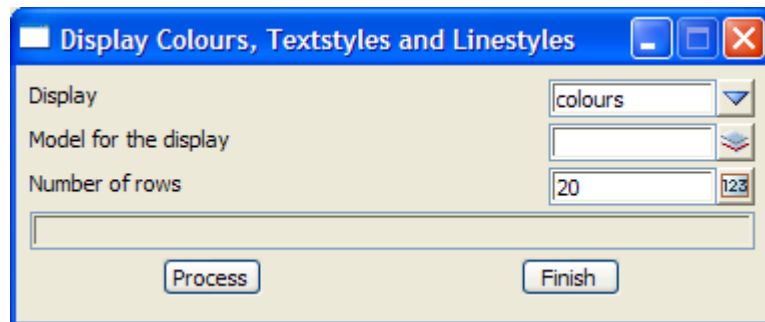

Model for labels	model box	Label chg off	available models
<i>if non-blank, create text for the calculated offset and chainage values and place it in this model.</i>			
Line colour		yellow	available colours
<i>colour of the line drawn.</i>			
Linestyle	linestyle box	hidden2	available linestyles
<i>text style for the text.</i>			
Symbol colour		cyan	available colours
<i>colour of the symbol drawn at the point. text style for the text.</i>			
Symbol size		0.5	
<i>size (in world units) of the symbol drawn at the point.</i>			
Label method	choice box	Chng/Offset	Chng/Offset, Offset/Chng
<i>method of labelling the line from a selected point to the dropped point.</i>			
Prefix chainage		Ch	
<i>prefix for the chainage value.</i>			
Prefix offset		Off	
<i>prefix for the offset value.</i>			
Textstyle data	textstyle data box		available text data
<i>textstyle, size, colour etc. for the text.</i>			
Centreline	string select		
<i>select the string to use for the calculation of chainage and offset.</i>			
Pick	button		
<i>pick a position and the offset from the position to the position dropped perpendicularly onto the selected Centreline is calculated, plus the chainage on the Centreline of the dropped point. The values are reported in the panel's message area and if Model for labels is non-blank, text of the values is created and place in the model.</i>			

Display Colours, Textstyles and Linestyles

display_colour_text_and_line_styles_panel

Position of option on menu: Drafting =>Display colours, text and line styles

This option creates a model to display either all the colours, linestyles or textstyles defined for a project.

The fields and buttons used in this panel have the following functions:

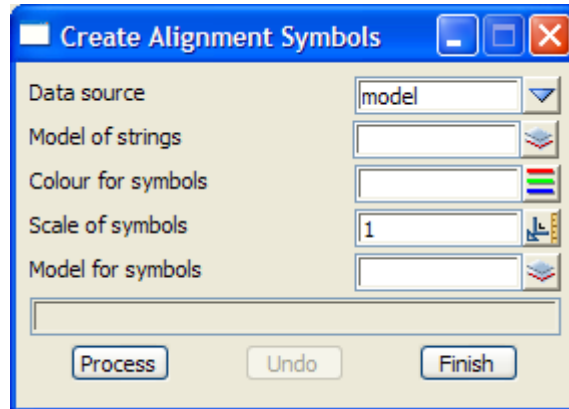

Field Description	Type	Defaults	Pop-Up
Display <i>type of data to display.</i>	choice	colours	colours, textstyles, linestyles
Model for the display <i>model to create the display in.</i>	model box		available modes
Number of rows <i>the display is created by first doing a column of the given "Number of rows" and then moves on to another column until all the data is drawn.</i>	input	20	
Process <i>run the option.</i>	button		

Draw Symbols for Alignment String

alignment_symbols_panel

Position of option on menu: Drafting =>Draw symbols for alignment

This panel is used to create symbols (butterflies and dumbbells) at the spiral-tangent, spiral-curve and curve tangent points.

The fields and buttons used in this panel have the following functions:

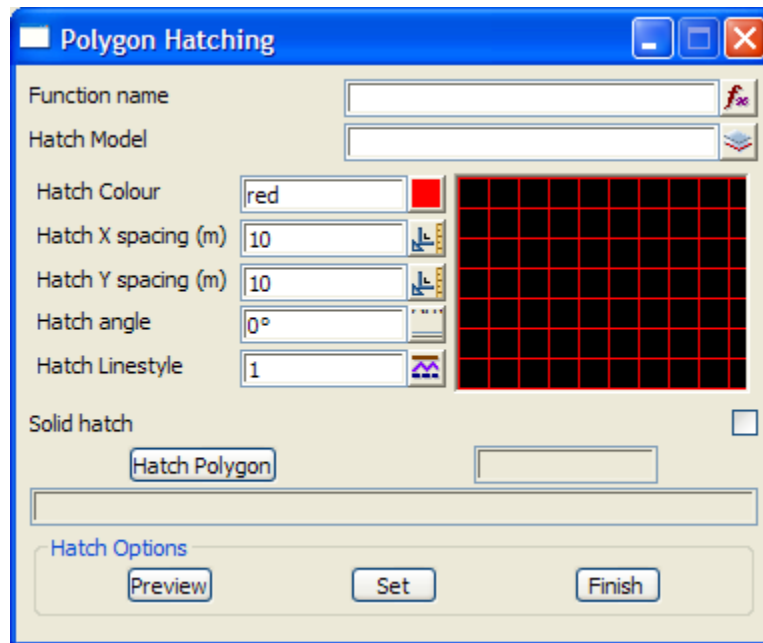

Field Description	Type	Defaults	Pop-Up
Data source <i>type of data to create symbols for.</i>	input box		
Model/View/String <i>data source to create symbols for.</i>	input box		
Colour of symbols <i>colour to use for the created symbols.</i>	input box		
Scale of symbols <i>scale of the created symbols.</i>	input box	1	
Model for symbols <i>model to put the created symbols into.</i>	input box		
Process <i>run the option.</i>	button		
Undo <i>undo the last set of symbols created whilst the panel has been up.</i>	button		

Polygon Hatching

hatch_func_panel

Position of option on menu: Drafting =>Hatch polygon

This option is used to create hatching within a user selected string. A function is created so that the hatching can be recalced if the string is modified.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the hatching function.model</i>	input box		
Hatch model <i>model to place the hatching in.</i>	input box		
Hatch colour <i>colour for the hatch lines</i>	colour box	red	
Hatch x/y spacing (m) <i>distance in world units between the x/y hatching lines.</i>	input box	10	
Hatch angle <i>angle of the hatch lines.</i>	input box	0	
Hatch linestyle <i>linestyle for the hatch lines.</i>	input box	1	
Solid hatch	tick box		

if tick, a solid fill of the given hatch colour is used.

Hatch polygon string select

select the string to hatch.

Preview button

draw the hatching to see if it is correct - the hatching function has not been defined.

Set button

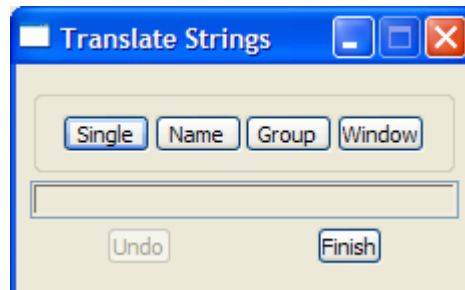

define the hatching function with the values given in the panel fields.

Translate Strings

trans_panel

Position of option on menu: Drafting =>Multi string translate

This panel is used to translate strings selected by name group of a window.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Single	button		
---------------	--------	--	--

select a single string to translate.

Name	button		
-------------	--------	--	--

select a string and all strings with the same name on the view will be translated.

Group	button		
--------------	--------	--	--

select a string and all strings with the same group on the view will be translated.

Window	button		
---------------	--------	--	--

click and release to define the first point of the window and then move the cursor and click and release to define the second point of the window. A position is then selected and as the cursor is moved, all strings in the view that are totally inside the window are translated and placed at the next selected position.

Undo	button		
-------------	--------	--	--

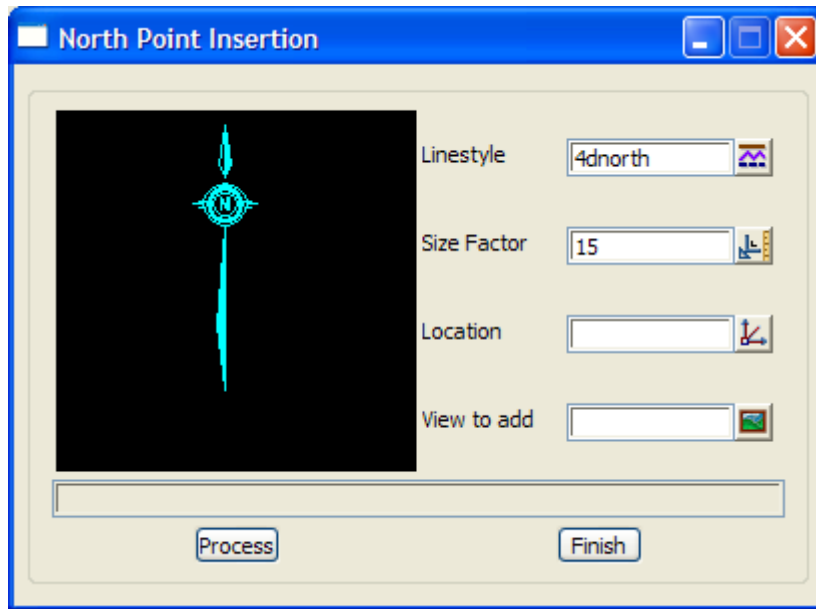

undo the last set of strings translated whilst the panel has been up.

North Point Insertion

4d_north_panel

Position of option on menu: Drafting =>North arrow

This option creates a point with a textstyle of the north point arrow.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Linestyle <i>Linestyle for the north point arrow - leave as 4dnorth.</i>	input box	4dnorth	
Size factor <i>factor the north arrow by this value.</i>	input box	15	
Location <i>either type in an x y position or click on "+" and use Pick xyz to locate the north arrow.</i>	input box		
View to add <i>view to add the arrow to.</i>	input box		
Process <i>create the north point arrow in the model North Point.</i>	button		

Quarter Points

Position of option on menu: Drafting =>Quarter points bubbles and table

This option is used to create bubbles and/or a report for the critical horizontal and vertical points and quarter points (by chord or by chainage) for any arcs in an alignment string.

This option has already been documented as

Survey=>Setout=>Setout lip line

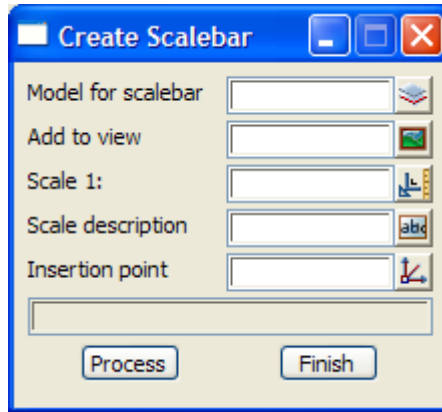

in the section “Setout Lip Line” of the chapter “Survey” .

Scalebar

scalebar_panel

Position of option on menu: Drafting =>Scale bar

This option is used to create a scale bar.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model for scalebar <i>model to place the scalebar in.</i>	model box		available models
Add to view <i>if non-blank, the model is added to this view.</i>	input box		available views
Scale 1: <i>scale to create the scale bar at.</i>	input box		
Scale description <i>description to write under the scale bar.</i>	input box		
Insertion point <i>position to place the left hand bottom corner of the scale bar at.</i>	pick ops		pick ops
Process <i>run the option.</i>	button		

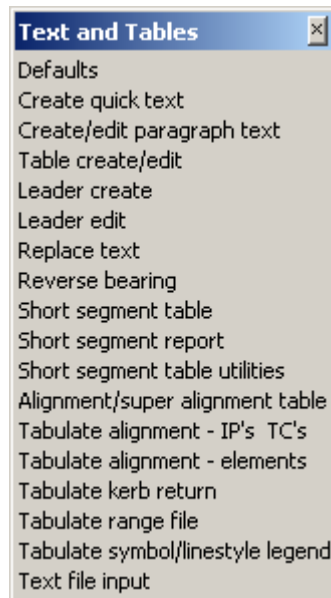

Text and Tables

text_and_tables

Position of menu: Drafting =>Text and Tables

The text and tables menu contains options to create text data and tables for plots.

The text and tables menu is

For the option *Defaults*, go to the section “Defaults - Text” .

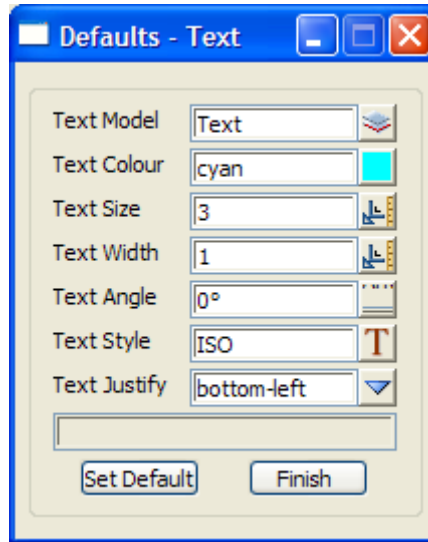

<i>Create quick text</i>	“Quick Text Input” .
<i>Create/edit paragraph text</i>	“Text Creation/Edit” .
<i>Table create/edit</i>	“Table Create/Edit” .
<i>Leader create</i>	“Leader Text Creation” .
<i>Leader edit</i>	“Leader Edit” .
<i>Replace text</i>	“Replace Text” .
<i>Short segment table</i>	“Short Segments Table” .
<i>Short segment report</i>	“Short Segment Report” .
<i>Short segment table utilities</i>	“Short Segments Table Utilities” .
<i>Alignment/super alignment table</i>	“Alignment & Super Alignment Table” .
<i>Tabulate alignment - IP's, TC's</i>	“Tabulate Alignment - IP's and CT's” .
<i>Tabulate alignment - elements</i>	“Tabulate Alignment - Elements” .
<i>Tabulate kerb return</i>	“Tabulate Kerb Return”
<i>Tabulate range file</i>	“Tabulate Range File”
<i>Tabulate symbols/linestyle legend</i>	“Symbol / Linestyle Legend - Tabulation”
<i>Text input file</i>	same option as “Text Creation/Edit”

Defaults - Text

text_defaults_panel

Position of option on menu: Drafting =>Text and Tables =>Defaults

This option is used to project text defaults that are used with the "Fonts" button on many of the text options.

The fields and buttons used in this panel have the following functions:

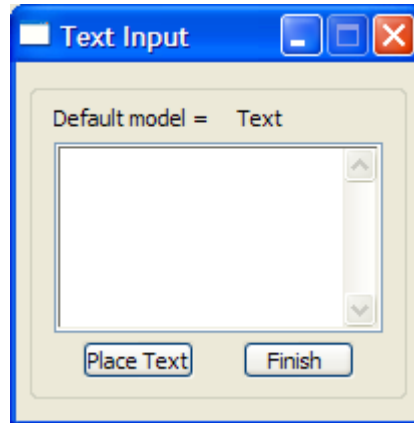

Field Description	Type	Defaults	Pop-Up
Text model <i>default model to place the text in.</i>	model box	Text	available models
Text colour <i>default colour for text.</i>	colour box	cyan	available colours
Text size <i>default size for text.</i>	input box	3	
Text width <i>default x-factor text.</i>	input box	1	
Text angle <i>default angle for text.</i>	input box	0	
Text style <i>default text style.</i>	input box	iso	
Text justify <i>default text justification.</i>	input box	bottom-left	
Set defaults <i>set the project defaults.</i>	button		

Quick Text Input

quick_text_panel

Position of option on menu: Drafting =>Text and Tables =>Create quick text

The quick text option creates lines of text using the text defaults. The text can be edited and modified using the create/edit paragraph text.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Text box	button		
<i>type the text to be created into the text box.</i>			

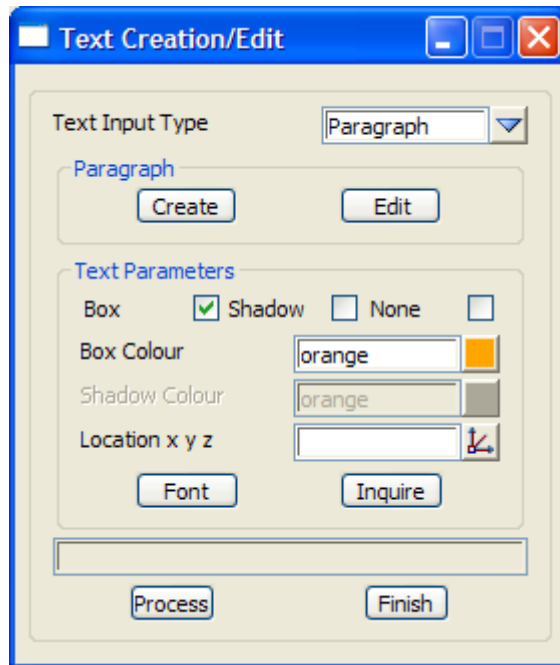

Place text	button		
<i>pick a position to become the justification point for the first line of text.</i>			

Text Creation/Edit

para_panel

Position of option on menu: Drafting =>Text and Tables =>Create/edit paragraph text

The option creates and edits a paragraph of text created with this option or the quick text option.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Text input type	choice box	paragraph	paragraph, file

method of creating text - type in a paragraph or read from a file

if *Paragraph* selected

Create button
select create to bring up the text box to type text into.

Edit button
select edit to pick and edit existing text.

if *File* selected

Text file file box
name of the file to read in.

Text parameters

Box/Shadow/None radio button box
if box is ticked, draw a box around the text.

*if shadow is ticked, draw shadowed box around the text.
if none is ticked, don't draw a box around the text.*

Box colour colour box orange

Colour of the box around the text

Shadow colour colour box orange

Colour of the shadow around the box around the text

Location x y z x,y,z box pick ops menu

pick the position for the text.

Font button

bring up the values for the text - e.g. model, colour, size etc.

Inquire button

xxxxx

Process button

create the text and place it at the given location.

Table Create/Edit

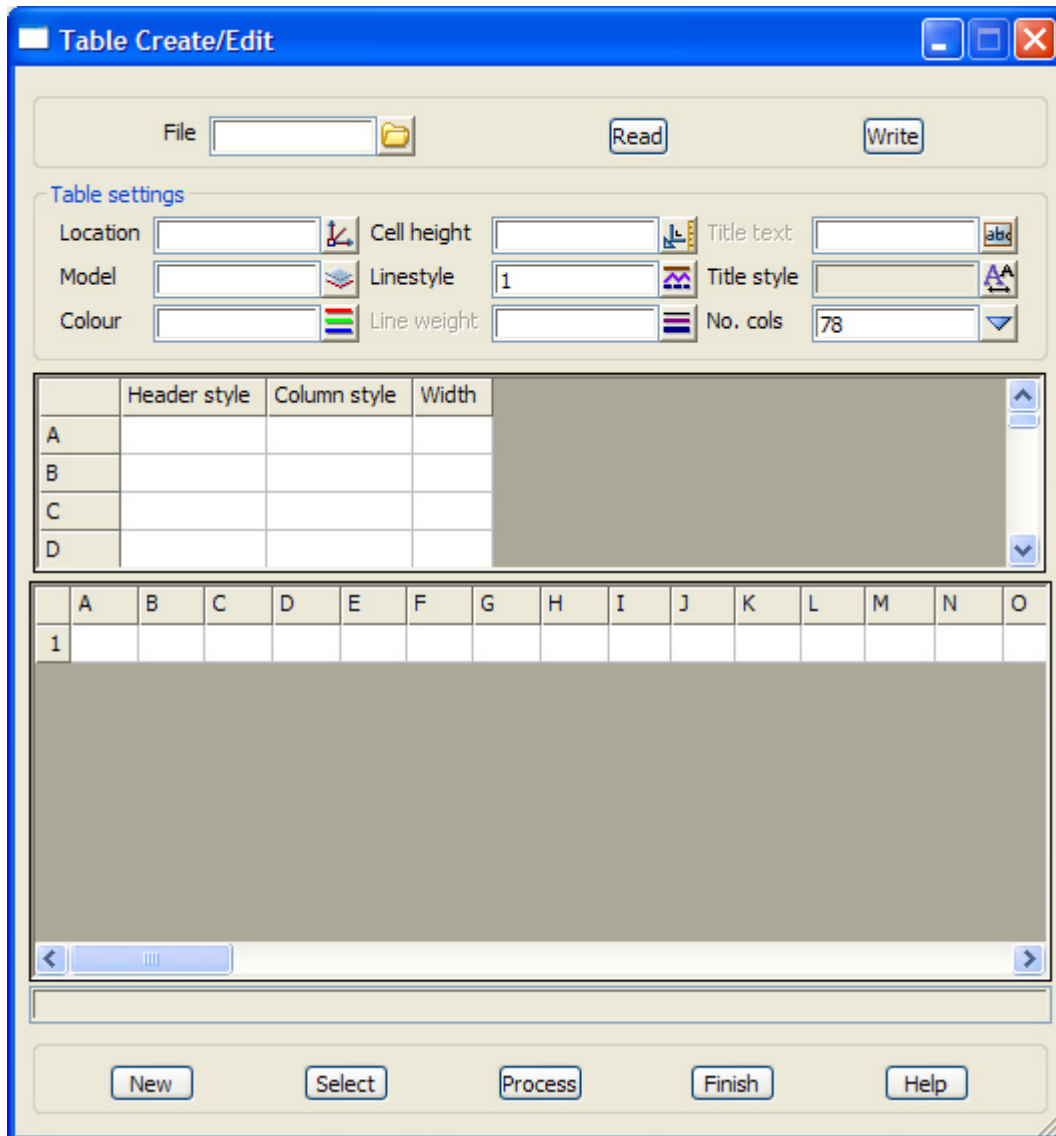

table_create_edit

Position of option on menu: Drafting =>Text and Tables =>Table Create/edit

This option is currently under development

This option reads in a csv file and loads the data into a grid on the panel. The data can be edited in the grid and then a table produced in a model.

An existing table in a model can also be selected and the data read into the grid on the panel. The data can then be edited and the table updated.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

File	file		
-------------	------	--	--

file to read in and display in the grid on the panel.

Read button
read the specified file in and display it in the grid on the panel.

Write button
write the data in the grid on the panel to the specified file.

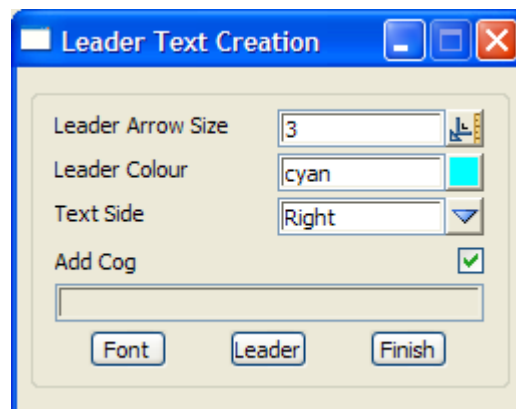

Table settings
create the text and place it at the given location.

Leader Text Creation

leader_text_panel

Position of option on menu: Drafting =>Text and Tables =>Leader create

This option is used to create leader lines and text.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Leader arrow size <i>length (in world units) of the head of the arrow of the leader line.</i>	input box	3	
Leader colour <i>colour of the leader line or arrow</i>	colour box	cyan	
Text side <i>side of the leader line to create the text.</i>	choice box	Right	Right, Left
Add cog <i>if tick, add a cog to the leader line.</i>	tick box	tick	
Font <i>brings up panel for defining information about the text (size, model colour etc.).</i>	button		
Leader <i>create the leader by first picking the point for the arrow end and then the point for the opposite</i>	button		

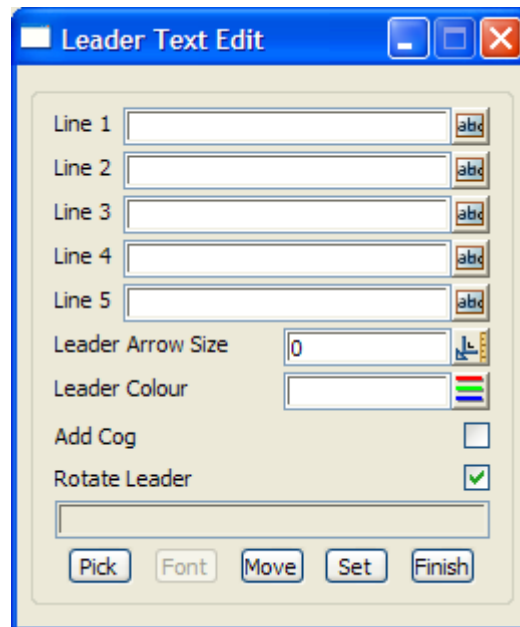

end.where the text goes. Once the second point is place, the "Leader Text Input" panel is displayed for entering five lines of text.

Leader Edit

leader_edit_panel

Position of option on menu: Drafting =>Text and Tables =>Leader edit

This option is used to edit leader lines and text.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Line 1-5 <i>lines of text from the selected leader.</i>	input box		
Leader arrow size <i>length (in world units) of the head of the arrow of the leader line.</i>	input/output box		
Leader colour <i>colour of the leader line or arrow</i>	colour box	cyan	
Text side <i>side of the leader line to create the text.</i>	choice box	Right	Right, Left
Add cog <i>if tick, add a cog to the leader line.</i>	tick box	tick	
Rotate leader <i>if tick, the leader arrow remains fixed when the leader is moved.</i>	tick box	tick	

If not tick, the whole leader line and text is moved.

Pick button

select the leader to be modified.

Font button

brings up panel for defining information about the text (size, model colour etc.).

Move button

move the select leader and its associated text. If "rotate leader" is ticked, then the leader arrow head is left fixed.

Set button

redefine the leader line and text with the current values in the panel fields.

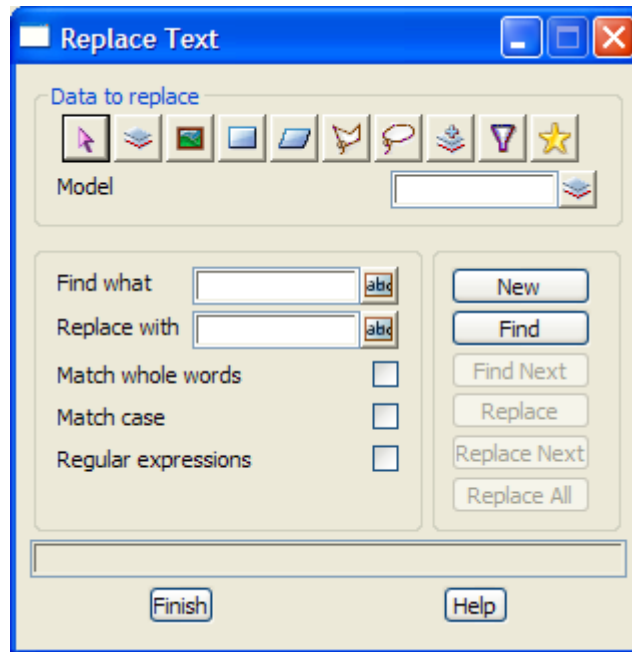

Replace Text

replace_text

Position of option on menu: Drafting =>Text and Tables =>Replace text

Position of option on menu: Utilities =>H-Z =>Find/replace text

This option is used to find and replace text in text strings, 4d string, super strings for vertex and segment text.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source

data source for text to search and change.

Find what	input box
------------------	-----------

text to search for.

Replace with	input box
---------------------	-----------

text to replace the searched text with

Match whole words	tick box
--------------------------	----------

if not tick, text is selected if the "find text" is only part of the text.

If tick, only find the text when the text is exactly the same as the "find text", not just a part of the text.

Match case	tick box
-------------------	----------

if not tick, case is ignored when trying to find a match.

If tick then case is not ignored when trying to find a match.

Regular expressions tick box

if tick then the Find what text can contain regular expressions.

If not tick, the Find what text is not considered to contain regular expressions.

New button

after selecting new the parameters for the find and replace can be changed.

Find button

find the search text. The text is highlighted and centred in the view.

Find Next button

find the next occurrence of the search text.

Replace button

replace the text.

Replace all button

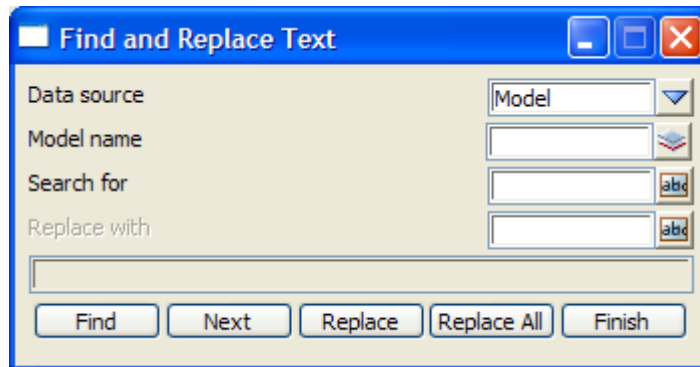

replace all occurrences of the text.

Find and Replace Text

replace_text_panel

Position of option on menu: Drafting =>Text and Tables =>Replace text

This option is used to find and replace text.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>	input box		string, model, view
Data source <i>source of data to change text.</i>	input box		
Search for <i>text to search for.</i>	input box		
Replace with <i>if non-blank, text to replace the searched text with</i>	input box		
Find <i>find the search text</i>	button		
Next <i>find the next occurrence of the search text.</i>	button		
Replace <i>replace the text.</i>	button		
Replace all <i>replace all occurrences of the text.</i>	button		

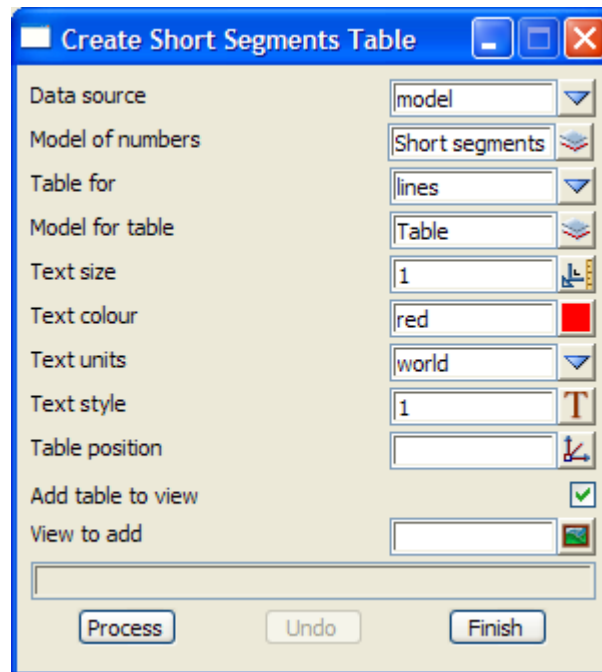

Short Segments Table

short_segment_table_panel

Position of option on menu: Drafting =>Text and Tables =>Short segment table

This panel is used to create a short segment table.

This option is still under development

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>type of data to process</i>	input box	model	model, string, view
Model/string/View of numbers <i>data to process and build a short segment table for.</i>			
Table for <i>type of short elements to tabulate.</i>	choice box	lines	lines, arcs, lines and arcs
Model for table <i>model to place the short segment table in.</i>	model box	Table	
Text size <i>text size.</i>	input box	1	
Text colour <i>text colour</i>	colour box	red	

- Text units** choice box world world, pixels
units for the text size - default is world units.
- Text style** input box 1
textstyle for the created text.
- Table position** input box
location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.
- Add table to view** tick box tick
if tick, add the model containing the table to the view.
- View to add** input box
view to add the table to.
- Process** button
create and place the short segment table
- Undo** button
undo the last short segment table created whilst the panel has been up.

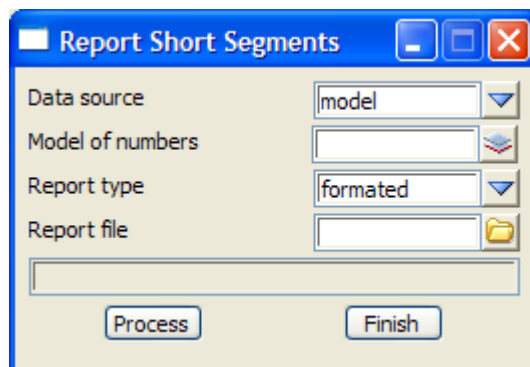

Short Segment Report

[short_segment_report_panel](#)

Position of option on menu: Drafting =>Text and Tables =>Short segment report

This panel is used create a report on the short segments.

This option is still under development

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>type of data to process</i>	input box	model	model, string, view
Model/string/View of numbers			

data to process and report on the short segments.

Report file report box
name of the report file.

Process button
create the short segment report

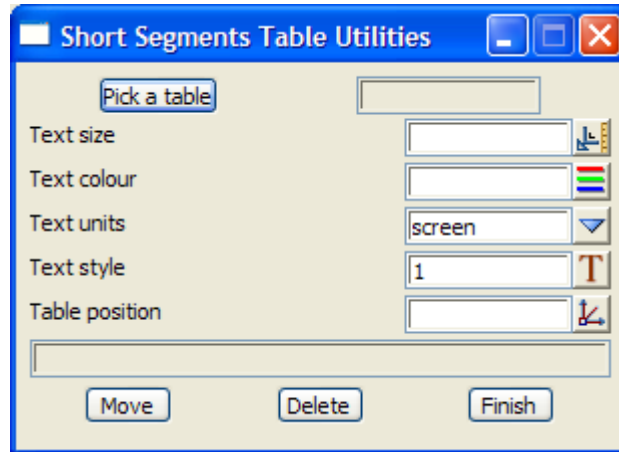

Short Segments Table Utilities

table_utilities_panel

Position of option on menu: Drafting =>Text and Tables =>Short segment table utilities

This panel is used modify an existing short segments table.

This option is still under development

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Pick a table <i>select the short segments table to modify.</i>	string select		
Text size <i>text size.</i>	input box	1	
Text colour <i>text colour</i>	colour box	red	
Text units <i>units for the text size - default is world units.</i>	choice box	world	world, pixels
Text style <i>textstyle for the created text.</i>	input box	1	
Table position <i>location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.</i>	input box		
Move <i>move the selected table to the new location.</i>	button		
Delete <i>delete the selected table.</i>	button		

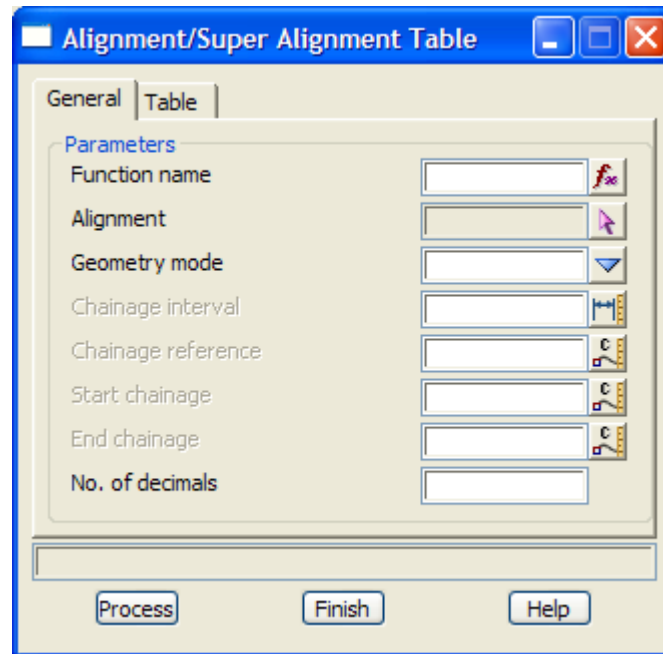

Alignment & Super Alignment Table

alignment_super_alignment_table

Position of option on menu: Drafting =>Text and Tables =>Alignment/Super alignment table

This option is used to create a report and/or a table in a model for an alignment and super alignment string in an IP or element format.

This option is under development.

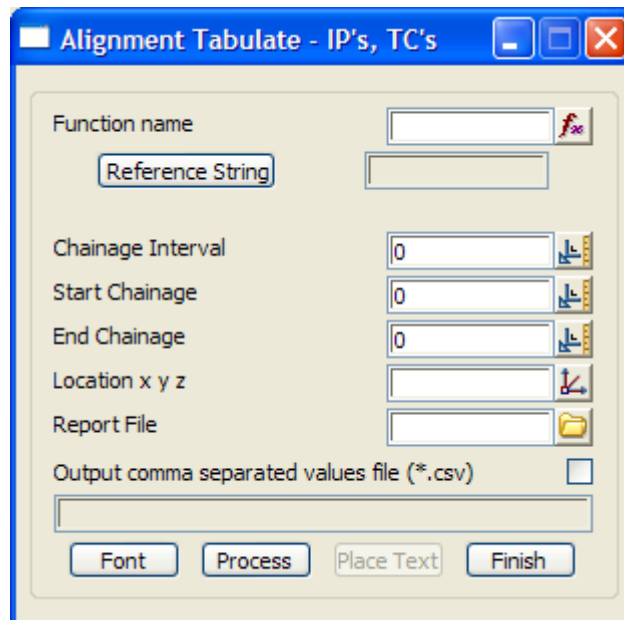

Tabulate Alignment - IP's and CT's

align_ch_tps_func_panel

Position of option on menu: Drafting =>Text and Tables =>Tabulate alignment - IP's TC's

This option is used to create a report and/or a table in a model of an alignment string in an IP and tangent point format.

The table is created by a function so that if the alignment string changes, the table can be easily recalced.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the function</i>	input box		
Reference string <i>select the string to create the table and/or report for.</i>	string select		
Chainage interval <i>if zero, only information on the tangent and intersection points is given. If non-zero, the chainage interval to use to report the information about the reference string. The horizontal tangent and intersection points are included.</i>	input box	0	
Start/End chainage <i>start/end chainage to use. If 0, the start/end chainage is used.</i>	input box	0	
Location x y z <i>location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.</i>	input box		
Report file	file box		

*if non blank, name of the report file.
If blank, don't create the report.*

Font button

brings up panel for defining information about the text (size, model colour etc.).

Process button

process the reference string and create the report. The table is not yet created.

Place text button

create the table and place it at the given location.

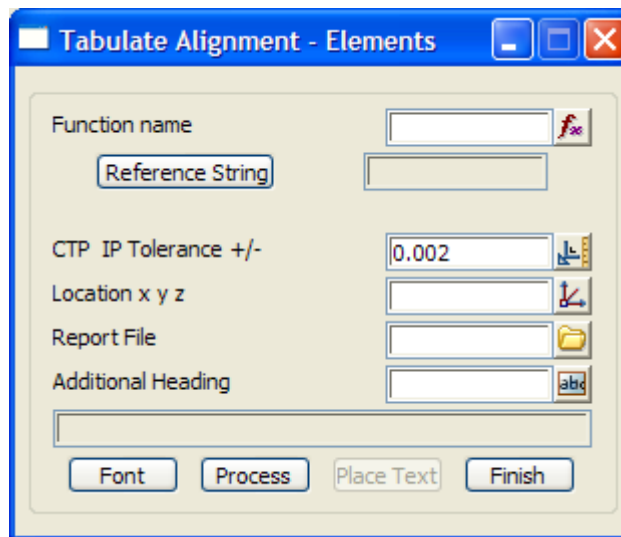

Tabulate Alignment - Elements

moss_ch_tps_func_panel

Position of option on menu: Drafting =>Text and Tables =>Tabulate alignment - elements

This option is used to create a report and/or a table in a model of an alignment string in an horizontal element format.

The table is created by a function so that if the alignment string changes, the table can be easily recalced.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the function</i>	input box		
Reference string <i>select the string to create the table and/or report for.</i>	string select		
CTP IP tolerance +/- <i>xxxx.</i>	input box	0.002	
Location x y z <i>location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.</i>	input box		
Report file <i>if non blank, name of the report file. If blank, don't create the report.</i>	file box		
Additional heading <i>additional information for the heading above the table.</i>	input box		
Font	button		

brings up panel for defining information about the text (size, model colour etc.).

Process button

process the reference string and create the report. The table is not yet created.

Place text button

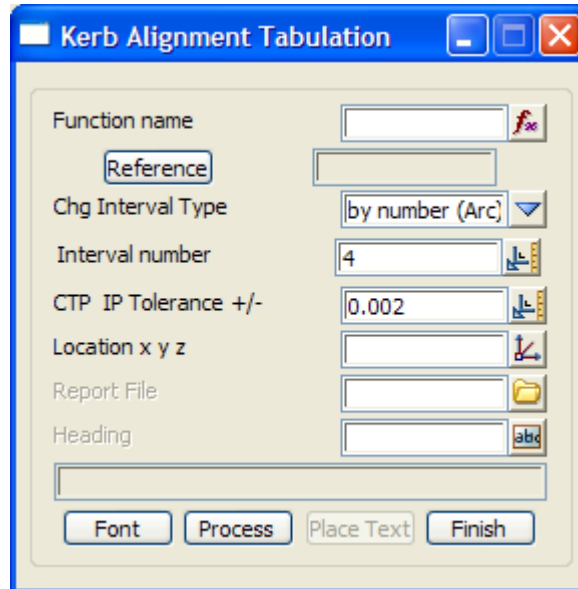

create the table and place it at the given location.

Tabulate Kerb Return

kret_ch_tps_panel

Position of option on menu: Drafting =>Text and Tables =>Tabulate kerb return

This option creates a table for a kerb return.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the function</i>	input box		
Reference <i>select the string to create the kerb return table and/or report for.</i>	string select		
Chg interval type	choice box	by number (Arc)	by number (Arc) by distance (Arc) by special chg file by number (Chord)
Interval number <i>number of points to divide the alignment into.</i>	input box	4	
CTP IP tolerance +/- <i>xxxx.</i>	input box	0.002	
Interval number <i>xxxx.</i>	input box	4	

Location x y z input box

location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.

Report file file box

*if non blank, name of the report file.
If blank, don't create the report.*

Heading input box

heading above the table.

Font button

brings up panel for defining information about the text (size, model colour etc.).

Process button

process the reference string and create the report. The table is not yet created.

Place text button

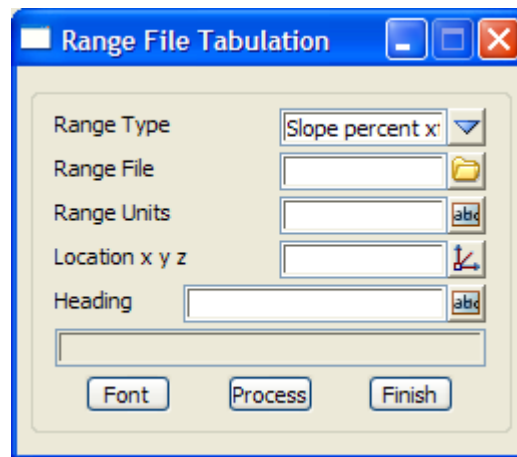

create the table and place it at the given location.

Tabulate Range File

range_table_panel

Position of option on menu: Drafting =>Text and Tables =>Tabulate range file

This option creates a table for a range file.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Range type <i>type of range file to be created.</i>	choice box	slope percent xfall	slope percent xfall slope 1 v in, slope degrees depth, aspect, height
Range file <i>name of the range file.</i>	file box		
Range units <i>text to place beside each line of upper and lower values.</i>	input box		
Heading <i>heading to place at the top of the table.</i>	input box		
Location x y z <i>location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.</i>	input box		
Font <i>brings up panel for defining information about the text (size, model colour etc.).</i>	button		
Process <i>create and place the range table.</i>	button		

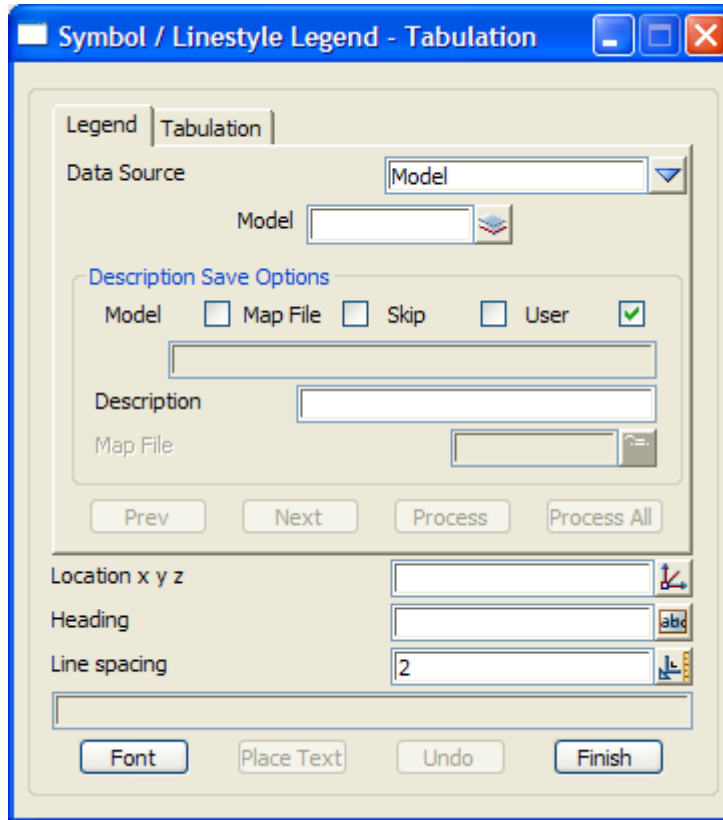

Symbol / Linestyle Legend - Tabulation

sym_tab_panel

Position of option on menu: Drafting =>Text and Tables =>Tabulate symbol/linestyle legend

This panel is used to tabulate symbols and linestyles used in a model.

This option is still under development

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Text File Input

Position of option on menu: Drafting =>Text and Tables =>Text file input

This option has already been documented as "Text Creation/Edit"

Drafting =>Text and Tables =>Create/edit paragraph text

23 Plots

plots

Position of menu: It is on the main menu as Plot

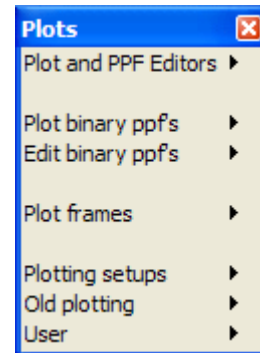

The plots walk-right menu is

on Main menu

create floating Plots menu
plotting and ppf editors
plot an existing ppf
edit an existing ppf
create/edit/plot plot frames
plotting set ups
old plotting options

on 12d Model
Plots floating menu

The options **Plot binary ppf's** and **Edit binary ppf's** are both walk-right menus which list all the binary ppf's in the project and the when the ppf is double clicked, it is Plotted/Edited.

For the options *Plot and PPF Editors*, go to the section "Plot and PPF Editors"

Plot frames

Plotting setups

Old plotting

"Plot Frames"

"Plotting Setups"

"Old Plotting"

Plot and PPF Editors

ppf_editors

Position of menu: Plot =>Plot and PPF editors

The Plot and PPF editor walk-right menu is

cross section ppf editor
long section ppf editor
creating/editing plot frames
drainage long section ppf editor
drainage plan plot ppf editor
Melb water sewer long section ppf editor
pipeline long section ppf editor

convert old ppf files to new ppf files
copy title data

For the option <i>Cross sections</i> , go to	"X Plot PPF Editor"
<i>Long sections</i>	"Long Plot PPF Editor"
<i>Plot frames</i>	"Plot Frame and PPF Editor"
<i>Drainage</i>	"Drainage Plot PPF Editor"
<i>Drainage plan</i>	"Drainage Plan Plot PPF Editor"
<i>Melbourne Water</i>	"Melbourne Water Plot PPF Editor"
<i>Pipeline</i>	"Pipeline Plot PPF Editor"
<i>Convert ascii to binary</i>	"Convert Ascii PPF to Binary"
<i>Copy title data</i>	"Copy Title Data"

Plot Frames

plot_frames

Position of menu: Plot =>Plot frames

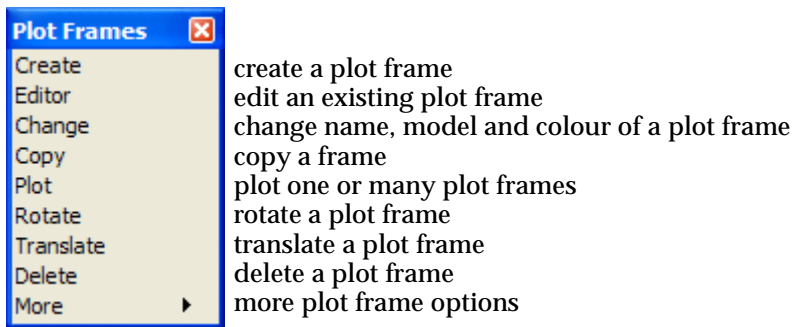

Although plan view plots can be generated in 12d Model by plotting the contents of the plan view with the **Plot** option, the plot will only have a simple title block.

To create plan plots of an arbitrary size, rotation and scale and with complex title blocks, 12d Model uses **plot frames**.

Basically a plot frame consists of a sheet size (in mm), margins within the sheet and a scale for the plot. This will define a plotting area in world co-ordinates (the plot frame).

The plot frame can be arbitrarily positioned and rotated on a plan view.

The plot frames walk-right menu is

For the option *Create*, go to the section "Create"

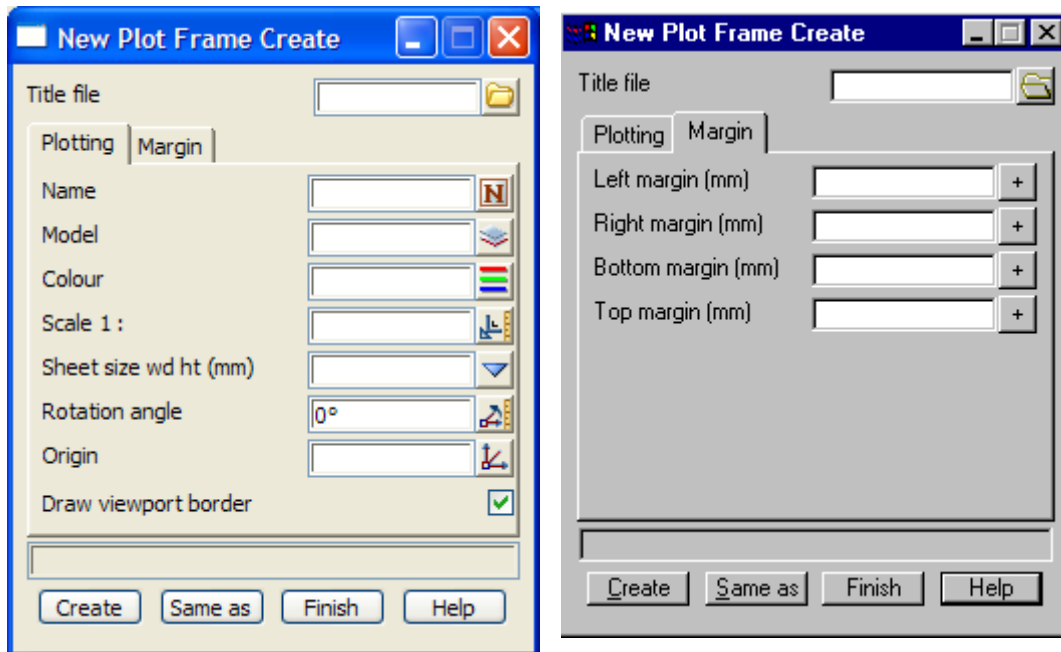

<i>Editor</i>	"Editor"
<i>Change</i>	"Change"
<i>Copy</i>	"Change"
<i>Plot</i>	"Plot Frame and PPF Editor"
<i>Rotate</i>	"Rotate"
<i>Translate</i>	"Translate"
<i>Delete</i>	"Delete"
<i>More</i>	"More Plot Frames"

Create

new_plot_frame_create

Position of option on menu: Plot =>Plot frames =>Create

On selecting the Create option, the **New Plot Frame Create** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Title file <i>name for the title file to use when plotting the plot frame. The title block file can contain default information for the rest of the panel fields. See "Values Used for Defaults when Creating Plot Frames" in the Chapter "PPF Editors"</i>	title file box		all title files
Name <i>name for the plot frame.</i>	input		
Model <i>the model for the plot frame.</i>	input		available model
Colour <i>the colour for the plot frame.</i>	input		available colours
Scale 1: <i>scale for the plot.</i>	input		
Sheet size wd ht (mm) <i>the width and height values (separated by spaces) or the name of a user defined sheet size.</i>	input		
Rotation angle <i>angle of rotation for the plot frame.</i>	input	0	
Origin <i>x_origin y_origin z_origin origin (in world units) for the corner of the plot frame - given as three values separated by spaces. The</i>	input		xyz ops menu

values can either be typed in, or selected by clicking LB in the origin panel view and getting up the xyz ops menu and selecting the pick xyz option.

Draw viewport border tick-cross tick

if **tick**, plot the box around the plotting area (viewport).

Create button

create the plot frame and then put up the plot frame edit panel for the created plot frame.

Same as button

after picking the **same as** button, an existing plot frame is selected and its information is used to fill in the above panel fields.

Margins tab

Left/right margin (mm) 10.0

the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0

the bottom/top margin between the sheet and the plotting area inside the sheet.

How To Use the Option

The plot frame contains all the information required to define the physical area in real world units to be plotted, the position on the sheet of the area being plotted, the plotter type and the plot file name.

Once the frame is created, the **New Plot Frame Edit** panel for the created plot frame is automatically placed on the screen so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

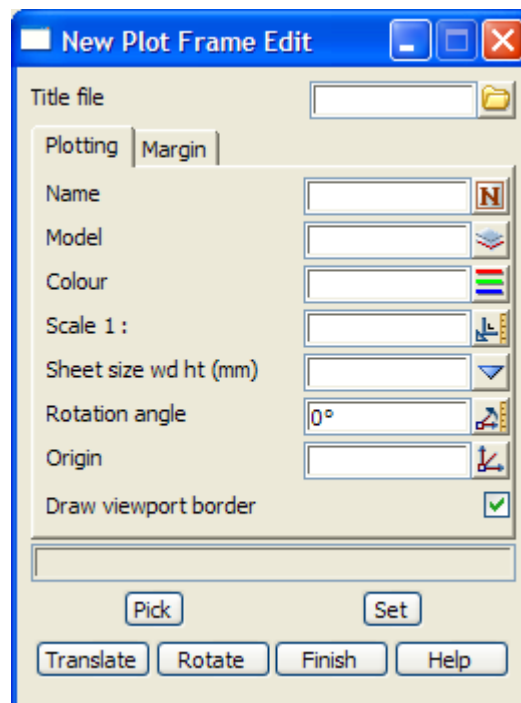

Editor

new_plot_frame_edit

Position of option on menu: Plot =>Plot frames =>Editor

The plot frame editor is used to edit existing plot frames. It is automatically placed on the screen when a plot frame is created so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

On selecting the Editor option, the **New Plot Frame Edit** panel is displayed.

Most of the fields and buttons used in this panel are the same as the **New Plot Frame Create** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Title file <i>name for the title file to use when plotting the plot frame. The title block file can contain default information for the rest of the panel fields. See "Values Used for Defaults when Creating Plot Frames" in the Chapter "PPF Editors"</i>	title file box		all title files
Name <i>name for the plot frame.</i>	input		
Model <i>the model for the plot frame.</i>	input		available model
Colour <i>the colour for the plot frame.</i>	input		available colours
Scale 1: <i>scale for the plot.</i>	input		
Sheet size wd ht (mm) <i>the width and height values (separated by spaces) or the name of a user defined sheet size.</i>	input		

Rotation angle input 0

angle of rotation for the plot frame.

Origin input xyz ops menu

x_origin y_origin z_origin

origin (in world units) for the corner of the plot frame - given as three values separated by spaces. The values can either be typed in, or selected by clicking LB in the origin panel view and getting up the xyz ops menu and selecting the pick xyz option.

Draw viewport border tick-cross tick

if tick, plot the box around the plotting area (viewport).

Pick button

select the plot frame to be edited.

Set button

update the plot frame with the information in the above panel fields.

Translate button

*after picking the **Translate** button, the plot frame will move with the cursor until a point is selected to give the final position of the plot frame.*

Rotate button

*after picking the **Rotate** button, the plot frame is further rotated around the left hand corner of the sheet, by the angle made between the rotation point and the current cursor position. The plot frame will continue to rotate until a point is selected to fix the rotation angle.*

Margin tab

Left/right margin (mm) 10.0

the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0

the bottom/top margin between the sheet and the plotting area inside the sheet.

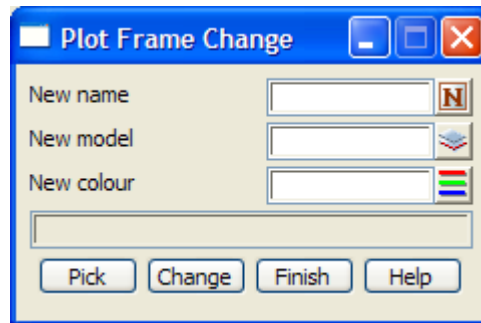

Change

plot_frame_change

Position of option on menu: Plot =>Plot frames =>Change

The change option is used to modify a plot frame's name, model or colour.

On selecting the change option, the **plot frame change** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name <i>if non-blank, then the name of the selected plot frame will be changed to the name given in the new name field.</i>	input		
New model <i>if non-blank, then the selected plot frame will be moved to the model given in the new model field.</i>	input		available model
New colour <i>if non-blank, then the colour of the selected plot frame will be changed to the colour given in the new colour field.</i>	input		available colours
Pick <i>select the plot frame to be changed.</i>	button		
Change <i>update the plot frame with the information in the above panel fields.</i>	button		

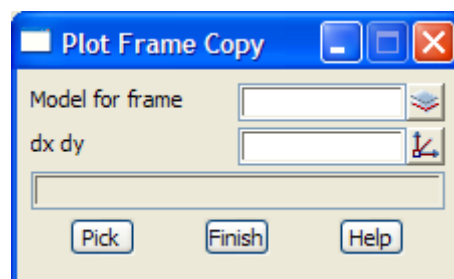

Copy

plot_frame_copy

Position of option on menu: Plot =>Plot frames =>Copy

The copy option is used to make a copy of a plot frame.

On selecting the copy option, the **plot frame copy** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for frame	input		available models
<i>if blank, then the model of the copied plot frame will be the same as that of the picked frame.</i>			
<i>if non-blank, then the copied plot frame will be placed in the model given in the model for frame field.</i>			
dx dy	input		xyz ops menu
<i>dx_val dy_val</i>			
<i>translation in world units to apply to the copied plot frame - given as two values separated by spaces.</i>			
Pick	button		
<i>select the plot frame to be copied - the copy will be made as soon as the selected plot frame is accepted.</i>			

Rotate

plot_frame_rotate

Position of option on menu: Plot =>Plot frames =>Rotate

The rotate option is used to rotate a plot frame about a selected point.

On selecting the rotate option, the **plot frame rotate** panel is displayed.

The buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Rotate	button		

*after picking the **rotate** button, the user is first asked to select a plot frame to rotate, and then to selected a point to rotate about. Once the rotation point has been selected, the plot frame is further rotated by the angle made between the rotation point and the current cursor position. The plot frame will continue to rotate until a point is selected to fix the rotation angle. The option then repeats.*

Translate

plot_frame_translate

Position of option on menu: Plot =>Plot frames =>Translate

The translate option is used to translate a plot frame.

On selecting the translate option, the **plot frame translate** panel is displayed.

The button used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Move	button		

*after picking the **move** button, the user is first asked to select a plot frame to translate. Once the plot frame has been selected, the plot frame will move with the cursor until a point is selected to give the final position of the plot frame.*

The option then repeats.

Delete

Position of option on menu: Plot =>Plot frames =>Delete

The delete option just gets up the standard **string delete** panel which can be used to delete plot frames as well as strings.

See “Delete” in the chapter “Strings”

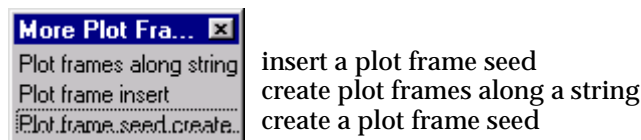

More Plot Frames

more_plot_frames

Position of menu: Plot =>Plot frames =>More

This menu contains options to create plot frame seeds, insert plot frame seeds into a view and create plot frames along a string.

The more plot frames walk-right menu is

Each option in this menu will now be described.

For the option *Plot frames along string*, go to the section “Create Plot Frames along String”

Plot frame insert “Insert Plot Frame Seed”

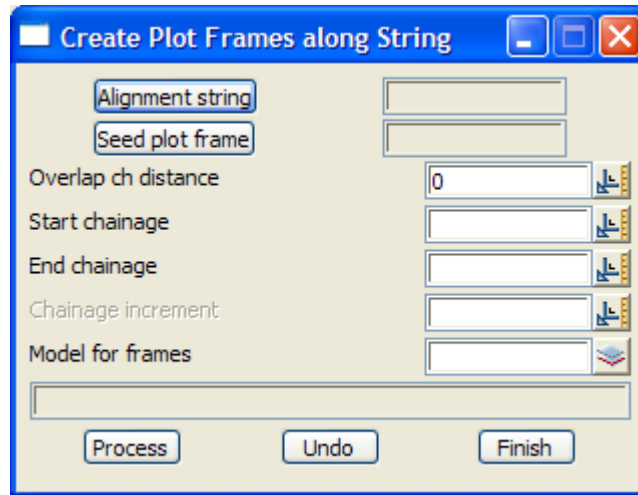

Plot frame seed create “Create Plot Frame Seed”

Create Plot Frames along String

plot_frames_panel

Position of option on menu: Plot =>Plot frames =>More =>Plot frames along string

On selecting the plot frames along string option, the **create plot frames along string** panel is displayed.

The fields and buttons used in this panel have the following functions.

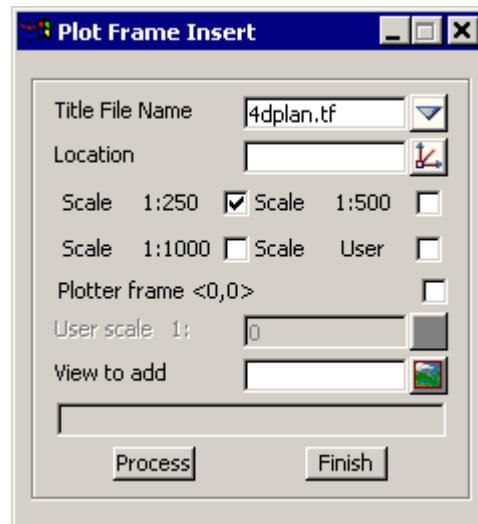

Field Description	Type	Defaults	Pop-Up
String <i>string to create plot frame along.</i>	string select		
Seed plot frame <i>plot frame to create along the selected string.</i>	plot frame select		
Overlap chainage distance <i>if non-zero, the next plot frame is started so that it includes this chainage distance of the selected string from previous plot frame.</i>	input	0	
Start/End chainage <i>start/end chainage to restrict the amount of the selected string to place plot frames along.</i>	input	0	
Chainage increment <i>if non-blank, the start of the next plot frame is placed this chainage distance along the string from the start of the previous plot frame. Used when you want to match the plot frames with the chainage interval on a long section plot. If blank, the next plot frame is placed at the chainage point at the end of the previous plot frame (minus the overlap chainage distance).</i>	input		
Model for frames <i>model to place the created plot frames in.</i>	model box		available models
Process <i>create the plots frames along the selected string.</i>	button		
Undo <i>undo the last set of plot frames created whilst this panel is up.</i>	button		

Insert Plot Frame Seed

4d_pframe_panel

Position of option on menu: Plot =>Plot frames =>More =>Plot frame insert

On selecting the insert plot frame seed option, the **plot frame insert** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot frame to insert <i>plot frame from the seed library to insert.</i>			plot frame seeds
Location <i>the bottom left hand corner of the plot frame in inserted at this location.</i>	xyz box		xyz ops menu
Scale <i>scale to use for the inserted plot frame.</i>	radio buttons	1: 250	1: 250, 1: 500, 1:1000, User
User scale 1: <i>if User is selected for Scale, then the required scale is entered here.</i>	tick box		
Plotter frame <0,0> <i>if tick, the bottom left hand corner of the plot frame is placed at (0,0).</i>	tick box		
View to add <i>if non-blank, add to plot frame to this view.</i>	view box		available views
Process <i>insert the selected seed plot frame at the given location at the given scale.</i>	button		

How To Use the Option

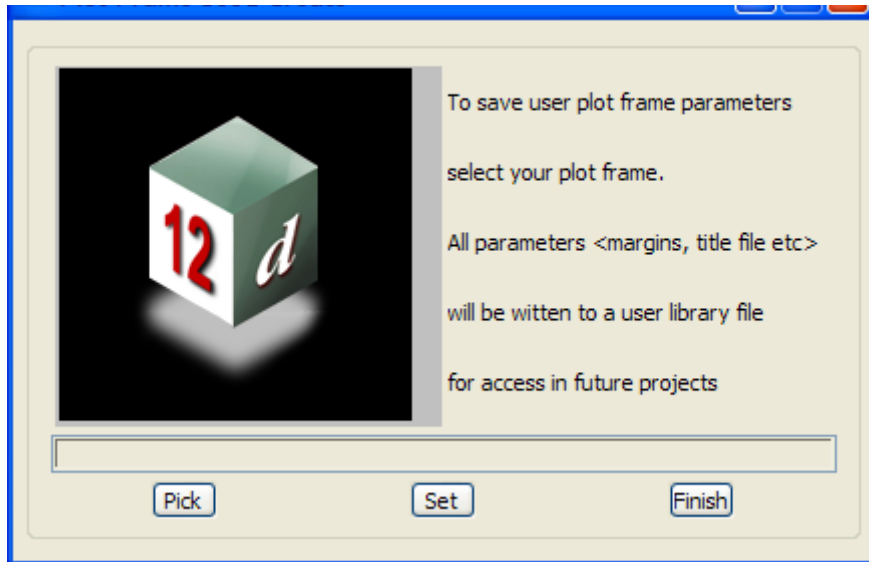

The selected plot frame is inserted at the given location with the given scale.

Create Plot Frame Seed

pframe_seed_panel

Position of option on menu: Plot =>Plot frames =>More =>Plot frame seed create

On selecting the plot frame seed create option, the **plot frame seed create** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick <i>pick the plot frame to add to the plot frame seed library.</i>	string select		
Add <i>add the selected plot frame to the plot frame seed library.</i>	button		available model

How To Use the Option

The plot frame contains all the information required to define the physical area in real world units to be plotted, the position on the sheet of the area being plotted, the plotter type and the plot file name.

The **create plot frame seed** panel adds selected plot frames to a library of plot frame seeds.

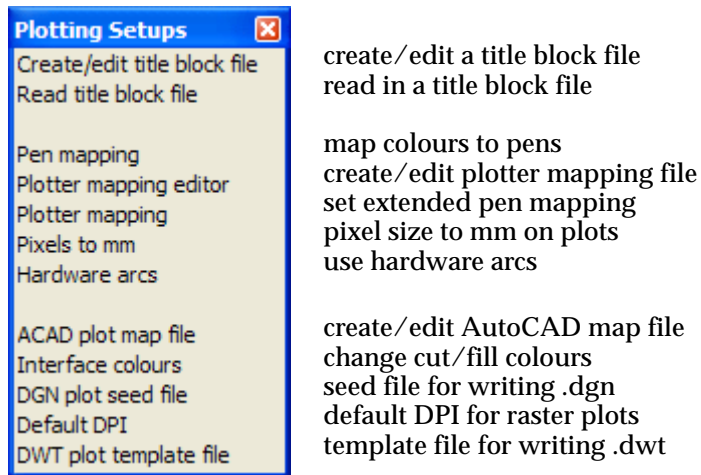

The seeds from the library can be inserted in a plan view using the insert plot frame seed option.

Plotting Setups

ppf_editors

Position of menu: Plot =>Plot and PPF editors

The Plot and PPF editor walk-right menu is

For the option *Create/edit title block file*, go to “Create/Edit Title Block File”

<i>Read title block file</i>	“Create/Edit Title Block File”
<i>Pen mapping</i>	“Pen Mapping”
<i>Plotter mapping editor</i>	“Plotter Mapping Editor”
<i>Plotter mapping</i>	“Plotter Mapping”
<i>Pixels to mm</i>	“Pixels to mm”
<i>Hardware arcs</i>	“Hardware Arcs”
<i>ACAD plot map file</i>	“ACAD Plot Map File”
<i>Interface colours</i>	“Interface Colours”
<i>DGN plot seed file</i>	“DGN Plot Seed File”
<i>DWT plot template file</i>	“DWT Plot Template File”

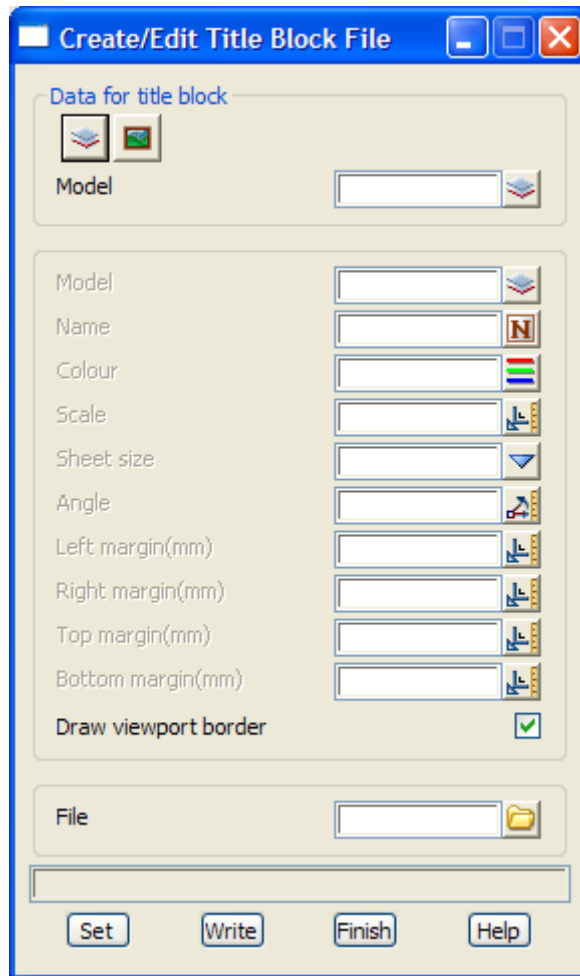

Create/Edit Title Block File

create_edit_title_block_file

Position of option on menu: Plot =>Plotting setups =>Create/edit title block file

This option is used to create a title block file from string data in a model.

The data in the model should be set up with (0,0) representing the left hand bottom of the plotting sheet and the units in model represent *millimetres* on the paper.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data Model <i>model used to create a title block file.</i>	model box		available models

Plot frame parameters

these parameters are written as attributes in the Data Model and are used as defaults for fields in the option Plots=>Plot frames=>Create

Name

name to use for the plot frame.

Model

model for the plot frame.

model box

available models

Colour <i>colour for the plot frame.</i>	colour box	available colours
Scale 1: <i>scale for the plot frame</i>	input	
Sheet size <i>sheet size for the plot frame</i>	input	available sheet sizes
Angle <i>angle of the plot frame - measured anticlockwise from the positive x-axis</i>	angle box	
Left margin, Right margin, Top margin, Bottom margin <i>margins for the plot frame</i>		
Draw viewport border <i>if tick, a border is drawn around the view port in the colour of the plot frame.</i>	tick box	tick
Title block file <i>name of the file to be created which defines a title block.</i>	file box	*.tbf files
Set <i>save the plot frame parameters as attributes in the data model.</i>	button	
Write <i>run the option – create the title block file.</i>	button	

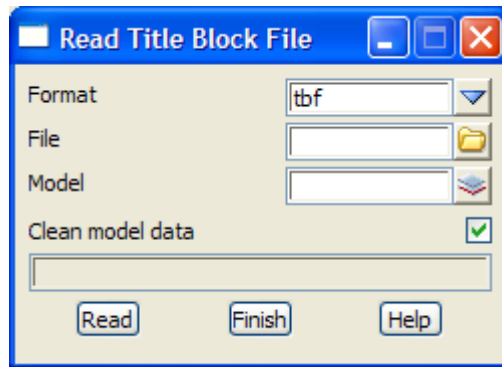

Read Title Block

read_title_block_file

Position of option on menu: Plot =>Plotting setups =>Read title block file

The **read title block file** option is for reading in a title block file and placing the lines, arcs and text defined in the title block file into a given model.

On selecting the Read title block file option, the **Read Title Block File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	choice box		tbf, tf <i>specify if the format of the file is the V7 title block file (.tbf) or the older format (.tf).</i>
Title block file name	file box		<i>name of title block file to read in.</i>
Model for title block	model box		available models <i>model to place the title block in when it is read. The plot frame parameters are set as attributes for the model.</i>
Read	button		<i>read in the title block file and place the information in the given model.</i>

Pen Mapping

This option brings up the **Edit Colours** panel.

For more information on this option, go to the section “Colours” in the Chapter “Tools and Concepts”

Plotter Mapping Editor

create_plotter_mapping_file

Position of option on menu: Plot =>Plotter mapping editor

The **plotter mapping editor** is used to create a plotter mapping file which is used when making a plot from 12d Model. The plotter mapping file defines:

- the mapping from 12d Model colours to the plotter pens and weights of the plotter pen
- the colours for the plotter pens

Different *plotter mapping files* are used for different plotter configurations.

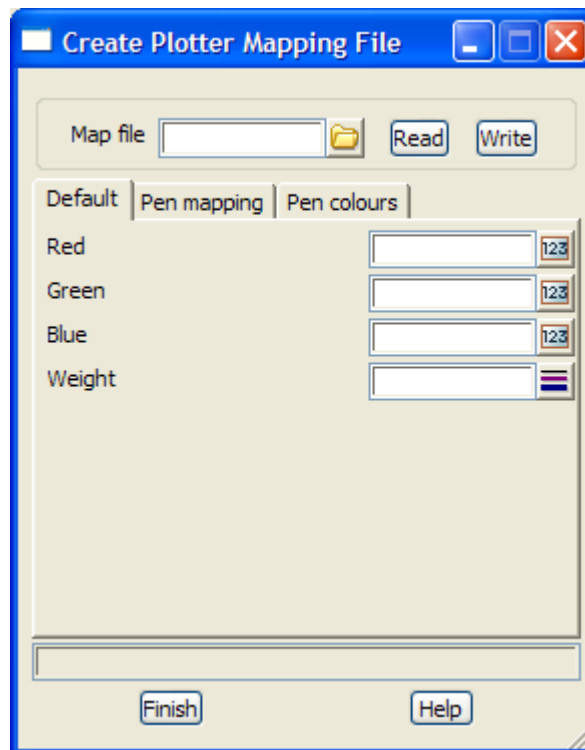

For example, different plotter mapping files would be used when plotting the same plot in 12d Model to a mono-colour plotter or to a colour plotter.

For plotting to a mono-colour plotter, 12d Model colours would be mapped to the one black pen but with possible different weights for different colours. So only one pen colour would be needed and its colour would be set to black (Red 0, Green 0 and Blue 0).

For plotting to a colour plotter, 12d Model colours could be mapped to different colours and weights on the plotter.

The text definition of the plotter mapping file is given in the next section "Plotter Mapping".

On selecting the plotter mapping editor option, the **create plotter mapping file** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file <i>the plotter mapping file to be created/edited.</i>	file box		*.pmf file
Read	button		

read in the plotter mapping file given in Map file

Write button

write out to plotter mapping information in the panel to the file given in Map file.

Default tab

Red/Green/Blue input

the value between 0 and 255 of red/green/blue to be used for the default pen colour.

Weight input

the default pen weight.

12d Colour mapping tab

12d Colour colour box

the 12d colour to define the pen mapping for.

Use Pen Number integer box

the number of the pen on the plotter for the 12d colour to be mapped to.

Weight real number box

the weight to use for the plotter pen for the given 12d colour.

Define Pen Colours tab

Pen Number integer box

the number of the plotter pen to define the colour for.

Red/Green/Blue input

the value between 0 and 255 of red/green/blue to be used for the colour of the plotter pen.

Plotter Mapping

plotter_mapping_table

Position of option on menu: Plot =>Plotter mapping

The **plotter mapping file** can be used use with pen plotters but is more specifically designed for electostatic and inject plotters and allows the user to

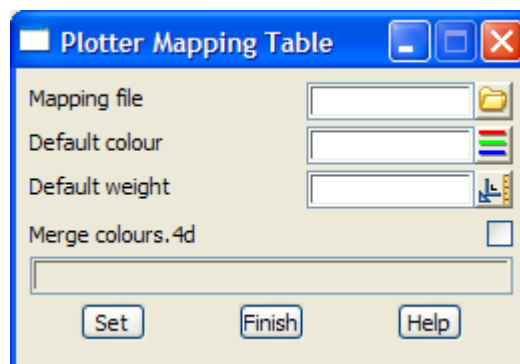

- (a) map the full 10,240 12d Model colours to particular plotter pens and also specify a width (or weight) to be used forPCL5, HPGL2 and postscript plotters.
- (b) specify the red, green and blue mix for pens on HPGL2 and colour postscript plotters

There are also two special formats of the plotter mapping file which are used for plotting to Autocad dxf/dwg and Intergraph dgn. The special mapping files use the 12d Model colour as a key to tables which control how the information is passed to DXF/DWG and DGN.

- (c) .tbl file used with plotting to Intergraph dgn
- (d) .amf used with plotting to Autocad dxf and dwg

The .tbl and .amf files are documented in the “Definition and Example of a .tbl File” and “Definition and Example of a .amf File” sections in the Appendix “Plotters and Plotting” .

On selecting the plotter mapping option, the **plotter mapping table** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mapping file <i>the plotter mapping file to be used when plotting. If no plotter mapping file is given, the pen mapping table is used.</i>	input		*.pmf file
Default colour <i>the rgb of this colour is used as the rgb for the default pen colour.</i>	input		available colours
Default weight <i>if not blank, the default pen weight.</i>	input		
Merge colour_map.def <i>If tick, the rgb columns from the colour_map.def file are used to define the pen_colours (first row is pen 0, second row is pen 1 etc.), and the pen mapping number is used to construct the pen_mapping table.</i>	tick-cross	tick	
Set <i>set the information in the panel</i>	button		

Plotter Mapping File

The plotter mapping file (.pmf) consists of two sections and two default values:

- (a) the **pen_mapping** table which defines the plotter pens that the **12d** Model colours are mapped to, and the weights for each "12d Model colour to plotter pen" mapping.

The `pen_mapping` table consists of the key word `pen_mapping` followed by the mapping for each **12d** Model colour to the appropriate plotter pen number and pen weight (one per line), all enclosed in curly braces (`{ }`).

```
pen_mapping {                               // pen mapping and weight table

//12d Model colour number      plotter pen number      pen weight

          0                      1                      0.15
          1                      2                      0.25
          3                      1                      0.5
//          etc.
}
```

- (b) the **pen_colours** table which defines the red, green and blue values to be used for the pens on the plotter.

The `pen_colours` table consists of the key word `pen_colours` followed by the red, green and blue values for the plotter pens (one per line), all enclosed in curly braces (`{ }`).

```
pen_colours {                               // pen colours table
//pen      red      green      blue      values 0-255
  0        0        0        0        // pen 0 is black
  1       255        0        0        // pen 1 is red
//          etc.
}
```

- (c) the **default_weight** command that goes at the top of the file (not inside the `pen_mapping` or `pen_colours` table) which is used as the weight for any **12d** Model colour used in the plot but not mapped and given a weight in the `pen_mapping` table.

```
default_weight      weight
```

- (d) the **default_colour** command that also goes at the top of the file (not inside the `pen_mapping` or `pen_colours` table) which defines the default red, green and blue for any pens used but not set in the `pen_colours` table.

```
default_colour      red      green      blue
```

Initialization of the plotter mapping file

When using the plotter mapping table panel:

When used with the **plotter mapping table** panel, the `pen_mapping` and `pen_colours` tables are initialised before the plotter mapping file is used. This is to ensure that any colours and/or pens not mentioned in the file but used in a plot, do have valid definitions.

Hence the initialisation sequence for the plotter mapping file used with the **plotter mapping table** panel is:

Before the plotter mapping file is used, a default `pen_mapping` table for colours 0 to 255 is set up by:

colour `n` goes to pen `n` with the default weight from the **plotter mapping table** panel.

Before the plotter mapping file is used, a default `pen_colours` table for pens 0 to 255 is set up by:

pen `n` is given the red, green and blue of the default colour from the **plotter mapping table** panel.

If the **merge colours.4d** flag is set in the **plotter mapping table** panel, the **rgb** columns from the **colours.4d** file are used to define the **pen_colours** (first row is pen 0, second row is pen 1 etc.), and the pen mapping number is used to construct the **pen_mapping** table.

The **plotter mapping file** is then processed and over writes any of the above initial mapping values.

When using user defined plotters:

A plotter mapping file can be set for a user defined plotter in the file *plotters.4d*.

In this case, the **plotter mapping table** panel is **not** used and hence the initialisation sequence is slightly different.

When used with the **plotter mapping table** panel, the **pen_mapping** and **pen_colours** tables are initialised before the plotter mapping file is used. This is to ensure that any colours and/or pens not mentioned in the file but used in a plot, do have valid definitions.

For a **user defined plotter**, the initialisation sequence for the plotter mapping file is:

Before the plotter mapping file is used, a default **pen_mapping** table for colours 0 to 255 is set up by:

colour *n* goes to pen *n* with the **default weight** *default_weight* from the specified plotter mapping file, or zero if the *default_weight* does not exist.

Before the plotter mapping file is used, a default **pen_colours** table for pens 0 to 255 is set up by:

pen *n* is given the red, green and blue of the **default colour** *default_colour* from the specified plotter mapping file, or **rgb 0 0 0** if the *default_colour* does not exist

The **plotter mapping file** is then processed and over writes any of the above initial mapping values.

An Example of a Plotter Mapping File

An example of a plotter mapping file (.pmf) is:

```

default_colour      100      0      100
default_weight      0.1

pen_mapping {
// pen mapping and weight table
//      colour      pen      weight
      0      1      0.15      // map colour 0 to pen 1 with weight 0.15
      1      2      0.25      // map colour 1 to pen 2 with weight 0.25
      3      1      0.5       // map colour 3 to pen 1 with weight 0.5
}
pen_colours {
// pen colours table
//pen      red      green      blue      values 0-255
      0      0      0      0      // pen 0 is black
      1      255     0      0      // pen 1 is red
      3      0      255     0      // pen 3 is green
}

```

Pixels to mm

[pixels_to_millimetres_plot_factor](#)

Position of option on menu: Plot =>Pixels to mm

To plot an object, it must be possible to calculate the size in millimetres that the object will have in the plot.

However, in **12d Model** it is possible for text and linestyles to be defined in the screen unit pixels, and since the size of a pixel varies between screens, there is no direct millimetre equivalent for a pixel.

To allow text and linestyles with only a pixel size to be plotted, a factor to convert pixels to millimetres is used.

When plotting, all text and linestyles defined only in pixel units is **multiplied** by the pixels-to-millimetre factor to determine its size in the plot.

On selecting the pixel to mm option, the **pixels to millimetres plot factor** panel is displayed.

To define a new factor, simply type the value into the factor field and select **set**.

The pixel-to-millimetres value is stored for the project.

For a new project, the initial value is loaded from the **defaults** file and is defined in the file by

```
PIXELS TO MM PLOT FACTOR    value
```

Hardware Arcs

[draw_hardware_arcs](#)

Position of option on menu: Plot =>Hardware arcs

When plotting arcs, the arc can either be broken into a series of straight lines within **12d Model**, or plotted using the arc command (if it exists) for the relevant plotter.

This option allows the user to choose whether

- (a) the plotter arc command is used (hardware arcs)
- or
- (b) before plotting, the arc is broken into a series of lines.

On selecting the hardware arcs option, the **draw hardware arcs** panel is displayed.

To use hardware arcs in plots, simply change the draw arcs in hardware tick-cross box to tick and select **set**.

ACAD Plot Map File

[autocad_plot_map_file_create_edit](#)

Position of option on menu: Plot =>Plotting setups =>ACAD plot map file

When plotting to AutoCAD, an Autocad map file can be used which uses the 12d Model colour of an entity in the plot as a key to mapping the entity into AutoCAD.

On selecting the ACAD plot map file option, the AutoCAD Map File Create/Edit panel is displayed.

Interface Colours

plotting_colours_for_interface_strings

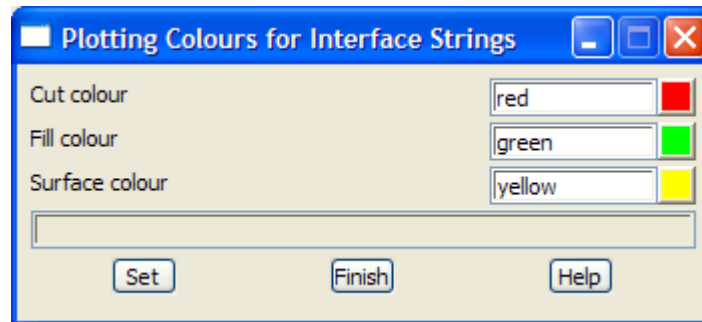

Position of option on menu: Plot =>Interface colours

When drawing interface strings in 12d Model, cut areas are denoted in red, fill areas in green and sections on the surface in yellow.

However, when plotting it is convenient to be able to map the interface colours to other colours.

This panel is used to define new colours for the interface colours, and the new colours are then mapped to pens using the pen mapping table or plotter mapping file.

On selecting the interface colours option, the **plotting colours for interface string** panel is displayed.

To define new colours, simply type the values into the appropriate panel fields and select **set**.

Note - the new interface colours are not used for displaying interface strings in 12d Model, only for plotting.

DGN Plot Seed File

dgn_plot_seed_file

Position of option on menu: Plot =>DGN plot seed file

When creating plot files in Intergraph DGN format, an Intergraph DGN seed file can be used.

On selecting the DGN plot seed file option, the **DGN plot seed file** panel is displayed.

To define an Intergraph IGDS plot seed file to use for Intergraph plotting, simply type the file name into the plot seed file panel field and select **set**.

Default DPI

default_raster_dpi

Position of option on menu: Plot =>Default DPI

This defines the default DPI (dots per inch) when plotting rasters.

On selecting Default DPI, the **Default Raster DPI** panel is displayed.

The *DPI* value give the default dots per inch that is used for plotting rasters.

DWT Plot Template File

autocad_plotter_drawing_template_file

Position of option on menu: Plot =>DWG plot template file

When creating plot files in AutoCAD format, an AutoCAD template file can be used.

On selecting the DWT plot template file option, the AutoCAD Plotter Drawing Template File panel is displayed.

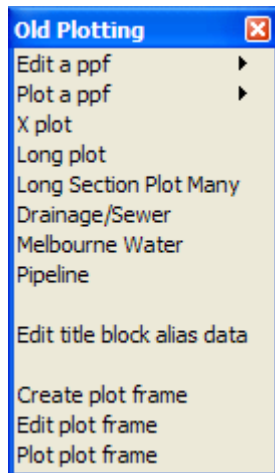

To define an AutoCAD plot seed file to use for AutoCAD plotting, simply select either *DWG* or *DXF* for the File format, type the file name into the plot seed file panel field and select **set**.

Old Plotting

old_plotting

Position of menu: Plot =>Plot =>Old plotting

The Old plotting walk-right menu is

edit a V5ascii ppf
 plot a V5 ascii ppf

“Plots” in chapter “Pipeline” .

“Title Block Data Editor”

“Create Old Plot Frame”

“Editor Old Pot Frame”

“Plotting Old Plot Frames”

Edit a ppf

directory__ppf

edit_a_file__ppf

Position of option on menu: Plot =>Old plotting =>Edit a ppf

The edit a ppf option is used to edit V5 ascii plot parameter files (*.ppf) with the editor pointed to by the EDITOR_4D environment variable.

The edit a ppf walk-right menu provides a list all the plot parameter files (files ending in .ppf) in the current folder.

When a file is selected from the list, it is loaded into the editor pointer to by the environment variable EDITOR_4D.

Plot a ppf

directory__ppf

Position of option on menu: Plot =>Old plotting =>Plot a ppf

The V5 ascii ppf's for long section, cross section and plot frames can have enough information in them to totally generate the plot from the ppf. The plot a ppf option is used to plot such a plot parameter file (*.ppf).

The plot a ppf walk-right menu provides a list all the plot parameter files (files ending in .ppf) in the current folder.

When a file is selected from the list, it is then used to generate a plot.

Note - the plot parameter file is defined in the chapter **Advanced Plotting**.

X Plot

cross_section_plot section_x_plot_title

Position of option on menu: Plot =>Old plotting =>X plot

The x plot option is used to make the traditional pages of cross-section plots, that is, stacked x-sections, with offsets and elevations labelled for each cross section string, and elevations displayed for each of the tins on the section view.

For 12d Model V5, each string to be plotted is assumed to be on a straight line in plan. Hence the cross section is taken as a straight line from the first point of the string to the last point of the string. The chainage of the first point of the string is used as the offset.

For 12d Model V6 and above, sections do not have to be a straight line in plan. The chainage of the first point of the string is used as the offset.

The format of the x-section plot is partially controlled by fields in the **Section X Plot** panel but more extensive control is possible using a **plot parameter file** (*.ppf). The plot parameter file is fully documented in the "Cross Section Plot Parameter File" section of the Appendix, "Plot Parameters".

The cross section plot is tailored by using the plot parameter file (.ppf file) given in the plot parameters field. A default .ppf file is set by pointing to it with the environment variable

X_SECTION_PPF_4D pathname of default .ppf file

In the pathname to the default .ppf file, \$LIB is used to stand for the library folder set by LIB_4D. For example, "\$LIB/cross.ppf" is the file cross.ppf in the library area.

Which x-sections are to be plotted is specified by giving the model containing the appropriate cross sections. Sections are also drawn through any triangulations and service items on the section view. Vertical exaggeration, services and corridor settings are taken from a plot parameter file or from the settings for the section view.

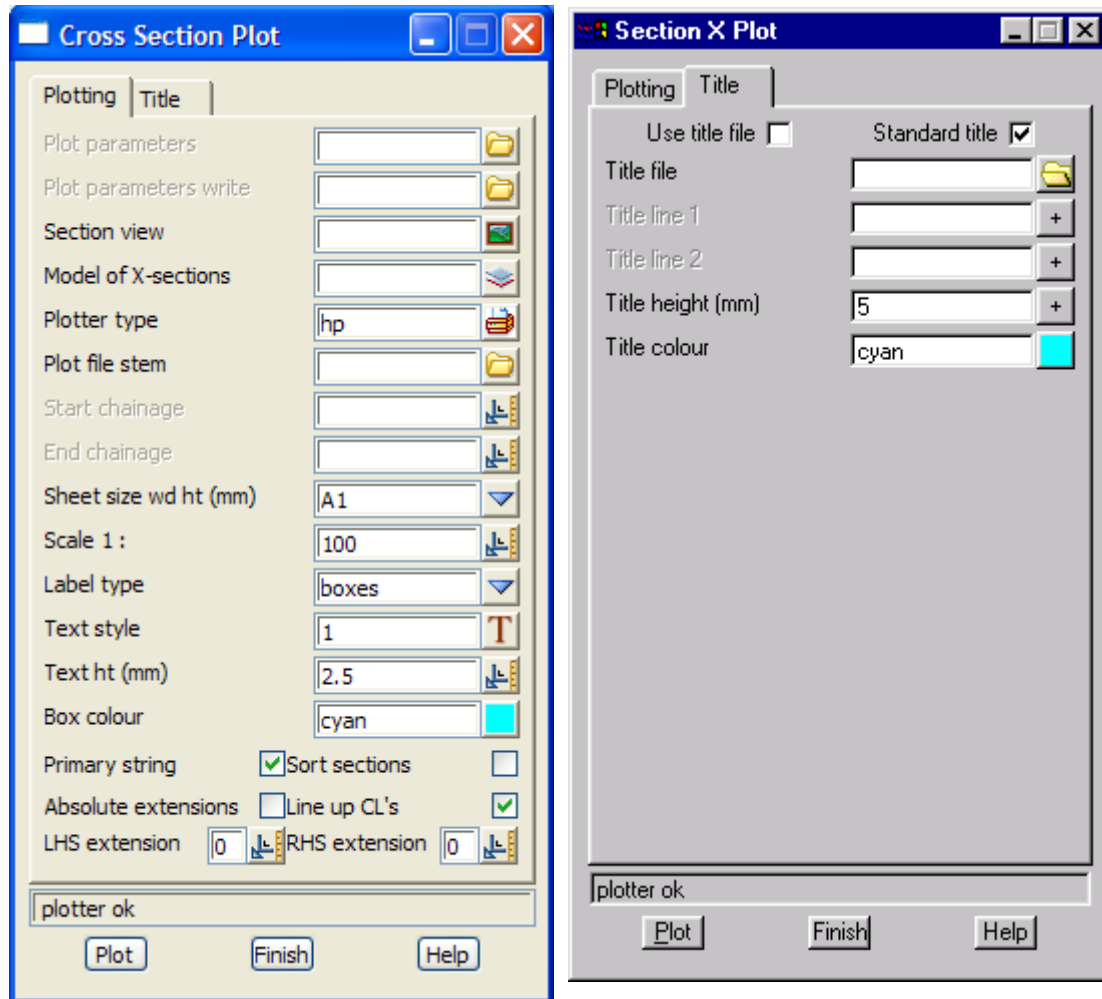

X-sections can be labelled with either the offset from the centreline and heights for each of the x-section points, or simply the position of the centre-line.

The required page size is given, plus the scale (the vertical exaggeration is taken from the view settings) and the sections are then plotted in columns on the plotter page. Once a page is full, a new plot page is automatically begun.

The stacked x-section plots in each column can be lined up by their centre-lines.

After selecting the x plot option, the **section x plot** panel is displayed.

The **title** button on the bottom of this panel controls the use of a title block file and the plotting of a border and two lines of title. If the **title** button is selected, the **section x plot title** panel is displayed.

The fields and buttons used in the first panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters	input	X_SECTION_PPF.4D*.ppf	

file of plot parameters used for extra control of the x section plot. The default .ppf file is pointed to by the environment variable X_SECTION_PPF_4D.

For more information on the x section plot parameters, please go to the section “Cross Section Plot Parameter File” in the Appendix “Plot Parameters”

Plot parameters write	input		*.ppf
------------------------------	-------	--	-------

file to write a copy of the plot parameters necessary to regenerate the plot.

Section view	input/output	current view	available views
---------------------	--------------	--------------	-----------------

section view to use for plot definitions such as the tins to profile, the models of services, corridor width and vertical exaggeration.

Model of X-sections	input		available models
----------------------------	-------	--	------------------

the model containing all the x-sections to be plotted. The x-sections are plotted in the same order as they are in the model.

Each string to be plotted is assumed to be on a straight line in plan. Hence the cross section is taken as a straight line from the first point of the string to the last point of the string. The chainage of the first point of the string is used as the offset.

Plotter type	input	hp	hp, dxf, postscript etc.
---------------------	-------	----	--------------------------

file format for the plot output.

- Plot file stem** input
since more than one plot page may be produced, the plot file stem plus a plot page sequence number followed by the ending for the plotter type is used as the plot file names.
- Start/end chainage** input
the plots cover the chainage range for the cross sections given by the start and end chainage fields. If the start/end chainage is blank, the start/end chainage of the x-section strings are used.
- Sheet size wd ht (mm)** input available sheet sizes
must contain the width and height values (separated by space) or the name of a user defined sheet size.
- Scale 1:** input
horizontal scale for plotting the x-sections.
- Label type** input boxes boxes, centreline
if boxes, the offset from the centreline and heights for each point in the x-section will be plotted in the traditional offset/height boxes.
if centre line, only the position of the centre-line and the height of the section at that point will be drawn.
- Text style (mm)** input 1
text style to be used in the x section plot boxes or centreline labelling.
- Text ht (mm)** input 3
height (in millimetres) to plot the offset and heights in the boxes in the plots of the x-sections
- Offset colour** input red available colours
colour used for the offset text and the boxes.
- Primary string** tick-cross tick
if tick, the string from the model of x-sections (the primary string) is plotted.
- Sort sections** tick-cross tick
if tick, the strings from the model of x-sections are sorted by chainage along the design string.
- Absolute extensions** tick-cross
If tick, the sections are only drawn from the centreline out to the left and right extension distances. if no tick, the left and right extension values are added to the section left and right widths, and the section is taken between the extended values
- Line up CL's** tick-cross tick
if tick, the centre-lines are lined up under each other for each plot in a column.
- LHS extension** input 0
distance to extend the x-section to the left.
- RHS extension** input 0
distance to extend the x-section to the right.
- Title** button
bring up the panel for defining information in the title block.
- Plot** button
write out the plots for the x-sections given in the model of x-sections field.
- The fields and buttons in *title* tab are:
- Use title file** tick-cross
if tick, a user defined title block file is used.

Standard Title	tick-cross	tick	
	<i>if tick, the standard 4D Solutions border and two lines of title are placed on the bottom of the plot</i>		
Title file	input		*.tf
	<i>if non-blank and use title file is set to tick, then the file given in this field is used to generate a user defined title block for the plot.</i>		
Title line 1/2	input		
	<i>first/second line of title information</i>		
Title height (mm)	input	5	
	<i>height (in millimetres) to draw the characters in the two lines of title information.</i>		
Title colour	input	cyan	available colours
	<i>colour used for the border and the title information.</i>		

Long Plot

[long_section_plot](#)

[section_long_plot_title](#)

[section_long_plot_title](#)

[section_long_plot_pagination](#)

Position of option on menu: Plot =>Old plotting =>Long plot

The long plot option is used to make traditional long section plots with string chainages and elevations labelled for the primary string and elevations and depths displayed for each of the tins on the section view.

The format of the long section plot is partially controlled by fields in the section long plot panel but more extensive control is possible using a **plot parameter file** (*.ppf). The plot parameter file is fully documented in the “Long Section Plot Parameter File” section of the chapter, “Plot Parameters” .

After selecting the long plot, the **section long plot** panels respectively, is displayed.

The long section plot is tailored by using the plot parameter file (.ppf file) given in the plot parameters field. A default .ppf file is set by pointing to it with the environment variable

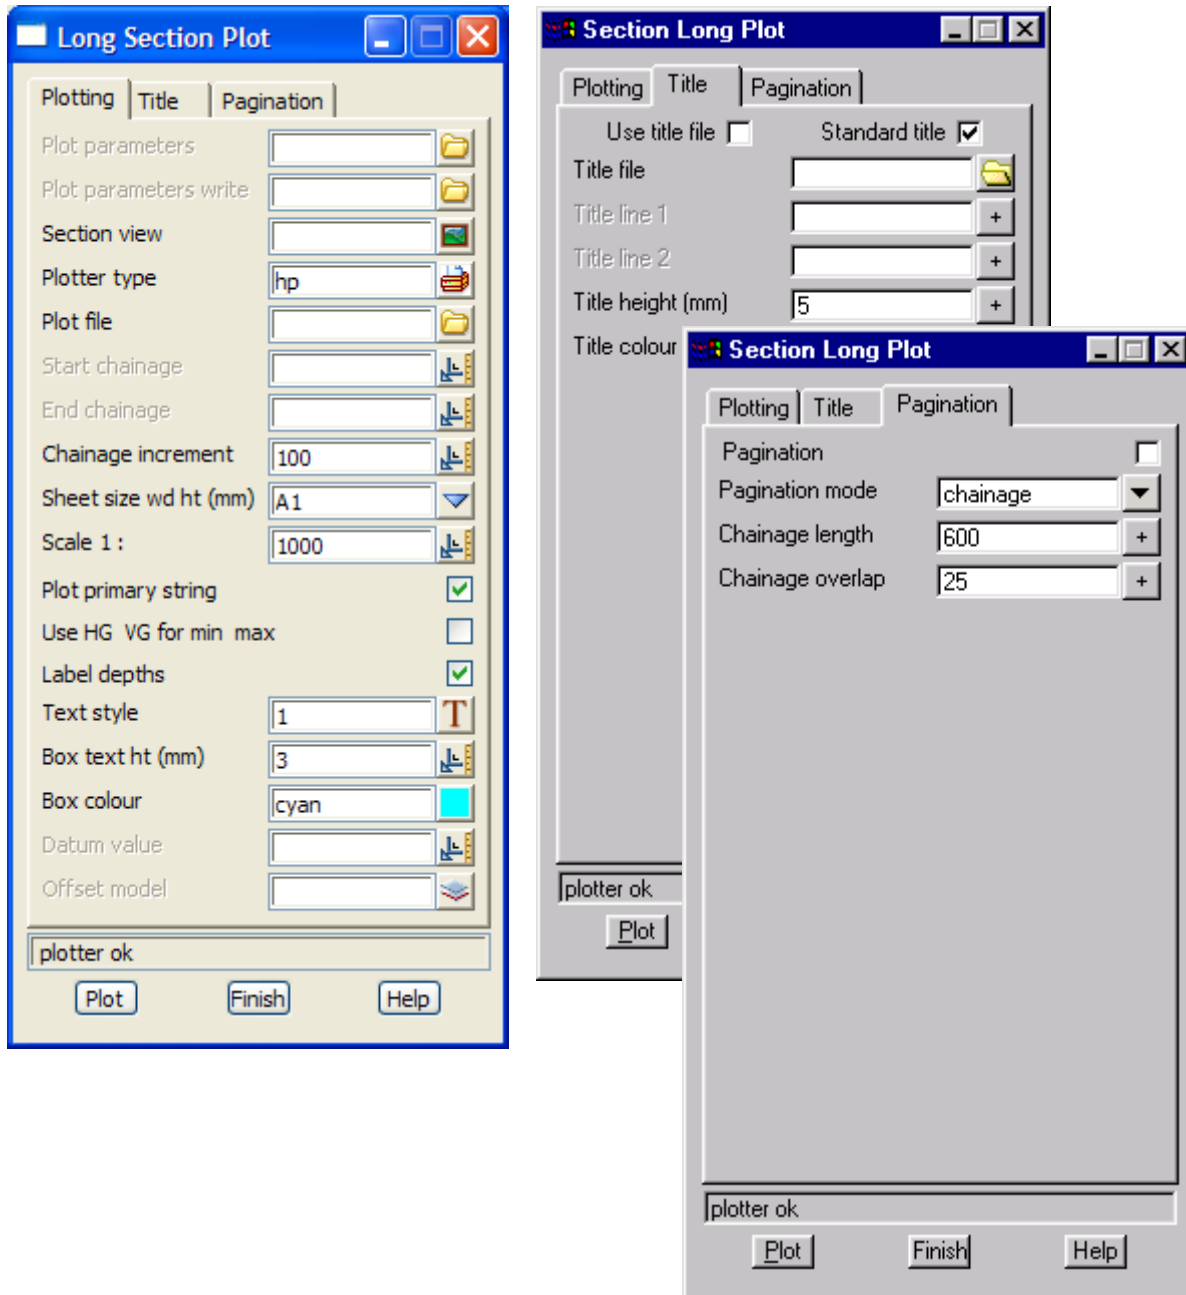

LONG_SECTION_PPF_4D pathname of default .ppf file

In the pathname to the default .ppf file, \$LIB is used to stand for the library folder set by LIB_4D. For example, "\$LIB/long.ppf" is the file long.ppf in the library area.

The **title** button on the bottom of this panel controls the use of a title block file and the plotting of a border and two lines of title. If the **title** button is selected, the **section long plot title** panel is displayed.

The **pagination** button on the bottom of this panel controls whether the long section plot is broken into pages, by a chainage length or millimetres of plot.

If the **pagination** button is selected, the **section long plot pagination** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters	input	LONG_SECTION_PPF_4D*.ppf	
<i>file of plot parameters used for extra control of the long section plot. The default .ppf file is pointed to by the environment variable LONG_SECTION_PPF_4D.</i>			
<i>For more information on the long section plot parameters, please go to the section “Long Section Plot Parameter File” in the Appendix “Plot Parameters”</i>			
Plot parameters write	input		*.ppf
<i>file to write a copy of the plot parameters necessary to regenerate the plot.</i>			
Section view	input/output	current view	available section views
<i>section view to use for plot definitions such as the tins to profile, the models of services, corridor width and vertical exaggeration.</i>			

Plotter type	input	hp	hp, dxf, postscript etc.
	<i>file format for the plot information.</i>		
Plot file	input		*.hp etc.
	<i>name of the file to write out the long section plot to.</i>		
Start/end chainage	input		
	<i>the plot covers the chainage range given by the start and end chainage fields. If the start/end chainage is blank, the start/end chainage of the primary string is used.</i>		
Chainage increment	input	100	
	<i>chainage increment to label the long plot with chainage and height values.</i>		
Sheet size wd ht (mm)	input		available sheet sizes
	<i>The width and height values (separated by space) or the name of a user defined sheet size.</i>		
Scale 1:	input		
	<i>horizontal scale for the plot. The vertical scale is taken from the ppf or the section view.</i>		
Plot primary string	tick box	tick	
	<i>if tick, the primary string is plotted along with any horizontal geometry displayed in the section view.</i>		
Use HG VG for min, max	tick box	tick	
	<i>if tick, the chainage range available for plotting is from the minimum of the horizontal geometry (HG) and the vertical geometry (VG) to the maximum of the HG and VG. Useful for kerb returns. If no tick, the chainage range available for plotting is from the minimum of the horizontal geometry (HG) to the maximum of the HG.</i>		
Label depths	tick box	tick	
	<i>if tick, label in boxes at the bottom of the plot, the distance between the primary string and the tins.</i>		
Text style	input	1	
	<i>text style to be used in the long section plot boxes.</i>		
Box text ht (mm)	input	3	
	<i>height (in millimetres) to plot the chainage and elevations in the boxes in the long section plot.</i>		
Box colour	input	cyan	available colours
	<i>colour used for the chainage text and the boxes.</i>		
Datum value	input		
	<i>if non-blank, the value to be used as a datum. If blank, then a suitable datum value will be calculated.</i>		
Offset model	input		available models
	<i>if non-blank, then all the strings in the offset model will be projected onto the primary string and drawn and labelled on the long section plot.</i>		
Pagination	button		
	<i>button to bring up the section long plot pagination panel.</i>		
Title	button		
	<i>button to bring up the section long plot title panel.</i>		
Plot	button		
	<i>write out the plot for the long section plot between the chainages given in the start and end chainage fields. The format of the file is given by the plotter type</i>		

The fields and buttons in *title* tab are:

Use title file	tick-cross		
	<i>if tick, a use supplied title block file is used.</i>		
Standard Title	tick-cross	tick	
	<i>if tick, the standard 4D Solutions border and two lines of title are placed on the bottom of the plot</i>		
Title file	input		*.tf
	<i>if non-blank and use title file is set to tick, then the file given in this field is used to generate a user defined title block for the plot.</i>		
Title line 1/2	input		
	<i>first/second line of title information</i>		
Title height (mm)	input	5	
	<i>height (in millimetres) to draw the characters in the two lines of title information.</i>		
Title colour	input	cyan	available colours
	<i>colour used for the border and the title information.</i>		

The fields and buttons in *pagination* tab are

Pagination	tick-cross	tick	
	<i>if tick, the long section plot is broken into separate plots of length given in the length field, from the start chainage to the end chainage. If the overlap field is non-zero, then each page of the long section plot also includes the overlap value of the end of the previous page of plot.</i>		
	<i>The units for length and overlap can be either chainage distance or millimetres on the plot page.</i>		
	<i>Hence apart from the first page and possibly the last page, the plot will have a total length given by the sum of the length and the overlap panel fields.</i>		
Pagination mode	input	chainage	chainage, millimetres
	<i>the units for length and overlap can be either chainage distance or millimetres on the plot page.</i>		
	<i>If pagination mode is set to chainage, the units are chainage distance.</i>		
	<i>If pagination mode is set to millimetres, the units are millimetres on the plot.</i>		
Length	input	600	
	<i>if pagination is set to tick, the length of new plot to be included in the current plot.</i>		
Overlap	input	25	
	<i>if pagination is set to tick, the length of the previous plot page to be included in the current plot.</i>		

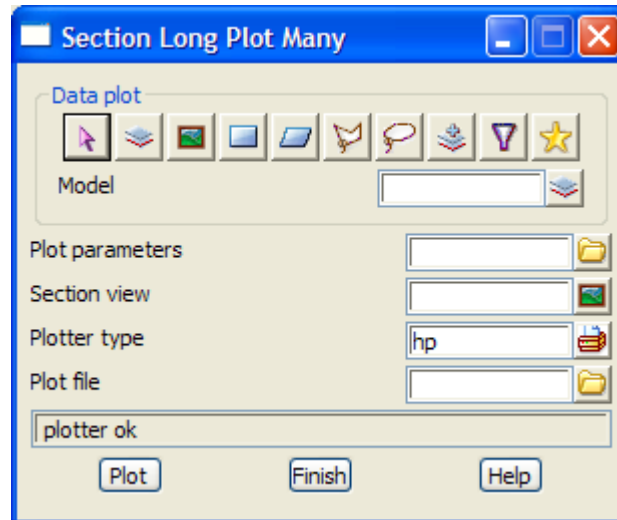

Plot Many Long Sections

[section_long_plot_many](#)

Position of option on menu: Plot =>Old plotting =>Longsection plot many

The Long section plot many option is used to plot individual long section plots for each string selected by the Data source.

On selecting the Long section plot many option, the **Section Long Plot Many** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data to plot - Data source type

data source type.

Data source

*when the **plot** button is selected, long section plots are created for all the strings selected by the data source.*

Plot parameters	input		*.ppf files
------------------------	-------	--	-------------

file of plot parameters to be used for the long section plots.

Section view	input		available views
---------------------	-------	--	-----------------

name of the section view for defining information for the long section plots. For example, tins to plot.

Plotter type	input	hp	available plotters
---------------------	-------	----	--------------------

type of plotter to plot to.

Plotter file	input		
---------------------	-------	--	--

stem of the name to use for the long section plots.

Plot	button		
-------------	--------	--	--

*when the **Plot** buttons is selected, individual long section plots will be created for all the strings selected in the data source field.*

Drainage/Sewer Plot

Position of option on menu: Plot =>Old plotting =>Drainage/Sewer

The Drainage/sewer plot option is for creating drainage and/or sewer long-section plots.

The option has already been described under **Design=>Drainage-sewer =>Plots**.

See "Drainage Longsections" in chapter "Drainage and Sewer"

Melbourne Water Sewer Plot

Position of option on menu: Plot =>Old plotting =>Melbourne Water

The Melbourne Water sewer plot option is for creating sewer long-section plots to Melbourne Water specifications.

The option has already been described under **Design =>Drainage-sewer =>Plots**.

See “Melbourne Water” in chapter “Drainage and Sewer”

Pipeline Plot

Position of option on menu: Plot =>Old plotting =>Pipeline

The Pipeline plot option is for creating pipeline long-section plots.

The option has already been described under **Design =>Pipeline =>Plots**.

See “Plots” in chapter “Pipeline”

Title Block Data Editor

title_file_alias_panel

Position of option on menu: Plot =>Old Plotting =>Edit title block data

NO LONGER USED IN V7

This panel is used to easily change to data in your drawing title blocks (set values for the user_text_n field in a title file).

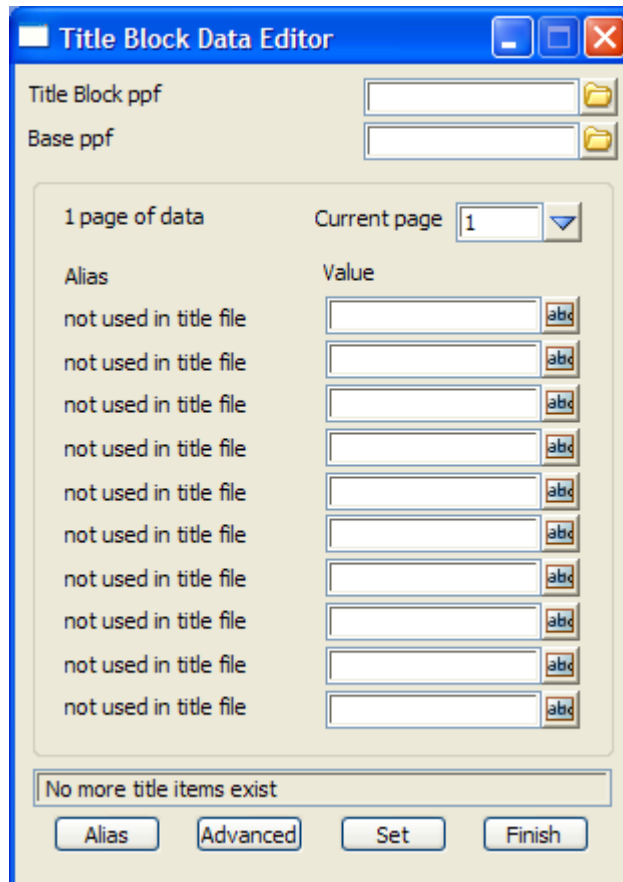

The **Title block ppf** is the ppf that is created by the panel. You may want to create a title block ppf for every drawing you create. This way you can easily re-plot a drawing with the same title block data. This is the ppf name that you will use in the future plot panels when you are ready to plot using the title block.

The **Base ppf** field is an existing ppf that includes all of your default plot parameters for creating your drawing. It must reference a title file.

12d marks the location of your title block data using the variables *user_text_1*, *user_text_2* etc. Since it is difficult to remember what *user_text_1* represents in the title block, 12d allows you to use a meaningful name reference (Main title for example) instead of *user_text_1*. The Alias button allows you to set these alias names for the title file referenced in your base ppf.

The Advanced button is only used if the same text data is to be used in another Title Block ppf (share the data between drawing).

The Set button creates/updates the title block ppf and the title file values that you entered.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Title block ppf

this is the ppf that is created by the panel. This is the ppf name that you will use in the future plot panels when you are ready to plot using the title block. The Title Block ppf is usually stored locally (in the current folder).

Base ppf

this ppf must exist (often in library or your user library). It will contain all of your default plot parameters for creating your drawing. It must reference a title file (see notes below). When you press enter, the ppf file is read to find the name of the title file you reference. Once the title file is found, the alias names are read from the title alias file if available.

To convert an existing ppf file into a Base ppf file use a text editor to delete all references to *user_text_n* variables in the file.

Current page	choice box	available pages
--------------	------------	-----------------

if more than one page of data (10 fields) are required additional pages will be listed here.

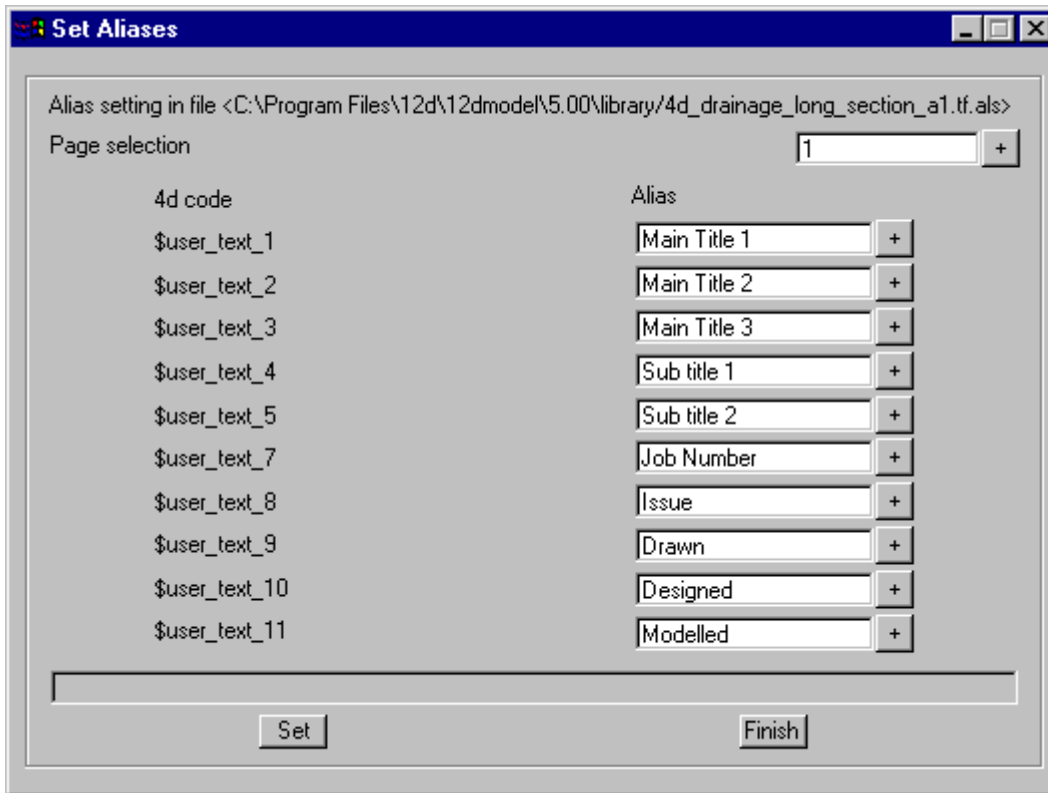

Value	input box
-------	-----------

the data to be shown into your drawing title block is entered here. The description to the left is either *\$user_text_n* (Note that there may be gaps in the numbering sequence) or an alias that has been set up using the alias button below.

Alias	button
-------	--------

if the fields have the names *\$user_text_1*, *\$user_text_2* etc. use the button to change the names

to a more meaningful description. These new names will be stored in the same folder as the with the title file specified in your base ppf file (the extension *als* will be added). The following panel will be displayed.

Note that there may be gap in the *\$user_text_n* sequence. Only the variable used in the title file will be listed.

Advanced button

this feature allows you to share text data between different *title block ppf* files. The actual text data is stored in a title file txt (*.tft) file. Selecting the button will bring up the following panel and allow you to change the *.tft file to be used. Generally you will select a *.tft file previously set up for another title block file.

Select the **Set** button to set your select. The text data will be read and the main panel updated when you select the **Finish** button.

Set button
creates/updates the Title block ppf file and *.tft file.

Notes:

Short-cuts:

*.als and *.tft files can be copied, renamed and then edited using the Title Block Edit Panel or your own text editor.

Alias files (*.als) are kept in the same folder as the your title files. Once you have one alias file set up copy the alias file and rename the copy the same name as the title file but add the additional extension .als. For example:

```
title file    4d_drainage_long_section_a1.tf
alias file    4d_drainage_long_section_a1.tf.als
```

CAUTION: The *user_text_n* variables should represent the same data in both title files. For example *user_text_1* should be the main title in both files.

Title file text files (*.tft see advanced) files are kept in the same folder as the your Title block ppf. If you choose not to share a tft between Title block ppf files you can simply copy and rename them. Once you have saved one *.tft file, copy the file and rename the copy the same name as the title block pp file but add the additional extension .tft

```
Title Block ppf file    drawing 1.ppf
title file text file drawing 1.ppf.tft
```

Title Block ppf

The title block ppf file does not contain any data itself. Rather it references a *.tft file containing the text data and your base ppf file (file containing all of your default plot parameters). An example ppf file follows:

The Title Block ppf file is a ppf file with the Base ppf and user text values (in the tft file) referenced by #include statements.

```
#define ALIAS 1
section_long_plot "plot 2" {
// TITLE BLOCK PPF FILE
#include "Base_ljg.ppf"
#include "Title_block.ppf.tft"
}
```

Base ppf

The Base ppf can be anywhere including local, Library and User Library. It must contain a reference to a title file in the *use_title_file* parameter. The *user_title_file* parameter must be in the file and can't be in an #include file.

The following is an example title file reference.

```
use_title_file    yes
title_file        "your title file.tf "
```

Note: If you already have user_text variables defined in your Base ppf these values will not be used and a warning message will be issued at plot time. It is best to remove all user_text variables from your existing ppfs before attempting to use them with this new 4d facility.

The panel scans the title file reference and records all of the *user_text_n* entries that are used. **Only those used are displayed in the panel.** Next a file with the (is located. If found the alias values are used in the panel instead of *\$user_text_1*, *\$user_text_2* etc.

If an alias file (same name as the title file PLUS the extension .als) has been previously created using the Alias button, the aliases for the user_text's are used on the left hand side of the panel. If an alias file has not been found, they can be created by simply selecting the Alias button.

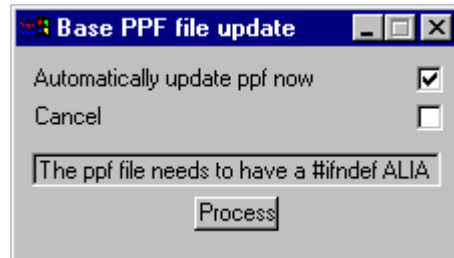

The Base ppf is also checked to see if a

```
#ifndef ALIAS
```

```
and
```

```
#endif
```

exist around the opening "xxxxxxx {" and closing "}" braces. If not, a Base PPF file update panel is displayed.

Select *Automatically update ppf now* and select the Process button. The extra lines then are added to the Base ppf.

For example, the beginning and end of the updated file will look like:

BEGINNING

```
#ifndef ALIAS
```

```
section_long_plot "plot 2" {
```

```
#endif
```

END

```
#ifndef ALIAS
```

```
}
```

```
#endif
```

Clicking on the Alias button brings up the Set Aliases panel. Simply fill in the names to use instead of the words \$user_texts_n in the Title Block - User Text Data Editor panel. Selecting Set writes out an aliases file which has the same names as the title file but with the appended ending .als.

Set

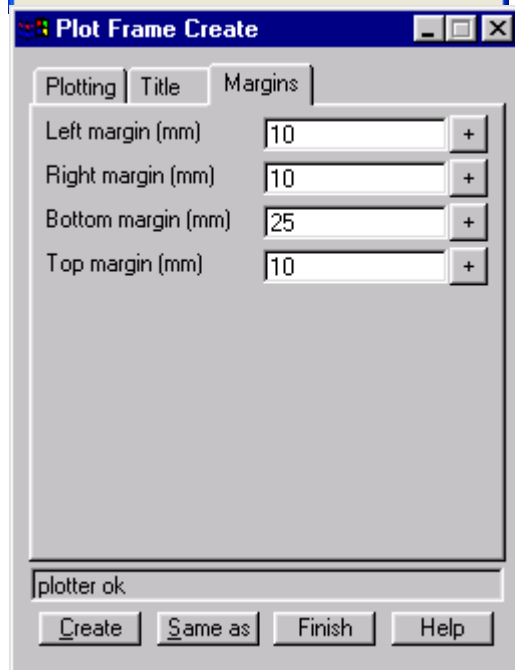

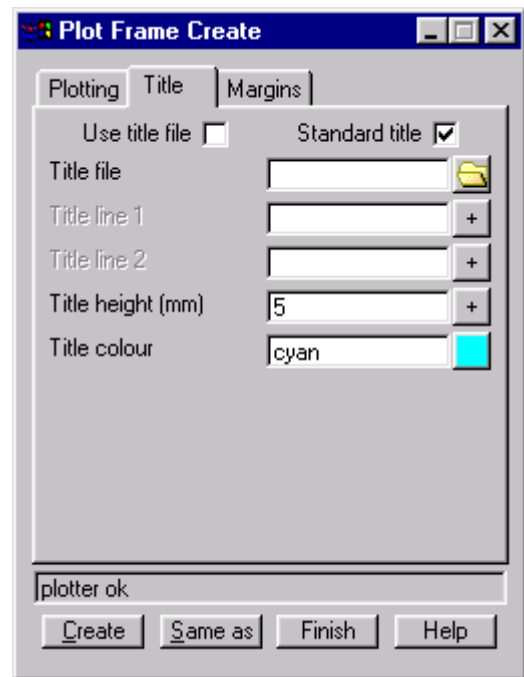

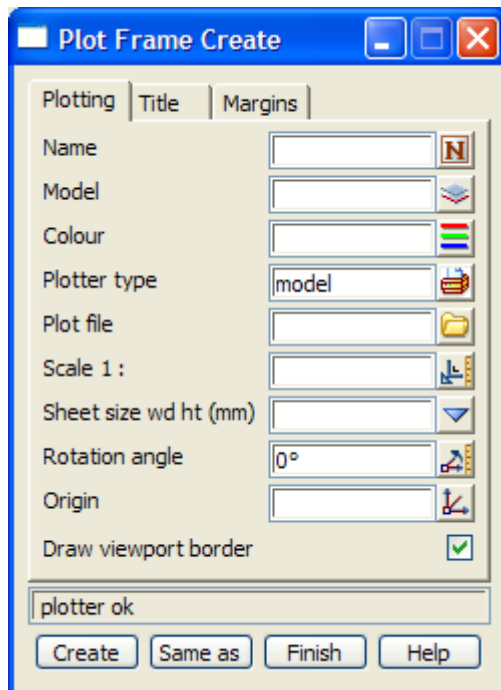

After selecting Set, the values for the user_texts are written to a file specified under **Advanced** (if used) or of the same name as the Title block ppf but with .tft appended.

Create Old Plot Frame

[plot_frame_create](#) [plot_frame_title](#) [plot_frame_margins](#)

Position of option on menu: Plot =>Old plotting =>Create plot frame

On selecting the Create old option, the **plot frame create** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>name for the plot frame.</i>	input		
Model	input		available model

the model for the plot frame.

Colour	input		available colours
	<i>the colour for the plot frame.</i>		
Plotter type	input	hp	hp, dxf, dwg, postscript etc.
	<i>format for the plot file.</i>		
Plot file	input		*.hp etc.
	<i>name of the file to write the plot of the plot frame to.</i>		
Scale 1:	input		
	<i>scale for the plot.</i>		
Sheet size wd ht (mm)	input		
	<i>the width and height values (separated by spaces) or the name of a user defined sheet size.</i>		
Rotation angle	input	0	
	<i>angle of rotation for the plot frame.</i>		
Origin	input		xyz ops menu
	<i>x_origin y_origin z_origin</i>		
	<i>origin (in world units) for the corner of the plot frame - given as three values separated by spaces. The values can either be typed in, or selected by clicking LB in the origin panel view and getting up the xyz ops menu and selecting the pick xyz option.</i>		
Draw viewport border	tick-cross	tick	
	<i>if tick, plot the box around the plotting area (viewport).</i>		
Create	button		
	<i>create the plot frame and then put up the plot frame edit panel for the created plot frame.</i>		
Same as	button		
	<i>after picking the same as button, an existing plot frame is selected and its information is used to fill in the above panel fields.</i>		

Title tab

Use title file	tick-cross		
	<i>if tick, use the file given in the title file field to generate a title block.</i>		
Standard Title	tick-cross	tick	
	<i>if tick, plot the standard 12d Model title block with the text, height and colour given in the following panel fields.</i>		
Title line 1/2	input		
	<i>first/second line of title information in the 12d titleblock or for the user defined title block.</i>		
Title height (mm)	input	10	
	<i>height (in millimetres) to draw the two lines of title information in the 12d titleblock.</i>		
Title colour	input	cyan	available colours
	<i>colour used for the border and the title information in the 12d titleblock.</i>		

Title tab

Left/right margin (mm)	10.0		
	<i>the left/right hand side margin between the sheet and the plotting area inside the sheet.</i>		
Bottom/top margin (mm)	10.0		

the bottom/top margin between the sheet and the plotting area inside the sheet.

How To Use the Option

The plot frame contains all the information required to define the physical area in real world units to be plotted, the position on the sheet of the area being plotted, the plotter type and the plot file name.

Once the frame is created, the **plot frame edit** panel for the created plot frame is automatically placed on the screen so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

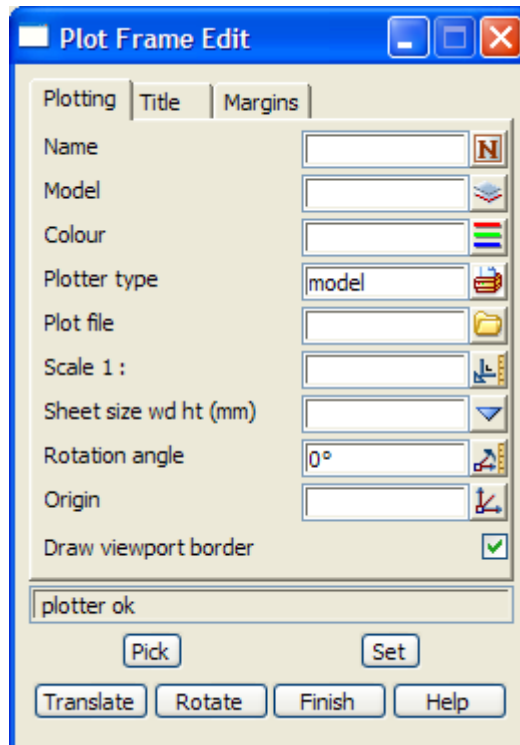

Editor Old Pot Frame

plot_frame_edit

Position of option on menu: Plot =>Old plotting =>Editor plot frame

The plot frame editor is used to edit existing plot frames. It is automatically placed on the screen when a plot frame is created so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

On selecting the Editor old option, the **plot frame edit** panel is displayed.

Most of the fields and buttons used in this panel are the same as the **plot frame create** panel - see the previous section "Create Old Plot Frame". The different ones are

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick	button		
-------------	--------	--	--

select the plot frame to be edited.

Set	button		
------------	--------	--	--

update the plot frame with the information in the above panel fields.

Translate	button		
------------------	--------	--	--

*after picking the **translate** button, the plot frame will move with the cursor until a point is selected to give the final position of the plot frame.*

Rotate	button		
---------------	--------	--	--

*after picking the **rotate** button, the plot frame is further rotated around the left hand corner of the sheet, by the angle made between the rotation point and the current cursor position. The plot frame will continue to rotate until a point is selected to fix the rotation angle.*

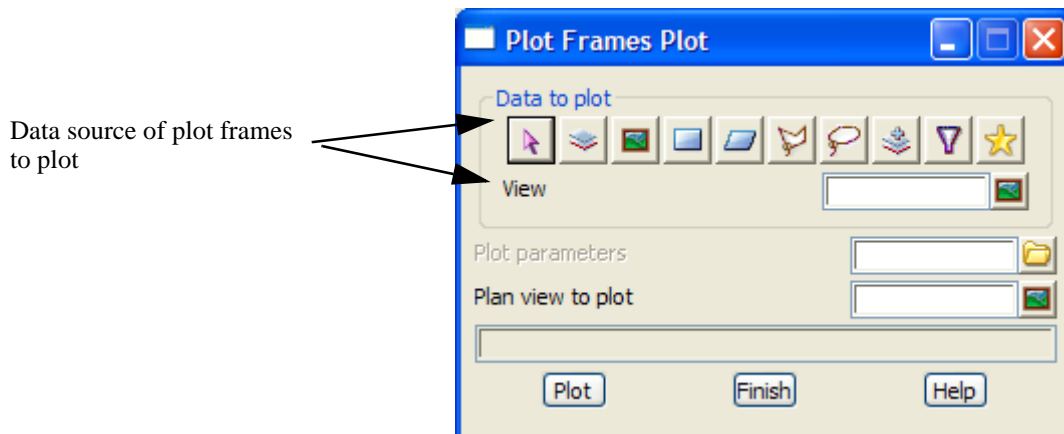

Plotting Old Plot Frames

plot_frames_plot

Position of option on menu: Plot =>Old plotting =>Plot plot frame

The plot old option is used to make a plot of the data on a given plan view for all the selected plot frames (selected by the data source). Note that the plots are of a given plan view and the plot frames do not have to be on the plan view.

On selecting the plot old option, the **plot frames plot** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data to plot	Data source type			
Plot parameters	input			*.ppf files
Plan view to plot	input			available views
Plot	button			

Data to plot - Data source type

data source type.

Data source

when the plot button is selected, all the plot frames in the data source will be plotted.

Plot parameters

input

*.ppf files

file of plot parameters to be used for the plot frames.

For more information on the plot frame plot parameters, please go to the section "Plot Frame Plot Parameter File" in the Appendix "Plot Parameters"

Plan view to plot

input

available views

*the name of the view that is plotted when the plot frames are selected for plotting. Note that the plot frames **do not** have to be on the view.*

Plot

button

when the plot buttons is selected, all the plot frames in the data source field will be plotted.

Pen Mapping Old

colours_to_pens

Position of option on menu:

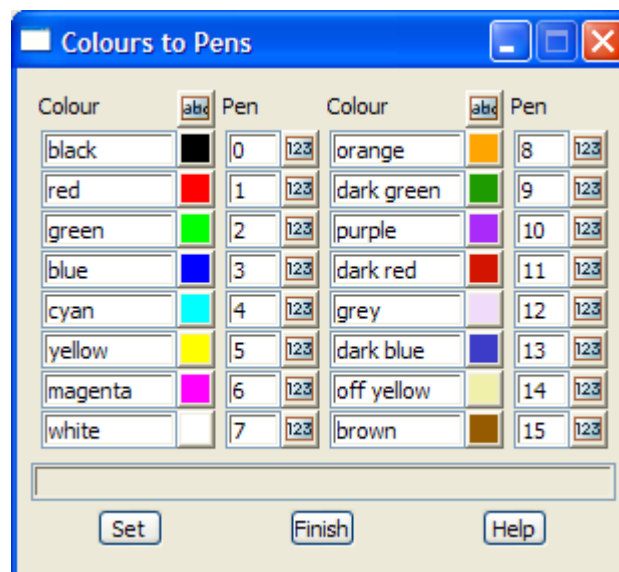

NO LONGER USED

Although 12d Model uses up to 10,240 different colours, most plotters have a smaller number of pens. Consequently for any plot, it is necessary to define what pen number corresponds to each 12d Model colour.

For all plotters types except Eagle, the pen mapping option can be used to define the correspondence between 12d Model colours and plotter pens for the first sixteen colours. The other colours are given in the colour_map.def file. For Eagle plots, the **eagleplt.pmf** file is used to map colours to pens.

The pen mapping option is only used if a plotter mapping is not being used (see next section).

On selecting the pen mapping option, the current pen mapping table is displayed in the **colours to pens** panel.

When starting a new project or entering an existing project, the default pen mapping table is defined by the **colours.4d** file.

Once inside the project, any pen number in the table can be modified by changing the appropriate pen field and then selecting the **set** button. The modified table is stored until 12d Model is quit or the user changes to another project.

The pen mappings for colours above sixteen are given in the **colours.4d** file but can not be displayed or modified by the **colour to pens** panel.

Whenever a plot is created using non-eagle plotter types, the colours are mapped to the pen numbers given in the **colours to pen** table before writing out the plot file.

For Eagle plots, the **eagleplt.pmf** file is used to map colours to pens.

Note - when 12d Model is started up again or the user changes to a new project, the table reverts to its default settings as given in the **colours.4d** file.

24 PPF Editors

Title Blocks

Title blocks used for plots generated by plot frames, long sections, cross sections, pipe line and drainage can be defined by the user.

A user defined title block is build up from lines, circles, arcs and text. The format of the commands to draw these objects is the same as the draw_commands for user defined linestyles given in the Appendix.

For the purpose of defining a title block, all plots are considered to have the **origin** (0,0) in the bottom left hand corner (i.e. the plot is in the positive quadrant only) and the *units* used in the title block drawing commands are **millimetres**.

The title block drawing commands are placed in a file with ending **.tf**

Inside the file, the set of all title block drawing commands is enclosed within a set of curly brackets { } with the header

```
linestyle title_block
```

before the curly brackets.

That is,

```
linestyle title_block {
    title block drawing commands
    one command per line
}
```

Title Block Variables

For title blocks, the text drawing command has been extended so that special information such as the current date and time, plotting scales etc. can be automatically inserted into the title block.

To achieve this, special **title block variables** have been defined and wherever these variables appear in a title block text command, they are expanded to their defined value.

Hence the title block variables are simply place markers which have text values substituted for them when the title block file is used.

The title block variables all begin with a \$ and are followed by either another title block variable or a single space. For example

```
text "text $variable more text" angle height justification textstyle
```

or

```
text "text $variable_1$variable_2 more text" angle height justification textstyle
```

Note - xfactor, slant, offset_width and offset_height can also be given by using:

```
text text angle height "justification" textstyle xfactor slant offset_width offset_height
```

The title block variables which don't involve plot parameters are:

```
$project // the current project
$plot_file // the current plot file
$scale // for plot frames, the current scale
$horizontal_scale // for section plots, the current horizontal scale
$vertical_scale // for section plots, the current vertical scale
$start_chainage // for section plots, the start chainage for the plot
// sheet
$end_chainage // for section plots, the end chainage of the plot sheet
```

The following title block variables take values which are passed down from the **plot parameter file** for the plot (plot parameter files are described in more detail in the rest of this manual):

\$time

The current date and time. The format for the date and time is given by the plot parameter `time_format`. See the next section for the description of the format.

\$title_1, \$title_2

`$title_1` takes the value from the panel field title line 1 from the **section x plot title**, **section long plot title** or **plot frame title** panels, or from the parameter `title_1` in the plot parameter file. If `title_1` doesn't exist, then `$title_1` is blank.

Similarly for `$title_2`.

\$user_text_n where n=1,2,... 1000

`$user_text_n` takes the value of the parameter `user_text_n` in the plot parameter file. If `user_text_n` doesn't exist, then `$user_text_n` is blank.

Aliases can also be defined for the `$user_text_n` which are used in the PPF editors. See the next section on aliases.

\$page_number

`$page_number` has the starting value one, or the value given by the parameter **start_page_number** from the plot parameter file, and is incremented by one, for each plot produced by the plot option (for example, for each page of a long section plot, for each page of x-section plots or each plot generated from a model of plot frames).

\$drawing_number_prefix, \$drawing_number, \$drawing_number_postfix

The values for `$drawing_number_prefix` and `$drawing_number_postfix` are passed down from the plot parameter file by the parameters **drawing_number_prefix** and **drawing_number_postfix** respectively.

`$drawing_number` has the starting value one, or the value given by the parameter **start_drawing_number** from the plot parameter file, and is incremented by one for each plot produced by the plot option (for example, for each page of a long section plot, for each page of x-section plots or each plot generated from a model of plot frames).

Notes

1. For plot frames, the `horizontal_scale` and `vertical_scale` are given the current scale, and `$start_chainage` and `$end_chainage` are ignored.
2. For section plots, `$scale` is ignored.

Aliases for \$User Text

12d Model user defined title blocks can include up to 1,000 markers for placing *user defined text* (`$user_text_n` where n can be from 1 to 1000) which is only substituted for actual text at plotting time. Because of the difficulty of knowing exactly what *\$user_text_n* stood for when the title block is being plotted, the concept of aliases has been introduced.

For example, instead of referring to `$user_text_4`, an alias can be defined to use the text "Engineers name:" instead.

The definition of `$user_text_n` in a title block file has been **extended** so that it also includes any **alias** for the `$user_text_n`.

To define an alias for the `$user_text_n` in the title block file, simply replace the

`"_n"` by `"<n,text for the alias>"`

For example, if `$user_text_1` is to have the alias "Engineers name", the title block file would now

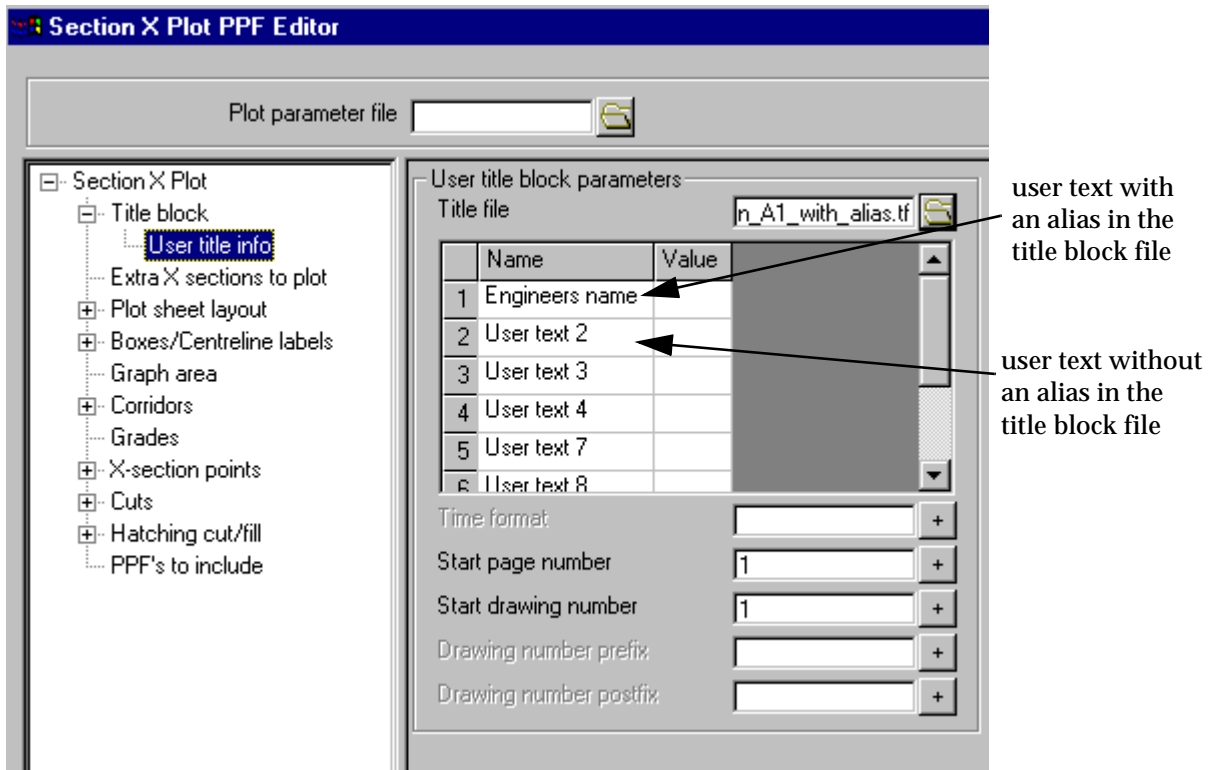

contain:

```
text "$user_text<1,Engineers name:>" 0.000000 2.500 "bottom-left" "1" 1.000 0.000000 0.0 0.0
```

The title file and aliases work seamlessly with the interactive PPF editors and Plotters (which are described in their own sections). In the *Title block* section of the interactive PPF editors and Plotters, the user defined title block file is *scanned* for any *\$user_text* in it and it is presented as a grid containing all the *\$user_text*'s in the title block with a column to fill in the values that the user wants to be plotted.

If the format *\$user_text_n* is in the title block file, it is displayed as "User text n" in the PPF editor. If an *alias* exists, then the *alias* is displayed instead of "User text n".

For example, using the *\$user_text<1,Engineers name>* in a title block file will give:

Values Used for Defaults when Creating Plot Frames

There are special parameters that are written as comments at the top of title block file that are used as defaults for fields in the option *Plots=>Plot frames=>Create new*. They are

```
// plot_frame_name          text
// plot_frame_model        text
// plot_frame_colour       text
// plot_frame_scale        real_number
// plot_frame_sheet_size   text
// plot_frame_angle        real_number
// plot_frame_left_margin  real_number
// plot_frame_right_margin real_number
// plot_frame_top_margin   real_number
// plot_frame_bottom_margin real_number
// plot_frame_viewport     logical (yes or no)
```

Specifying the Format for \$time

The format for \$time is passed down by the plot parameter **time_format**.

```
time_format          format          // format for $time
```

The format consists of one or more codes and the formatting codes are preceded by a percent sign (%). Characters that do not begin with a % are copied unchanged.

%a	abbreviated weekday name
%A	full weekday name
%b	abbreviated month name
%B	full month name
%c	date and time representation for locale
%d	day of month as decimal number (01 - 31)
%H	hour in 24-hour format (00 - 23)
%I	hour in 12-hour format (01 - 12)
%j	day of year as decimal number (001 - 366)
%m	month as decimal number (01 - 12)
%M	minute as decimal number (00 - 59)
%p	current locale's A.M./P.M. indicator for 12-hour clock
%S	second as decimal number (00 - 59)
%U	week of year as decimal number, with Sunday as first day of week (00 - 51)
%w	weekday as decimal number (0 - 6; Sunday is 0)
%W	week of year as decimal number, with Monday as first day of week (00 - 51)
%x	date representation for current locale
%X	time representation for current locale
%y	year without century, as decimal number (00 - 99)
%Y	year with century, as decimal number
%z, %Z	time-zone name or abbreviation; no characters if time zone is unknown
%%	percent sign

The # flag may prefix any formatting code and the meaning of the format code is changed as follows

Format Code	Meaning
%%#c	long date and time representation, appropriate for current locale. For example, "Tuesday, March 16, 1993,12:41:29"
%%#x	long date, appropriate for current locale. For example, "Tuesday, March 16"
%%#d, %%#H, %%#I, %%#, %%#m, %%#M, %%#S, %%#U, %%#W, %%#y, %%#Y	Remove leading zeros (if any).
%%#a, %%#A, %%#b, %%#B, %%#p, %%#X, %%#z, %%#Z, %%#%	# flag is ignored

Examples

The format to give the date in the form dd/mm/yy (06/09/97) is

“%d/%m/%y”

If you want to remove leading zeros from the day and month (6/9/97)

“%#d/%#m/%y”

Example of a Title Block File

```
// Information used for creating plot frames
// plot_frame_name "plot 17"
// plot_frame_model "plot frames"
// plot_frame_colour "green"
// plot_frame_scale 500.000
// plot_frame_sheet_size "A1"
// plot_frame_angle 0.000
// plot_frame_left_margin 10.000
// plot_frame_right_margin 20.000
// plot_frame_top_margin 50.000
// plot_frame_bottom_margin 100.000
// plot_frame_viewport yes
//
// Drawing the title block

X Plot PPF Editor

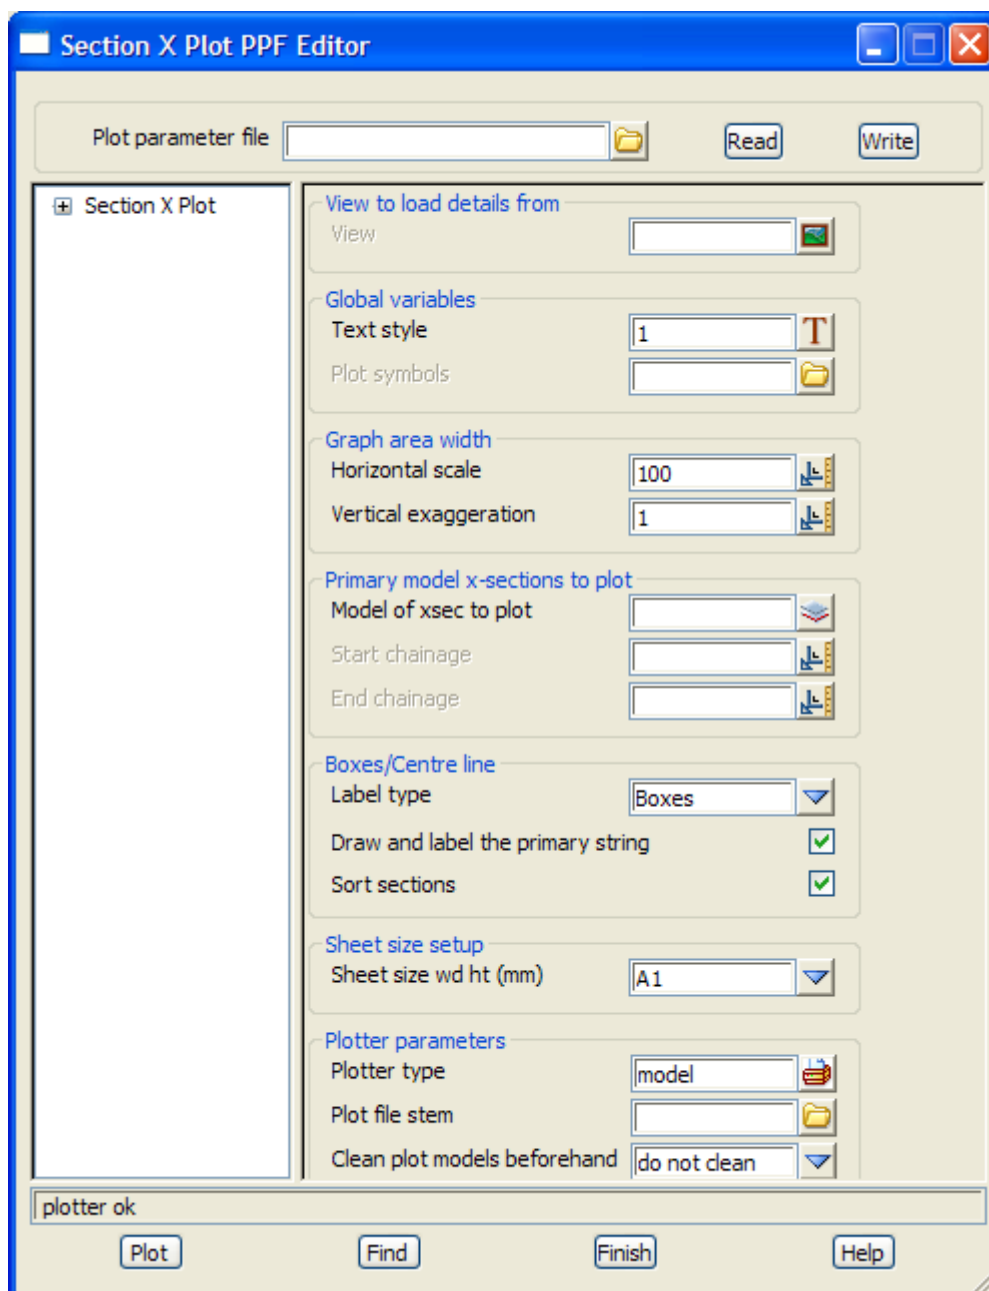

section_x_plot_ppf_editor

Position of option on menu: Plot =>X Plot PPF Editor

The **x section ppf editor** is for creating and/or editing a (binary) x-section ppf file and for creating a cross section plot.

Note: binary ppf's are stored *within* the project (not in the folder containing the project as the ascii ppf's were).

On selecting the X plot ppf editor option, the **Section X Plot PPF Editor** panel is displayed.

Panel field

Type

Plot parameter file

file box

name for the binary plot parameter file to read in or write out.

Read button

read the given plot parameter file in.

Write button

write out the plot parameters to the given plot parameter file. An ascii ppf file is also written out.

Plot button

use the plot parameters from the panel to create the plot.

Find button

brings up a search box. If a valid parameter name is keyed in followed by the enter key, the cursor will be placed in the appropriate field on the appropriate page.

Section X Plot

Section_X_Plot

Section X Plot

Section: View to load details from

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

View		section view box	
-------------	--	------------------	--

on selection of an existing section view, the vertical exaggeration, model of x-sections to plot, corridor model and corridor settings from the section view are loaded into the ppf editor.

Section: Global Variables

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Text style	global_textstyle	text box	
-------------------	------------------	----------	--

default text style

Plot Symbols	plot_symbols	file box	
---------------------	--------------	----------	--

specify a plot symbol file if it exists.

Section: Global Area Width

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Horizontal Scale	scale	input	
-------------------------	-------	-------	--

horizontal scale to be used for X section plots

Vertical exaggeration	vertical_exaggeration	input	
------------------------------	-----------------------	-------	--

vertical scale to be used for X section plots

Section: Primary Model X-Sections To Plot

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Model of xsec to plot <i>model of X sections to plot</i>	model_to_plot	model box	
Start chainage <i>start chainage of X sections to plot</i>	start_chainage	input	
End chainage <i>start chainage of X sections to plot</i>	end_chainage	input	

Section: Boxes/Centre lines

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Label type <i>the label type to be used for plotting.</i>	label_type	choice box	centre line boxes

Draw and label the primary string

	primary_string	tick box	
<i>if ticked, the primary string will be labelled and drawn.</i>			

Sort sections <i>if ticked, the X sections will be sorted in increasing chainage. This is important if individual cross sections are added after an apply function for example.</i>	sort_sections	tick box	
---	---------------	----------	--

Section: Sheet Size Setup

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Sheet size wd ht (mm) <i>a valid sheet size is selected.</i>	sheet_size	sheet size box	

Section: Plotter parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Plotter type <i>a valid plotting option is selected.</i>	plotter_type	plotter box	
Plot file stem <i>plot file name. The appropriate extension is added dependant on the plotter type selected.</i>	plot_stem	plotter box	
Clean plot models beforehand	plot_model_clean	choice box	do not clean prompt for clean

always clean

whether to clean (delete the elements in) any resultant plot models that may already exist, before generating the plot(s). This parameter is only applicable if plotting to a model or models. Note that if the models are cleaned using this parameter, any non-plot or locked elements found in the models will not be cleaned from the models, and the plot job will be cancelled.

Title Block

Section_X_Plot_Title_block

Common title block parameters

Panel field	Parameter name	Type
Standard title	plot_border	tick box
		<i>if ticked, a standard 12d title block will be used.</i>
Use title file	use_title_file	tick box
		<i>if ticked, a user defined title file is used.</i>
Title line 1	title_1	input
		<i>if Standard title is ticked, Title line 1 is the first line of title text. If Use title file is ticked, Title line 1 is substituted for the title block variable \$title_1.</i>
Title line 2	title_2	input
		<i>if Standard title is ticked, Title line 2 is the second line of title text. If Use title file is ticked, Title line 2 is substituted for the title block variable \$title_2.</i>

12d default title block parameters

Panel field	Parameter name	Type	Pop-Up
Text size	title_text_size	input	
		<i>text size of title text.</i>	
Text colour	title_colour	colour	available colours
		<i>colour of title text.</i>	

Section_X_Plot_Title_block_User_title_info

User title info

The parameters shown below are subject to the appropriate title block variables existing in the title file. For more information on these variables see the section "Title Block Variables".

Panel field	Parameter name	Type	Pop-Up
Title file	title_file	file box	available title files
		<i>specifies the name of the title file to use. If a valid title file exists, the specified Name values will be filled out in the grid using the title block variable \$user_text_n.</i>	
Name		output	
		<i>the alias for the nth user text specified in the title file.</i>	
Value	user_text_n	input	
		<i>the alias text to be substituted in for the user text specified.</i>	
Time format	time_format	input	
		<i>the time format relates to the \$time title block variable. For more information on the time formats see the section "Specifying the Format for \$time".</i>	

Start page number	start_page_number	input
<i>used as the starting value for the title block variable \$page_number. If missing, \$page_number starts at 1.</i>		
Start drawing number	start_drawing_number	input
<i>used as the starting value for the title block variable \$drawing_number. If missing, \$drawing_number starts at 1.</i>		
Drawing number prefix	drawing_number_prefix	input
<i>the value entered is used for the title block variable \$drawing_number_prefix.</i>		
Drawing number postfix	drawing_number_postfix	input
<i>the value entered is used for the title block variable \$drawing_number_postfix.</i>		

Extra X Sections To Plot

Section_X_Plot_Extra_X_sections_to_plot

Extra X Sections To plot

Section: Extra Models of X-Sections To Plot

The order and centreline chainages of the x-section subplots for the x-section plot are defined by the sections from the primary model of cross sections.

The sections through any specified triangulations and service models, and offsets for labelling are fully defined by these primary x-sections.

However it is also possible to plot extra x-sections on each of the sub-plots by supplying extra models of x-sections which are at the same plan positions as the primary x-section strings.

Only those x-sections from the extra models that are within a user specified tolerance of a primary x-section are plotted.

The extra models of x-sections and the plan tolerance for checking that the extra cross-sections are the same position as the primary x-sections are

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Model tolerance	extra_model_tolerance_1	input	
<i>user defined distance</i>			
Model name	extra_model_n	input	
<i>extra models of x-sections to plot.</i>			

Plot Sheet Layout

Section_X_Plot_Plot_sheet_layout

X-sections are normally generated at chainages along a given centreline. This centreline chainage is stored with each x-section string.

The chainages of the actual x-sections are referred to as **offsets** from the centreline position rather than x-section chainages. The offsets of the x-section are set up so that the zero offset occurs where the x-section crossed the centreline string.

The x-sections along the centreline are stored in the one model (the primary model) which is then used to generate the cross section plot.

The x-sections are plotted in the order they occur in the x-section model and start being plotted at the bottom left hand corner of the sheet (left_margin,bottom_margin).

The individual x-section plots are then drawn going up the column, and when the column is full, start from the bottom of the next column.

When a sheet is full, a follow on sheet is created.

Each x-section from the primary model of x-sections generates its own sub-plot for which the x-section is the primary string. Hence the cross section plot consists of many individual plots drawn on one or more plot sheets.

Each plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

Plot Sheet Layout

Section: Plot Width Parameters

The width of the plot can be a fixed distance left or right of the centre line (zero offset) or for the full section plus an extra left and right distance:

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Absolute extensions	absolute_extensions	tick box	

if ticked, the section goes from the left_extension offset on the left to the right_extension offset on the right. If unticked the section goes for the entire section length plus the left and right extension distances.

Left extension	left_extension	input	
-----------------------	----------------	-------	--

The left_extension value in world units.

Right extension	right_extension	input	
------------------------	-----------------	-------	--

The right_extension value in world units

Section: Align Section Parameters

If required, all the sub-plots in a column can be automatically positioned so that the zero offsets (the centrelines) of each x-section line up.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Line up centrelines	line_up_cl	tick box	

if ticked, each sub plot will be aligned on the plot using the centreline of each x section.

Section_X_Plot_Plot_sheet_layout_Margins

Margins

Section: Margins For Standard 12d Title File - Border gaps

If the *default 12d title block* is used, then the size of the bottom of title block depends on the text size. The following parameters are used in the default title block case and the *bottom_border_gap* is added to the calculated height of the bottom of the title block.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Left (mm) <i>left border gap (in millimetres).</i>	left_border_gap	input	
Right (mm) <i>right border gap (in millimetres).</i>	right_border_gap	input	
Top (mm) <i>top border gap (in millimetres).</i>	top_border_gap	input	
Bottom (mm) <i>bottom border gap (in millimetres).</i>	bottom_border_gap	input	

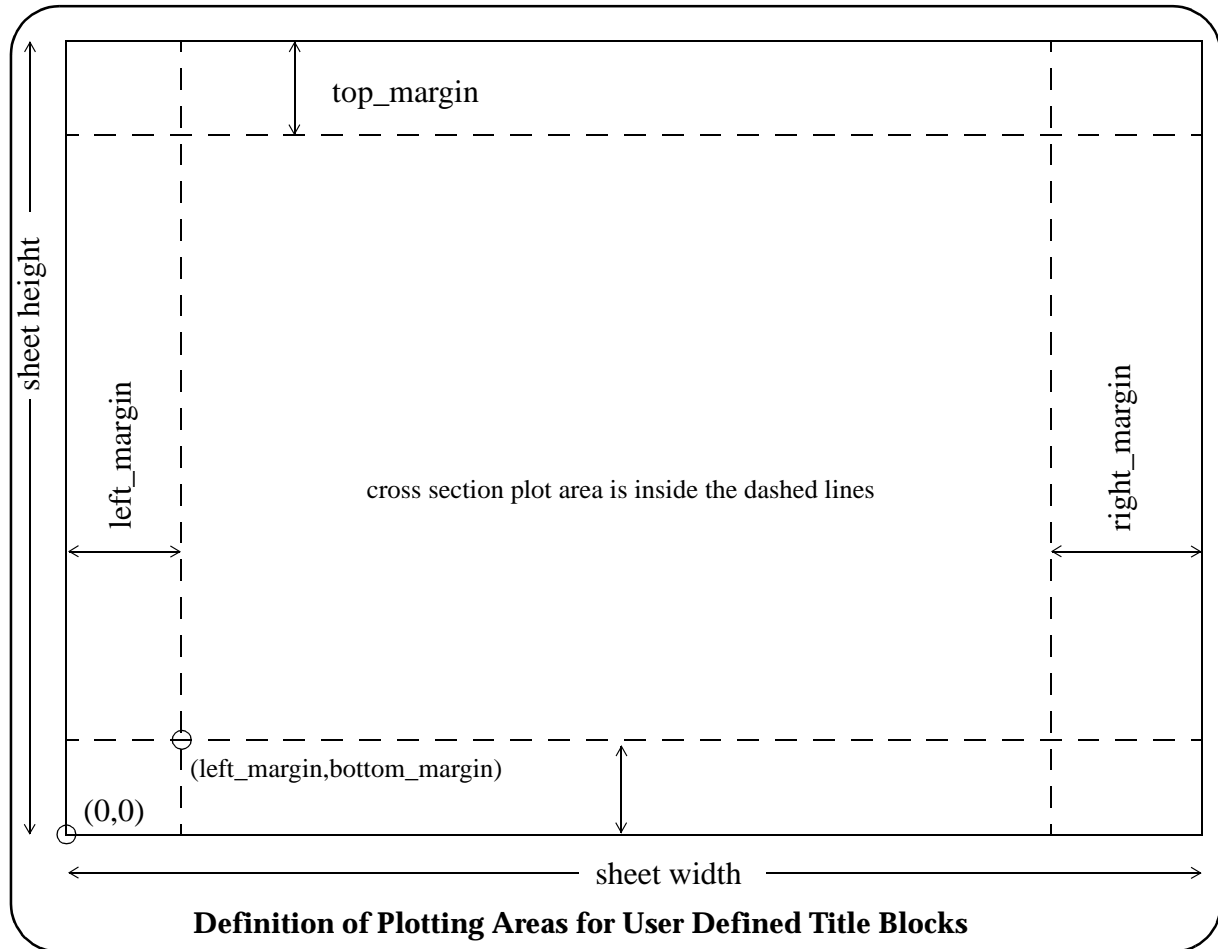

Section: Margins For User Title File

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Left (mm) <i>left margin (in millimetres).</i>	left_margin	input	
Right (mm) <i>right margin (in millimetres).</i>	right_margin	input	
Top (mm) <i>top margin (in millimetres).</i>	top_margin	input	
Bottom (mm) <i>bottom margin (in millimetres).</i>	bottom_margin	input	

Because the user can easily select from the plotting panel whether a User Defined Title Block or the default 12d title block is used, both sets of margin and gap parameters can exist in the one plot parameter file.

The x-sections are plotted in the order they occur in the x-section model and start being plotted at the bottom left hand corner of the cross section plotting area.

The individual x-section plots are then drawn going up the column, and when the column is full, start from the bottom of the next column.

When a sheet is full, a follow on sheet is created.

Section_X_Plot_Plot_sheet_layout_Sub_plot_gaps

Sub Plot Gaps

Section: Sub Plot Gaps Parameters

The gaps between the sub plots is restricted to those specified below.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Left (mm) <i>left margin (in millimetres).</i>	left_sub_plot_gap	input	
Right (mm)	right_sub_plot_gap	input	

right margin (in millimetres).

Top (mm) top_sub_plot_gap input

top margin (in millimetres).

Bottom (mm) bottom_sub_plot_gap input

bottom margin (in millimetres).

The x-section sub-plot itself consists of the three regions - boxes, datum and graph.

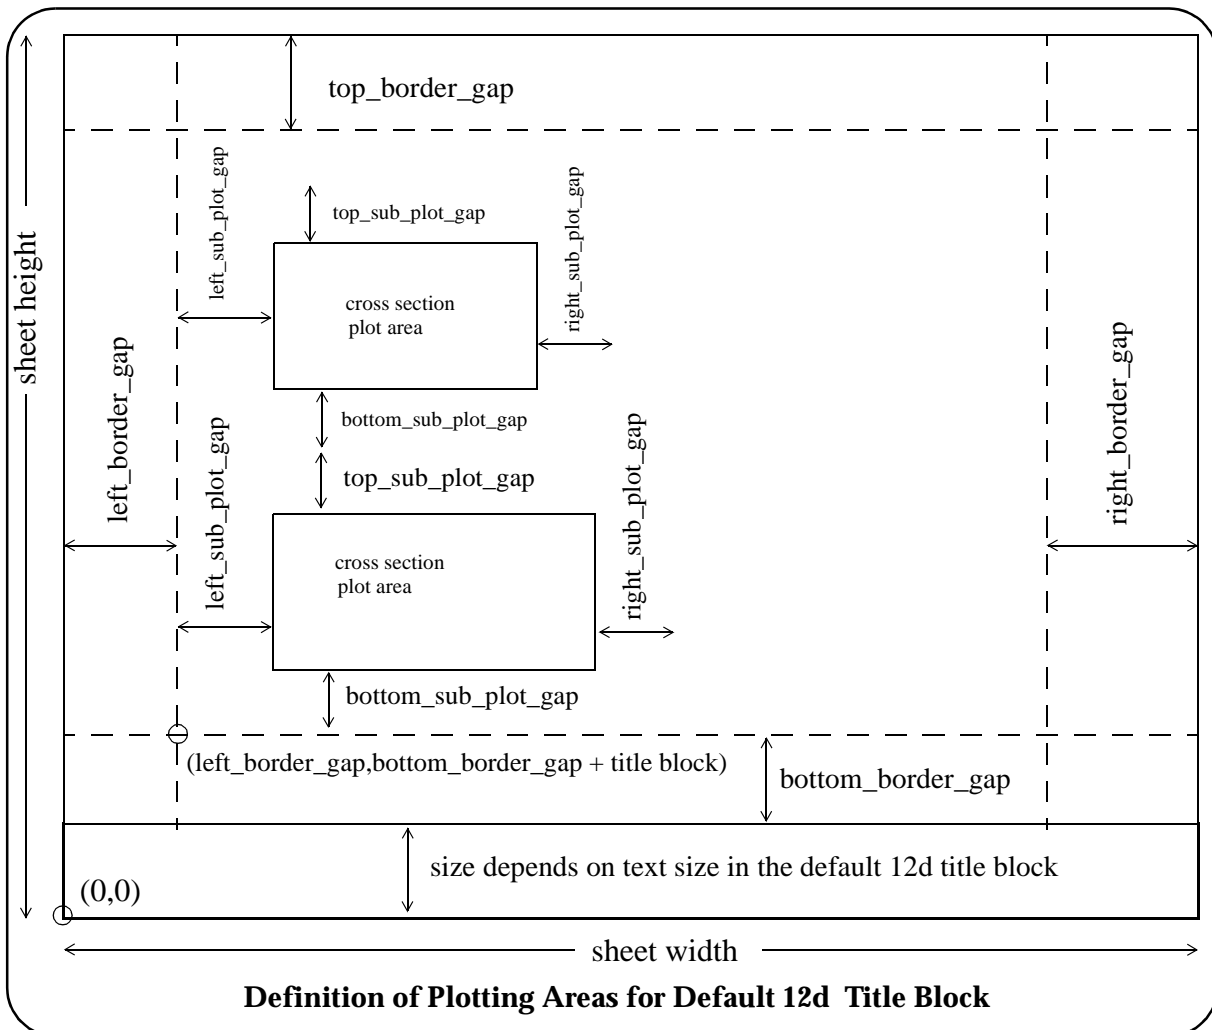

The **boxes area** is where the offset values and the heights for the strings drawn on the x-section plot are labelled.

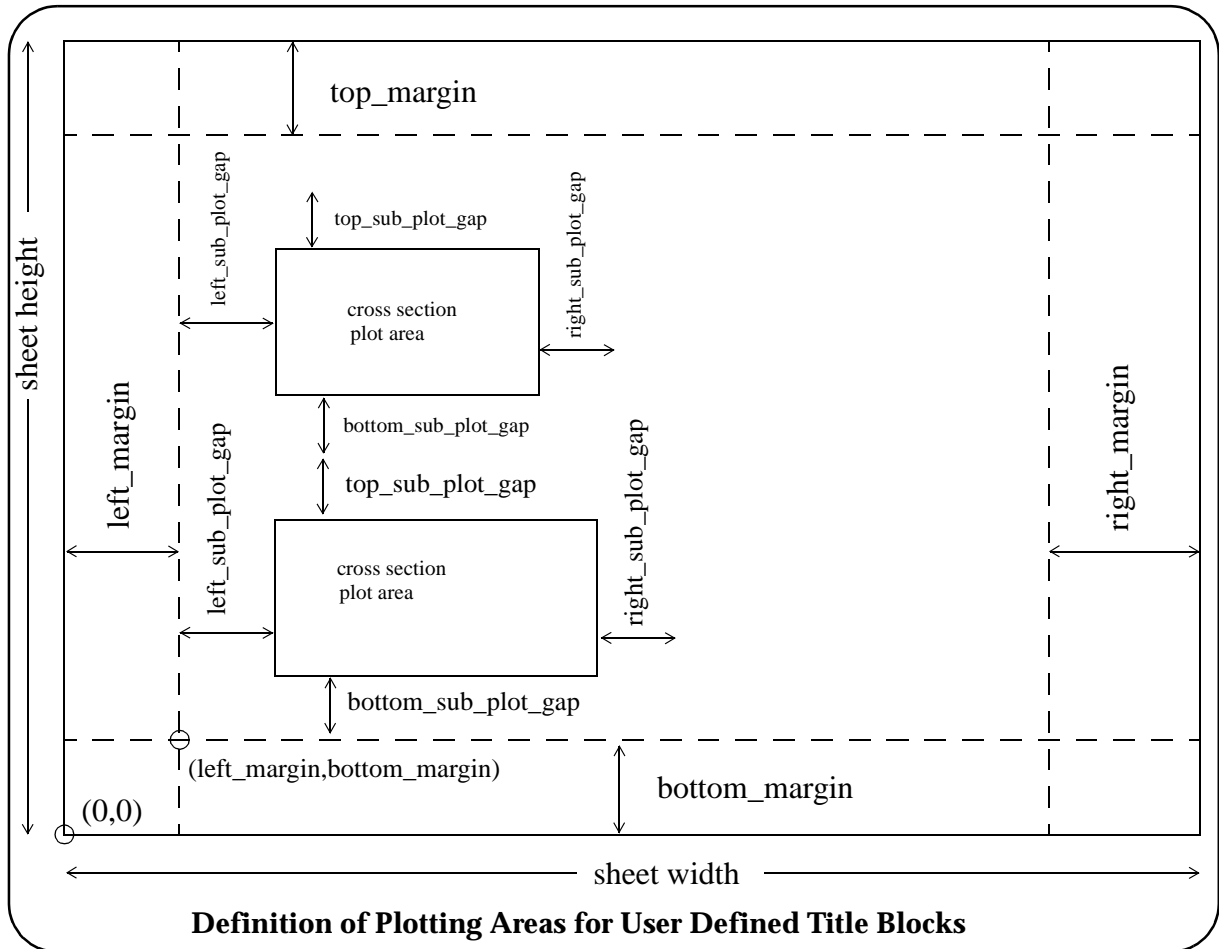

The **datum area** is the region between the boxes area and the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.

Apart from information labelled in the boxes area, the x-section sub-plot can label other information such as

- (a) grades across the x-section
- (b) points across the x- section
- (c) cuts the x-section makes through strings
- (d) cut and fill areas

Please continue to the next section “Boxes/ Centreline Labels” .

Boxes/ Centreline Labels

Section_X_Plot_Boxes_Centreline_labels

Boxes/ Centreline Labels

Section: Boxes or Centreline Labels

The x-section can be labelled with either

- an upright, and the offset and height value at the zero offset (normally the centre line position) - Centre line
- the heights of the x-section and the tins at all the x-section points. - Boxes

The choice is given by the parameter *label_type* defined in the section “Section: Boxes/Centre lines” .

A datum line exists for both cases.

For the boxes case, a box area for the offset and heights is created below the datum line. The available parameters for tailoring the box area will be given after describing the datum line parameters.

For the centre line case, the centre line and offset and height of the centre line are shown.

In both cases, the actual cross section plot is drawn above the datum line in the graph area.

Common Parameters

Section_X_Plot_Boxes_Centreline_labels_Common_parameters

The parameters defined below, are common to both label types

Common Parameters

Section: Common Datum Line Label Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Datum roundoff	datum_roundoff	input	

value to roundoff the datum value to e.g. 0.5, 0.2, 1.0 (default 1.0)

The roundoff for the datum value is specified by the user (default 1.0) and the datum is automatically calculated for each sub-plot, and labelled.

Datum places for datum	datum_decimals	input	
-------------------------------	----------------	-------	--

number of decimal places to display the datum value (default 1). If > 0, trailing zeros are removed after the decimal point. If < 0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed

Datum linestyle	datum_linestyle	linestyle box	
------------------------	-----------------	---------------	--

datum line linestyle (default solid)

Datum name	datum_name	input
	<i>text to write before the datum value</i>	
Datum textstyle	datum_textstyle	text box
	<i>textstyle for datum information</i>	
Datum text size (mm)	datum_text_size	input
	<i>size of datum text and value (mm)</i>	
Datum colour	datum_colour	colour box
	<i>colour of the datum text</i>	
Datum line colour	datum_line_colour	colour box
	<i>colour of the datum line</i>	

Section_X_Plot_Boxes_Centreline_labels_Common_parameters_Tins_to_label

Tins To Label

Section: Common Parameters for Tins To Label

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Define tin set #		input	
	<i>where n = 1 to.... The set enables the specification of a number of parameters for a number of specified tin names.</i>		
Tin name	tin_n_name	tin box	available tins
	<i>the name of the nth tin to be used for labelling.</i>		

If a tin of the name given by *tin_n_name* does not exist, then the plot is not produced and an error message is given.

Section_X_Plot_Boxes_Centreline_labels_Common_parameters_Centreline_chainage

Centreline Chainage

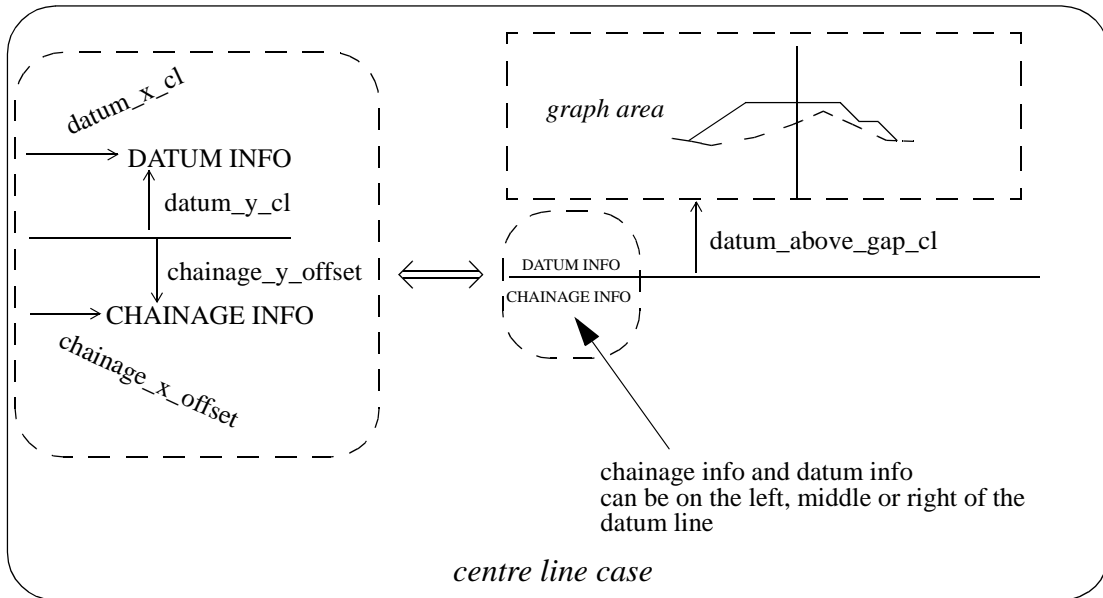

Section: Common Centreline Chainage Label Parameters

Each x-section sub-plot can be labelled with the centreline chainage of the x-section string.

This CHAINAGE INFO label is made up of the text strings:

"chainage_title" followed by the *chainage-value*

and is drawn under the datum line.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Label subplot with centreline chainage

	chainage_label	tick box	
--	----------------	----------	--

if ticked, label sub-plot with centreline

Chainage title	chainage_title	input	
-----------------------	----------------	-------	--

text before the chainage value

Chainage Decimal places	chainage_decimals	input	
--------------------------------	-------------------	-------	--

number of decimals in the chainage value. If <0, the absolute value is taken as the number of decimal places i.e. no trailing zeros are removed for the values in the chainage values.

Chainage colour	chainage_colour	colour box	
------------------------	-----------------	------------	--

colour of the text

Chainage text size (mm)	chainage_size	input	
--------------------------------	---------------	-------	--

size of the text

Chainage textstyle	chainage_textstyle	text box	
---------------------------	--------------------	----------	--

textstyle for the chainage label

Chainage text x position (mm)

	chainage_x_offset	input	
--	-------------------	-------	--

x position of text (mm)

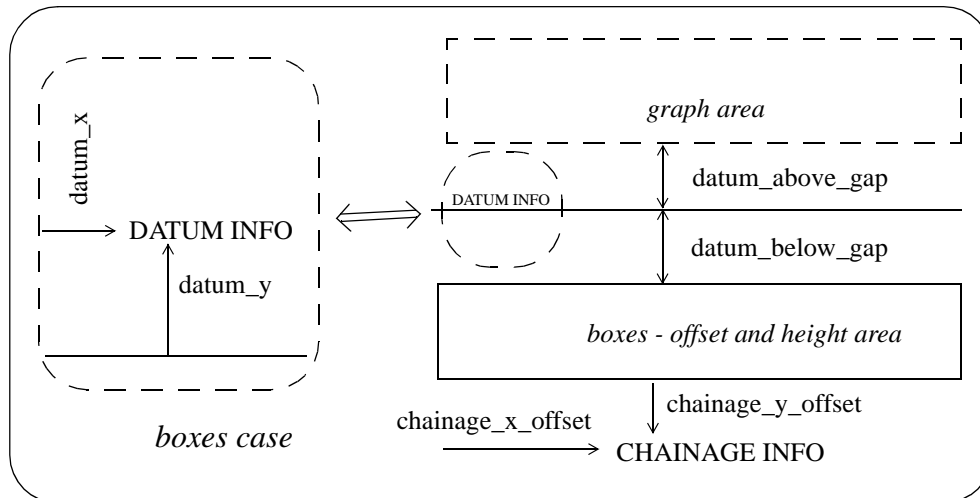

Chainage text y position (mm)

	chainage_y_offset	input	
--	-------------------	-------	--

y position of text (mm)

The *chainage_x_offset* is measured from the beginning of the datum line.

The *chainage_y_offset* is measured from the bottom of the datum line with positive being **down**.

The values of the height and X and Y co-ordinates of the **primary string** (usually the design cross section) at the zero offset can be labelled. Note that zero offset is normally where the alignment string cuts the cross section.

The heights of any tins (such as the natural surface) at the zero offset can also be labelled.

The labels are made up of:

pre_text value post_text

where *value* is either a height or a co-ordinate.

The label is positioned at either the left, right or middle of the datum line, with an x and y adjustment and a rotation.

Boxes

When **boxes** is selected for *label_type*, the primary string (usually the design cross section) and each tin in the x-section sub-plot can be labelled with one or two lines of title, and the height at the offset position for each point in the primary string.

The **title** for the strings, is drawn in the **title area** of the **boxes area**.

The offsets/heights are drawn in the **heights area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

string/tin titles followed by the **offset/height values** across the string/tin.

Each row is surrounded by lines to form a box.

The default order of the boxes from the bottom up is

- (a) offset title and values
- (b) tin title and heights - natural surface etc. (optional)
- (c) primary string title and heights - design x-section (optional)

The **title area** starts at the relative position (left_sub_plot_gap,bottom_sub_plot_gap).

mode for drawing the boxes for the x section plot.

Section_X_Plot_Boxes_Centreline_labels_Boxes_Datum_lines

Datum Lines

Section: Boxes - Datum Line Parameters

For the boxes case, the **datum line** is positioned the distance *datum_below_gap* above the top of the boxes area and the graph area is then positioned the distance *datum_above_gap* above the datum line.
Hence the graph area is distance (*datum_below_gap* + *datum_above_gap*) above the top of the boxes area.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Graph area to datum line gap (mm) <i>dist from datum line to bottom of the</i>	<i>datum_above_gap</i>	input	
Datum line gap to top of boxes (mm) <i>dist from datum line to the top of the boxes</i>	<i>datum_below_gap</i>	input	
X adjustment (mm) <i>distance to move the datum text along the datum line</i>	<i>datum_x</i>	input	
Y adjustment (mm) <i>distance to raise the datum text above the datum line (used to be called datum_offset) The datum_x and datum_y can be positive, zero or negative.</i>	<i>datum_y</i>	input	

Section_X_Plot_Boxes_Centreline_labels_Boxes_Centreline_chainage

Centreline Chainage

Section: Boxes - Centre Line Parameters

Field Description	Parameter name	Type	Pop-Up
Justification of chainage text	<i>chainage_text_justification</i>	justification box	bottom-left bottom-centre bottom-right bottom-decimal middle-left middle-centre middle-right middle-decimal top-left top-centre top-right top-decimal decimal-left decimal-centre decimal-right decimal-point

justification of the chainage text.

Section_X_Plot_Boxes_Centreline_labels_Boxes_Title_area

Title Area

Many distance definitions in the plot parameter file are given in terms of distance above the **top** of the boxes area.

**Section: Boxes - Title Area Parameters**

The size of the title text is given by the *title_box_text_size* parameter.

The width of the title area is either given by the *space_for_titles* parameter, or if omitted, the required width is automatically calculated.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Size of titles (mm)	<i>title_box_text_size</i>	input	
----------------------------	----------------------------	-------	--

size of offset, height label and values

Space for titles (mm)	<i>space_for_titles</i>	input	
------------------------------	-------------------------	-------	--

size of title area.

There can be two lines of title text and the title text, textstyle and colour can be set independently for the primary string and each tin.

The x position of the title text is the same for all the lines of title text and can be set to be a fixed distance from the left hand side of the boxes.

X adjustment (mm)	<i>box_titles_x</i>	input	
--------------------------	---------------------	-------	--

distance to move the title text from the left hand side of the boxes

The text in the title area is the same for each cross section plot on the sheet so it is possible to restrict the title area to be only on the first cross section on the sheet or the first column of cross sections.

Title area mode	<i>label_first_only</i>	choice box	on all sections on first x-sec of page only on x-sec's in first column
------------------------	-------------------------	------------	--

it is possible to restrict the title area to be only on the first cross section on the sheet or the first column of cross sections

Section_X_Plot_Boxes_Centreline_labels_Boxes_Heights_area

Heights Area

The **heights area** starts at the end of the title area.

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_text_justification*).

The number of decimal places and the size of the heights text can also be specified.

The height of each individual box area is either given by the *horizontal_line_spacing* parameter, or if omitted, the required height is automatically calculated.

Section: Boxes - Height Area Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Number of decimals	number_of_decimals	input	

number of decimal places in the offset height boxes. If <0, the absolute value is taken as the number of decimal places i.e. no trailing zeros are removed for the values in the offset, heights area.

Text size (mm)	text_size	input	
-----------------------	-----------	-------	--

size of the height values

Justification	box_text_justification	choice box	bottom of individual boxes top of individual boxes
----------------------	------------------------	------------	---

justification of box text.

Horizontal line spacing (mm)	horizontal_line_spacing	input	
-------------------------------------	-------------------------	-------	--

height of each individual box area of title area. Calculated if omitted

The total height of the boxes area is simply given by number of boxes drawn multiplied by the height of one box (they all have the same height).

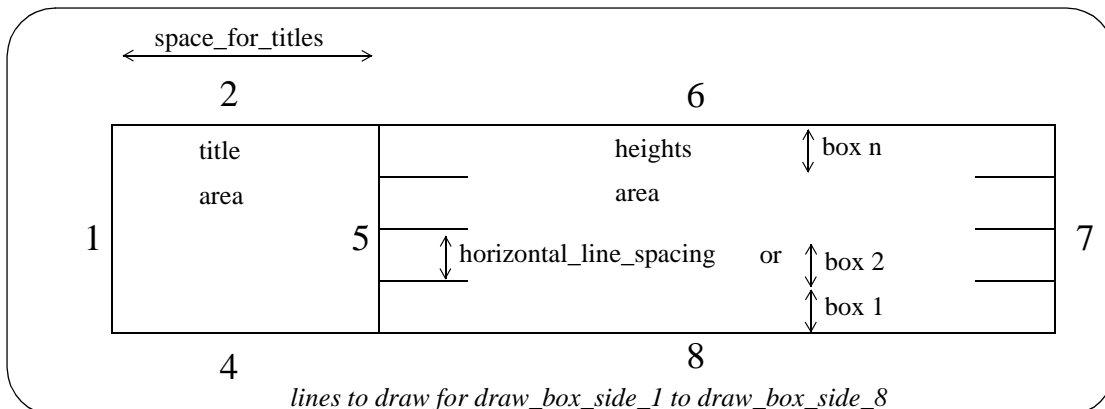

The **width** of the heights area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

Hence the total width of the boxes area is the width of the labels area plus the width of the heights area.

Section_X_Plot_Boxes_Centreline_labels_Boxes_Outside_linework

Outside Linework

Section: Boxes - Outside Linework Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up

<i>colour to draw top of heights area</i>			
Colour (7)	box_side_colour_7	colour box	
<i>colour for right side of heights area</i>			
Colour (8)	box_side_colour_8	colour box	
<i>colour for bottom of heights area</i>			

Section_X_Plot_Boxes_Centreline_labels_Boxes_Inside_linework

Inside Linework

Section: Boxes - Inside Linework Parameters

The lines at the top of the individual boxes inside the title area and heights area (separation lines) are controlled by the parameters *box_line_draw_mode* and *box_line_mode_n*.

The separation lines can be drawn just in the title area, just in the heights area or in both areas.

The parameter *box_line_draw_mode* can be set to control all the separation lines but there are additional parameters, *box_line_mode_n*, which override *box_line_draw_mode* for each of the individual boxes where n = 1, ... number of boxes -1.

The top of the top box is not controlled by *box_line_mode_n* but is controlled by the parameters *draw_box_side_2* and *draw_box_side_6*.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Separation line mode	<i>box_line_draw_mode</i>	choice box	Do not draw any separation lines Draw the separation lines in both areas Draw the separation lines in the title area only Draw the separation lines in the heights area only

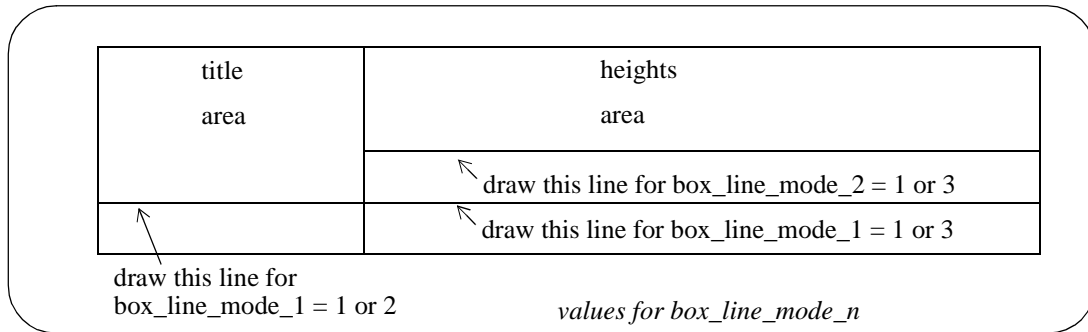

the separation line draw mode.

Box # input

Where box # = 1 to number of boxes(n). Box 1 is the bottom box, increasing upwards.

Line mode	<i>box_line_mode_n</i>	choice box	No top line for title or height area (mode=0) Draw top line for title or height area (mode=1) Draw top line for title area only (mode=2) Draw top line for height area only (mode=3)
------------------	------------------------	------------	---

line mode for top of title and height areas for box number specified.

Section_X_Plot_Boxes_Centreline_labels_Boxes_Extension_mode

Extension Mode

Section: Boxes - Extension Mode Parameters

The right hand end of the boxes can stop at the end of the design x-section or extend to the end of the right_extension distance.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Extension mode	box_extension_mode	choice box	extend boxes to end of design x-section (mode=0) extend boxes to end of right extension distance

nth tin depth title textstyle

Depth title colour tin_n_depth_title_colour colour box

nth tin depth title colour

Depth title size (mm) tin_n_depth_title_size input

nth tin depth title size

Depth title Y position (mm) tin_n_depth_title_y_pos input

if set, the height in mm above the bottom of all the boxes that the tin depth title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.

Decimals in depth value tin_n_depth_decimals input

number of dec places in tin height. < 0 to keep all trailing zeros

Depth value textstyle tin_n_depth_textstyle text box

nth tin depth textstyle

Depth value colour tin_n_depth_colour colour box

nth tin depth colour

Depth value size (mm) tin_n_depth_size input

nth tin depth size

Depth value Y position (mm) tin_n_depth_y_pos input

if set, the height in mm above the bottom of all the boxes that the tin depth text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.

Multiplier for positive depths depth_positive_factor input

if set, this value will be used to multiply positive depth values.

Multiplier for negative depths depth_negative_factor input

if set, this value will be used to multiply negative depth values.

The depth from the primary string to a tin, at a particular offset is defined as

$$\mathbf{depth} = \text{tin height value} - \text{height of the primary string}$$

That is, the depth that the primary string is **below** the tin.

Before plotting, the value of depth is multiplied by either the *depth_positive_factor* or *depth_negative_factor*.

if (depth >= 0) plotted_depth_value = depth * depth_positive_factor

if (depth < 0) plotted_depth_value = depth * depth_negative_factor

Hence the definition of depth can be modified by the parameters:

depth_positive_factor *value* // multiplier for positive depths

depth_negative_factor *value* // multiplier for negative depths

For example, if the opposite sign is required for depth, that is,

$$\mathbf{depth} = \text{height of the primary string} - \text{tin height value}$$

simply set

depth_positive_factor -1

Section_X_Plot_Boxes_Centreline_labels_Boxes_Upright_offset_staggering_parameters

Upright Offset/Staggering Parameters

Section: Upright Offset/Staggering Parameters

For each sub-plot, the offsets of the points across the x-section string (primary string) are used for positioning uprights (leader lines), and the offset and height labels for the uprights.

By default, there is an upright at each point across the primary string.

However, if the primary string is a 4d string, then the text at the points on the 4d string can be used as a key to **suppress** the labelling and upright at that point. See “Section: Exclude Uprights At Nominated X-Sec Points”

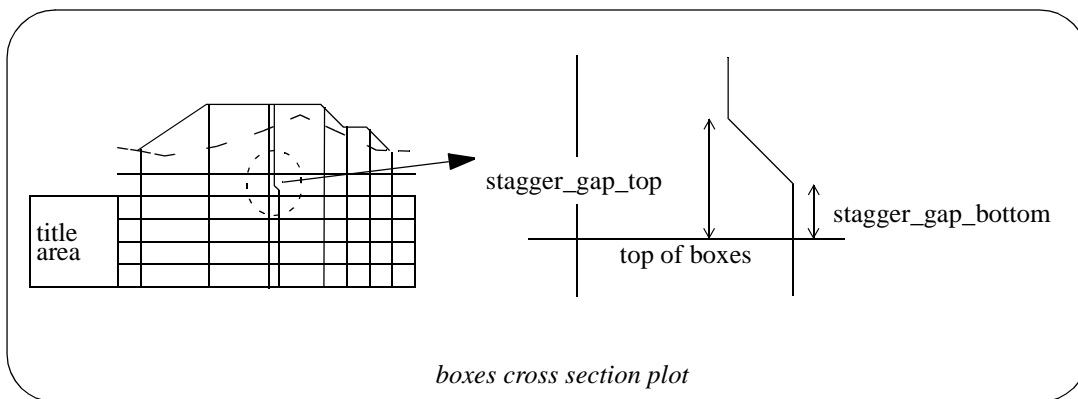

If the real offset position is used for the horizontal position of the offset/height text, text over writing can easily occur. To prevent over writing, the text is automatically **staggered**.

When staggering occurs, the real offset position is then indicated by the offset markers which are drawn at the top of the text boxes from the staggered text position back to the actual offset position of the text.

The size and position of the staggers are given by:

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	TypePop-Up
Offset label tolerance <i>weed out offset values closer together (in offset units) than this value.</i>	offset_label_tolerance	input
Top of stagger to boxes distance (mm) <i>distance from boxes to top of stagger.</i>	stagger_gap_top	input
Bottom of stagger to boxes distance (mm) <i>distance from boxes to bottom of stagger.</i>	stagger_gap_bottom	input
Stagger gap factor <i>distance between staggers is box_text_size * stagger_gap_factor</i>	stagger_gap_factor	input

Section_X_Plot_Boxes_Centreline_labels_Boxes_Upright_offset_staggering_parameters_Uprights_to_exclude

Uprights To Exclude

Section: Exclude Uprights At Nominated X-Sec Points

For each sub-plot, the offsets of the points across the x-section string (primary string) are used for positioning uprights (leader lines), and the offset and height labels for the uprights.

By default, there is an upright at each point across the primary string.

However, if the primary string is a 4d string, then the text at the points on the 4d string can be used as a key to **suppress** the labelling and upright at that point.

The parameters to **stop** labelling and uprights are:

mask_name_n 4d_string_point_text where n=1,100

After any *name masks* have been applied, it is often desirable to weed out offset values that are too close together before doing any labelling.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Set #		input	
<i>set number to be used to define a number of uprights to suppress</i>			
X-sec points to exclude	mask_name_n	input	
<i>the string name to be excluded. Note -the name can include wild cards (*) and characters (?). n is the value from the Set # provided.</i>			

Section_X_Plot_Boxes_Centreline_labels_Boxes_Uprights

Uprights

Section: Uprights

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Uprights draw mode	uprights_draw_mode	choice box	<i>none</i>
<i>ticks to stagger height</i>			
<i>to uprights_y above boxes</i>			
<i>to primary string</i>			
<i>to tin 1</i>			
<i>to tin 2</i>			
<i>to tin 3</i>			
<i>to tin 4</i>			
<i>to tin 5</i>			
<i>to tin 6</i>			
<i>to tin 7</i>			
<i>to tin 8</i>			
<i>to tin 9</i>			
<i>to tin 10</i>			

Upright draw mode above boxes.

Uprights Y distance (mm) uprights_y input
 distance to draw the uprights for uprights_draw_mode = "to uprights_y above boxes"

Uprights colour uprights_colour colour box
uprights colour. Default is box_colour

Uprights bottom mode uprights_bottom_mode choice box stop at top of boxes
draw to bottom of boxes
draw to uprights_bottom_y
below top of boxes
draw to uprights_bottom_y
above bottom of boxes
ticks at chainage

Upright draw mode below top of boxes.

Uprights bottom Y distance (mm) uprights_bottom_y input
distance in mm.

Uprights text offset factor uprights_text_offset_factor input
move the text by this factor**size*.

When uprights go below the top of the boxes, the height and offset text is moved to the left so that the upright does not go through the text. The left hand side of the heights boxes also moves to the left to leave room for the height text.

Centreline

Section_X_Plot_Boxes_Centreline_labels_Centreline

Centreline

Section: Centreline Linestyle

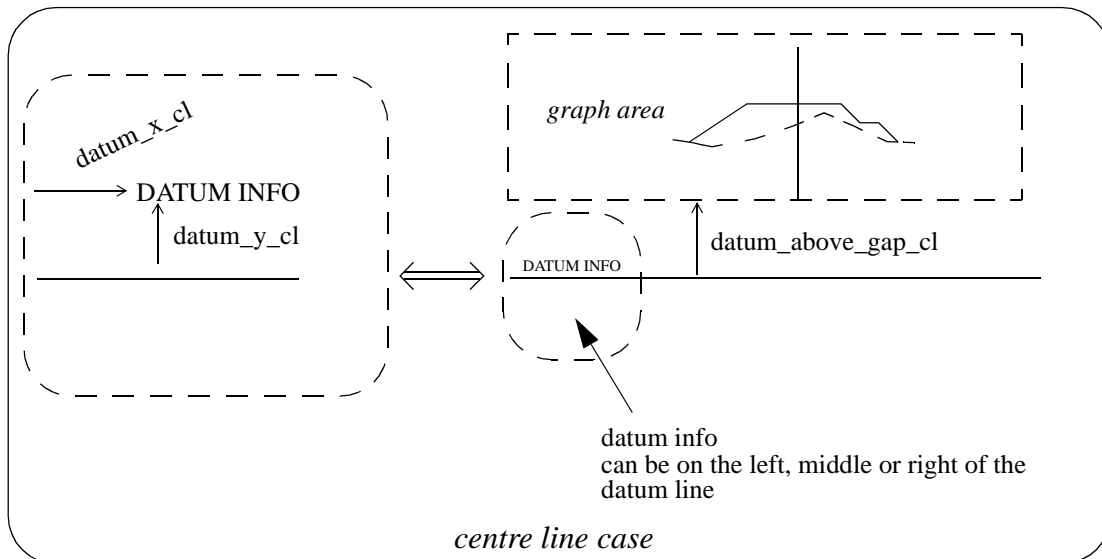

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Linestyle of centreline	cl_linestyle	linetype box	
<i>linestyle to be used for drawing centreline</i>			

Section_X_Plot_Boxes_Centreline_labels_Centreline_Datum_lines

Datum Lines

Section: Centreline - Datum Line Parameters

For the centreline case, the graph area is positioned the distance *datum_above_gap_cl* above the datum line.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Graph area - datum line gap (mm)	datum_above_gap_cl	input	
<i>dist from datum line to bottom of the graph area</i>			
Position of text	datum_side_cl	choice box	Middle of datum line Left of datum line Right of datum line

Section_X_Plot_Boxes_Centreline_labels_Centreline_Labelling_offset_height_Superseded_

Labelling Offset/Height (Superseded)

Section: Centreline - Labelling Offset/Height Parameters

In the centre line case, the value of the height of the **primary string** (usually the design cross section) at the zero offset can be labelled. This is normally where the alignment string cuts the cross section.

The label is made up of the texts:

primary_title offset_title offset_value height_text height_value

NOTE: These parameters have now been superseded. The parameters for labelling the height of the primary string at zero offset covers this case. To use the zero offset parameters instead, the *primary_height_pre_text* would include all text required for the Primary_title, offset_title, offset_value and height_text (offset_value is always 0.0).

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Include primary title in label

	primary_mode_cl	Tick box	
--	-----------------	----------	--

*The parameter primary_mode_cl controls whether the **primary_title** is included in the label.*

Include height in label

	height_mode_cl	Tick box	
--	----------------	----------	--

*The parameter height_mode_cl controls whether the **height_title** and **height_value** are included in the label.*

Include offset in label

	offset_mode_cl	Tick box	
--	----------------	----------	--

*The parameter offset_mode_cl controls whether the **offset_title** and **offset_value** are included in the label.*

Position of text	offset_height_side_cl	Choice	0
		Choice	1
		Choice	2

The label can be placed on the left, centre of right side of the datum line.

Justification of text	offset_height_text_justification_cl		
-----------------------	-------------------------------------	--	--

*justification of the text.justification of the offset height text. **NOTE** : - this is not normally required since by default the text justification is set to match offset_height_side_cl*

Height text label	height_text	Input	
-------------------	-------------	-------	--

height text.

Distance to move text position along datum line (mm)

	offset_x_cl	Input	
--	-------------	-------	--

distance to move the text along the datum line.

Distance to move text position below datum line (mm)

	offset_y_cl	Input	
--	-------------	-------	--

distance to move the text below the datum line.

Graph Area

Section_X_Plot_Graph_area

Graph area

The **graph area** for each section sub-plot is the area where the actual plot of the x-section string is drawn.

The **width** of the graph area is determined by the width of the x-section string being plotted, the left and right extensions and horizontal scale (scale) given by the parameters.

Section: Graph Area - Extra Space Parameters

The size of the graph area can be extended to allow for symbols by the following parameters:

The types of strings that are drawn in the graph area of a cross section plot are:

- (a) primary string the x-section string from the x-section model that is being drawn.
Called the primary string and is usually the design x-section.
- (b) tins sections of the primary string through any tins in models in the

- corridor models.
- (c) services parts of strings (from models in corridor models) that cut the defined corridor.

The **colour** of the strings in the plot is the actual string colour for cases (a) and (c), and the colour of the tin used for the section in case (b).

Although all the strings are plotted, the plot parameter file can be used to select which ones are labelled with heights.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Extra space units	extra_space_units	choice box	world units millimetres

units for specifying extra space.

Extra space left (units)	extra_space_left	input
---------------------------------	------------------	-------

distance to subtract from left of plot area

Extra space right (units)	extra_space_right	input
----------------------------------	-------------------	-------

distance to add to right of plot area

Extra space top (units)	extra_space_top	input
--------------------------------	-----------------	-------

distance to add to top of plot area

Extra space bottom (units)	extra_space_bottom	input
-----------------------------------	--------------------	-------

distance to subtract from bottom of plot area

Corridors

Section_X_Plot_Corridors

A corridor around the primary string is defined by giving a left and right corridor width.

Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, it is drawn on the cross-section plot.

To be drawn, strings do not have to cross the primary string, but just be in the corridor.

Panel field	Parameter name	Type
Left corridor width (world units)		
	<code>corridor_width_left</code>	input
<i>left corridor width</i>		
Right corridor width (world units)		
	<code>corridor_width_right</code>	input
<i>right corridor width</i>		
Left corridor overlap (world units)		
	<code>corridor_overlap_left</code>	input
<i>left corridor overlap</i>		
Right corridor overlap (world units)		
	<code>corridor_overlap_right</code>	input
<i>right corridor overlap</i>		
Chord-arc tolerance (world units)		
	<code>corridor_chord_arc</code>	input
<i>chord-arc tolerance used near any bends in the corridor.</i>		

Model selection

Panel field	Parameter name	Type
Corridor model	<code>corridor_model_n</code>	model box

models containing tins and service strings to be drawn on the section. Where n = 1, 2, ... ,100 given by line number on grid.

Grades

Section_X_Plot_Grades

Grades

Section: Corridor - Grade Parameters

The plot of the x-section string is made up of straight lines joining the individual points of the x-section.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Label grades	grade_label	tick box	

if ticked, label grades.

Either the individual lines can be used as the segments to be labelled for grade, or adjacent lines of the same grade can be considered to be just one segment and labelled only once.

Hence the segments to be labelled for grade can be the individual lines of the x-section, or the segments defined by changes of grade.

Label change of grade segments

grade_change_only	tick box
-------------------	----------

if ticked, label change of grade segments. If not, label individual lines.

It is also possible to ignore segments smaller than a given minimum width on the plot.

Minimum segment width	grade_minimum_width	input
------------------------------	---------------------	-------

segments smaller than specified value (in mm) are not labelled

The grade labels are drawn parallel to the segment, centred about the segments end points, and a distance *grade_offset* above the segment. The size, colour and number of decimal places can all be set.

Decimal places for grades	grade_decimals	input
----------------------------------	----------------	-------

number of decimal places in grade

Size for grade text (mm)	grade_size	input
---------------------------------	------------	-------

size of the grade label

Textstyle for grades	grade_textstyle	text box
-----------------------------	-----------------	----------

textstyle of the grade label

Colour for grades	grade_colour	colour box
--------------------------	--------------	------------

number of decimal places in grade

Grade offset (mm)	grade_offset	input
--------------------------	--------------	-------

distance above the segment for label

Show grade sign	grade_offset	tick box
------------------------	--------------	----------

if ticked, the sign of the grade is labelled.

The grade can be labelled as percent cross-fall, 1 in slope, m/m or VicRoads x:1.

Also a threshold value can be set and any grades whose absolute value are below the threshold can be labelled in one way, and those above the threshold labelled a different way.

Hence, if the absolute value of the grade is less than or equal to the absolute value of *grade_threshold*, then *grade_mode* is used, otherwise *grade_upper_mode* is used.

Grade mode	grade_mode	choice box	% grade 1 in m/m VicRoads x:1
-------------------	------------	------------	--

type of grade value

Grade threshold	grade_threshold	input
------------------------	-----------------	-------

grade threshold for type of grade labelling

Grade threshold mode grade_threshold_mode choice box % grade
1 in

m/m
VicRoads x:1

type of grade value

Decimal places for grades above threshold value
grade_upper_decimals input
number dec places in grades above threshold value

X-Section Points

[Section_X_Plot_X_section_points](#)

X-Section Points

The points across each x-section can be automatically labelled on the x-section plots.

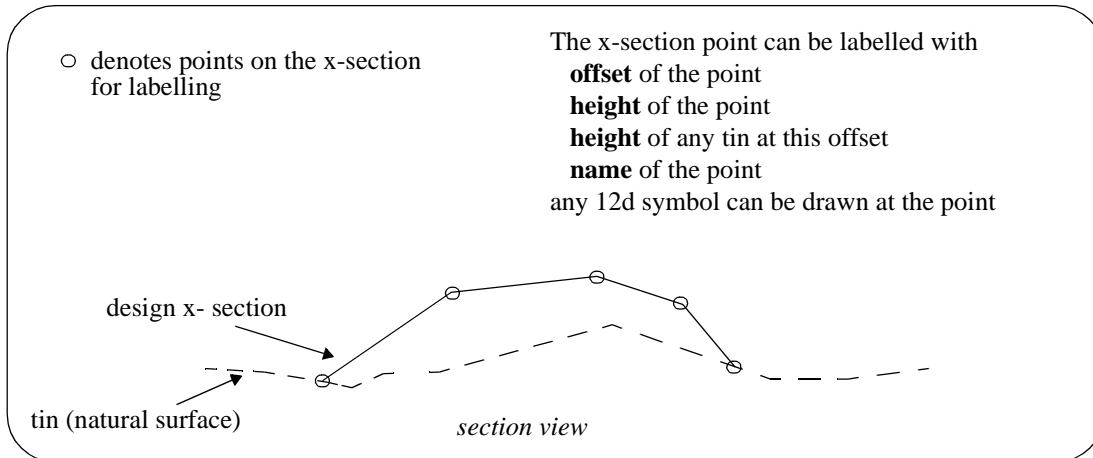

The **offset**, **height** and **name** of the point can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The offset position for the labelling is the offset of the point.

The height position for the labelling can be specified as the

- (a) top of the boxes for the x-section
- (b) above the maximum height of the strings on the plot
- (c) height of the point on the x-section string (primary string)
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

**Note:**

Only case (b) involves the actual height of the point on the cross section string. For all other cases, only the offset of the cut string is used.

Other heights, for example, the height of the tin at that offset can be used as the height (case (d)).

Section: X-Section Point Mask Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Define Set #		input	

set number to be used to define a number of points to include

Point mask	points_n_mask	input	
-------------------	---------------	-------	--

The points of the x-section to be labelled for the nth set of parameters is restricted to all the points whose name satisfying the points_n_mask. For example

points_1_mask = "ke"*

or *points_1_mask = "?bank*"*

or, if both masks are required,

points_1_mask = "ke ?bank*"*

Size (mm) `points_symbol_n_size` input

size of symbol. A value of 0 = no symbol

Hatching Cut/Fill

Section_X_Plot_Hatching_cut_fill

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins may be hatched.

Panel Field	Parameter name	Type
Define Set #		input
<i>set number to be used to define different original/new tin sets.</i>		
Original tin	hatch_original_tin_n	tin box
<i>tin_name for original surface</i>		
New tin	hatch_new_tin_n	tin box
<i>tin_name for final surface</i>		

Notes

- (a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- (b) cut hatching is turned off by setting *hatch_cut_separation_n* to 0.0.
fill hatching is turned off by setting *hatch_fill_separation_n* to 0.0.

Section_X_Plot_Hatching_cut_fill_Cut

Cut

Panel Field	Parameter name	Type

Draw new tin <i>draw mode for sides of new tin in fill.</i>	hatch_fill_draw_new_n	choice box

Cuts

Section_X_Plot_Cuts

The cuts that each x-section string makes though strings in any user-specified model, can be automatically labelled on the x-section plots.

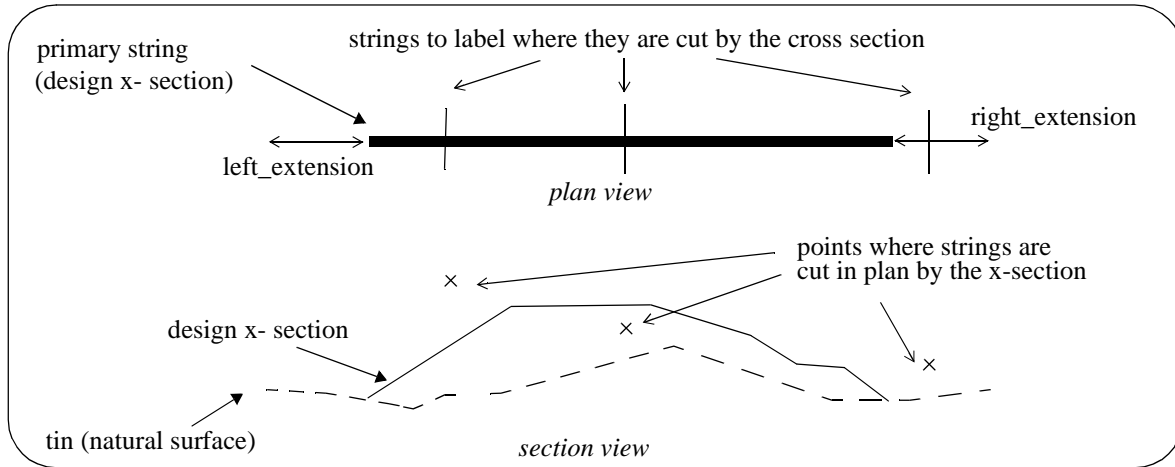

The **height**, **offset** and **name** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The offset position for the labelling is the offset of the cut string.

The height position for the labelling can be specified as the:

- (a) top of the boxes on the x-section,
- (b) above the maximum height of the strings on the plot,
- (c) height value of the cut string,
- (d) height of the x-section string (the primary string),
- (e) height of a tin.

The actual position of the label is defined relative to the above point.

Note: Only case (c) involves the actual height of the cut string. For all other cases, only the offset of the cut string is used. Hence, for all cases except (c), the string does not need to have a sensible height to be used for cuts through strings. For example, a boundary string may have null heights but only the offset is required and the height of the tin at that offset can be used as the height (case (e)).

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose names match the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

Panel Field	Parameter name	Type
Define Set #		input
	<i>set number to be used to define different model/mask sets.</i>	
Model	cuts_n_model	model box
	<i>model from which cut masks are derived</i>	
Name mask	cuts_n_mask	input
	<i>text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.</i>	
	<i>For example: "ke*" or,</i>	
	<i>"?bank*" or, if both masks are required,</i>	
	<i>"ke* ?bank*" or,</i>	
	<i>If cuts_n_mask is blank, then all strings in the model are used. This is equivalent to name mask being set to "*".</i>	

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the x-sections, and if a cut occurs, the cut point will be labelled according to the rest of the

parameters in the nth set.

Section_X_Plot_Cuts_Offsets

PPF's To Include

Section_X_Plot_PPF_s_to_include

Panel Field	Parameter name	Type	Pop-Up
PPF files		input	

by including pre existing PPF files, the user can build up a modified version without having to set all the parameters.

Long Plot PPF Editor

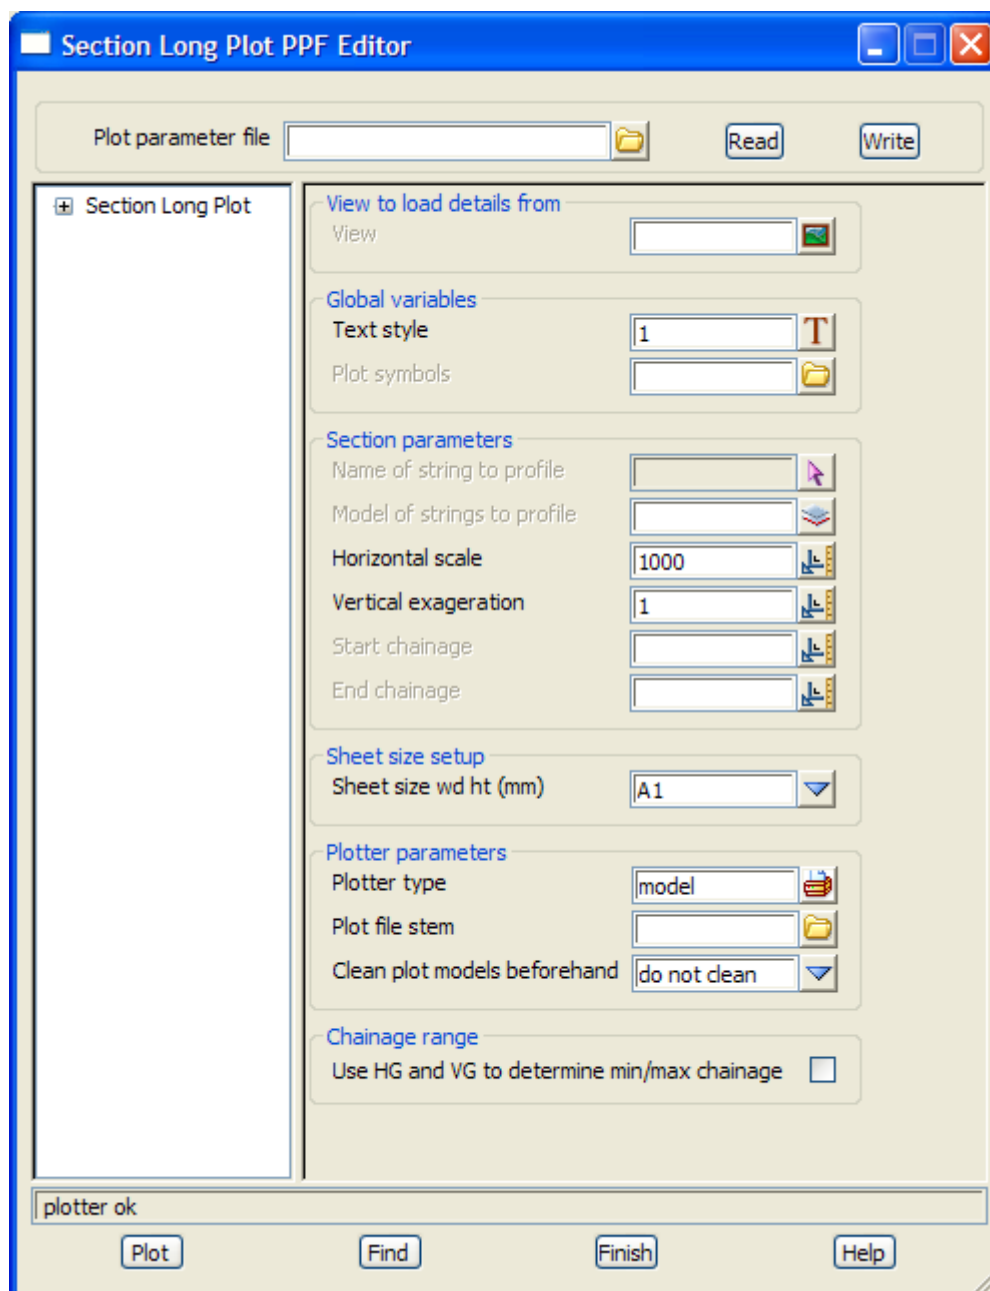

section_long_plot_ppf_editor

Position of option on menu: Plot =>Long Plot PPF Editor

The **long section ppf editor** is for creating and/or editing a (binary) long-section ppf file and for creating a long section plot.

Note: binary ppf's are stored *within* the project (not in the folder containing the project as the ascii ppf's were).

On selecting the Long plot ppf editor option, the **Section Long Plot PPF Editor** panel is displayed.

Panel field	Type
Plot parameter file	file box

name for the binary plot parameter file to read in or write out.

Read button

read the given plot parameter file in.

Write button

write out the plot parameters to the given plot parameter file. An ascii ppf file is also written out.

Plot button

use the plot parameters from the panel to create the plot.

Find button

brings up a search box. If a valid parameter name is keyed in followed by the enter key, the cursor will be placed in the appropriate field on the appropriate page.

Section Long Plot

Section_Long_Plot

Section Long Plot

The long plot itself consists of the three regions - boxes, datum and graph areas.

The **boxes area** is where the titles and the chainage values and the heights/depths for the strings drawn on the long plot are labelled.

The **datum area** is the region between the boxes area and the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.

Apart from information labelled in the boxes area, the long section plot can label other information such as

- (a) horizontal geometry
- (b) vertical geometry
- (c) chainage, heights at special points
- (d) symbols at special points
- (e) bubbles at special chainages
- (f) cuts the design string makes through strings
- (g) cut and fill areas

Section: View to load details from

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
View		section view box	

on selection of an existing section view, the vertical exaggeration, string to profile, corridor model and corridor settings from the section view are loaded into the ppf editor.

Section: Global Variables

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Text style	global_textstyle	text box	

default text style

Plot Symbols	plot_symbols	file box
---------------------	--------------	----------

specify a plot symbol file if it exists.

Section: Section Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Name of string to profile	string_to_plot		string box
<i>model of long sections to plot</i>			
Horizontal Scale	scale	input	
<i>horizontal scale to be used for long section plots</i>			
Vertical exaggeration	vertical_exaggeration	input	
<i>vertical scale to be used for long section plots</i>			
Start chainage	start_chainage	input	
<i>start chainage of long sections to plot</i>			
End chainage	end_chainage	input	
<i>start chainage of long sections to plot</i>			

Section: Sheet Size Setup

The plot **page** or **sheet** is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Sheet size wd ht (mm)	sheet_size	sheet size box	
<i>a valid sheet size is selected.</i>			

Section: Plotter Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Plotter type	plotter_type	plotter box	
<i>a valid plotting option is selected.</i>			
Plot file stem	plot_stem	file box	
<i>plot file name. The appropriate extension is added dependant on the plotter type selected.</i>			

Clean plot models beforehand

plot_model_clean	choice box	do not clean prompt for clean always clean
------------------	------------	--

whether to clean (delete the elements in) any resultant plot models that may already exist, before generating the plot(s). This parameter is only applicable if plotting to a model or models. Note that if the models are cleaned using this parameter, any non-plot or locked elements found in the models will not be cleaned from the models, and the plot job will be cancelled.

Section: Chainage Range

Use **HG VG for min, max** determines whether the horizontal geometry (HG) and the vertical geometry (VG) are both used to determine the minimum and maximum chainages for drawing. This allows the vertical geometry to be plotted when it is outside the horizontal geometry (e.g. kerb returns).

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use HG and VG to determine min/max chainage	use_hg_vg_for_min_max	tick box	

if ticked, the min/max chainage will be determined by the Horizontal and Vertical geometry.

Title Block

Section_Long_Plot_Title_block

Common title block parameters

Panel field	Parameter name	Type
Standard title	plot_border	tick box

if ticked, a standard 12d title block will be used.

Use title file	use_title_file	tick box
-----------------------	----------------	----------

if ticked, a user defined title file is used.

Title line 1	title_1	input
---------------------	---------	-------

*if **Standard title** is ticked, **Title line 1** is the first line of title text. If **Use title file** is ticked, **Title line 1** is substituted for the title block variable \$title_1.*

Title line 2	title_2	input
---------------------	---------	-------

*if **Standard title** is ticked, **Title line 2** is the second line of title text. If **Use title file** is ticked, **Title line 2** is substituted for the title block variable \$title_2.*

12d default title block parameters

Panel field	Parameter name	Type	Pop-Up
Text size	title_text_size	input	
Text colour	title_colour	colour	available colours

text size of title text.

colour of title text.

Section_Long_Plot_Title_block_User_title_info

User title info

The parameters shown below are subject to the appropriate title block variables existing in the title file. For more information on these variables see the section "Title Block Variables" .

Panel field	Parameter name	Type	Pop-Up
Title file	title_file	file box	available title files

*specifies the name of the title file to use. If a valid title file exists, the specified **Name** values will be filled out in the grid using the title block variable \$user_text_n.*

Name		output	
-------------	--	--------	--

the alias for the nth user text specified in the title file.

Value user_text_n input

the alias text to be substituted in for the user text specified.

Time format time_format input

the time format relates to the \$time title block variable. For more information on the time formats see the section “Specifying the Format for \$time” .

Start page number start_page_number input

used as the starting value for the title block variable \$page_number. If missing, \$page_number starts at 1.

Start drawing number start_drawing_number input

used as the starting value for the title block variable \$drawing_number. If missing, \$drawing_number starts at 1.

Drawing number prefix drawing_number_prefix input

the value entered is used for the title block variable \$drawing_number_prefix.

Drawing number postfix drawing_number_postfix input

the value entered is used for the title block variable \$drawing_number_postfix.

Plot Sheet Layout

[Section_Long_Plot_Plot_sheet_layout](#)

[Section_long_Plot_Plot_sheet_layout_Margins](#)

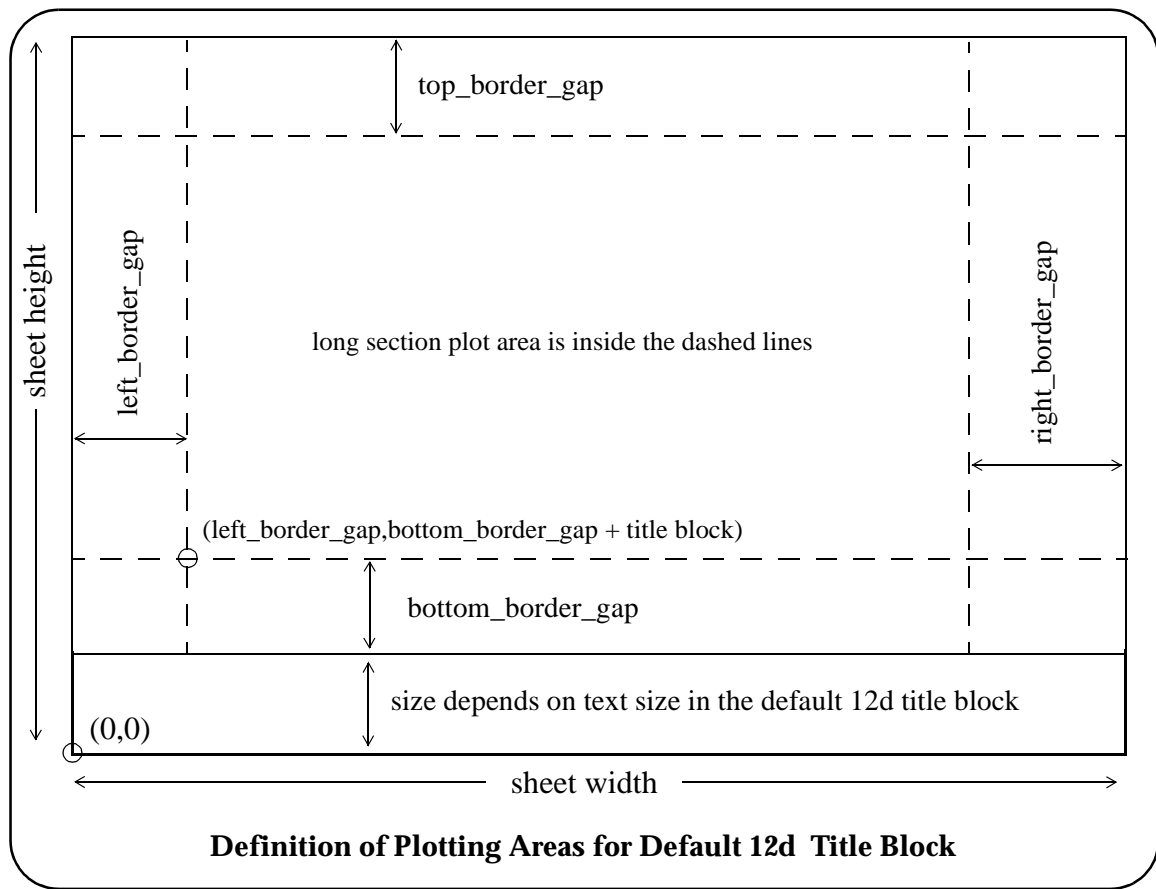

Margins

Section: Margins For Standard 12d Title File - Border gaps

If the *default 12d title block* is used, then the size of the bottom of title block depends on the text size. The following parameters are used in the default title block case and the *bottom_border_gap* is added to the calculated height of the bottom of the title block.

The fields and buttons used in this section have the following functions.

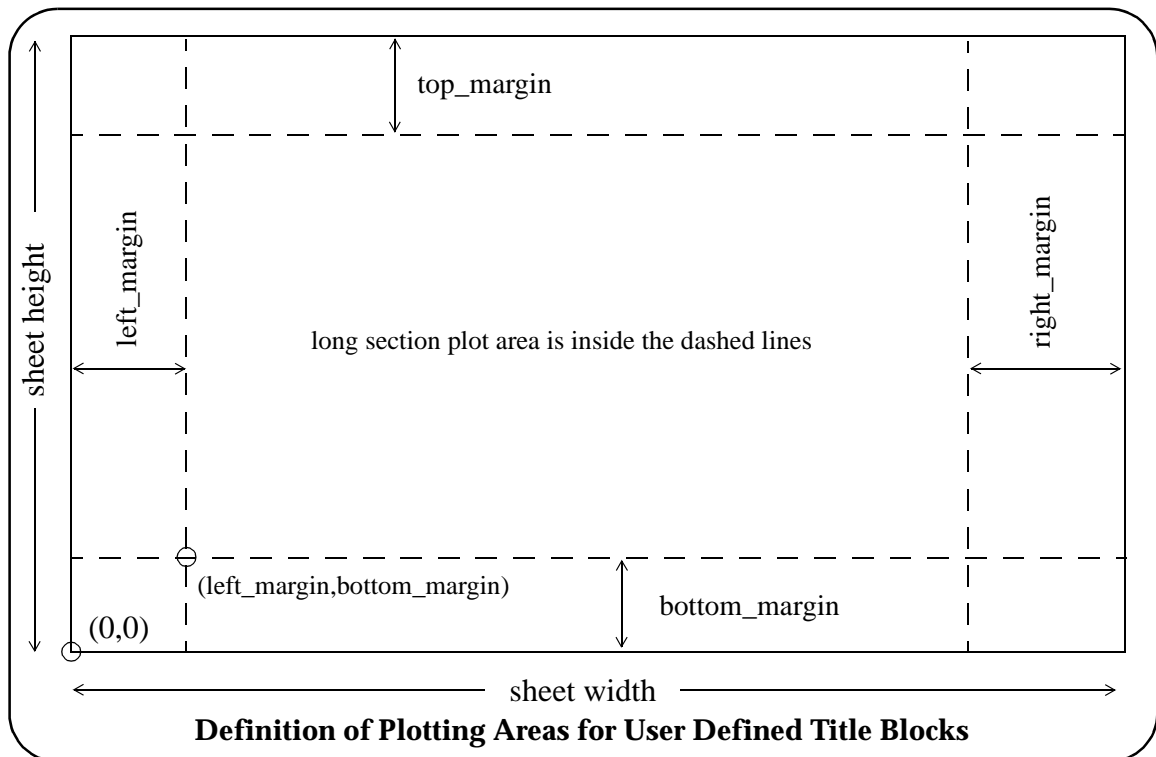

Field Description	Parameter name	Type	Pop-Up
Left (mm)	left_border_gap	input	
	<i>left border gap (in millimetres).</i>		
Right (mm)	right_border_gap	input	
	<i>right border gap (in millimetres).</i>		
Top (mm)	top_border_gap	input	
	<i>top border gap (in millimetres).</i>		
Bottom (mm)	bottom_border_gap	input	
	<i>bottom border gap (in millimetres).</i>		

Section: Margins For User Title File

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Left (mm) <i>left margin (in millimetres).</i>	left_margin	input	
Right (mm) <i>right margin (in millimetres).</i>	right_margin	input	
Top (mm) <i>top margin (in millimetres).</i>	top_margin	input	
Bottom (mm) <i>bottom margin (in millimetres).</i>	bottom_margin	input	

Because the user can easily select from the plotting panel whether a User Defined Title Block or the default 12d title block is used, both sets of margin and gap parameters can exist in the one plot parameter file.

The `(left_margin, bottom_margin)` defines the left hand corner position of the long plot on the plot sheet.

The `right_margin` and `top_margin` need not be set and if missing, will be calculated from the other plot parameters defining the plot layout.

If the sheet sizes are missing, they will also be automatically calculated.

Pagination

Section_Long_Plot_Pagination

Pagination

If the long section plot is too long to fit on one page, it can be broken into a number of pages (sheets).

The parameter, `pagination_length`, controls the amount of new chainage length on each plot page. Each page of the long section plot can also included a set chainage amount from the end of the **previous** plot.

Hence apart from the first page and possibly the last page, the plot will have a chainage length given by the sum of the `pagination_length` and `pagination_overlap`.

Section: Pagination Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use pagination	<code>pagination</code>	tick box	
<i>if ticked, then break the plot into pages.</i>			
Pagination mode	<code>pagination_mode</code>	choice	chainage

millimetres

length and overlap units.

Chainage length pagination_length input

new chainage range on each page.

Chainage overlap pagination_overlap input

overlap between pages.

Note

The *pagination_length* and *pagination_overlap* are given in chainage units **or** millimetres. The user must choose values which will fit on the selected sheet size or the end of each plot will be truncated by the sheet.

Boxes

Section_Long_Plot_Boxes

Boxes

Each string in the long section plot can be labelled with one or two lines of title, and the chainages/heights/depths at the user specified chainages for the strings.

The **title** for the strings, is drawn in the **title area** of the **boxes area**.

The **chainages/heights/depths** are drawn in the **heights area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

string/tin titles followed by the **chainage/height/depth** values along the string.

Each row is surrounded by lines to form a box.

The default order of the boxes from the bottom up is

- (a) optional super-elevation diagram
- (b) chainage values
- (c) can be primary string heights - user choice
- (d) tin heights and depths
- (e) offset heights and depths
- (f) optional volumes or earth works
- (g) can be primary string heights - user choice
- (h) zero or more blank boxes

Section: Linework Parameters

Field Description	Parameter name	Type	Pop-Up
Draw box mode	draw_box_mode	choice box	Do not draw any box lines Draw box lines around height area only Draw box lines around title and height area only Use parameters defined in boxes - heights

mode for drawing the boxes for the long section plot.

Default box colour	box_colour	colour box
---------------------------	------------	------------

default box colour

Number of blank boxes `number_of_blank_boxes` input

number of boxes to be left blank

The blank boxes are used to place other information in (such as horizontal or vertical geometry) or for other user supplied information.

Section: Primary String Parameters

The primary string (the design string) is used to define

- (a) the design long section
- (b) the chainage positions for labelling heights and drawing uprights
- (c) the section line used for sectioning through tins
- (d) the section line for defining the corridor for services

Although the primary string is used to set up most of the information for the long section plot, it doesn't have to be drawn on the long section.

The drawing or not drawing of the primary string on each cross section plot is controlled by the parameter *primary_string*.

The **colour** of the primary string in the plot is the actual primary string colour.

Sometimes the primary string is only required to define chainages or the horizontal path for tin sections. In this case, the primary string would not be drawn on the long section plot.

If the primary string is drawn, it is automatically labelled.

Also the drawing of crosses at the vertical intersection points can be controlled from the ppf file.

Draw and label the primary string `primary_string` tick box

if ticked, the primary string will be drawn and labelled.

Draw crosses at VIP's `primary_draw_vips` tick box

if ticked, crosses will be draw at the vertical intersection points.

The position of the primary string label box can be either straight after the chainage box, or after the tin and offset boxes but before the blank boxes.

Placing the primary string label before the bank boxes or just after the chainage box in controlled by the parameter *primary_label_mode*.

Primary string location `primary_label_mode` choice box in last box before blank
boxes

in first box above chainages

position of the primary string label.

Although the order of the boxes may appear to be fixed, in practice they can be in any order. This is possible because for each box, there is a parameter to set the height in millimetres from the bottom of all the boxes that the text in the box is drawn at (the *_y_pos* parameters).

The roundoff for the datum value is specified by the user (default 1.0) and the datum is automatically calculated for each sub-plot, and labelled.

Section_Long_Plot_Boxes_Title_area

Title Area

Section: Boxes - Title Area Parameters

The **title area** starts at the co-ordinate (left_margin,bottom_margin).

The size of the title text is given by the *title_box_text_size* parameter.

The **width** of the title area is either given by the *space_for_titles* parameter, or if omitted, the required width is automatically calculated.

Field Description	Parameter name	Type	Pop-Up
Size of titles (mm) <i>size of offset, height label and values</i>	title_box_text_size	input	
Space for titles (mm) <i>size of title area.</i>	space_for_titles	input	

The x position of the title text is the same for all the lines of title text and can be set to be a fixed distance from the left hand side of the boxes.

X adjustment (mm) <i>distance to move the title text from the left hand side of the boxes</i>	box_titles_x	input	
---	--------------	-------	--

The y position of the title text can be set separately for each type of title. The parameters are given later under each of the title types (e.g. chainages, primary string, tins, depths etc.).

After the title area there can be a user defined gap, followed by the heights area

Distance between title and heights area (mm) <i>distance between title and heights area in mm.</i>	box_gap	input	
--	---------	-------	--

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_text_justification*).

Section_Long_Plot_Boxes_Heights_area

Heights Area

Section: Boxes - Height Parameters

The **heights area** starts at the end of the title area.

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_text_justification*).

The number of decimal places (*number_of_decimals*), and the size of the heights text (*box_text_size*) can be specified globally but there is a parameter for each box which overrides these defaults for each box of heights.

Field Description	Parameter name	Type	Pop-Up
Justification <i>justification of height text.</i>	box_text_justification	choice box	bottom of individual boxes top of individual boxes

Number of decimals <i>number of decimal places in the height boxes. If <0, the absolute value is taken as the number of decimal places i.e. no trailing zeros are removed for the values in the heights area.</i>	number_of_decimals	input	
--	--------------------	-------	--

Text size (mm) <i>distance to move the title text from the left hand side of the boxes</i>	box_text_size	input	
--	---------------	-------	--

Horizontal line spacing (mm)	horizontal_line_spacing	input	
------------------------------	-------------------------	-------	--

height of the individual height boxes.

A global height for the individual boxes is either given by the *horizontal_line_spacing* parameter, or if omitted, a height to fit the largest height or depth value is calculated and used as the default box height.

However, the height of each box can be individually set by parameters *box_size_n* where the boxing numbering, n, starts from the bottom box. The value of *horizontal_line_spacing* is used for any of the *box_size_n* parameters not specified.

Box # input
specifying the nth value

Size (mm) box_size_n input
height of the nth box, numbered from bottom up.

The total height of the boxes area is simply given by the sum of the heights of each box.

The **width** of the **heights area** is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

Hence the total width of the boxes area is the width of the **title area** plus *box_gap*, plus the width of the **heights area**.

Many distance definitions in the plot parameter file are given in terms of distance above the **top** of the boxes area so that the distances are independent of the number of boxes and box sizes.

Section_Long_Plot_Boxes_Outside_linework

Outside Linework

The drawing of the box line work, the box colour, the position of the primary string labels and the number of blank boxes are all set by parameters.

Section: Boxes - Outside Linework Parameters

Field Description	Parameter name	Type	Pop-Up
Draw the left side of title area(1)	<i>draw_box_side_1</i>	tick box	
<i>if ticked, draw the left side of the title area (def).</i>			
Draw the top line of title area(2)	<i>draw_box_side_2</i>	tick box	

<i>if ticked, draw the top line of the title area (def).</i>		
Draw the top line of title area(3)	draw_box_side_3	tick box
<i>if ticked, draw right side of the title area (def).</i>		
Draw the bottom line of title area(4)	draw_box_side_4	tick box
<i>if ticked, draw the bottom line of the title area (def).</i>		
Draw the left side of heights area(5)	draw_box_side_5	tick box
<i>if ticked, draw the left side of the heights area (def).</i>

<i>if ticked, draw the top line of the heights area (def).</i>		
Draw right side of heights area(7)	draw_box_side_7	tick box
<i>if ticked, draw right side of the heights area (def).</i>		
Draw bottom side of heights area(8)	draw_box_side_8	tick box
<i>if ticked, draw bottom side of the heights area (def).</i>		
Colour (1)	box_side_colour_1	colour box
<i>colour to draw left side of title area</i>		
Colour (2)	box_side_colour_2	colour box
<i>colour to draw top of title area</i>		
Colour (3)	box_side_colour_3	colour box
<i>colour to draw right side of title area</i>		
Colour (4)	box_side_colour_4	colour box
<i>colour to draw bottom of title area</i>		
Colour (5)	box_side_colour_5	colour box
<i>colour to draw left side of heights area</i>		
Colour (6)	box_side_colour_6	colour box
<i>colour to draw top of heights area</i>		
Colour (7)	box_side_colour_7	colour box
<i>colour for right side of heights area</i>		
Colour (8)	box_side_colour_8	colour box
<i>colour for bottom of heights area</i>		

Section_Long_Plot_Boxes_Inside_linework

Inside Linework

Section: Boxes - Inside Linework Parameters

The lines at the top of the individual boxes inside the title area and heights area (separation lines) are controlled by the parameters *box_line_draw_mode* and *box_line_mode_n*.

The separation lines can be drawn just in the title area, just in the heights area or in both areas.

The parameter *box_line_draw_mode* can be set to control all the separation lines but there are additional parameters, *box_line_mode_n*, which override *box_line_draw_mode* for each of the individual boxes where n = 1, ... number of boxes -1.

The top of the top box is not controlled by *box_line_mode_n* but is controlled by the parameters *draw_box_side_2* and *draw_box_side_6*.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Separation line mode	<i>box_line_draw_mode</i>	choice box	Do not draw any separation lines Draw the separation lines in both areas Draw the separation lines in the title area only Draw the separation lines in the heights area only

the separation line draw mode.

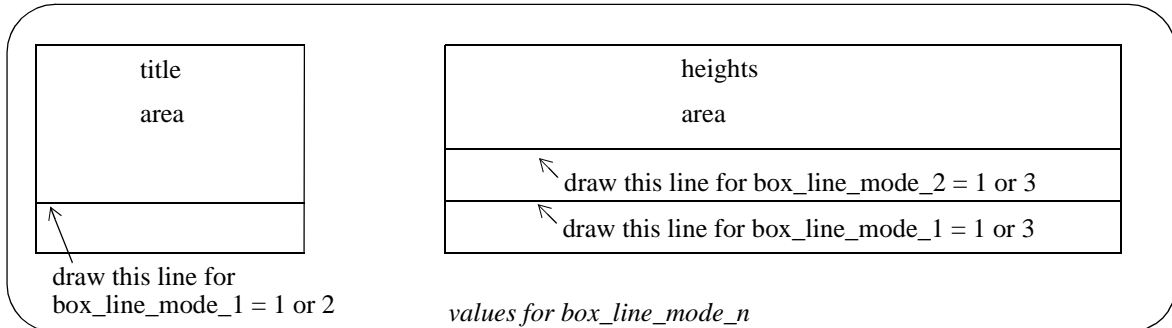

Box # input

Where box # = 1 to number of boxes(n). Box 1 is the bottom box, increasing upwards.

Line mode	<i>box_line_mode_n</i>	choice box	No top line for title or height area (mode=0) Draw top line for title or height area (mode=1) Draw top line for title area
------------------	------------------------	------------	--

only (mode=2)
 Draw top line for height area
 only (mode=3)

line mode for top of title and height areas for box number specified.

Section_Long_Plot_Boxes_Chainage_titles_values

Chainage Titles/Values

Section: Chainage Title Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Title line 1 <i>1st line of chainage title.</i>	chainage_title	input	
Title line 2 <i>second line of chainage title.</i>	chainage_title_2	input	
Textstyle <i>textstyle for the chainage title</i>	chainage_title_textstyle	text box	
Colour <i>colour of the chainage title</i>	chainage_title_colour	colour box	
Text size (mm) <i>size of the chainage title</i>	chainage_title_size	input	
Text y position (mm) <i>if set, the height in mm above the bottom of all the boxes that the chainage title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the chainage.</i>	chainage_title_y_pos	input	

Section: Chainage Value Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Decimal places <i>number of decimal places for chainages</i>	chainage_decimals	input	

Textstyle	chainage_textstyle	text box
	<i>textstyle for the chainage values</i>	
Colour	chainage_colour	colour box
	<i>colour of the chainage values</i>	
Text size (mm)	chainage_size	input
	<i>size of the chainage values</i>	
Text y position (mm)	chainage_y_pos	input
	<i>if set, the height in mm above the bottom of all the boxes that the chainage values are drawn. If not set, then the text is placed at a height that puts it inside the default box for the chainage.</i>	

Section_Long_Plot_Boxes_Primary_string_titles_heights

Primary String Titles/Heights

Sometimes the primary string is only required to define chainages or the horizontal path for tin sections. In this case, the primary string would not be drawn on the long section plot.

If the primary string is drawn, it is automatically labelled.

Also the drawing of crosses at the vertical intersection points can be controlled from the ppf file.

Section: Primary String Title Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Title line	primary_title	input	
	<i>1st line of string title.</i>		
Title line 2	primary_title_2	input	
	<i>second line of string title. Default is primary string name.</i>		
Textstyle	primary_title_textstyle	text box	
	<i>textstyle for the primary string title</i>		
Colour	primary_title_colour	colour box	
	<i>colour of the primary string title</i>		
Text size (mm)	primary_title_size	input	
	<i>size of the string title</i>		
Text y position (mm)	primary_title_y_pos	input	
	<i>if set, the height in mm above the bottom of all the boxes that the primary string title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the primary string.</i>		

Section: Primary String Height Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Decimal places	primary_decimals	input	
	<i>number of decimal places for height values.</i>		
Textstyle	primary_textstyle	text box	
	<i>textstyle for the height values</i>		

Colour	primary_colour	colour box
<i>colour of the height values</i>		
Text size (mm)	primary_size	input
<i>size of the height values</i>		
Text y position (mm)	primary_y_pos	input
<i>if set, the height in mm above the bottom of all the boxes that the primary string height values are drawn. If not set, then the text is placed at a height that puts it inside the default box for the primary string.</i>		
Search dist when no z (m)	primary_ch_tolerance	input
<i>for a given chainage, if no z value exists, this distance is added to/subtracted from the chainage to search for a valid z value.</i>		

Tin Titles/Heights/Depths

Section_Long_Plot_Boxes_Tin_titles_heights_depths

Tin Titles/Heights/Depths

Section: Tin Titles/Heights/Depths Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Label depth default	label_depths	tick box	

if ticked, the depths are labelled.

Define tin set #		input	
-------------------------	--	-------	--

where n = 1 to.... The set enables the specification of a number of parameters for a number of specified tin names.

Tin name	tin_n_name	tin box	available tins
-----------------	------------	---------	----------------

the name of the nth tin to be used for labelling.

If a tin of the name given by **tin_n_name** does not exist, then the plot is not produced and an error message is given.

Tin draw mode	tin_n_draw_mode	choice box	Draw the tin Do not draw the tin
----------------------	-----------------	------------	-------------------------------------

draw tin mode for the nth tin specified by tin set #.

Tin colour	tin_n_draw_colour	colour box	
-------------------	-------------------	------------	--

tin colour mode for the nth tin specified by tin set #.

Tin label mode	tin_n_label	choice box	Label the tin Do not label the tin
-----------------------	-------------	------------	---------------------------------------

tin label mode for the nth tin specified by tin set #.

Section_Long_Plot_Boxes_Tin_titles_heights_depths_Titles

Titles

Section: Tin - Title Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use tin set #		input	

set number to be used to define sets of tin parameters i.e. n value

First line of tin title	tin_n_title	input	
--------------------------------	-------------	-------	--

first line of nth tin title

Second line of tin title	tin_n_title_2	input	
---------------------------------	---------------	-------	--

second line of nth tin title

Tin title textstyle	tin_n_title_textstyle	text box	
----------------------------	-----------------------	----------	--

nth tin title textstyle

Tin title colour	tin_n_title_colour	colour box	
-------------------------	--------------------	------------	--

nth tin title colour

Tin title size (mm)	tin_n_title_size	input
----------------------------	------------------	-------

nth tin title size

Title Y position (mm)	tin_n_title_y_pos	input
------------------------------	-------------------	-------

if set, the height in mm above the bottom of all the boxes that the nth tin title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.

Section_Long_Plot_Boxes_Tin_titles_heights_depths_Heights

Heights

Section: Tin - Height Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Use tin set #		input	
----------------------	--	-------	--

set number to be used to define sets of tin parameters i.e. n value

Decimals	tin_n_decimals	input	
-----------------	----------------	-------	--

number of dec places in nth tin height. < 0 to keep all trailing zeros

Textstyle	tin_n_textstyle	text box	
------------------	-----------------	----------	--

textstyle of nth tin height

Colour	tin_n_colour	colour box	
---------------	--------------	------------	--

nth tin height and depth colour

Size (mm)	tin_n_size	input	
------------------	------------	-------	--

nth tin height size

Y pos (mm)	tin_n_y_pos	input	
-------------------	-------------	-------	--

if set, the height in mm above the bottom of all the boxes that the tin height text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.

Section_Long_Plot_Boxes_Tin_titles_heights_depths_Depths

Tin Depths

Section: Tin Depth Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Use tin set #		input	
----------------------	--	-------	--

set number to be used to define sets of tin parameters i.e. n value

Depth label mode	tin_n_depth_label	choice box	Label depths Do not label depths
-------------------------	-------------------	------------	-------------------------------------

depth label mode for the nth tin specified by set #.

First line of tin depth title	tin_n_depth_title	input	
--------------------------------------	-------------------	-------	--

first line of nth tin depth title

Second line of tin depth title	tin_n_depth_title_2	input	
---------------------------------------	---------------------	-------	--

second line of nth tin depth title

Depth title textstyle	tin_n_depth_title_textstyle	text box	
------------------------------	-----------------------------	----------	--

nth tin depth title textstyle

Depth title colour tin_n_depth_title_colour colour box

nth tin depth title colour

Depth title size (mm) tin_n_depth_title_size input

nth tin depth title size

Depth title Y position (mm) tin_n_depth_title_y_pos input

if set, the height in mm above the bottom of all the boxes that the tin depth title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.

Decimals in depth value tin_n_depth_decimals input

number of dec places in tin height. < 0 to keep all trailing zeros

Depth value textstyle tin_n_depth_textstyle text box

nth tin depth textstyle

Depth value colour tin_n_depth_colour colour box

nth tin depth colour

Depth value size (mm) tin_n_depth_size input

nth tin depth size

Depth value Y position (mm) tin_n_depth_y_pos input

if set, the height in mm above the bottom of all the boxes that the tin depth text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.

Multiplier for positive depths depth_positive_factor input

if set, this value will be used to multiply positive depth values.

Multiplier for negative depths depth_negative_factor input

if set, this value will be used to multiply negative depth values.

The depth from the primary string to a tin, at a particular offset is defined as

$$\text{depth} = \text{tin height value} - \text{height of the primary string}$$

That is, the depth that the primary string is **below** the tin.

Before plotting, the value of depth is multiplied by either the *depth_positive_factor* or *depth_negative_factor*.

if (depth >= 0) plotted_depth_value = depth * depth_positive_factor

if (depth < 0) plotted_depth_value = depth * depth_negative_factor

Hence the definition of depth can be modified by the parameters:

depth_positive_factor value // multiplier for positive depths

depth_negative_factor value // multiplier for negative depths

For example, if the opposite sign is required for depth, that is,

$$\text{depth} = \text{height of the primary string} - \text{tin height value}$$

simply set

depth_positive_factor -1

depth_negative_factor 1

Offset String Titles/Heights/Depths

Section_Long_Plot_Boxes_Offset_string_titles_heights_depths

Offset String Titles/Heights/Depths

Section: Offset Titles/Heights/Depths Parameters

Each string in the offset model given can be automatically projected onto the primary string and drawn on the long section plot.

The offset model has been modified to allow strings to be projected onto the primary string to be specified by model and name, rather than just projecting all the strings in a given model. The string can also be labelled with either the string name, its model name or both.

The string is specified by

offset_n_mask "model_name->string_name"

For each n, a set of plot parameters determine if the string's heights and/or depths from the primary string are labelled in the boxes area.

If only the *string_name* is given, then the model given in the Offset model field of the **Section Long Plot** panel.

If there is **more than one string** with the given model and name, then it will be considered to be one string and at any primary string chainage, the closest of the strings will be the part used for projecting. For example, strings of the same name on either side of a road intersection will be considered to be the one string for projecting.

If any *offset_n_mask* is used, then the Offset option expects all the strings to be specified by an *offset_n_mask*. Then if no mask exists for any value of n, then that parameter set is ignored and no string projected.

If no offset masks are used (that is, no *offset_n_mask*'s are used), then the plot parameters determine whether each string in the offset model is drawn, and if the string's heights and depths from the primary string are labelled in the boxes area. The order that the strings are then plotted and labelled is the same as the order of the strings in the Offset model.

For the following sets of parameters, n takes the value 1 to 100 and specifies that the parameter set applies to the nth string given by *offset_n_mask* or, if no offset masks are given, the nth string in the *Offset model*.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Default offset model <i>default offset model.</i>	offset_model	model	box
Define set # <i>where n = 1 to.... The set enables the specification of a number of parameters for a number of specified tin names.</i>		input	
Offset mask <i>the value specified by model_name->string_name.</i>	offset_n_mask	input	
Offset draw mode <i>draw mode for offset string.</i>	offset_n_draw_mode	choice box	Draw the offset string Do not draw the offset string
Left search distance <i>default 1000. Distance to search to the left of the primary string for the offset string. If 0, don't search to the left.</i>	offset_n_lw	input	

Right search distance	offset_n_rw	input	
	<i>default 1000. Distance to search to the right of the primary string for the offset string. If 0, don't search to the right.</i>		
Offset colour	offset_n_draw_colour	colour box	
	<i>default offset string colour.</i>		
Offset label mode	offset_n_label	choice box	Label the strings heights Do not label the strings heights
	<i>offset string label mode.</i>		

Section_Long_Plot_Boxes_Offset_string_titles_heights_depths_Titles

Titles

Section: Offset String - Title Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

The default title for each set each parameter set, is the string name but this can be changed to just the model name or the model and string name:

Offset string mode	offset_title_mode	choice box	Label with string name Label with model name Label with model->string as name
---------------------------	-------------------	------------	---

offset string title mode.

Use set #		input	
------------------	--	-------	--

set number to be used to define sets of offset parameters i.e. n value

or, for any set, the *offset_title_mode* can be replaced by two lines of user defined title:

First line of offset title	offset_n_title	input	
-----------------------------------	----------------	-------	--

first line of nth offset title

Second line of offset title	offset_n_title_2	input	
------------------------------------	------------------	-------	--

second line of nth offset title

title textstyle	offset_n_title_textstyle	text box	
------------------------	--------------------------	----------	--

nth offset title textstyle

Title colour	offset_n_title_colour	colour box	
---------------------	-----------------------	------------	--

nth offset title colour

Title size (mm)	offset_n_title_size	input	
------------------------	---------------------	-------	--

nth offset title size

Title Y position (mm)	offset_n_title_y_pos	input	
------------------------------	----------------------	-------	--

if set, the height in mm above the bottom of all the boxes that the offset title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the offset heights.

Section_Long_Plot_Boxes_Offset_string_titles_heights_depths_Heights

Heights

Section: Offset String - Height Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	
<i>set number to be used to define sets of offset parameters i.e. n value</i>			
Decimals	offset_n_decimals	input	
<i>number of dec places in nth offset height. < 0 to keep all trailing zeros</i>			
Textstyle	offset_n_textstyle	text box	
<i>textstyle of nth offset height</i>			
Colour	offset_n_colour	colour box	
<i>nth offset height and depth colour</i>			
Size (mm)	offset_n_size	input	
<i>nth offset height size</i>			
Y pos (mm)	offset_n_y_pos	input	
<i>if set, the height in mm above the bottom of all the boxes that the offset height text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the offset heights.</i>			

Section_Long_Plot_Boxes_Offset_string_titles_heights_depths_Depths

Depths

Section: Offset String - Depth Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	
<i>set number to be used to define sets of offset parameters i.e. n value</i>			
Depth label mode	offset_n_depth_label	choice box	Label depths Do not label depths
<i>depth label mode for the nth offset specified by set #.</i>			
First line of depth title	offset_n_depth_title	input	
<i>first line of nth offset depth title</i>			
Second line of depth title	offset_n_depth_title_2	input	
<i>second line of nth offset depth title</i>			
Depth title textstyle	offset_n_depth_title_textstyle	text box	
<i>nth offset depth title textstyle</i>			
Depth title colour	offset_n_depth_title_colour	colour box	
<i>nth offset depth title colour</i>			
Depth title size (mm)	offset_n_depth_title_size	input	
<i>nth offset depth title size</i>			
Depth title Y position (mm)	offset_n_depth_title_y_pos	input	

if set, the height in mm above the bottom of all the boxes that the offset depth title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the offset heights.

Decimals in depth value offset_n_depth_decimals input
number of dec places in offset height. < 0 to keep all trailing zeros

Depth value textstyle offset_n_depth_textstyle text box
nth offset depth textstyle

Depth value colour offset_n_depth_colour colour box
nth offset depth colour

Depth value size (mm) offset_n_size input
nth offset depth size

Depth value Y position (mm) offset_n_depth_y_pos input
if set, the height in mm above the bottom of all the boxes that the offset depth text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the offset heights.

Offset String chainages

Section_Long_Plot_Boxes_Offset_string_chainages

Offset String Chainages

Section: Offset String - Chainage Parameters

The fields and buttons used in this section have the following functions for the nth defined offset string.

Field Description	Parameter name	Type	Pop-Up
Use String <i>if ticked, use offset string.</i>	chainage_n_offset_mode	tick box	
Offset String <i>the value specified by model_name->string_name.</i>	chainage_n_offset_string	select box	
Title line 1 <i>1st line of offset chainage title.</i>	chainage_n_title	input	
Title line 2 <i>second line of offset chainage title.</i>	chainage_n_title_2	input	
Textstyle <i>textstyle for the offset chainage title</i>	chainage_n_title_textstyle	text box	
Colour <i>colour of the offset chainage title</i>	chainage_n_title_colour	colour box	
Text size (mm) <i>size of the offset chainage title</i>	chainage_n_title_size	input	
Text y position (mm) <i>if set, the height in mm above the bottom of all the boxes that the offset chainage title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the chainage.</i>	chainage_n_title_y_pos	input	
Decimal places <i>number of decimal places for offset chainages</i>	chainage_n_decimals	input	
Textstyle <i>textstyle for the offset chainage values</i>	chainage_n_textstyle	text box	
Colour <i>colour of the offset chainage values</i>	chainage_n_colour	colour box	
Text size (mm) <i>size of the offset chainage values</i>	chainage_n_size	input	
Text y position (mm) <i>if set, the height in mm above the bottom of all the boxes that the offset chainage values are drawn. If not set, then the text is placed at a height that puts it inside the default box for the chainage.</i>	chainage_n_y_pos	input	

Super Elevation Diagram

Section_Long_Plot_Boxes_Super_elevation_diagram

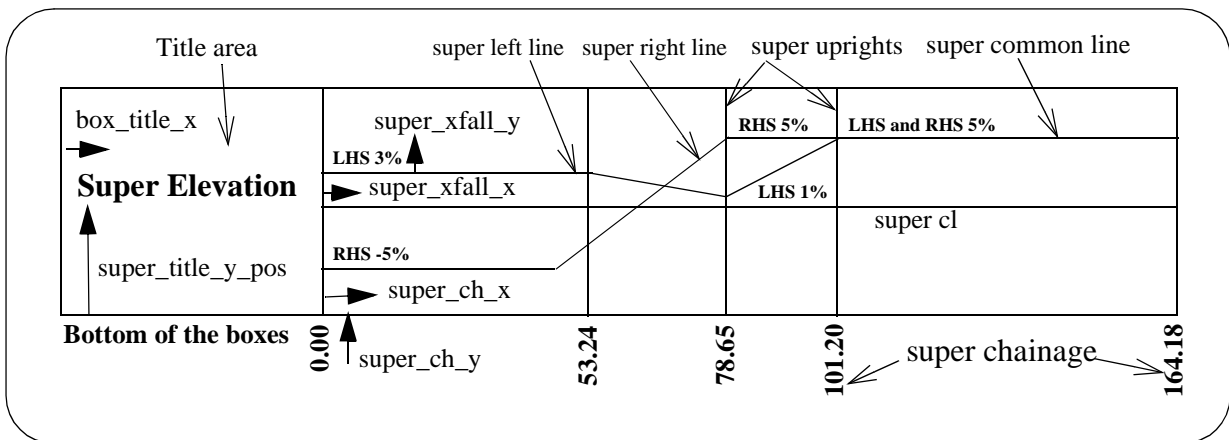

Super Elevation Diagram

Section: Super Elevation Diagram Parameters

The optional *super-elevation diagram* draws the values of the cross-fall (x-fall) between two strings using the primary string as the reference string. The cross-fall at a given chainage on the primary string is calculated by sectioning perpendicular to the reference string at that chainage and cutting the two strings. The cross-fall is defined as the cross-fall between the two cuts points on the strings.

The diagram has levels for the cross fall for a pair of strings on the left of the primary string, and a pair of strings on the right of the primary string. The diagram also has uprights in the super-elevation box with chainage values at the change of super values.

For the left hand side, the cross-fall is calculated at right angles to the primary string between the user given left hinge string and the left edge string.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Super elevation diagram draw mode	super_draw_mode	choice box	don't draw diagram
		mode = 1	draw diagram using super sample interval
		mode = 2	sample super using chainages of x-sec's
		mode = 3	sample super using chainages from a string

super elevation diagram draw mode.

Super sample interval super_sample_interval input
if mode = 1, Chainage distance to sample x-fall. (default 20)

Super sample name super_sample_name input
name to be used in sampling. If mode = 2, name = model_name.

If mode = 3, name = model_name->string_name

Super tolerance super_tolerance input

If super_draw_mode is 1, the change of super is greater than super_tolerance, draw uprights

Section_Long_Plot_Boxes_Super_elevation_diagram_Titles

Titles

Section: Super Elevation Diagram - Title Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

First line of super title	super_title	input	
----------------------------------	-------------	-------	--

1st line of the super title

Super title textstyle	super_title_textstyle	text box	
------------------------------	-----------------------	----------	--

textstyle of super title

Section: Volumes Cut/Fill - Title Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
First line of volume title	volume_title	input	
<i>1st line of the volume title</i>			
Volume title textstyle	volume_title_textstyle	text box	
<i>textstyle of volume title</i>			
Volume title colour	volume_title_colour	colour box	
<i>colour of volume title</i>			

Volume title size (mm) volume_title_size input

size of volume title

Volume title Y position (mm) volume_title_y_pos input

if set, the height in mm above the bottom of all the boxes that the volume title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the volumes.

Section_Long_Plot_Boxes_Volume_cut_fill_Titles_Cut

Cut

Section: Volumes Cut/Fill - Title Cut Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

First line of volume cut title	volume_cut_title	input	
---------------------------------------	------------------	-------	--

1st line of the cut volume title

Volume cut title textstyle	volume_cut_title_textstyle	text box	
-----------------------------------	----------------------------	----------	--

textstyle of cut volume title

Volume cut title colour	volume_cut_title_colour	colour box	
--------------------------------	-------------------------	------------	--

colour of cut volume title

Volume cut title size (mm)	volume_cut_title_size	input	
-----------------------------------	-----------------------	-------	--

size of cut volume title

Volume cut title Y position (mm)	volume_cut_title_y	input	
---	--------------------	-------	--

if set, the height in mm above the default position. If not set, then the text is placed at a height that puts it inside the default box for the cut volumes.

Section_Long_Plot_Boxes_Volume_cut_fill_Titles_Fill

Fill

Section: Volumes Cut/Fill - Title Fill Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

First line of volume fill title	volume_fill_title	input	
--	-------------------	-------	--

1st line of the fill volume title

Volume fill title textstyle	volume_fill_title_textstyle	text box	
------------------------------------	-----------------------------	----------	--

textstyle of fill volume title

Volume fill title colour	volume_fill_title_colour	colour box	
---------------------------------	--------------------------	------------	--

colour of fill volume title

Volume fill title size (mm)	volume_fill_title_size	input	
------------------------------------	------------------------	-------	--

size of fill volume title

Volume fill title Y position (mm)	volume_fill_title_y	input	
--	---------------------	-------	--

if set, the height in mm above the default position. If not set, then the text is placed at a height that puts it inside the default box for the fill volumes.

Section_Long_Plot_Boxes_Volume_cut_fill_Values

Values

Section: Volumes Cut/Fill - Cut Value Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Textstyle <i>textstyle of the cut values.</i>	volume_cut_textstyle	text box	
Colour <i>colour of cut values</i>	volume_cut_text_colour	colour box	
Size (mm) <i>size of cut values</i>	volume_cut_text_size	input	
X position (mm) <i>the x distance to move the cut text from the default cut text position, def 0, it is not used if volume_text_centre_mode= between the uprights</i>	volume_cut_text_x	input	
Y position (mm) <i>the y distance to move the cut text from the default cut text position</i>	volume_cut_text_y	input	
Decimal places <i>number of dec places in cut values.</i>	volume_cut_decimals	input	

Section: Volumes Cut/Fill - Fill Value Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Textstyle <i>textstyle of the fill values.</i>	volume_fill_textstyle	text box	
Colour <i>colour of fill values</i>	volume_fill_text_colour	colour box	
Size (mm) <i>size of fill values</i>	volume_fill_text_size	input	
X position (mm) <i>the x distance to move the fill text from the default fill text position, def 0, it is not used if volume_text_centre_mode= between the uprights</i>	volume_fill_text_x	input	
Y position (mm) <i>the y distance to move the fill text from the default fill text position</i>	volume_fill_text_y	input	
Decimal places <i>number of dec places in fill values.</i>	volume_fill_decimals	input	

Section_Long_Plot_Boxes_Volume_cut_fill_Uprights_Sub_uprights

Uprights/Sub Uprights

Section: Volumes Cut/Fill - Upright Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Draw cut/fill uprights	volume_uprights_draw_mode	choice box	don't draw cut/fill uprights draw cut/fill uprights

upright draw mode.

Colour of uprights	volume_uprights_line_colour	colour box	
---------------------------	-----------------------------	------------	--

colour of uprights

Section: Volumes Cut/Fill - Sub Upright Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Colour of sub uprights	volume_sub_upright_colour	colour box	

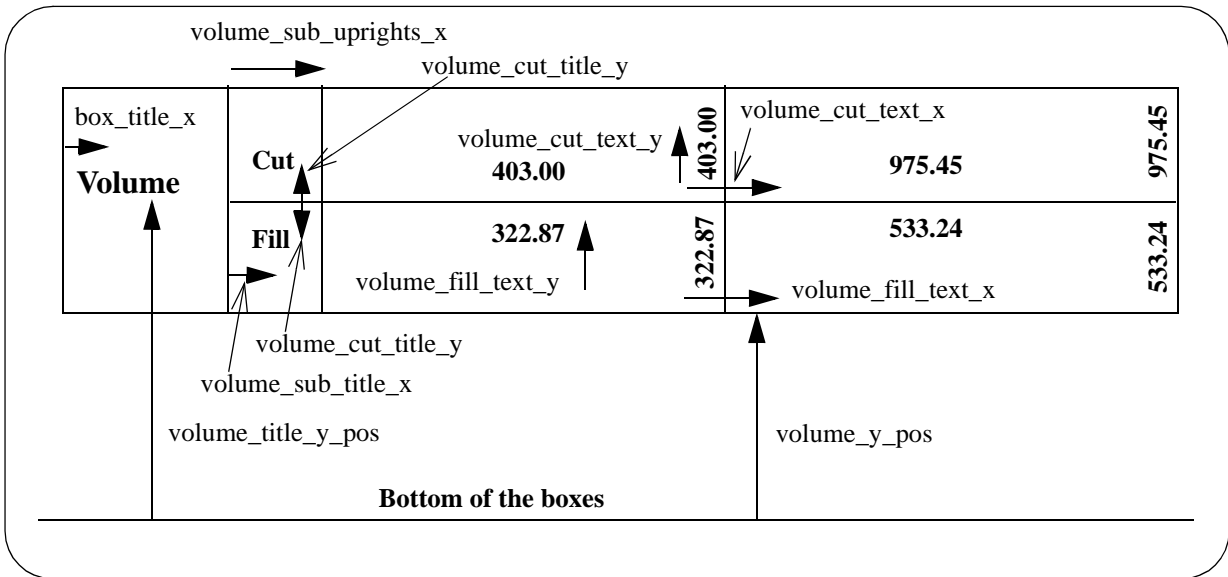

colour of sub uprights line

Sub upright X position (mm)	volume_sub_uprights_x	input	
------------------------------------	-----------------------	-------	--

the x distance to move from the default sub uprights position.

Sub upright title X position (mm)	volume_sub_title_x	input	
--	--------------------	-------	--

the distance to move the sub title text from the volume sub uprights

Section_Long_Plot_Boxes_X_Y

X, Y

Section: X, Y Parameters

The values of the X and Y coordinate for selected chainages can be labelled as separate boxes.

The chainages specified are limited to the base set of chainages already defined in the chainage selection and staggering section. i.e. an upright must exist for the X and Y value to be labelled. Not all of the uprights have to be labelled, just those specified in this section.

There are plot parameters to control all aspects of the X and Y labelling.

Chainages are used for positioning X and Y labels.

The chainages for the long section plot relate to the primary string and are controlled by a set of parameters.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
X, Y order	xy_order	choice box	X before Y Y before X
<i>order to place X and Y boxes. X before Y indicates that the X box will appear closest to the bottom of the boxes and the Y box will be on top of it. Note: The boxes are placed from bottom to top.</i>			
Chord/arc chainage mode	xy_chord_arc	choice box	Do not use chord/arc Use chord/arc chainages
<i>mode to include chord/arc chainages.</i>			
Start chainage	xy_start_chainage	input box	
<i>start chainage of chainage range to be labelled.</i>			
End chainage	xy_end_chainage	input box	
<i>end chainage of chainage range to be labelled.</i>			
Chainage interval	xy_interval	input	
<i>the regular interval (0=no regulars).</i>			
Include tangents, spirals	xy_label_hcp	tick box	
<i>if ticked, include the tangents and spirals.</i>			
Include hip points	xy_label_hip	tick box	
<i>if ticked, include horizontal intersection points.</i>			
Include vip points	xy_label_vip	tick box	
<i>if ticked, include vertical intersection points.</i>			
Include tangent points	xy_label_vtp	tick box	
<i>if ticked, include tangent points.</i>			
Include crest points	xy_label_crest	tick box	
<i>if ticked, include crest points.</i>			
Include sag points	xy_label_sag	tick box	
<i>if ticked, include sag points.</i>			
Include change of vertical grade	xy_label_grade_change	tick box	
<i>if ticked, include changes in vertical grade.</i>			
Chainage weeding tolerance	xy_label_tolerance	input	
<i>if >0 then use as a weeding tolerance, if <=0 don't weed.</i>			
Files of special chainages	xy_special_n_file	file box	

$n = 1$ to 20 - include chainages from the file (one chainage per line)

Section_Long_Plot_Boxes_X_Y_X_parameters

X Parameters

Section: X Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Label X values/titles	x_label	tick box	

if ticked, the X values/titles will be labelled.

Section: X Title Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Title line 1	x_title	input	

1st line of X title.

Title line 2	x_title_2	input	
---------------------	-----------	-------	--

second line of X title.

Textstyle	x_title_textstyle	text box	
------------------	-------------------	----------	--

textstyle for the X title

Colour	x_title_colour	colour box	
---------------	----------------	------------	--

colour of the X title

Text size (mm)	x_title_size	input	
-----------------------	--------------	-------	--

size of the X title

Text y position (mm)	x_title_y_pos	input	
-----------------------------	---------------	-------	--

if set, the height in mm above the bottom of all the boxes that the X title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the X labels.

Section: X Value Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Decimal places	x_label_decimals	input	

number of decimal places for X values

Textstyle	x_label_textstyle	text box	
------------------	-------------------	----------	--

textstyle for the X values

Colour	x_label_colour	colour box	
---------------	----------------	------------	--

colour of the X values

Text size (mm)	x_label_size	input	
-----------------------	--------------	-------	--

size of the X values

Text y position (mm) x_label_y_pos input

if set, the height in mm above the bottom of all the boxes that the X values are drawn. If not set, then the text is placed at a height that puts it inside the default box for the X labels.

Section_Long_Plot_Boxes_X_Y_Y_parameters

Y Parameters

Section: Y Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Label Y values/titles	y_label	tick box	

if ticked, the Y values/titles will be labelled.

Section: Y Title Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Title line 1	y_title	input	

1st line of Y title.

Title line 2	y_title_2	input	
---------------------	-----------	-------	--

second line of Y title.

Textstyle	y_title_textstyle	text box	
------------------	-------------------	----------	--

textstyle for the Y title

Colour	y_title_colour	colour box	
---------------	----------------	------------	--

colour of the Y title

Text size (mm)	y_title_size	input	
-----------------------	--------------	-------	--

size of the Y title

Text y position (mm)	y_title_y_pos	input	
-----------------------------	---------------	-------	--

if set, the height in mm above the bottom of all the boxes that the Y title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the Y labels.

Section: Y Value Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Decimal places	y_label_decimals	input	

number of decimal places for Y values

Textstyle	y_label_textstyle	text box	
------------------	-------------------	----------	--

textstyle for the Y values

Colour	y_label_colour	colour box	
---------------	----------------	------------	--

colour of the Y values

Text size (mm)	y_label_size	input	
-----------------------	--------------	-------	--

size of the Y values

Text y position (mm) y_label_y_pos input

if set, the height in mm above the bottom of all the boxes that the Y values are drawn. If not set, then the text is placed at a height that puts it inside the default box for the Y labels.

Chainage/Staggering

Section_Long_Plot_Chainage_Staggering

Chainage/Staggering

Section: Chainage/Staggering - Chainage Parameters

Chainages are used for positioning height labels, uprights (leader lines) and bubbles. The chainages for the long section plot relate to the primary string

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Chord/arc chainage mode chainages	chord_arc	choice box	Do not use chord/arc Use chord/arc chainages

mode to include chord/arc chainages.

Chainage interval chainage_interval input

the regular interval (0=no regulars).

Include start and end chainages

chainage_label_ends tick box

if ticked, include the start and end chainages.

Include tangents, spirals chainage_label_hcp tick box

if ticked, include the tangents and spirals.

Include hip points chainage_label_hip tick box

if ticked, include horizontal intersection points.

Include vip points chainage_label_vip tick box

if ticked, include vertical intersection points.

Include tangent points chainage_label_vtp tick box

if ticked, include tangent points.

Include crest points chainage_label_crest tick box

if ticked, include crest points.

Include sag points chainage_label_sag tick box

if ticked, include sag points.

Include change of vertical grade chainage_label_grade_change tick box

if ticked, include changes in vertical grade.

Chainage weeding tolerance chainage_label_tolerance input

if >0 then use as a weeding tolerance, if <=0 don't weed.

Merge in bubble chainages chainage_merge_bubbles tick box

if ticked, merge in bubble chainages.

Weeding tolerance after bubble merge chainage_merge_tolerance input

if > 0, weed after merge using specified weeding tolerance. If <= 0, don't weed after merge.

Files of special chainages chainage_special_n_file file box

n = 1 to 20 - include chainages from the file (one chainage per line)

Section_Long_Plot_Chainage_Staggering_Staggering Staggering

Section: Chainage/Staggering - Staggering Parameters

If the real chainage position is used for the horizontal position of the chainage/height/depth text, text over writing can easily occur.

To prevent over writing, the text can be **staggered**.

If the *stagger_mode* parameter is set to 1, the text position is adjusted so that the text does not over write.

The real chainage position is then indicated by the chainage markers which are drawn at the top of the text boxes from the staggered text position back to the actual chainage position of the text.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Stagger mode	stagger_mode	choice box	no staggering, allow over writing Stagger text

stagger mode.

Distance from boxes to top of staggers (mm)

stagger_gap_top input

distance from the top of boxes to top of staggers in mm.

Distance from boxes to bottom of staggers (mm)

stagger_gap_bottom input

distance from the top of boxes to bottom of staggers in mm.

Stagger gap factor stagger_gap_factor input

*distance between staggers is box_text_size * stagger_gap_factor*

When staggering occurs, it is possible for the heights area to be longer than the graph area.

Uprights

Section_Long_Plot_Uprights

Uprights

Section: Upright Parameters

Uprights, or leader lines, can be drawn from the top of the staggers to the strings drawn on the plot.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Upright draw mode	uprights_draw_mode	choice box	<i>none</i> max string height to stagger height uprights_y above boxes to primary string tin 1 tin 2 tin 3 tin 4 tin 5 tin 6 tin 7 tin 8 tin 9 tin 10 to offset 1 to offset 2 to offset 3 to offset 4 to offset 5 to offset 6 to offset 7 to offset 8 to offset 9 to offset 10

upright draw mode.

Uprights Y distance (mm) uprights_y input

*distance to draw the uprights for **uprights_draw_mode** = "to **uprights_y** above boxes"*

Uprights colour uprights_colour colour box

uprights colour. Default is box_colour

Uprights bottom mode uprights_bottom_mode choice box stop at top of boxes
draw to bottom of boxes
draw to **uprights_bottom_y**

below top of boxes
 draw to uprights_bottom_y
 above bottom of boxes
 ticks at chainage

Upright draw mode below top of boxes.

Uprights bottom Y distance (mm) `uprights_bottom_y` input
distance in mm.

Uprights text offset factor `uprights_text_offset_factor` input
 move the text by this factor**size*.

When uprights go below the top of the boxes, the height and offset text is moved to the left so that the upright does not go through the text. The left hand side of the heights boxes also moves to the left to leave room for the height text.

Datum Area

Section_Long_Plot_Datum_area

Datum Area

The **datum area** is the region between the boxes area and the graph area.

Section: Datum Area - Datum Value Mode

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use manual datum	manual_datum	tick box	

if ticked the datum will be calculated internally, else use the datum_value parameter for the datum.

Datum value	datum_value	input	
--------------------	-------------	-------	--

the value to be used for the datum.

Datum roundoff	datum_roundoff	input	
-----------------------	----------------	-------	--

the value to roundoff the datum value.

Decimal places for datum	datum_decimals	input	
---------------------------------	----------------	-------	--

If > 0, trailing zeros are removed after the decimal point. If < 0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed

Section: Datum Area - Other Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Datum name	datum_name	input	

text to write before the datum value

Graph area to datum line gap (mm)

datum_above_gap	input
-----------------	-------

distance from the bottom of the graph area to the datum line.

Datum line gap to top of boxes (mm)

datum_below_gap	input
-----------------	-------

distance from datum line to top of boxes.

The **datum line** is positioned the distance *datum_below_gap* above the top of the boxes area and the graph area is positioned the distance *datum_above_gap* above the datum line.

Hence the graph area is distance (*datum_below_gap* + *datum_above_gap*) above the top of the boxes area.

The *datum_below_gap* and *datum_above_gap* can be zero or positive.

Datum linestyle	datum_linestyle	linestyle box
------------------------	-----------------	---------------

datum line linestyle (default solid)

Datum textstyle	datum_textstyle	text box
------------------------	-----------------	----------

textstyle for datum information

Datum text size (mm)	datum_text_size	input
-----------------------------	-----------------	-------

size of datum text and value (mm)

Datum colour	datum_colour	colour box
---------------------	--------------	------------

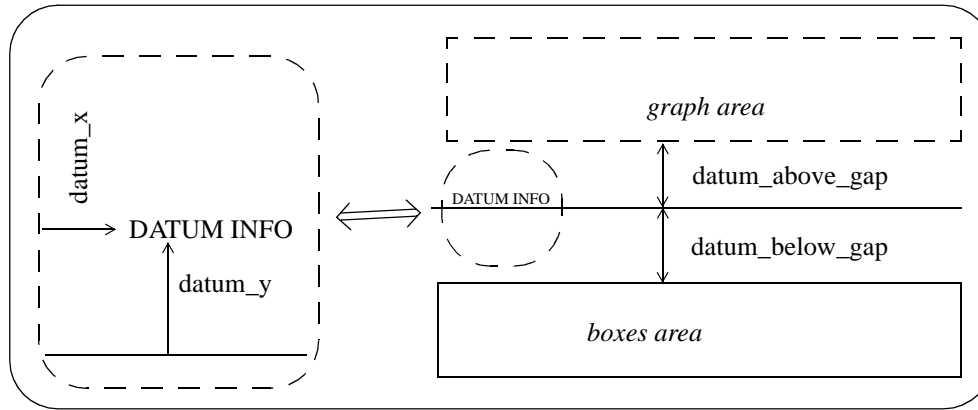

colour of the datum text and line.

X adjustment (mm) datum_x input

distance to move the datum text along the datum line

Y adjustment (mm) datum_y input

distance to raise the datum text above the datum line

Graph Area

Section_Long_Plot_Graph_area

Graph Area

The graph area sits on top of the boxes and datum areas, so there may not be enough room left on the sheet for the full plot height. In this case, the plot will be truncated at the top of the allowed graph area.

Section: Graph Area - Extra space parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Extra space units	extra_space_units	choice box	world units millimetres

units for specifying extra space.

Extra space left (units) extra_space_left input

distance to subtract from left of plot area

Extra space right (units) extra_space_right input

distance to add to right of plot area

Extra space top (units) extra_space_top input

distance to add to top of plot area

Extra space bottom (units) extra_space_bottom input

distance to subtract from bottom of plot area

Corridors

Section_Long_Plot_Corridors

A corridor around the primary string is defined by giving a left and right corridor width.

Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, it is drawn on the long section plot.

To be drawn, strings do not have to cross the primary string, but just be in the corridor.

Panel field	Parameter name	Type
Left corridor width (world units)		
	corridor_width_left	input
<i>left corridor width</i>		
Right corridor width (world units)		
	corridor_width_right	input
<i>right corridor width</i>		
Left corridor overlap (world units)		
	corridor_overlap_left	input
<i>left corridor overlap</i>		
Right corridor overlap (world units)		
	corridor_overlap_right	input
<i>right corridor overlap</i>		
Chord-arc tolerance (world units)		
	corridor_chord_arc	input
<i>chord-arc tolerance used near any bends in the corridor.</i>		

Model selection

Panel field	Parameter name	Type
Corridor model	corridor_model_n	model box

models containing tins and service strings to be drawn on the section. Where n = 1, 2, ... ,100 given by line number on grid.

Bubbles

Section_Long_Plot_Bubbles

Bubbles

Section: Bubble Definition Parameters

Circles with the string name and a unique number (**bubbles**) can be drawn on the long section plot. Bubbles are normally used for lip profiles.

The chainages used for the bubbles are given by a set of parameters similar to the chainage parameters. The resulting set of bubbles are sequentially numbered (starting with one) in chainage order.

Although many bubbles can be defined by the bubble parameters, a bubble is only drawn on the plot if there is a labelled chainage to draw it above.

Hence not all bubbles given by the bubble chainage parameters are drawn but for the ones that are drawn, the bubble number is taken from the full bubble set.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Bubble draw mode <i>draw bubble mode</i>	chainage_bubbles	choice box	Do not draw bubbles Draw bubbles
Bubble radius <i>radius of the bubbles</i>	bubble_radius	input	
Bubble colour <i>colour of the bubbles</i>	bubble_colour	colour box	
Bubble upright mode <i>draw bubble upright mode</i>	bubble_draw_upright	choice box	Do not draw bubble upright Draw bubble upright
Bubble start chainage <i>start chainage bubbles</i>	bubble_start_chainage	input	
Bubble end chainage <i>end chainage bubbles</i>	bubble_end_chainage	input	
Chord/arc chainage mode <i>chord/arc chainage mode</i>	bubble_chord_arc	choice box	Do not use chord/arc chainages Use chord/arc chainages
Bubble interval <i>include regular interval for bubbles</i>	bubble_interval	input	

Section_Long_Plot_Bubbles_Text

Text

Section: Bubble Definition - Text Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up

Section_Long_Plot_Bubbles_Label

Label

Section: Bubble Definition - Label Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Include tangents, spirals <i>if ticked, include the tangents and spirals.</i>	bubble_label_hcp	tick box	
Include hip points <i>if ticked, include horizontal intersection points.</i>	bubble_label_hip	tick box	
Include vip points <i>if ticked, include vertical intersection points.</i>	bubble_label_vip	tick box	
Include tangent points	bubble_label_vtp	tick box	

if ticked, include tangent points.

Include crest points bubble_label_crest tick box

if ticked, include crest points.

Include sag points bubble_label_sag tick box

if ticked, include sag points.

Include change of vertical grade

 bubble_label_grade_change tick box

if ticked, include changes in vertical grade.

Bubble weeding tolerance

 bubble_label_tolerance input

if >0 then use as a weeding tolerance, if <=0 don't weed.

Files of special chainages

 bubble_special_n_file file box

n = 1 to 20 - include chainages from the file (one chainage per line)

Quick Horizontal Geometry

Section_Long_Plot_Quick_horizontal_geometry

Quick Horizontal Geometry

Section: Quick Horizontal Geometry

The standard horizontal geometry arrows can be drawn at a given distance above the top of the boxes area.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Distance above boxes (mm) <i>distance above boxes for drawing of arrows</i>	horizontal_geometry_y	input	

Section: Quick Horizontal Geometry - Left Side Label Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type
Text <i>text for label</i>	horizontal_geometry_label_text	input
Textstyle <i>textstyle of label</i>	horizontal_geometry_label_textstyle	text box
Text colour <i>colour of label</i>	horizontal_geometry_label_text_colour	colour box
Text size (mm) <i>size of label</i>	horizontal_geometry_label_text_size	input

Section: Quick Horizontal Geometry - Arrow and text Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type
Text colour <i>colour of arrow text</i>	horizontal_geometry_arrow_text_colour	colour box
Textstyle <i>textstyle of arrow text</i>	horizontal_geometry_arrow_textstyle	text box
Text size (mm) <i>size of arrow text</i>	horizontal_geometry_arrow_text_size	input
Decimal places <i>number of decimal places in arrow text</i>	horizontal_geometry_label_decimals	input
Arrow colour <i>colour of arrow</i>	horizontal_geometry_arrow_colour	colour box
Arrow height (mm) <i>size of arrow</i>	horizontal_geometry_arrow_height	input

Extensive Horizontal Geometry

Section_Long_Plot_Extensive_horizontal_geometry

Extensive Horizontal Geometry

Section: Extensive Horizontal Geometry Parameters

The standard horizontal geometry arrows can be drawn at a given distance above the top of the boxes area.

For complicated horizontal geometry labelling, there are sets of horizontal geometry labelling parameters which give tight control over the position and types of labels.

It is also possible to label the horizontal geometry of *alignment* strings other than the primary string. To plot such a string on the same plot, the chainage position of the horizontal geometry for the non-primary alignment strings is *projected* onto the primary string to give a primary string chainage for plotting. The values of the horizontal geometry (such as radius and spiral length) that are plotted are taken from the other string. Independently graded offset strings (such as a left and right kerbs) are the type of additional alignment strings that may need to be plotted on the same long section plot as the reference string (primary string).

For plotting horizontal geometry, the user can give up to twenty sets of these labels and they can be used to label spirals, curves and tangent information for the primary string and/or additional alignment strings.

Each label set consists of three parts:

- (a) a text label on the left hand side of the plot
- (b) an arrow
- (c) text on the arrows.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Define set #		input	

where n = 1 to....20. The set enables the specification of a number of parameters for a number of specified extensive horizontal geometry.

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Geometry to label	h_g_n_type	choice box	label spirals label horizontal curves label horizontal tangents
--------------------------	------------	------------	---

specifies what geometry is to be labelled for the nominated set. If h_g_n_type is missing, then the set is ignored.

Value to label	h_g_n_value_mode	choice box	nothing length radius (for curve labelling) or radius*length (for spiral)
-----------------------	------------------	------------	--

specifies the value to label.

Y offset (mm)	h_g_n_label_y	input	
----------------------	---------------	-------	--

distance of arrow line above top of the boxes.

If the set of parameters is to apply to the horizontal geometry of an alignment string *other* than the primary string, then the offset string can be specified.

Offset string	h_g_n_offset_string	select box	
----------------------	---------------------	------------	--

the name of the non-primary string, i.e.

`h_g_n_offset_string` "model->string_name"
 or
`h_g_n_offset_string` "string_name"

and the model is the *defined by offset_model*. *offset_model* has been defined in the section "Offset String Titles/Heights/Depths".

If the *h_g_n_offset_string* parameter does not exist, then the set of horizontal geometry parameters is applied to the primary string.

Section_Long_Plot_Extensive_horizontal_geometry_Left_hand_labels

Section: Extensive Horizontal Geometry - Left Hand Labels Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	

set #, as specified by the define set # parameter.

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Label X (mm)	<code>h_g_n_label_x</code>	input	
---------------------	----------------------------	-------	--

distance from the left hand side of the labels area to start the left hand label text.

Offset (mm)	<code>h_g_n_label_offset</code>	input	
--------------------	---------------------------------	-------	--

distance to raise the left hand label text above arrow line.

Text size (mm)	<code>h_g_n_label_text_size</code>	input	
-----------------------	------------------------------------	-------	--

size of the left hand label text.

Text colour	<code>h_g_n_label_text_colour</code>	colour box	
--------------------	--------------------------------------	------------	--

size of the left hand label text.

Text	<code>h_g_n_label_text</code>	input	
-------------	-------------------------------	-------	--

left hand label text.

Textstyle	<code>h_g_n_label_textstyle</code>	text box	
------------------	------------------------------------	----------	--

textstyle for the left hand label text.

vertical_geometry_arrow_length_text_size
input

size of length arrow labels

Extensive Vertical Geometry

Section_Long_Plot_Extensive_vertical_geometry

Extensive Vertical Geometry

Section: Extensive Vertical Geometry Parameters

For complicated vertical geometry labelling of the *primary alignment* string, there are sets of vertical geometry labelling parameters which give tight control over the position and types of labels.

It is also possible to label the vertical geometry of *alignment* strings other than the primary string. To plot such a string on the same plot, the chainage position of the vertical geometry for the non-primary alignment strings is *projected* onto the primary string to give a primary string chainage for plotting. The values of the vertical geometry (such as grade and curve length) that are plotted are taken from the other string. Independently graded offset strings (such as a left and right kerbs) are the type of additional alignment strings that may need to be plotted on the same long section plot as the reference string (primary string).

For plotting vertical geometry, the user can give up to twenty sets of these labels and they can be used to label grades or vertical curve information for the primary string and/or additional alignment strings.

Each label set consists of three parts:

- a text label on the left hand side of the plot
- an arrow
- text on the arrows.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Define set #		input	

where n = 1 to....20. The set enables the specification of a number of parameters for a number of specified extensive horizontal geometry.

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Geometry to label	v_g_n_type	choice box	label grades label vg curve information
--------------------------	------------	------------	--

specifies what geometry is to be labelled for the nominated set. If v_g_n_type is missing, then the set is ignored.

Value to label	v_g_n_value_mode	choice box	nothing %grade or parab length, arc length 1 in grade or radius mm grade or K value ch length between curve points per chord(QR) or curve constant (QR).
-----------------------	------------------	------------	--

specifies the value to label. This will be dependant on the v_g_n_type chosen.

Vertical curve points to draw the arrows between (for grade labelling only)

Points to draw arrows between

v_g_n_between_mode choice box between chainages at the vips between chainages at the vtps

specifies where to draw the arrows between (for grade labelling only).

Y offset (mm) v_g_n_label_y input
distance of arrow line above top of the boxes. This value can be negative

If the set of parameters is to apply to the vertical geometry of an alignment string *other* than the primary string, then the following parameter can define the other alignment string

Offset string v_g_n_offset_string select box
the name of the non-primary string. i.e.

v_g_n_offset_string "model->string_name"
 or
 v_g_n_offset_string "string_name"

and the model is the *defined by offset_model*. *offset_model has been defined in the section “Offset String Titles/Heights/Depths”* .

If the *v_g_n_offset_string* parameter does not exist, then the set of vertical geometry parameters is applied to the primary string.

Section_Long_Plot_Extensive_vertical_geometry_Left_hand_labels

Section: Extensive Vertical Geometry - Left Hand Labels Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	

set #, as specified by the define set # parameter.

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Label X (mm) v_g_n_label_x input
distance from the left hand side of the labels area to start the left hand label text.

Offset (mm) v_g_n_label_offset input
distance to raise the left hand label text above arrow line.

Text size (mm) v_g_n_label_text_size input
size of the left hand label text.

Text colour v_g_n_label_text_colour colour box
size of the left hand label text.

Text v_g_n_label_text input
left hand label text.

Textstyle v_g_n_label_textstyle text box
textstyle for the left hand label text.

Symbol draw mode	symbol_n_draw_mode	choice box	height above boxes (mm)
			cross (0)
			upright from centre of box (1)
			up and downright from centre of box (2)
			square (3)
			triangle, base at bottom (4)
			circle (5)

draw mode for symbol

Hatching Cut/Fill

Section_Long_Plot_Hatching_cut_fill

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins may be hatched.

Panel Field	Parameter name	Type
Define Set #		input
	<i>set number to be used to define different original/new tin sets.</i>	
Original tin	hatch_original_tin_n	tin box
	<i>tin_name for original surface</i>	
New tin	hatch_new_tin_n	tin box
	<i>tin_name for final surface</i>	

Notes

- cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- cut hatching is turned off by setting *hatch_cut_separation_n* to 0.0.
fill hatching is turned off by setting *hatch_fill_separation_n* to 0.0.

Section_Long_Plot_Hatching_cut_fill_Cut

	<i>draw mode for sides of new tin in fill.</i>	

Cuts

Section_Long_Plot_Cuts

The cuts that the primary string (design line) makes through strings in any user-specified model can be automatically labelled on the long section plots.

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol**. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the:

- top of the boxes on the long section,
- height value of the cut string,
- height of the primary string,
- height of a tin.

The actual position of the label is defined relative to the above point.

Note: Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings. For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose names match the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

Panel Field	Parameter name	Type
Define Set #		input
	<i>set number to be used to define different model/mask sets.</i>	
Model	cuts_n_model	model box
	<i>model from which cut masks are derived</i>	
Name mask	cuts_n_mask	input

text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.

For example: "ke" or,
"?bank*" or, if both masks are required,
"ke* ?bank*"*

If cuts_n_mask is blank, then all strings in the model are used. This is equivalent to name mask being

set to "*".

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the design string, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the nth set.

justification of the label.

Section_Long_Plot_Cuts_Symbols

Symbols

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
	<i>set number as specified in the Define set#.</i>		
Mode	cuts_symbol_n_mode	choice box	cross (0) up from centre of box (1) up&down from box centre(2) square (3) triangle, base at bottom (4) circle (5) use a plot symbol

symbol mode.

Note: *If a plot symbol is to be used, the cuts_symbol_n_style parameter must be specified.*

Symbol	cuts_symbol_n_style	plot symbols
---------------	---------------------	--------------

a valid plot symbol can be selected.

Position	cuts_symbol_n_position	choice box	at cut string height above top of boxes above top of graph area to primary string to tin 1 to tin 2 to tin 3 to tin 4 to tin 5
-----------------	------------------------	------------	--

to tin 6
to tin 7
to tin 8
to tin 9
to tin 10

position of symbol.

X (mm)	cuts_symbol_n_x	input
	<i>horizontal adjustment to position of symbol.</i>	
Y (mm)	cuts_symbol_n_y	input
	<i>vertical adjustment to position of symbol.</i>	
Angle (dms)	cuts_symbol_n_angle	input
	<i>rotation of symbol about point.</i>	
Colour	cuts_symbol_n_colour	colour box
	<i>colour of symbol.</i>	
Size (mm)	cuts_symbol_n_size	input
	<i>size of symbol. A value of 0 means no symbol.</i>	

Primary String Name Label

Section_Long_Plot_Primary_string_name_label

The plot can be labelled with a name under the boxes area.

The name is made up of a concatenation of the text string names:

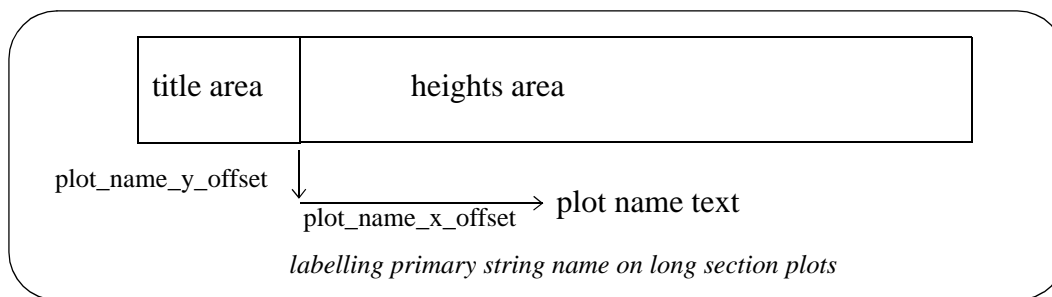

Panel Field	Parameter name	Type
Name mode	plot_name_string_name	choice box
	<i>determines what text is placed in the name labels.</i>	
Pre-text	plot_name_pre_text	input
	<i>text before label.</i>	
Post-text	plot_name_post_text	input
	<i>text after label.</i>	
Textstyle	plot_name_textstyle	text box
	<i>textstyle of label.</i>	
Size (mm)	plot_name_size	input
	<i>size of label.</i>	
Colour	plot_name_colour	colour box
	<i>colour of label.</i>	
X offset (mm)	plot_name_x_offset	input
	<i>horizontal adjustment to position of label.</i>	
Y offset (mm)	plot_name_y_offset	input
	<i>vertical adjustment to position of label.</i>	

The plot name is positioned under the boxes.

The *plot_name_x_offset* is measured from the beginning of the height boxes.

The default for *plot_name_x_offset* is centred on heights area.

The *plot_name_y_offset* is measured from the bottom of the box area with positive being down.

Scale labelling

The plot can be labelled with the horizontal and vertical scale under the boxes area.

The scale label is made up of concatenation the text strings:

scale_horizontal_pre_text horizontal scale value *scale_horizontal_post_text*
 and
scale_vertical_pre_text vertical scale value *scale_vertical_post_text*

The horizontal scale value is the value given by the scale parameter.

The scales are positioned under the boxes.

Section_Long_Plot_Scale_labelling

Section_Long_Plot_Scale_labelling_Horizontal

Horizontal

Section: Scale Labelling - Horizontal Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Pre-text <i>text before label</i>	<i>scale_horizontal_pre_text</i>	input	
Post-text <i>text after label</i>	<i>scale_horizontal_post_text</i>	input	
Textstyle <i>textstyle of label</i>	<i>scale_horizontal_textstyle</i>	text box	
Size (mm) <i>size of label</i>	<i>scale_horizontal_size</i>	input	
Colour <i>colour of label</i>	<i>scale_horizontal_colour</i>	colour box	
X offset (mm) <i>horizontal adjustment to position of label.</i>	<i>scale_horizontal_x_offset</i>	input	
Y offset (mm) <i>height adjustment to position of label.</i>	<i>scale_horizontal_y_offset</i>	input	
Decimal places	<i>scale_horizontal_decimals</i>	input	

height adjustment to position of label.

Section_Long_Plot_Scale_labelling_Vertical

Vertical

Section: Scale Labelling - Vertical Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Pre-text <i>text before label</i>	scale_vertical_pre_text	input	
Post-text <i>text after label</i>	scale_vertical_post_text	input	
Textstyle <i>textstyle of label</i>	scale_vertical_textstyle	text box	
Size (mm) <i>size of label</i>	scale_vertical_size	input	
Colour <i>colour of label</i>	scale_vertical_colour	colour box	
X offset (mm) <i>horizontal adjustment to position of label.</i>	scale_vertical_x_offset	input	
Y offset (mm) <i>height adjustment to position of label.</i>	scale_vertical_y_offset	input	
Decimal places <i>height adjustment to position of label.</i>	scale_vertical_decimals	input	

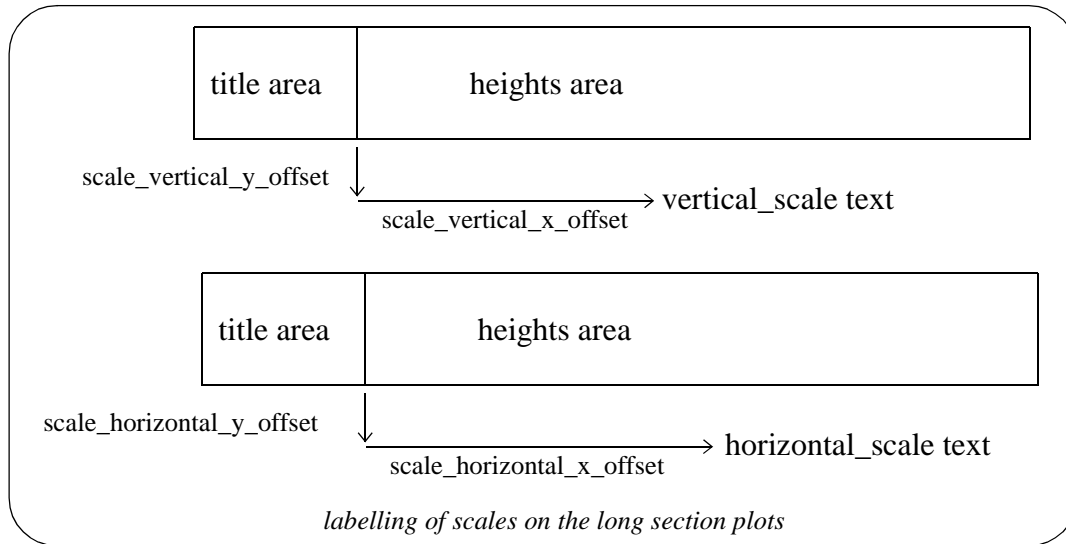

The *scale_vertical_x_offset* and *scale_horizontal_x_offset* are measured from the beginning of the heights area.

The default for *scale_vertical_x_offset* and *scale_horizontal_x_offset* are centred on the heights area.

The *scale_vertical_y_offset* and *scale_horizontal_y_offset* are measured from the bottom of the box area with positive being **down**.

If the **number of decimal places is greater than zero (> 0)**, then any trailing zeros after the decimal point are removed.

If the **number of decimal places is less than zero (< 0)**, the absolute value is taken as the number of decimal places and **no** trailing zeros after the decimal point are removed.

PPF's To Include

Section_Long_Plot_PPF_s_to_include

Panel Field	Parameter name	Type	Pop-Up
PPF files		input	

by including pre existing PPF files, the user can build up a modified version without having to set all the parameters.

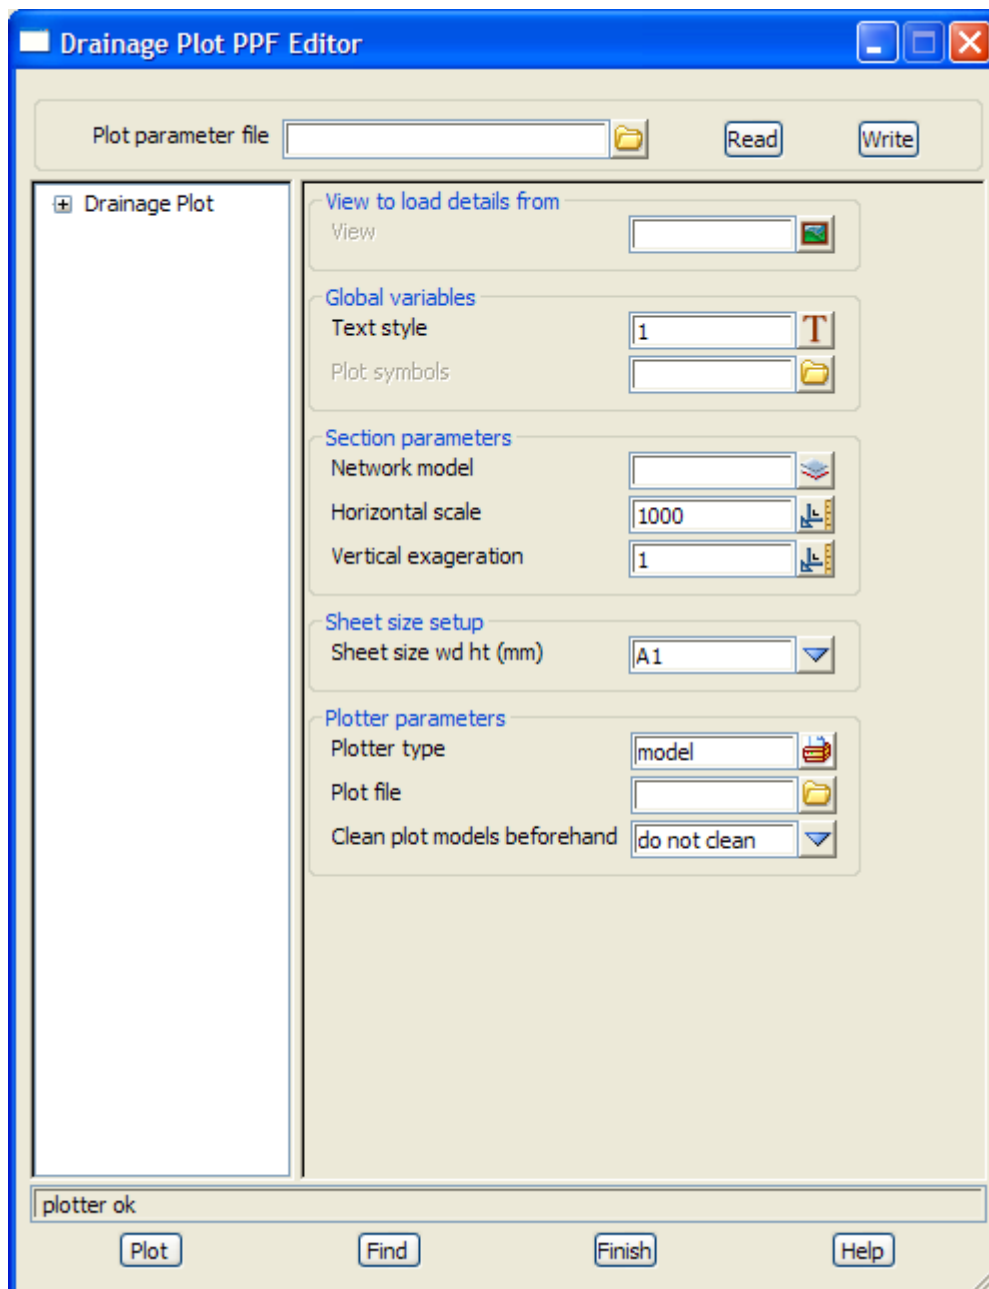

Drainage Plot PPF Editor

drainage_plot_ppf_editor

Position of option on menu: Plot =>Drainage Plot PPF Editor

The **drainage plot ppf editor** is for creating and/or editing a (binary) drainage and sewer long section ppf file and for creating a drainage and/or sewer long section plot. An ascii version of the file is also produced.

Note: binary and ascii ppf's are stored *within* the project (not in the folder containing the project). On selecting the Drainage plot ppf editor option, the **Drainage Plot PPF Editor** panel is displayed.

Panel field

Type

Plot parameter file

file box

name for the binary plot parameter file to read in or write out.

Read button

read the given plot parameter file in.

Write button

write out the plot parameters to the given plot parameter file. An ascii ppf file is also written out.

Plot button

use the plot parameters from the panel to create the plot.

Find button

brings up a search box. If a valid parameter name is keyed in followed by the enter key, the cursor will be placed in the appropriate field on the appropriate page.

Drainage Plot

Drainage_Plot

View to load details from

Panel field	Type	Pop-Up
View	view box	existing section views

on selection of an existing section view, the vertical exaggeration, network model to profile, corridor models and corridor settings from that section view are loaded into the ppf editor. The section view itself is not stored as a parameter in the ppf editor. It is only for convenience, in order to populate certain other parameters easily in the ppf editor, based on a particular section view that may currently exist.

Global variables

Panel field	Parameter name	Type	Pop-Up
Text style	global_textstyle	textstyle	available fonts
<i>default text style.</i>			
Plot Symbols	plot_symbols	file box	available symbol files
<i>specify a plot symbol file if it exists.</i>			

Section parameters

Panel field	Parameter name	Type	Pop-Up
Network model	network_model	model box	available models
<i>model containing the drainage strings to plot.</i>			
Horizontal scale	scale	input	
<i>horizontal scale to be used for the plot.</i>			
Vertical exaggeration	vertical_exaggeration	input	
<i>vertical exaggeration to be used for the plot.</i>			

Sheet size setup

The plot **page** or **sheet** is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

Panel field	Parameter name	Type	Pop-Up
Sheet size wd ht (mm)	sheet_size	sheet size	available sheet sizes

sheet size to plot on.

Plotter parameters

Panel field	Parameter name	Type	Pop-Up
Plotter type	plotter_type	plotter box	available plotter types

plotter type to plot to.

Plot file stem	plot_stem	input	
-----------------------	-----------	-------	--

plot file name stem. A number is appended to the stem for each sheet plotted. The appropriate file extension is added dependant on the plotter type selected.

Clean plot models beforehand

plot_model_clean	choice box	do not clean prompt for clean always clean
------------------	------------	--

whether to clean (delete the elements in) any resultant plot models that may already exist, before generating the plot(s). This parameter is only applicable if plotting to a model or models. Note that if the models are cleaned using this parameter, any non-plot or locked elements found in the models will not be cleaned from the models, and the plot job will be cancelled.

Title block

Drainage_Plot_Title_block

Common title block parameters

Panel field	Parameter name	Type
Standard title	plot_border	tick box

if ticked, a standard 12d title block will be used.

Use title file	use_title_file	tick box
-----------------------	----------------	----------

if ticked, a user defined title file is used.

Title line 1	title_1	input
---------------------	---------	-------

if **Standard title** is ticked, **Title line 1** is the first line of title text. If **Use title file** is ticked, **Title line 1** is substituted for the title block variable \$title_1.

Title line 2	title_2	input
---------------------	---------	-------

if **Standard title** is ticked, **Title line 2** is the second line of title text. If **Use title file** is ticked, **Title line 2** is substituted for the title block variable \$title_2.

12d default title block parameters

Panel field	Parameter name	Type	Pop-Up
Text size	title_text_size	input	

text size of title text.

Text colour	title_colour	colour	available colours
--------------------	--------------	--------	-------------------

colour of title text.

Drainage_Plot_Title_block_User_title_info

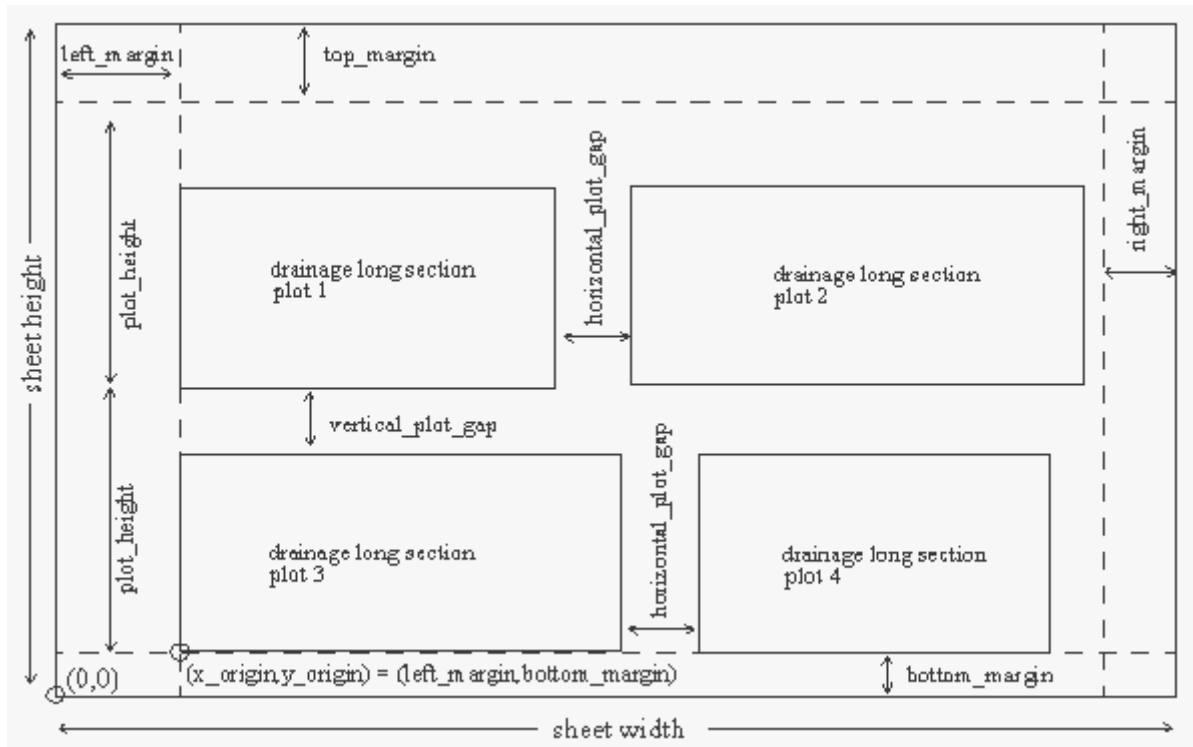

User title info

The parameters shown below are subject to the appropriate title block variables existing in the title file. For more information on these variables see the section "Title Block Variables".

Panel field	Parameter name	Type	Pop-Up
Title file	title_file	file box	available title files
<i>specifies the name of the title file to use. If a valid title file exists, the specified Name values will be filled out in the grid using the title block variable \$user_text_n.</i>			
Name		output	
<i>the alias for the nth user text specified in the title file.</i>			
Value	user_text_n	input	
<i>the alias text to be substituted in for the user text specified.</i>			
Time format	time_format	input	
<i>the time format relates to the \$time title block variable. For more information on the time formats see the section "Specifying the Format for \$time".</i>			
Start page number	start_page_number	input	
<i>used as the starting value for the title block variable \$page_number. If missing, \$page_number starts at 1.</i>			
Start drawing number	start_drawing_number	input	
<i>used as the starting value for the title block variable \$drawing_number. If missing, \$drawing_number starts at 1.</i>			
Drawing number prefix	drawing_number_prefix	input	
<i>the value entered is used for the title block variable \$drawing_number_prefix.</i>			
Drawing number postfix	drawing_number_postfix	input	
<i>the value entered is used for the title block variable \$drawing_number_postfix.</i>			

Plot sheet layout

[Drainage_Plot_Plot_sheet_layout](#)

Drainage_Plot_Plot_sheet_layout_Margins

Margins

Panel field	Parameter name	Type
Left (mm)	left_border_gap	input
<i>left border gap (in millimetres).</i>		
Right (mm)	right_border_gap	input
<i>right border gap (in millimetres).</i>		
Top (mm)	top_border_gap	input
<i>top border gap (in millimetres).</i>		
Bottom (mm)	bottom_border_gap	input
<i>bottom border gap (in millimetres).</i>		

Drainage_Plot_Plot_sheet_layout_Other_parameters

Other parameters

Panel field	Parameter name	Type	Pop-Up
Row per sheet mode	only_one_line	choice box	more than one row on sheet only one row on sheet
<i>whether to allow multiple rows on a sheet.</i>			
Plot height (mm)	plot_height	input	
<i>height of plot row (in millimetres).</i>			
Horizontal plot gap (mm)	horizontal_plot_gap	input	
<i>gap between plot columns (in millimetres).</i>			
Vertical plot gap (mm)	vertical_plot_gap	input	

gap between plot rows (in millimetres).

Boxes

Drainage_Plot_Boxes

The Boxes Area on the drainage long section plot, is used to label points on the drainage strings with the following information: chainages, road centre line chainages, natural surface heights, finished surface heights, before pit and after pit invert levels, before pit and after pit hgl values, and before pit and after pit depths to inverts.

The default order of the boxes is as shown in the diagram, below.

The *chainage box* is hardwired to always appear first (at the bottom) in the order of boxes. If, you wish to change the order of any of the other boxes, or wish to omit any of the other boxes, you can do so by specifying the following box order parameters.

Panel Field	Parameter name	Type	Pop-Up
Box #	box_n_set	input	
<i>order (from 1 to 6) of the nth box type.</i>			
List #	box_n	choice box	road centre line chainages natural surface heights finished surface heights invert levels hgl values depths to inverts

box type for the nth set of box order parameters.

Drainage_Plot_Boxes_Title_area

Title area

Panel Field	Parameter name	Type	Pop-Up
Box width (mm)	box_width	input	
<i>width of the box title area.</i>			
Box height (mm)	box_height	input	
<i>default height of each box.</i>			
Colour of box line work	box_colour	colour box	available colours

colour of box line work.

Size of titles (mm) title_box_text_size input

default text size of box titles.

Colour of titles title_box_text_colour colour box available colours

default text colour of box titles.

Drainage_Plot_Boxes_Values_area

Values area

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Size of values (mm) box_text_size input

default text size of box values.

Colour of values box_text_colour colour box available colours

default text colour of box values.

Justification mode box_text_left_justify choice box top justify values
bottom justify values

whether to justify the (vertical) value text with the top or the bottom of the box.

Text side mode box_text_side choice box left
right
centre

whether to place the (vertical) value text to the left of, to the right of, or on the chainage uprights.

Decimal places of values number_of_decimals input

default number of decimal places for box values.

Drainage_Plot_Boxes_Chainage

Chainage

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Box height (mm) chainage_box_size input

height of chainage box (only required if different from default box_height).

Title parameters

Line 1 plot_title_chainage_name
input

first line of text for chainage box title.

Line 2 plot_title_chainage_name_2
input

optional second line of text for chainage box title.

Colour chainage_title_colour colour box available colours

text colour of chainage box title (required only if different from default title_box_text_colour).

Text size (mm) chainage_title_text_size input

text size of chainage box title (required only if different from default title_box_text_size).

Textstyle chainage_title_textstyle font box available fonts

font of chainage box title (required only if different from default global_textstyle).

Value parameters

Colour	chainage_text_colour	colour box	available colours
	<i>text colour of chainage box values (required only if different from default box_text_colour).</i>		
Text size (mm)	chainage_text_size	input	
	<i>text size of chainage box values (required only if different from default box_text_size).</i>		
Textstyle	chainage_textstyle	font box	available fonts
	<i>font of chainage box values (required only if different from default global_textstyle).</i>		
Decimal places	chainage_decimals	input	
	<i>decimal places for chainage box values (required only if different from default number_of_decimals).</i>		

Drainage_Plot_Boxes_Road_centre_line_chainage

Road centreline chainage

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Include centre line chainage box

draw_centre_chainage	checkbox
----------------------	----------

whether to include the road centreline chainage box in the boxes area.

Box height (mm)

centre_chainage_box_size	input
--------------------------	-------

height of road centreline chainage box (only required if different from default box_height).

Title parameters

Line 1	plot_title_centre_chainage_name	input
---------------	---------------------------------	-------

first line of text for road centreline chainage box title.

Line 2	plot_title_centre_chainage_name_2	input
---------------	-----------------------------------	-------

optional second line of text for road centreline chainage box title.

Colour	chainage_title_colour_cl	colour box	available colours
---------------	--------------------------	------------	-------------------

text colour of road centreline chainage box title (required only if different from default title_box_text_colour).

Text size (mm)	chainage_title_text_size_cl	input
-----------------------	-----------------------------	-------

text size of road centreline chainage box title (required only if different from default title_box_text_size).

Textstyle	chainage_title_textstyle_cl	font box	available fonts
------------------	-----------------------------	----------	-----------------

font of road centreline chainage box title (required only if different from default global_textstyle).

Value parameters

Colour	chainage_text_colour_cl	colour box	available colours
---------------	-------------------------	------------	-------------------

text colour of road centreline chainage box values (required only if different from default box_text_colour).

Text size (mm)	chainage_text_size_cl	input
-----------------------	-----------------------	-------

text size of road centreline chainage box values (required only if different from default box_text_size).

Textstyle	chainage_textstyle_cl	font box	available fonts
------------------	-----------------------	----------	-----------------

font of road centreline chainage box values (required only if different from default global_textstyle).

Decimal places	chainage_cl_decimals	input
-----------------------	----------------------	-------

decimal places for road centreline chainage box values (required only if different from default number_of_decimals).

Drainage_Plot_Boxes_Natural_surface

Natural surface

Panel Field	Parameter name	Type	Pop-Up
Draw text mode	draw_ns_text	choice box	don't include ns box include ns box

whether to include the natural surface box in the boxes area.

Box height (mm)	surface_box_size	input
------------------------	------------------	-------

height of natural surface box (only required if different from default box_height).

Title parameters

Line 1	plot_title_surface_name	input
---------------	-------------------------	-------

first line of text for natural surface box title.

Line 2	plot_title_surface_name_2	input
---------------	---------------------------	-------

optional second line of text for natural surface box title.

Colour	ns_title_colour	colour box	available colours
---------------	-----------------	------------	-------------------

text colour of natural surface box title (required only if different from default title_box_text_colour).

Text size (mm)	ns_title_text_size	input
-----------------------	--------------------	-------

text size of natural surface box title (required only if different from default title_box_text_size).

Textstyle	ns_title_textstyle	font box	available fonts
------------------	--------------------	----------	-----------------

font of natural surface box title (required only if different from default global_textstyle).

Value parameters

Colour	ns_text_colour	colour box	available colours
---------------	----------------	------------	-------------------

text colour of natural surface box values (required only if different from default box_text_colour).

Text size (mm)	ns_text_size	input
-----------------------	--------------	-------

text size of natural surface box values (required only if different from default box_text_size).

Textstyle	ns_textstyle	font box	available fonts
------------------	--------------	----------	-----------------

font of natural surface box values (required only if different from default global_textstyle).

Decimal places	ns_decimals	input
-----------------------	-------------	-------

decimal places for natural surface box values (required only if different from default number_of_decimals).

Drainage_Plot_Boxes_Finished_surface

Finished surface

Panel Field	Parameter name	Type	Pop-Up
Draw text mode	draw_fs_text	choice box	don't include fs box include fs box

whether to include the finished surface box in the boxes area.

FS tin/Top of MH mode	draw_fs_mode	choice box	height from fs tin height from top of MH
------------------------------	--------------	------------	---

whether the finished surface height values come from the finished surface tin, or from the tops of the maintenance holes.

Box height (mm)	f_surface_box_size	input
------------------------	--------------------	-------

height of finished surface box (only required if different from default box_height).

Title parameters

Line 1	plot_title_finished_name	input
---------------	--------------------------	-------

first line of text for finished surface box title.

Line 2	plot_title_finished_name_2	input
---------------	----------------------------	-------

optional second line of text for finished surface box title.

Colour	fs_title_colour	colour box	available colours
---------------	-----------------	------------	-------------------

text colour of finished surface box title (required only if different from default title_box_text_colour).

Text size (mm)	fs_title_text_size	input
-----------------------	--------------------	-------

text size of finished surface box title (required only if different from default title_box_text_size).

Textstyle	fs_title_textstyle	font box	available fonts
------------------	--------------------	----------	-----------------

font of finished surface box title (required only if different from default global_textstyle).

Value parameters

Colour	fs_text_colour	colour box	available colours
---------------	----------------	------------	-------------------

text colour of finished surface box values (required only if different from default box_text_colour).

Text size (mm)	fs_text_size	input
-----------------------	--------------	-------

text size of finished surface box values (required only if different from default box_text_size).

Textstyle	fs_textstyle	font box	available fonts
------------------	--------------	----------	-----------------

font of finished surface box values (required only if different from default global_textstyle).

Decimal places	fs_decimals	input
-----------------------	-------------	-------

decimal places for finished surface box values (required only if different from default number_of_decimals).

Drainage_Plot_Boxes_Invert_levels

Invert levels

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Box height (mm)	invert_height_box_size	input
------------------------	------------------------	-------

height of invert level box (only required if different from default box_height).

Title parameters

Line 1	plot_title_invert_name	input
---------------	------------------------	-------

first line of text for invert level box title.

Line 2	plot_title_invert_name_2	input
---------------	--------------------------	-------

optional second line of text for invert level box title.

Colour	il_title_colour	colour box	available colours
---------------	-----------------	------------	-------------------

text colour of invert level box title (required only if different from default title_box_text_colour).

Text size (mm) il_title_text_size input

text size of invert level box title (required only if different from default title_box_text_size).

Textstyle il_title_textstyle font box available fonts

font of invert level box title (required only if different from default global_textstyle).

Value parameters

Colour il_text_colour colour box available colours

text colour of invert level box values (required only if different from default box_text_colour).

Text size (mm) il_text_size input

text size of invert level box values (required only if different from default box_text_size).

Textstyle il_textstyle font box available fonts

font of invert level box values (required only if different from default global_textstyle).

Decimal places il_decimals input

decimal places for invert level box values (required only if different from default number_of_decimals).

Drainage_Plot_Boxes_HGL

HGL

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Include HGL box

	draw_hgl_value	check box	
--	----------------	-----------	--

whether to include the HGL box in the boxes area.

Box height (mm) hgl_box_size input

height of HGL box (only required if different from default box_height).

Title parameters

Line 1 plot_title_hgl_name input

first line of text for HGL box title.

Line 2 plot_title_hgl_name_2 input

optional second line of text for HGL box title.

Colour hgl_title_colour colour box available colours

text colour of HGL box title (required only if different from default title_box_text_colour).

Text size (mm) hgl_title_text_size input

text size of HGL box title (required only if different from default title_box_text_size).

Textstyle hgl_title_textstyle font box available fonts

font of HGL box title (required only if different from default global_textstyle).

Value parameters

Colour hgl_text_colour colour box available colours

text colour of HGL box values (required only if different from default box_text_colour).

Text size (mm) hgl_text_size input

text size of HGL box values (required only if different from default box_text_size).

Textstyle	hgl_textstyle	font box	available fonts
	<i>font of HGL box values (required only if different from default global_textstyle).</i>		
Decimal places	hgl_decimals	input	
	<i>decimal places for HGL box values (required only if different from default number_of_decimals).</i>		

Drainage_Plot_Boxes_Depths

Depths

Panel Field	Parameter name	Type	Pop-Up
Depth box mode	depth_mode	choice box	don't include depths box depths from fs tin depths from top of MH depths from ns tin

whether to include the depths (to inverts) box in the boxes area, and if so, whether the depths are measured from the finished surface tin, the tops of the maintenance holes, or the natural surface tin.

Box height (mm)	invert_depth_box_size	input	
	<i>height of depths box (only required if different from default box_height).</i>		

Title parameters

Line 1	plot_title_depth_name	input	
	<i>first line of text for depths box title.</i>		
Line 2	plot_title_depth_name_2	input	
	<i>optional second line of text for depths box title.</i>		
Colour	depth_title_colour	colour box	available colours
	<i>text colour of depths box title (required only if different from default title_box_text_colour).</i>		
Text size (mm)	depth_title_text_size	input	
	<i>text size of depths box title (required only if different from default title_box_text_size).</i>		
Textstyle	depth_title_textstyle	font box	available fonts
	<i>font of depths box title (required only if different from default global_textstyle).</i>		

Value parameters

Colour	depth_text_colour	colour box	available colours
	<i>text colour of depths box values (required only if different from default box_text_colour).</i>		
Text size (mm)	depth_text_size	input	
	<i>text size of depths box values (required only if different from default box_text_size).</i>		
Textstyle	depth_textstyle	font box	available fonts
	<i>font of depths box values (required only if different from default global_textstyle).</i>		
Decimal places	depth_decimals	input	
	<i>decimal places for depths box values (required only if different from default number_of_decimals).</i>		

Drainage_Plot_Boxes_Chainage_box_mode

Chainage box mode

Panel Field	Parameter name	Type	Pop-Up
Chainage box mode	chainage_box_mode	choice box	don't draw the chainage box draw the chainage box

whether to draw the line work around the chainage box.

Drainage_Plot_Boxes_Title_area_box_mode

Title area box mode

Panel Field	Parameter name	Type	Pop-Up
Title area box mode	draw_box_mode	choice box	do not draw title area box draw title area box, no lines draw title area box with lines

whether to draw the line work around the titles area, and if so, whether to draw lines separating each title as well.

Chainages/Uprights

Drainage_Plot_Chainages_Uprights

Uprights, or leader lines, can be drawn through the points on the drainage strings, anywhere from the top area to the bottom of the boxes area.

Upright parameters

Panel Field	Parameter name	Type	Pop-Up
Top of uprights mode	uprights_top_mode	choice box	stop at top of pit go to top area

determines how high on the plot, the uprights are drawn.

Bottom of uprights mode	uprights_bottom_mode	choice box	stop at top of boxes go to bottom of boxes
--------------------------------	----------------------	------------	---

determines how low on the plot, the uprights are drawn.

Colour of uprights to pits	manhole_line_colour	colour box	available colours
-----------------------------------	---------------------	------------	-------------------

colour of the uprights.

Chainage parameters

Panel Field	Parameter name	Type	Pop-Up
Chainage values at uprights	chainage_mode	choice box	pipe length chainage running chainage both pipe length and running

whether the chainage values represent the individual pipe lengths, the running chainages, or both.

Pipe length label position	centre_pipe_length	choice box	0 at start pit, length at end pit centre of pipe length
-----------------------------------	--------------------	------------	--

determines how pipe length chainages are displayed. **Note:** if the centre of pipe length option is chosen, the pipe length chainage text is drawn horizontally, rather than vertically.

Drainage_Plot_Chainages_Uprights_Services

Services

Any services crossing the drainage strings (defined by specifying *corridor service models* in the *Corridors* section) can be automatically labelled with an upright, chainage and invert level labels (of the drainage string, placed within the appropriate boxes in the Boxes area), and a name label (that includes the crossing service string name, its diameter, and its invert level at the point of crossing).

Note: crossing services may also be labelled (independently) by utilising the parameters in the *Cuts* section.

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Service chainage values at uprights

service_chainage_mode	choice box	pipe length chainage running chainage both pipe length and running
-----------------------	------------	--

whether the crossing service chainage values represent the chainages from the previous pits, the running chainages, or both.

Colour of uprights to crossing services

service_line_colour	colour box	available colours
---------------------	------------	-------------------

colour of the crossing service uprights.

Service chainage text parameters

Panel Field	Parameter name	Type	Pop-Up
Colour	service_ch_text_colour	colour box	available colours

text colour of crossing service chainage box values (required only if different from default box_text_colour).

Text size (mm)	service_ch_text_size	input
-----------------------	----------------------	-------

text size of crossing service chainage box values (required only if different from default box_text_size).

Textstyle	service_ch_textstyle	font box	available fonts
------------------	----------------------	----------	-----------------

font of crossing service chainage box values (required only if different from default global_textstyle).

Decimal places	service_ch_decimals	input
-----------------------	---------------------	-------

decimal places for crossing service chainage box values (required only if different from default number_of_decimals).

Service invert level text parameters

Panel Field	Parameter name	Type	Pop-Up
Colour	service_il_text_colour	colour box	available colours

text colour of crossing service invert level box values (required only if different from default box_text_colour).

Text size (mm)	service_il_text_size	input
-----------------------	----------------------	-------

text size of crossing service invert level box values (required only if different from default box_text_size).

Textstyle	service_il_textstyle	font box	available fonts
------------------	----------------------	----------	-----------------

font of crossing service invert level box values (required only if different from default global_textstyle).

Decimal places	service_il_decimals	input
-----------------------	---------------------	-------

decimal places for crossing service invert level box values (required only if different from default number_of_decimals).

Service label text parameters

Panel Field	Parameter name	Type	Pop-Up
Distance of label below crossing point (mm)	service_name_y	input	

distance (in millimetres) of crossing service name labels below crossing points.

Colour	service_name_text_colour	colour box	available colours
---------------	--------------------------	------------	-------------------

text colour of crossing service name labels (required only if different from default box_text_colour).

Text size (mm) service_name_text_size input

text size of crossing service name labels (required only if different from default box_text_size).

Textstyle service_name_textstyle font box available fonts

font of crossing service name labels (required only if different from default global_textstyle).

Decimal places service_name_decimals input

decimal places for the crossing service invert levels that make up part of the crossing service name labels (required only if different from default number_of_decimals).

Drainage_Plot_Chainages_Uprights_Finished_surface_Top_of_MH_values

Finished surface/Top of MH values

In addition to the finished surface level labels within the Boxes area, more detailed vertical labels representing finished surface levels at the pits, can be added to accompany the pit uprights within the Graph area.

Panel Field	Parameter name	Type	Pop-Up
Finished surface draw mode			
	draw_fs_vertical	choice box	do not draw fs values always draw fs values only draw if different

whether to label the finished surface levels within the Graph area. Additional control is provided to only draw the labels if the finished surface level is different from the level at the top of the maintenance hole.

Finished surface value mode			
	draw_fs_vertical_mode	choice box	value from fs tin value from top of mh

whether the finished surface level label values come from the fs tin or the top of the maintenance holes.

Pre text	fs_vertical_pre_text	input
-----------------	----------------------	-------

label text before the finished surface level.

Post text	fs_vertical_post_text	input
------------------	-----------------------	-------

label text after the finished surface level.

Decimal places	fs_vertical_decimals	input
-----------------------	----------------------	-------

decimal places for finished surface level values (required only if different from default number_of_decimals).

Colour	fs_vertical_colour	colour box	available colours
---------------	--------------------	------------	-------------------

text colour of finished surface level labels (required only if different from default box_text_colour).

Size (mm)	fs_vertical_size	input
------------------	------------------	-------

text size of finished surface level labels (required only if different from default box_text_size).

Textstyle	fs_vertical_textstyle	font box	available fonts
------------------	-----------------------	----------	-----------------

font of finished surface level labels (required only if different from default global_textstyle).

X adjustment (mm)	fs_vertical_x	input
--------------------------	---------------	-------

horizontal adjustment to position of finished surface level labels.

Y adjustment (mm)	fs_vertical_y	input
--------------------------	---------------	-------

vertical adjustment to position of finished surface level labels.

Drainage_Plot_Chainages_Uprights_Staggering

Staggering

Because the pit and service uprights are sometimes too close together to fit all the desired information in the Boxes and Arrows areas, the uprights can be staggered (widened) in such a way as to provide more space in these areas, below and above the Graph area, whilst still maintaining the correct upright spacing within the Graph area itself. Specifically, the staggering of the uprights occurs below the Graph area between Arrow areas 1 and 2, and above the Graph area between Arrow areas 3 and 4. As such, it is recommended that Arrow areas 2 and 3 be used only for information requiring minimal space.

Stagger area below graph area parameters

Panel Field	Parameter name	Type
Top of arrow area 1 to start of the staggers (mm)	stagger_height_1	input
<i>refer to stagger_height_1 on above diagram.</i>		
Distance over which stagger occurs (mm)	stagger_height_2	input
<i>refer to stagger_height_2 on above diagram.</i>		
End of the staggers to bottom of arrow area 2 (mm)	stagger_gap_bottom	input
<i>refer to stagger_gap_bottom on above diagram.</i>		

Stagger area above graph area parameters

Panel Field	Parameter name	Type
Top of arrow area 3 to start of the staggers (mm)	stagger_gap_top	input
<i>refer to stagger_gap_top on above diagram.</i>		
Distance over which stagger occurs (mm)	stagger_height_3	input
<i>refer to stagger_height_3 on above diagram.</i>		
End of the staggers to bottom of arrow area 4 (mm)		

	stagger_height_4	input
--	------------------	-------

refer to stagger_height_4 on above diagram.

Text offset parameters

Panel Field	Parameter name	Type
-------------	----------------	------

Minimum distance for text after pit values (mm)

	horizontal_text_gap	input
--	---------------------	-------

refer to horizontal_text_gap on above diagram.

Minimum distance for text after service values (mm)

	service_text_gap	input
--	------------------	-------

refer to service_text_gap on above diagram.

Datum area

Drainage_Plot_Datum_area

The Datum area is where each long section plot's datum value is drawn. The datum line for each long section plot is defined at the bottom of Arrow area 1.

Panel Field	Parameter name	Type
-------------	----------------	------

Below datum area gap (mm)

	datum_gap	input
--	-----------	-------

distance from the top of the Boxes area to the bottom of Arrow area 1.

Drainage_Plot_Datum_area_Name

Name

The datum name (or title) is drawn at the datum line, above the Boxes title area.

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Datum name	datum_name	input
-------------------	------------	-------

title for the datum area.

X offset (mm)	datum_title_x	input
----------------------	---------------	-------

horizontal adjustment to position of datum name.

Y offset (mm)	datum_title_y	input
----------------------	---------------	-------

vertical adjustment to position of datum name.

Textstyle	datum_title_textstyle	font box	available fonts
------------------	-----------------------	----------	-----------------

font of datum name (required only if different from default global_textstyle).

Text size (mm)	datum_title_text_size	input
-----------------------	-----------------------	-------

text size of datum name (required only if different from default box_text_size).

Colour	datum_title_colour	colour box	available colours
---------------	--------------------	------------	-------------------

text colour of datum name (required only if different from default box_text_colour).

Drainage_Plot_Datum_area_Values

Values

The datum values are drawn at the datum lines, above the Box values areas.

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Decimal places	datum_decimals	input
-----------------------	----------------	-------

number of decimal places for datum values.

X offset (mm) datum_x input

horizontal adjustment to position of datum values.

Y offset (mm) datum_y input

vertical adjustment to position of datum values.

Textstyle datum_textstyle font box available fonts

font of datum values (required only if different from default global_textstyle).

Text size (mm) datum_text_size input

text size of datum values (required only if different from default box_text_size).

Colour datum_text_colour colour box available colours

text colour of datum values (required only if different from default box_text_colour).

Arrows

Drainage_Plot_Arrows

The Arrow areas on the drainage long section plot, are used to label segments (individual pipes) on the drainage strings with the following information: grades, diameters and types, flow velocities, flow volumes, drainage line names, and any user-defined pipe attribute values.

There are four separate Arrow areas on the plot, any of which can be used to label the above information. From plot bottom to top, the Arrow areas are:

- Arrow area 1: staggered arrows below the Graph area,
- Arrow area 2: unstaggered arrows below the Graph area,
- Arrow area 3: unstaggered arrows above the Graph area,
- Arrow area 4: staggered arrows above the Graph area.

Panel Field Parameter name Type

Height of arrow area 1 (mm)
arrow_area_1 input

refer to arrow_area_1 on the above diagram.

Height of arrow area 2 (mm)
 arrow_area_2 input

refer to arrow_area_2 on the above diagram.

Height of arrow area 3 (mm)
 arrow_area_3 input

refer to arrow_area_3 on the above diagram.

Height of arrow area 4 (mm)
 arrow_area_4 input

refer to arrow_area_4 on the above diagram.

Drainage_Plot_Arrows_Grades

Grades

Panel Field	Parameter name	Type	Pop-Up
Draw pipe grade	draw_pipe_grade	check box	

whether to draw the pipe grades in one of the Arrow areas.

Arrow area for the arrow	pipe_grade_arrow_area	choice box	Area 1 Area 2 Area 3 Area 4
---------------------------------	-----------------------	------------	--------------------------------------

the desired Arrow area for the pipe grade information.

Y offset (mm)	pipe_grade_y	input	
----------------------	--------------	-------	--

vertical offset of pipe grade information, measured upwards from the bottom of the selected Arrow area.

Grade mode	percentage_grade	choice box	1 in grade % grade
-------------------	------------------	------------	-----------------------

determines the format of the pipe grade information.

Drainage_Plot_Arrows_Grades_Title_text

Grades: Title text

Panel Field	Parameter name	Type	Pop-Up
Text	pipe_grade_title	input	

title for the pipe grade information.

Textstyle	pipe_grade_title_textstyle	font box	available fonts
------------------	----------------------------	----------	-----------------

font of pipe grade title.

Size (mm)	pipe_grade_title_text_size	input	
------------------	----------------------------	-------	--

text size of pipe grade title.

Colour	pipe_grade_title_text_colour	colour box	available colours
---------------	------------------------------	------------	-------------------

text colour of pipe grade title.

Offset (mm)	pipe_grade_title_offset	input	
--------------------	-------------------------	-------	--

vertical adjustment to position of pipe grade title.

X offset (mm)	pipe_grade_title_x	input	
----------------------	--------------------	-------	--

horizontal adjustment to position of pipe grade title.

Drainage_Plot_Arrows_Grades_Arrow_type

Grades: Arrow type

Panel Field	Parameter name	Type	Pop-Up
Arrow type	pipe_grade_arrow_mode	choice box	available arrow types
<i>arrow type (0 to 8) for the pipe grade information.</i>			
Colour	pipe_grade_arrow_colour	colour box	available colours
<i>arrow colour for pipe grade information.</i>			
Size (mm)	pipe_grade_arrow_size	input	
<i>arrow size for pipe grade information.</i>			
Arrow gap mode	pipe_grade_arrow_gap	choice box	no gap in arrow leave gap in arrow for text
<i>whether to put text gaps in the arrows, for pipe grade information.</i>			

Drainage_Plot_Arrows_Grades_Arrow_text

Grades: Arrow text

Panel Field	Parameter name	Type	Pop-Up
Pre text	pipe_grade_arrow_pre_text	input	
<i>label text before the pipe grade values.</i>			
Post text	pipe_grade_arrow_post_text	input	
<i>label text after the pipe grade values.</i>			
Decimal places	pipe_grade_arrow_decimals	input	
<i>decimal places for pipe grade values.</i>			
Colour	pipe_grade_arrow_text_colour	colour box	available colours
<i>text colour for pipe grade values.</i>			
Size (mm)	pipe_grade_arrow_text_size	input	
<i>text size for pipe grade values.</i>			
Textstyle	pipe_grade_arrow_textstyle	font box	available fonts
<i>font of pipe grade values.</i>			
Offset (mm)	pipe_grade_arrow_text_offset	input	
<i>vertical adjustment to position of pipe grade values.</i>			

Drainage_Plot_Arrows_Diameters

Diameters

Panel Field	Parameter name	Type	Pop-Up
Pipe diameter scale factor			

pipe_diameter_scale_factor
input

multiplier of pipe diameter values.

Draw pipe diameter mode

draw_pipe_diameter choice box don't draw pipe diameter
draw pipe diameter

whether to draw the pipe diameters in one of the Arrow areas.

Arrow area for the arrow

pipe_diameter_arrow_area
choice box Area 1
Area 2
Area 3
Area 4

the desired Arrow area for the pipe diameter information.

Y offset (mm)

pipe_diameter_y input

vertical offset of pipe diameter information, measured upwards from the bottom of the selected Arrow area.

Drainage_Plot_Arrows_Diameters_Title_text

Diameters: Title text

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Text	pipe_diameter_title	input	
-------------	---------------------	-------	--

title for the pipe diameter information.

Textstyle

pipe_diameter_title_textstyle	font box	available fonts
-------------------------------	----------	-----------------

font of pipe diameter title.

Size (mm)

pipe_diameter_title_text_size	input
-------------------------------	-------

text size of pipe diameter title.

Colour

pipe_diameter_title_text_colour	colour box	available colours
---------------------------------	------------	-------------------

text colour of pipe diameter title.

Offset (mm)

pipe_diameter_title_offset	input
----------------------------	-------

vertical adjustment to position of pipe diameter title.

X offset (mm)

pipe_diameter_title_x	input
-----------------------	-------

horizontal adjustment to position of pipe diameter title.

Drainage_Plot_Arrows_Diameters_Arrow_type

Diameters: Arrow type

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Arrow type	pipe_diameter_arrow_mode	choice box	available arrow types
-------------------	--------------------------	------------	-----------------------

arrow type (0 to 8) for the pipe diameter information.

Colour

pipe_diameter_arrow_colour	colour box	available colours
----------------------------	------------	-------------------

arrow colour for pipe diameter information.

Size (mm) pipe_diameter_arrow_size
input

arrow size for pipe diameter information.

Arrow gap mode pipe_diameter_arrow_gap
choice box no gap in arrow
leave gap in arrow for text

whether to put text gaps in the arrows, for pipe diameter information.

Drainage_Plot_Arrows_Diameters_Arrow_text

Diameters: Arrow text

Panel Field	Parameter name	Type	Pop-Up
Pre text	pipe_diameter_arrow_pre_text	input	

label text before the pipe diameter values.

Post text pipe_diameter_arrow_post_text
input

label text after the pipe diameter values.

Pipe type mode pipe_type_mode
choice box don't include the pipe type
include the pipe type

whether to include the pipe type after the post text in the pipe diameter labels.

Colour pipe_diameter_arrow_text_colour
colour box available colours

text colour for pipe diameter values.

Size (mm) pipe_diameter_arrow_text_size
input

text size for pipe diameter values.

Textstyle pipe_diameter_arrow_textstyle
font box available fonts

font of pipe diameter values.

Offset (mm) pipe_diameter_arrow_text_offset
input

vertical adjustment to position of pipe diameter values.

Drainage_Plot_Arrows_Velocities

Velocities

Panel Field	Parameter name	Type	Pop-Up
Draw pipe velocity	draw_pipe_velocity	check box	

whether to draw the flow velocities in one of the Arrow areas.

Arrow area for the arrow pipe_velocity_arrow_areachoice box
Area 1
Area 2
Area 3
Area 4

the desired Arrow area for the flow velocity information.

Y offset (mm) pipe_velocity_y
input

vertical offset of flow velocity information, measured upwards from the bottom of the selected Arrow area.

Drainage_Plot_Arrows_Velocities_Title_text

Velocities: Title text

Panel Field	Parameter name	Type	Pop-Up
Text	pipe_velocity_title	input	
<i>title for the flow velocity information.</i>			
Textstyle	pipe_velocity_title_textstyle	font box	available fonts
<i>font of flow velocity title.</i>			
Size (mm)	pipe_velocity_title_text_size	input	
<i>text size of flow velocity title.</i>			
Colour	pipe_velocity_title_text_colour	colour box	available colours
<i>text colour of flow velocity title.</i>			
Offset (mm)	pipe_velocity_title_offset	input	
<i>vertical adjustment to position of flow velocity title.</i>			
X offset (mm)	pipe_velocity_title_x	input	
<i>horizontal adjustment to position of flow velocity title.</i>			

Drainage_Plot_Arrows_Velocities_Arrow_type

Velocities: Arrow type

Panel Field	Parameter name	Type	Pop-Up
Arrow type	pipe_velocity_arrow_mode	choice box	available arrow types
<i>arrow type (0 to 8) for the flow velocity information.</i>			
Colour	pipe_velocity_arrow_colour	colour box	available colours
<i>arrow colour for flow velocity information.</i>			
Size (mm)	pipe_velocity_arrow_size	input	
<i>arrow size for flow velocity information.</i>			
Arrow gap mode	pipe_velocity_arrow_gap	choice box	no gap in arrow leave gap in arrow for text
<i>whether to put text gaps in the arrows, for flow velocity information.</i>			

Drainage_Plot_Arrows_Velocities_Arrow_text

Velocities: Arrow text

Panel Field	Parameter name	Type	Pop-Up
Pre text	pipe_velocity_arrow_pre_text	input	
<i>label text before the flow velocity values.</i>			
Post text	pipe_velocity_arrow_post_text	input	

label text after the flow velocity values.

Decimal places pipe_velocity_arrow_decimals
input

decimal places for flow velocity values.

Colour pipe_velocity_arrow_text_colour
colour box available colours

text colour for flow velocity values.

Size (mm) pipe_velocity_arrow_text_size
input

text size for flow velocity values.

Textstyle pipe_velocity_arrow_textstyle
font box available fonts

font of flow velocity values.

Offset (mm) pipe_velocity_arrow_text_offset
input

vertical adjustment to position of flow velocity values.

Drainage_Plot_Arrows_Flow

Flow

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Draw pipe flow	draw_pipe_flow	check box	
-----------------------	----------------	-----------	--

whether to draw the flow volumes in one of the Arrow areas.

Arrow area for the arrow	pipe_flow_arrow_area	choice box	Area 1 Area 2 Area 3 Area 4
---------------------------------	----------------------	------------	--------------------------------------

the desired Arrow area for the flow volume information.

Y offset (mm)	pipe_flow_y	input
----------------------	-------------	-------

vertical offset of flow volume information, measured upwards from the bottom of the selected Arrow area.

Drainage_Plot_Arrows_Flow_Title_text

Flow: Title text

Panel Field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Text	pipe_flow_title	input
-------------	-----------------	-------

title for the flow volume information.

Textstyle	pipe_flow_title_textstyle	font box	available fonts
------------------	---------------------------	----------	-----------------

font of flow volume title.

Size (mm)	pipe_flow_title_text_size	input
------------------	---------------------------	-------

text size of flow volume title.

Colour	pipe_flow_title_text_colour	colour box	available colours
---------------	-----------------------------	------------	-------------------

text colour of flow volume title.

Offset (mm)	pipe_flow_title_offset	input
--------------------	------------------------	-------

vertical adjustment to position of flow volume title.

X offset (mm) pipe_flow_title_x input

horizontal adjustment to position of flow volume title.

Drainage_Plot_Arrows_Flow_Arrow_type

Flow: Arrow type

Panel Field	Parameter name	Type	Pop-Up
Arrow type	pipe_flow_arrow_mode	choice box	available arrow types

arrow type (0 to 8) for the flow volume information.

Colour	pipe_flow_arrow_colour	colour box	available colours
---------------	------------------------	------------	-------------------

arrow colour for flow volume information.

Size (mm)	pipe_flow_arrow_size	input	
------------------	----------------------	-------	--

arrow size for flow volume information.

Arrow gap mode	pipe_flow_arrow_gap	choice box	no gap in arrow leave gap in arrow for text
-----------------------	---------------------	------------	--

whether to put text gaps in the arrows, for flow volume information.

Drainage_Plot_Arrows_Flow_Arrow_text

Flow: Arrow text

Panel Field	Parameter name	Type	Pop-Up
Pre text	pipe_flow_arrow_pre_text	input	

label text before the flow volume values.

Post text	pipe_flow_arrow_post_text	input	
------------------	---------------------------	-------	--

label text after the flow volume values.

Decimal places	pipe_flow_arrow_decimals	input	
-----------------------	--------------------------	-------	--

decimal places for flow volume values.

Colour	pipe_flow_arrow_text_colour	colour box	available colours
---------------	-----------------------------	------------	-------------------

text colour for flow volume values.

Size (mm)	pipe_flow_arrow_text_size	input	
------------------	---------------------------	-------	--

text size for flow volume values.

Textstyle	pipe_flow_arrow_textstyle	font box	available fonts
------------------	---------------------------	----------	-----------------

font of flow volume values.

Offset (mm)	pipe_flow_arrow_text_offset	input	
--------------------	-----------------------------	-------	--

vertical adjustment to position of flow volume values.

Drainage_Plot_Arrows_Drainage_line_name

Drainage line name

Panel Field	Parameter name	Type	Pop-Up
Draw drainage line	draw_drainage_line	check box	
<i>whether to draw the drainage line names in one of the Arrow areas.</i>			
Arrow area for the arrow	drainage_line_arrow_area	choice box	Area 1 Area 2 Area 3 Area 4
<i>the desired Arrow area for the drainage line name information.</i>			
Y offset (mm)	drainage_line_y	input	
<i>vertical offset of drainage line name information, measured upwards from the bottom of the selected Arrow area.</i>			

Drainage_Plot_Arrows_Drainage_line_name_Title_text

Drainage line name: Title text

Panel Field	Parameter name	Type	Pop-Up
Text	drainage_line_title	input	
<i>title for the drainage line name information.</i>			
Textstyle	drainage_line_title_textstyle	font box	available fonts
<i>font of drainage line name title.</i>			
Size (mm)	drainage_line_title_text_size	input	
<i>text size of drainage line name title.</i>			
Colour	drainage_line_title_text_colour	colour box	available colours
<i>text colour of drainage line name title.</i>			
Offset (mm)	drainage_line_title_offset	input	
<i>vertical adjustment to position of drainage line name title.</i>			
X offset (mm)	drainage_line_title_x	input	
<i>horizontal adjustment to position of drainage line name title.</i>			

Drainage_Plot_Arrows_Drainage_line_name_Arrow_type

Drainage line name: Arrow type

Panel Field	Parameter name	Type	Pop-Up
Arrow type	drainage_line_arrow_mode	choice box	available arrow types
<i>arrow type (0 to 8) for the drainage line name information.</i>			
Colour	drainage_line_arrow_colour	colour box	available colours
<i>arrow colour for drainage line name information.</i>			
Size (mm)	drainage_line_arrow_size	input	
<i>arrow size for drainage line name information.</i>			

Arrow gap mode drainage_line_arrow_gap choice box no gap in arrow
leave gap in arrow for text

whether to put text gaps in the arrows, for drainage line name information.

Drainage_Plot_Arrows_Drainage_line_name_Arrow_text

Drainage line name: Arrow text

Panel Field	Parameter name	Type	Pop-Up
Pre text	drainage_line_arrow_pre_text	input	
	<i>label text before the drainage line names.</i>		
Post text	drainage_line_arrow_post_text	input	
	<i>label text after the drainage line names.</i>		
Colour	drainage_line_arrow_text_colour	colour box	available colours
	<i>text colour for drainage line names.</i>		
Size (mm)	drainage_line_arrow_text_size	input	
	<i>text size for drainage line names.</i>		
Textstyle	drainage_line_arrow_textstyle	font box	available fonts
	<i>font of drainage line names.</i>		
Offset (mm)	drainage_line_arrow_text_offset	input	
	<i>vertical adjustment to position of drainage line names.</i>		

Drainage_Plot_Arrows_User_defined_pipe_attributes

User defined pipe attributes

User defined pipe attribute data can be drawn in the Arrow areas.

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	
	<i>a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters.</i>		
Draw pipe attribute mode	draw_pipe_attr_n	choice box	don't draw pipe attribute draw pipe attribute
	<i>whether to draw the nth set of pipe attribute data in one of the Arrow areas.</i>		
Attribute name	pipe_attr_n_name	input	
	<i>name of the nth pipe attribute.</i>		
Arrow area for the arrow	pipe_attr_n_arrow_area	choice box	Area 1 Area 2 Area 3 Area 4
	<i>the desired Arrow area for the nth set of pipe attribute data.</i>		
Y offset (mm)	pipe_attr_n_y	input	

vertical offset of the *n*th set of pipe attribute data, measured upwards from the bottom of the selected Arrow area.

Drainage_Plot_Arrows_User_defined_pipe_attributes_Title_text

User defined pipe attributes: Title text

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	
	<i>a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters. The Set # should match one of the Set #'s from the grid in the parent node: "User defined pipe attributes".</i>		
Text	pipe_attr_n_title	input	
	<i>title for the nth set of pipe attribute data.</i>		
Textstyle	pipe_attr_n_title_textstyle	font box	available fonts
	<i>font of the title for the nth set of pipe attribute data.</i>		
Size (mm)	pipe_attr_n_title_text_size	input	
	<i>text size of the title for the nth set of pipe attribute data.</i>		
Colour	pipe_attr_n_title_text_colour	colour box	available colours
	<i>text colour of the title for the nth set of pipe attribute data.</i>		
Offset (mm)	pipe_attr_n_title_offset	input	
	<i>vertical adjustment to position of the title for the nth set of pipe attribute data.</i>		
X offset (mm)	pipe_attr_n_title_x	input	
	<i>horizontal adjustment to position of the title for the nth set of pipe attribute data.</i>		

Drainage_Plot_Arrows_User_defined_pipe_attributes_Arrow_type

User defined pipe attributes: Arrow type

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	
	<i>a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters. The Set # should match one of the Set #'s from the grid in the parent node: "User defined pipe attributes".</i>		
Arrow type	pipe_attr_n_arrow_mode	choice box	available arrow types
	<i>arrow type (0 to 8) for the nth set of pipe attribute data.</i>		
Colour	pipe_attr_n_arrow_colour	colour box	available colours
	<i>arrow colour for the nth set of pipe attribute data.</i>		
Size (mm)	pipe_attr_n_arrow_size	input	
	<i>arrow size for the nth set of pipe attribute data.</i>		
Arrow gap mode	pipe_attr_n_arrow_gap	choice box	no gap in arrow leave gap in arrow for text
	<i>whether to put text gaps in the arrows, for the nth set of pipe attribute data.</i>		

Drainage_Plot_Arrows_User_defined_pipe_attributes_Arrow_text**User defined pipe attributes: Arrow text**

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	
	<i>a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters. The Set # should match one of the Set #'s from the grid in the parent node: "User defined pipe attributes".</i>		
Pre text	pipe_attr_n_arrow_pre_text	input	
	<i>label text before the values of the nth set of pipe attribute data.</i>		
Post text	pipe_attr_n_arrow_post_text	input	
	<i>label text after the values of the nth set of pipe attribute data.</i>		
Decimal places	pipe_attr_n_arrow_decimals	input	
	<i>decimal places the values of the nth set of pipe attribute data.</i>		
Colour	pipe_attr_n_arrow_text_colour	colour box	available colours
	<i>text colour for the values of the nth set of pipe attribute data.</i>		
Size (mm)	pipe_attr_n_arrow_text_size	input	
	<i>text size for the values of the nth set of pipe attribute data.</i>		
Textstyle	pipe_attr_n_arrow_textstyle	font box	available fonts
	<i>font for the values of the nth set of pipe attribute data.</i>		
Offset (mm)	pipe_attr_n_arrow_text_offset	input	
	<i>vertical adjustment to position of values of the nth set of pipe attribute data.</i>		

Graph area**Drainage_Plot_Graph_area**

The Graph area is where the diagram of the drainage line, in long-section, is drawn. In addition, if Hydraulic Grade Line (HGL) information is set, the HGL can also be drawn in the Graph area.

Panel Field	Parameter name	Type	Pop-Up
Draw hgl diag	draw_hgl_diag	check box	
	<i>whether to draw the HGL in the Graph area.</i>		
Colour of hgl	hgl_colour	colour box	available colours
	<i>colour of HGL.</i>		

Top area**Drainage_Plot_Top_area**

Panel Field	Parameter name	Type	Pop-Up
Line at the bottom of the top area mode			
	draw_top_line	choice box	don't draw line draw line

whether to draw a horizontal line at the bottom of the Top area.

Corridors

Drainage_Plot_Corridors

A corridor around the primary string is defined by giving a left and right corridor width.

Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, it is drawn on the long section plot.

To be drawn, strings do not have to cross the primary string, but just be in the corridor.

Panel field	Parameter name	Type
Left corridor width (world units)		
	corridor_width_left	input
<i>left corridor width</i>		
Right corridor width (world units)		
	corridor_width_right	input
<i>right corridor width</i>		
Left corridor overlap (world units)		
	corridor_overlap_left	input
<i>left corridor overlap</i>		
Right corridor overlap (world units)		
	corridor_overlap_right	input
<i>right corridor overlap</i>		
Chord-arc tolerance (world units)		
	corridor_chord_arc	input
<i>chord-arc tolerance used near any bends in the corridor.</i>		

Drainage Plot Corridors_Model_selection

Panel field	Parameter name	Type
Corridor model	corridor_model_n	model box

models containing tins and service strings to be drawn on the section. Where $n = 1, 2, \dots, 100$ given by line number on grid.

Maintenance hole symbols

Drainage_Plot_Maintenance_hole_symbols

Symbols representing the different types of maintenance holes used, can be drawn on the plots.

The following fields form one set (grid row) of controls for the placement of MH symbols on the plot. Normally, the grid will contain one row for each MH type/symbol used.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	

a unique integer n , greater than 0, to identify the n th set of MH symbol plot parameters.

MH type	manhole_symbol_n_type	choice box	available MH types
----------------	-----------------------	------------	--------------------

the MH type to associate with the Set #, n .

MH symbol mode	manhole_symbol_n_mode	choice box	cross (0) up from centre of box (1) up&down from box centre(2) square (3) triangle, base at bottom (4) circle (5) use a symbol
-----------------------	-----------------------	------------	--

for the n th MH type, whether to use one of the hard-wired symbols (1-5), or a symbol from the defined symbols list.

MH symbol position	manhole_symbol_n_position	choice box	at top of mh above top of boxes above highest point to primary string to first found tin
---------------------------	---------------------------	------------	--

for the n th MH type, the desired position of the symbol.

Size (mm)	manhole_symbol_n_size	input
------------------	-----------------------	-------

for the n th MH type, the symbol size.

X (mm)	manhole_symbol_n_x	input
---------------	--------------------	-------

for the n th MH type, the horizontal adjustment to the selected MH symbol position.

Y (mm)	manhole_symbol_n_y	input
---------------	--------------------	-------

for the n th MH type, the vertical adjustment to the selected MH symbol position.

Symbol	manhole_symbol_n_style	choice box	available symbols
---------------	------------------------	------------	-------------------

for the n th MH type, and with manhole_symbol_n_mode set to use a symbol, the symbol to use from the defined symbols list.

Angle (dms)	manhole_symbol_n_angle	angle box	
	<i>for the nth MH type, the symbol angle.</i>		
Colour	manhole_symbol_n_colour	colour box	available colours
	<i>for the nth MH type, the symbol colour.</i>		

Maintenance hole names/types/bubbles

Drainage_Plot_Maintenance_hole_names_types_bubbles

Panel Field	Parameter name	Type	Pop-Up
Include line name mode	draw_line_name	choice box	don't include line name include line name
	<i>whether to include the drainage line name in the MH name label.</i>		
Include pit name mode	draw_pit_name	choice box	don't include pit name include pit name
	<i>whether to include the MH name in the MH name label.</i>		
Include pit type mode	draw_pit_type	choice box	don't include pit type include pit type
	<i>whether to include the MH type in the MH name label.</i>		
Size (mm)	bubble_text_size	input	
	<i>text size of MH name label.</i>		
Colour	bubble_text_colour	colour box	available colours
	<i>text colour of MH name label.</i>		
Textstyle	bubble_textstyle	font box	available fonts
	<i>font of MH name label.</i>		
X adjustment (mm)	bubble_text_x	input	
	<i>horizontal adjustment to position of MH name label.</i>		
Y adjustment (mm)	bubble_text_y	input	
	<i>vertical adjustment to position of MH name label.</i>		
Pre text	bubble_pre_text	input	
	<i>text to go before MH name label.</i>		
Post text	bubble_post_text	input	
	<i>text to go after MH name label.</i>		
Text angle (dms)	bubble_text_angle	angle box	
	<i>text angle of MH name label.</i>		
Text justification	bubble_text_justify	justification box	
	<i>text justification of MH name label.</i>		
Bubble radius (mm)	bubble_radius	input	
	<i>radius of bubble around MH name label. Zero (0) for no bubble.</i>		
Bubble colour	bubble_colour	colour box	available colours
	<i>colour of bubble around MH name label.</i>		

Bubble length (mm)	bubble_length	input	
	<i>length of bubble around MH name label. Zero (0) for circular bubble.</i>		
Bubble text position	draw_text_at_pit	choice box	draw bubble&text in top area draw bubble&text above pit
	<i>whether to position the MH name labels and bubbles in the Top area, or directly above the pits.</i>		
Distance to add to place bubble above the pit (mm)	distance_above_pit	input	
	<i>for draw_text_at_pit set to draw bubble & text above pit, distance to add between top of pit and bottom of bubble.</i>

Hatching cut/fill

[Drainage_Plot_Hatching_cut_fill](#)

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins may be hatched.

Panel Field	Parameter name	Type
Define Set #		input
<i>set number to be used to define different original/new tin sets.</i>		
Original tin	hatch_original_tin_n	tin box
<i>tin_name for original surface</i>		
New tin	hatch_new_tin_n	tin box
<i>tin_name for final surface</i>		

Notes

- (a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- (b) cut hatching is turned off by setting *hatch_cut_separation_n* to 0.0.
fill hatching is turned off by setting *hatch_fill_separation_n* to 0.0.

[Drainage_Plot_Hatching_cut_fill_Cut](#)

Cut

Panel Field	Parameter name	Type
Use Set #		input
<i>set number as specified in the Define set#.</i>		

Cut separation (mm)	hatch_cut_separation_n	input
	<i>distance between cut hatch lines. If 0, no hatching.</i>	
Cut hatch angle (dms)	hatch_cut_angle_n	input
	<i>angle of hatching.</i>	
Cut colour	hatch_cut_colour_n	colour box
	<i>colour of the hatching.</i>	
Cut linestyle	hatch_cut_linestyle_n	linestyle box

	<i>draw mode for sides of original tin in fill.</i>	
Draw new tin	hatch_fill_draw_new_n	choice box
	<i>draw mode for sides of new tin in fill.</i>	

Cuts

Drainage_Plot_Cuts

The cuts that the primary string (design line) makes through strings in any user-specified model can be automatically labelled on the long section plots.

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol**. The height of tins at

the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the:

- (a) top of the boxes on the long section,
- (b) height value of the cut string,
- (c) height of the primary string,
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note: Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings. For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose names match the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

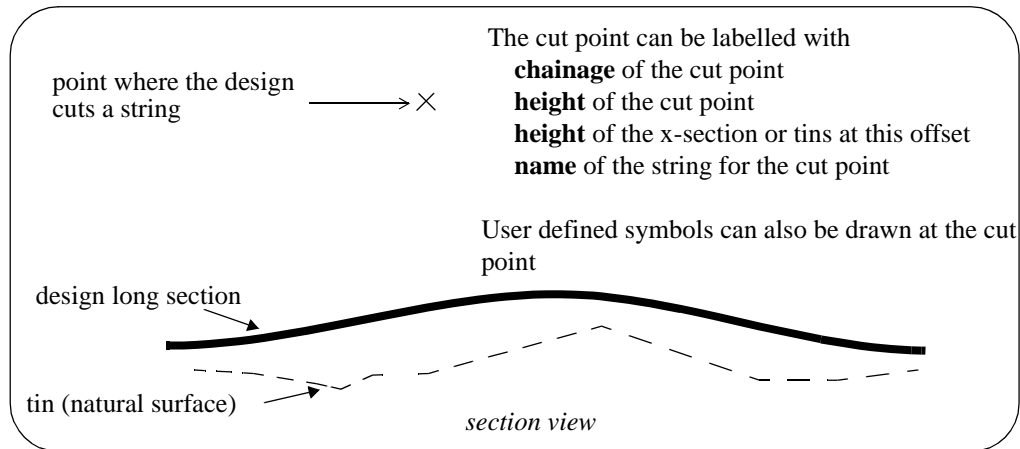

Panel Field	Parameter name	Type
Define Set #		input
<i>set number to be used to define different model/mask sets.</i>		
Model	cuts_n_model	model box
<i>model from which cut masks are derived</i>		
Name mask	cuts_n_mask	input

text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.

For example: "ke" or,
 "?bank*" or, if both masks are required,
 "ke* ?bank*"*

If cuts_n_mask is blank, then all strings in the model are used. This is equivalent to name mask being set to "".*

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the design string, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the nth set.

Drainage_Plot_Cuts_Chainage

Chainage

Drainage_Plot_Cuts_Symbols

Symbols

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
	<i>set number as specified in the Define set#.</i>		
Mode	cuts_symbol_n_mode	choice box	cross (0) up from centre of box (1) up&down from box centre(2) square (3) triangle, base at bottom (4) circle (5) use a plot symbol

symbol mode.

Note: *If a plot symbol is to be used, the cuts_symbol_n_style parameter must be specified.*

Symbol	cuts_symbol_n_style	plot symbols	
	<i>a valid plot symbol can be selected.</i>		
Position	cuts_symbol_n_position	choice box	at cut string height above top of boxes above top of graph area to primary string to tin 1 to tin 2 to tin 3 to tin 4 to tin 5 to tin 6 to tin 7 to tin 8 to tin 9 to tin 10

position of symbol.

X (mm)	cuts_symbol_n_x	input
<i>horizontal adjustment to position of symbol.</i>		
Y (mm)	cuts_symbol_n_y	input
<i>vertical adjustment to position of symbol.</i>		
Angle (dms)	cuts_symbol_n_angle	input
<i>rotation of symbol about point.</i>		
Colour	cuts_symbol_n_colour	colour box
<i>colour of symbol.</i>		
Size (mm)	cuts_symbol_n_size	input
<i>size of symbol. A value of 0 means no symbol.</i>		

Primary string name label

Drainage_Plot_Primary_string_name_label

The plot can be labelled with a name under the boxes area.

The name is made up of a concatenation of the text string names:

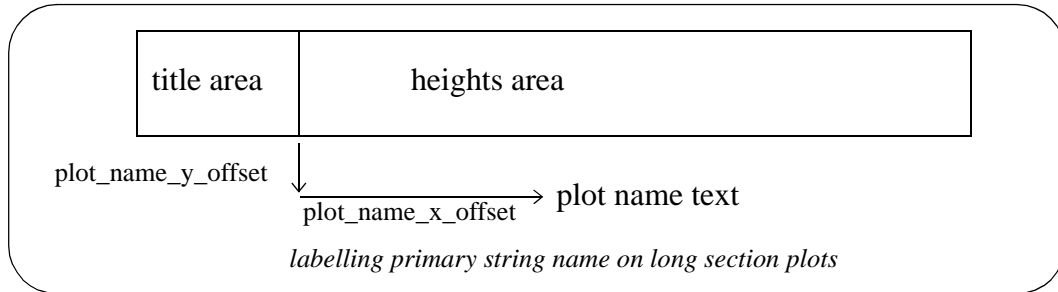

Panel Field	Parameter name	Type
Name mode	plot_name_string_name	choice box
<i>determines what text is placed in the name labels.</i>		
Pre-text	plot_name_pre_text	input
<i>text before label.</i>		
Post-text	plot_name_post_text	input
<i>text after label.</i>		
Textstyle	plot_name_textstyle	text box
<i>textstyle of label.</i>		
Size (mm)	plot_name_size	input
<i>size of label.</i>		
Colour	plot_name_colour	colour box
<i>colour of label.</i>		
X offset (mm)	plot_name_x_offset	input
<i>horizontal adjustment to position of label.</i>		
Y offset (mm)	plot_name_y_offset	input
<i>vertical adjustment to position of label.</i>		

The plot name is positioned under the boxes.

The *plot_name_x_offset* is measured from the beginning of the height boxes.

The default for *plot_name_x_offset* is centred on heights area.

The *plot_name_y_offset* is measured from the bottom of the box area with positive being down.

PPF's to include

Drainage_Plot_PPF_s_to_include

Panel Field	Parameter name	Type	Pop-Up
PPF files		input	

by including pre existing PPF files, the user can build up a modified version without having to set all the parameters.

Melbourne Water Plot PPF Editor

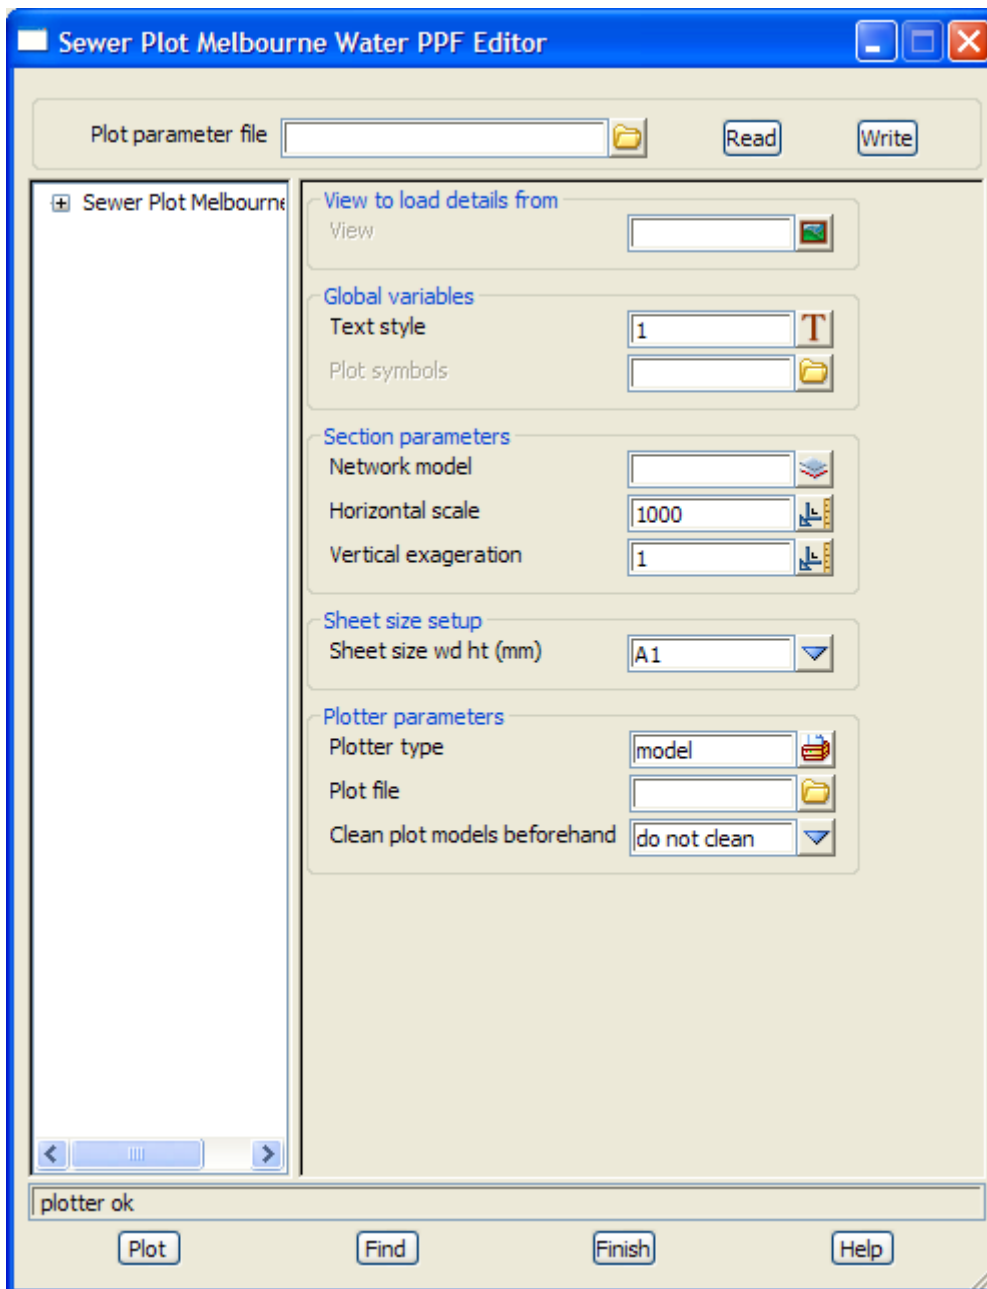

sewer_plot_melbourne_water_ppf_editor

Position of option on menu: Plot =>Melb Water Plot PPF Editor

The **Melb Water plot ppf editor** is for creating and/or editing a (binary) Melbourne Water sewer long section ppf file and for creating a Melbourne Water sewer long section plot. An ascii version of the file is also produced.

Note: binary and ascii ppf's are stored *within* the project (not in the folder containing the project).

On selecting the Melb Water plot ppf editor option, the **Sewer Plot Melbourne Water PPF Editor** panel is displayed.

Panel field	Type
Plot parameter file	file box

name for the binary plot parameter file to read in or write out.

Read button

read the given plot parameter file in.

Write button

write out the plot parameters to the given plot parameter file. An ascii ppf file is also written out.

Plot button

use the plot parameters from the panel to create the plot.

Find button

brings up a search box. If a valid parameter name is keyed in followed by the enter key, the cursor will be placed in the appropriate field on the appropriate page.

Pipeline Plot PPF Editor

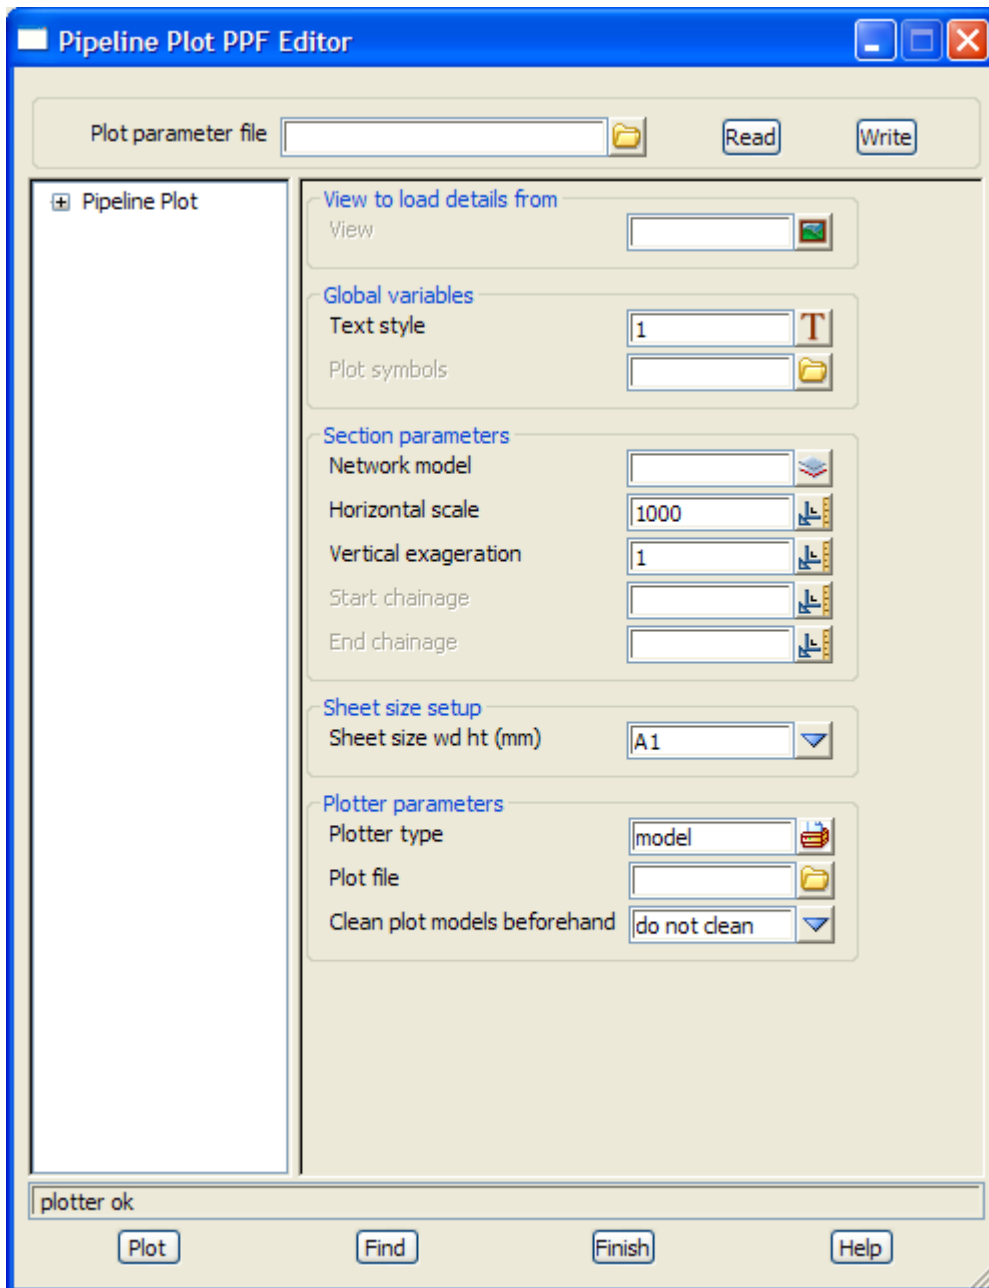

pipeline_plot_ppf_editor

Position of option on menu: Plot =>Pipeline Plot PPF Editor

The **pipeline plot ppf editor** is for creating and/or editing a (binary) pipeline long section ppf file and for creating a pipeline long section plot.

Note: binary ppf's are stored *within* the project (not in the folder containing the project as the ascii ppf's were).

On selecting the pipeline plot ppf editor option, the **Pipeline PPF Editor** panel is displayed.

Panel field	Type
Plot parameter file	file box

name for the binary plot parameter file to read in or write out.

Read button

read the given plot parameter file in.

Write button

write out the plot parameters to the given plot parameter file. An ascii ppf file is also written out.

Plot button

use the plot parameters from the panel to create the plot.

Find button

brings up a search box. If a valid parameter name is keyed in followed by the enter key, the cursor will be placed in the appropriate field on the appropriate page.

Drainage Plan Plot PPF Editor

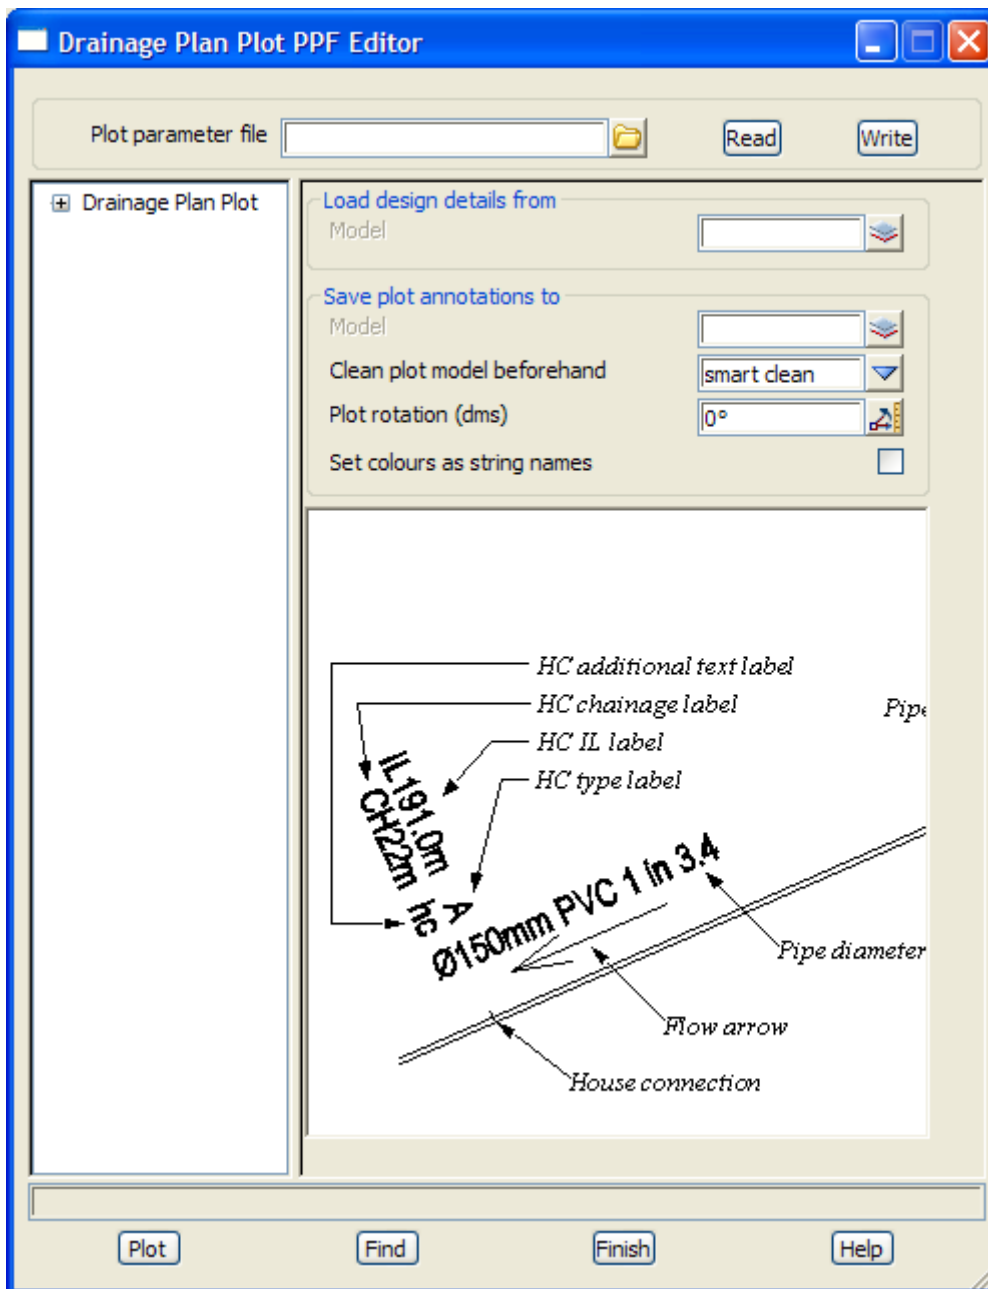

Drainage_Plan_Plot_PPF_Editor

Position of option on menu: Plot =>Drainage Plan Plot PPF Editor

The **drainage plan plot ppf editor** is for creating and/or editing a (binary) drainage and sewer plan plot ppf file and for creating a drainage and/or sewer plan annotation overlay model. An ascii version of the file is also produced.

Note: binary and ascii ppf's are stored *within* the project (not in the folder containing the project).

On selecting the Drainage plan plot ppf editor option, the **Drainage Plan Plot PPF Editor** panel is displayed.

Panel field	Type
Plot parameter file	file box

name for the binary plot parameter file to read in or write out.

Read button

read the given plot parameter file in.

Write button

write out the plot parameters to the given plot parameter file. An ascii ppf file is also written out.

Plot button

use the plot parameters from the panel to create the plot.

Find button

brings up a search box. If a valid parameter name is keyed in followed by the enter key, the cursor will be placed in the appropriate field on the appropriate page.

Drainage Plan Plot

Drainage_Plan_Plot

Note: When creating Drainage Plan Plot overlays, all distances and sizes (including text sizes, offsets, rises, etc.) are specified in world units.

Load design details from

Panel field	Parameter name	Type	Pop-Up
Model	input_model	model	available models

input model containing the drainage design strings.

Save plot annotations to

Panel field	Parameter name	Type	Pop-Up
Model	output_model	model	available models

output model to which the plot annotations are saved.

Clean plot model beforehand

plot_model_clean	choice box	smart clean full clean
------------------	------------	---------------------------

*determines how to clean (delete the elements in) the output model, if it exists, before generating the plot annotations. In the case of a **smart clean**, any existing text, flow arrow and bubble annotation elements found that match the annotations about to be generated, will retain their pre-existing positions. In the case of a **full clean**, no information about the pre-existing plot annotation is used, and the new plot annotation is created from scratch.*

Set colours as string names	colour_string_ naming_mode	tick box
------------------------------------	-------------------------------	----------

names all created plot annotation strings by their colour names. This will override any user specified string names defined in other sections.

Pipes

Drainage_Plan_Plot_Pipes

Pipe representation

The fields in this section are grid column fields that may each have up to 20 sets (rows) defined.

Panel field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Min pipe diam (m)	pipe_dia_min_n	input	
<i>minimum pipe diameter in metres for the nth set of pipe representations.</i>			

Max pipe diam (m)	pipe_dia_max_n	input	
<i>maximum pipe diameter in metres for the nth set of pipe representations. All pipes with diameters that fall between the min and max diameters of this set (row), will be represented according to the values of the other fields in this set. Pipe diameters are defined in the drainage design strings.</i>			

Representation mode	pipe_dia_mode	choice box	none linestyle pipe linestyle and pipe
----------------------------	---------------	------------	---

determines whether to represent pipes as linestyles and/or solid pipes for the nth set of pipe representations.

Trim mode	trim_edge_mode	choice box	don't trim strings trim pipes trim linestyles trim pipes and linestyles
------------------	----------------	------------	--

determines whether to trim pipe and/or linestyle strings around maintenance holes for the nth set of pipe representations.

Colour	pipe_dia_colour_n	colour	available colours
<i>colour to use for the nth set of pipe representations.</i>			

Linestyle	pipe_dia_linestyle_n	linestyle	available linestyles
------------------	----------------------	-----------	----------------------

linestyle to use for the nth set of pipe representations.

Linestyle string name pipe_dia_name_n input
string name of linestyles for the nth set of pipe representations.

Pipe string name pipe_edge_name_n input
string name of pipes for the nth set of pipe representations.

Pipe labels

Panel field	Parameter name	Type	Pop-Up
Rise mode	rise_mode	choice box	rise from centre of pipe rise from edge of pipe

determines where all pipe label text rise values are measured from.

Drainage_Plan_Plot_Pipes_Pipe_diameter_labels

Pipe diameter labels

Panel field	Parameter name	Type	Pop-Up
Label mode	pipe_label_mode	choice box	none pre dia post pre dia post grade pre dia post type grade

*determines what text is to be placed for the pipe diameter labels. Pipe types and grades can be included, in addition to diameters. Pipe diameters, types and grades are all defined in the drainage design strings. **Note:** if a pipe attribute of real type named "width" exists and is greater than zero, the pipe is considered to be rectangular and is labelled <width x height>, where the height takes the value of the pipe diameter.*

Text size pipe_label_size input

text size of the pipe diameter labels. The labels will only be created if the size is greater than zero.

Text offset pipe_label_offset input

distance to move the pipe diameter labels along the pipe, from the mid position of the pipe segment. Positive values are to the right.

Text rise pipe_label_rise input

distance to move the pipe diameter labels away from the pipe centreline or edge (depending on setting of rise_mode). A negative value will place the labels on the other side of the pipes.

Text colour pipe_label_colour colour available colours

colour of the pipe diameter labels.

Text style pipe_label_textstyle textstyle available fonts

font of the pipe diameter labels.

Pre text pipe_label_pre_text input

text to be placed before the diameter in the pipe diameter labels.

Post text pipe_label_post_text input

text to be placed after the diameter in the pipe diameter labels.

Units factor pipe_label_factor input

multiplier of diameter values. A Units factor of 1000 will result in the diameters being labelled in mm.

Decimal places pipe_label_decimals input

number of decimal places in labelled diameter values.

Text string name pipe_label_name input

string name of the pipe diameter labels.

Drainage_Plan_Plot_Pipes_Pipe_IL_labels

Pipe IL labels

Panel field Parameter name Type Pop-Up

Text size pipe_text_size_il input

text size of the pipe IL (Invert Level) labels. The labels will only be created if the size is greater than zero.

Text offset pipe_text_offset_il input

distance to move the pipe IL labels along the pipe, from the ends of the pipe. Positive values are towards the mid position of the pipe segment.

Text rise pipe_text_rise_il input

distance to move the pipe IL labels away from the pipe centreline or edge (depending on setting of rise_mode). A negative value will place the labels on the other side of the pipes.

Text colour pipe_text_colour_il colour available colours

colour of the pipe IL labels.

Text style pipe_text_textstyle_il textstyle available fonts

font of the pipe IL labels.

Pre text pipe_text_pre_text_il input

text to be placed before the IL in the pipe IL labels.

Post text pipe_text_post_text_il input

text to be placed after the IL in the pipe IL labels.

Units factor pipe_text_factor_il input

multiplier of IL values. A Units factor of 3.281 will result in the ILs being labelled in feet.

Decimal places pipe_text_decimals_il input

number of decimal places in labelled IL values.

Text string name pipe_text_name_il input

string name of the pipe IL labels.

Maintenance holes

Drainage_Plan_Plot_Maintenance_holes

Maintenance hole representation

Panel field Parameter name Type Pop-Up

MH symbol direction mode mh_symbol_dir_mode choice box

use symbol angle
left
right
average

determines what mode of direction is used to place the MH symbols.

MH symbol angle (dms) mh_symbol_angle angle

angle of MH symbol placement. This is only used depending on the setting of mh_symbol_dir_mode.

The remaining fields in this section are grid column fields that may each have up to 20 sets (rows) defined.

Panel field	Parameter name	Type	Pop-Up
MH type	mh_type_n	input	
	<i>MH type of the nth set of maintenance holes. All MHs of this type will be represented according to the values of the other fields in this set (row). MH types are defined in the drainage design strings.</i>		
MH mode	mh_mode_n	choice box	none text symbol circle
	<i>determines whether a text string, a symbol, or a circle is to be used to represent the nth set of maintenance holes.</i>		
MH Symbol or Text	mh_symbol_n	symbol	available symbols
	<i>symbol or text string to use to represent the nth set of maintenance holes. If mh_mode_n is set to "text", a text string can be typed in. If mh_mode_n is set to "symbol", the symbol name can be chosen from the pop-up list. Ignored if mh_mode_n is set to "circle".</i>		
Justification	mh_symbol_justify_n	choice box	left bottom left middle left top centre bottom centre middle centre top right bottom right middle right top
	<i>justification mode of the MH text for the nth set of maintenance holes, relative to the centres of the MHs. This will only be relevant if mh_mode_n is set to "text".</i>		
Size	mh_symbol_size_n	input	
	<i>size of the MH symbols or text strings for the nth set of maintenance holes. The symbols, circles or text strings will only be created if the size is greater than zero. In the case of a circle, the size is determined to match the diameter of the MH.</i>		
Offset	mh_symbol_offset_n	input	
	<i>distance to move the MH symbols, circles or text strings to the left or right of the MH centres, for the nth set of maintenance holes. Positive values are to the right. The direction of movement is parallel to the angle of the MH symbols (see mh_symbol_dir_mode and mh_symbol_angle).</i>		
Rise	mh_symbol_rise_n	input	
	<i>distance to move the MH symbols, circles or text strings above or below of the MH centres, for the nth set of maintenance holes. Positive values are upwards. The direction of movement is perpendicular to the angle of the MH symbols (see mh_symbol_dir_mode and mh_symbol_angle).</i>		
Colour	mh_symbol_colour_n	colour	available colours
	<i>colour of the MH symbols, circles or text strings, for the nth set maintenance holes.</i>		
Text style	mh_symbol_textstyle_n	textstyle	available fonts
	<i>font of the MH text for the nth set of maintenance holes. This will only be relevant if mh_mode_n is set to "text".</i>		
MH Symbol string name	mh_symbol_name_n	input	
	<i>string name of the MH symbols, circles or text strings for the nth set of maintenance holes.</i>		

Maintenance hole labels

Panel field	Parameter name	Type	Pop-Up
MH label direction mode	mh_text_mode	choice box	use label angle use pipe angle

determines what angle is to be used to position the maintenance hole label text.

MH label angle	mh_text_angle	angle
-----------------------	---------------	-------

angle of MH label text. This is only used depending on the setting of mh_text_mode.

MH label justification	mh_text_justify	choice box	left bottom left middle left top centre bottom centre middle centre top right bottom right middle right top
-------------------------------	-----------------	------------	---

justification mode of all MH label text strings, relative to the MH centres.

Drainage_Plan_Plot_Maintenance_holes_MH_name_labels

MH name labels

Panel field	Parameter name	Type	Pop-Up
Text size	mh_text_size	input	

text size of the MH name labels. The labels will only be created if the size is greater than zero. MH names are defined in the drainage design strings.

Text offset	mh_text_offset	input
--------------------	----------------	-------

distance to move the MH name labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.

Text rise	mh_text_rise	input
------------------	--------------	-------

distance to move the MH name labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.

Text colour	mh_text_colour	colour	available colours
--------------------	----------------	--------	-------------------

colour of the MH name labels.

Text style	mh_text_textstyle	textstyle	available fonts
-------------------	-------------------	-----------	-----------------

font of the MH name labels.

Pre text	mh_text_pre	input
-----------------	-------------	-------

text to be placed before the MH name in the MH name labels.

Post text	mh_text_post	input
------------------	--------------	-------

text to be placed after the MH name in the MH name labels.

Text string name	mh_text_name	input
-------------------------	--------------	-------

string name of the MH name labels.

Drainage_Plan_Plot_Maintenance_holes_MH_diameter_labels

MH diameter labels

Only label if diameter is outside range:

Panel field	Parameter name	Type
Min	mh_text_min_dia	input
Max	mh_text_max_dia	input

range of MH diameters for which the MH diameter labels will not be created. Both Min and Max are entered in metres.

Panel field	Parameter name	Type	Pop-Up
Text size	mh_text_size_dia	input	

text size of the MH diameter labels. The labels will only be created if the size is greater than zero. MH diameters are defined in the drainage design strings.

Text offset	mh_text_offset_dia	input
--------------------	--------------------	-------

distance to move the MH diameter labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.

Text rise	mh_text_rise_dia	input
------------------	------------------	-------

distance to move the MH diameter labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.

Text colour	mh_text_colour_dia	colour	available colours
--------------------	--------------------	--------	-------------------

colour of the MH diameter labels.

Text style	mh_text_textstyle_dia	textstyle	available fonts
-------------------	-----------------------	-----------	-----------------

font of the MH diameter labels.

Pre text	mh_text_pre_dia	input
-----------------	-----------------	-------

text to be placed before the diameter in the MH diameter labels.

Post text	mh_text_post_dia	input
------------------	------------------	-------

text to be placed after the diameter in the MH diameter labels.

Units factor	mh_text_factor_dia	input
---------------------	--------------------	-------

multiplier of diameter values. A Units factor of 1000 will result in the diameters being labelled in mm.

Decimal places	mh_text_decimals_dia	input
-----------------------	----------------------	-------

number of decimal places in labelled diameter values.

Text string name	mh_text_name_dia	input
-------------------------	------------------	-------

string name of the MH diameter labels.

Drainage_Plan_Plot_Maintenance_holes_MH_depth_labels**MH depth labels**

Panel field	Parameter name	Type	Pop-Up
Text size	mh_text_size_depth	input	

text size of the MH depth labels. The labels will only be created if the size is greater than zero. MH depths are defined in the drainage design strings.

Text offset	mh_text_offset_depth	input
--------------------	----------------------	-------

distance to move the MH depth labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters

`mh_text_mode` and `mh_text_angle`. The justification of the text is specified by parameter `mh_text_justify`.

Text rise	<code>mh_text_rise_depth</code>	input	
<i>distance to move the MH depth labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters <code>mh_text_mode</code> and <code>mh_text_angle</code>. The justification of the text is specified by parameter <code>mh_text_justify</code>.</i>			
Text colour	<code>mh_text_colour_depth</code>	colour	available colours
<i>colour of the MH depth labels.</i>			
Text style	<code>mh_text_textstyle_depth</code>	textstyle	available fonts
<i>font of the MH depth labels.</i>			
Pre text	<code>mh_text_pre_depth</code>	input	
<i>text to be placed before the depth in the MH depth labels.</i>			
Post text	<code>mh_text_post_depth</code>	input	
<i>text to be placed after the depth in the MH depth labels.</i>			
Units factor	<code>mh_text_factor_depth</code>	input	
<i>multiplier of depth values. A Units factor of 3.281 will result in the depths being labelled in feet.</i>			
Decimal places	<code>mh_text_decimals_depth</code>	input	
<i>number of decimal places in labelled depth values.</i>			
Text string name	<code>mh_text_name_depth</code>	input	
<i>string name of the MH depth labels.</i>			

Drainage Plan Plot Maintenance_holes_MH_chainage_labels

MH chainage labels

Panel field	Parameter name	Type	Pop-Up
Chainage mode	<code>mh_text_mode_ch</code>	choice box	running chainage previous chainage next chainage
<i>determines what chainage values will be labelled at the MHs. The "running chainage" option refers to the start of the drainage design string. The "previous chainage" and "next chainage" options refer to the previous and next MHs respectively.</i>			
Text size	<code>mh_text_size_ch</code>	input	
<i>text size of the MH chainage labels. The labels will only be created if the size is greater than zero.</i>			
Text offset	<code>mh_text_offset_ch</code>	input	
<i>distance to move the MH chainage labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters <code>mh_text_mode</code> and <code>mh_text_angle</code>. The justification of the text is specified by parameter <code>mh_text_justify</code>.</i>			
Text rise	<code>mh_text_rise_ch</code>	input	
<i>distance to move the MH chainage labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters <code>mh_text_mode</code> and <code>mh_text_angle</code>. The justification of the text is specified by parameter <code>mh_text_justify</code>.</i>			
Text colour	<code>mh_text_colour_ch</code>	colour	available colours

colour of the MH chainage labels.

Text style	mh_text_textstyle_ch	textstyle	available fonts
-------------------	----------------------	-----------	-----------------

font of the MH chainage labels.

Pre text	mh_text_pre_ch	input
-----------------	----------------	-------

text to be placed before the chainage in the MH chainage labels.

Post text	mh_text_post_ch	input
------------------	-----------------	-------

text to be placed after the chainage in the MH chainage labels.

Units factor	mh_text_factor_ch	input
---------------------	-------------------	-------

multiplier of chainage values. A Units factor of 3.281 will result in the chainages being labelled in feet.

Decimal places	mh_text_decimals_ch	input
-----------------------	---------------------	-------

number of decimal places in labelled chainage values.

Text string name	mh_text_name_ch	input
-------------------------	-----------------	-------

string name of the MH chainage labels.

House Connections

Drainage_Plan_Plot_House_connections

House connection representation

Panel field	Parameter name	Type	Pop-Up
HC linestyle	hc_line_style	linestyle	available linestyles

linestyle with which to represent the house connections to the pipes. The HCs will be represented as lines perpendicular to the pipe, from the pipe centreline, to the sides of the pipe that the HCs are on.

HC colour	hc_colour	colour	available colours
------------------	-----------	--------	-------------------

colour of the house connection linestyles

HC string name	hc_line_name	input
-----------------------	--------------	-------

string name of the HC lines.

The remaining fields in this section are grid column fields that may each have up to 6 sets (rows) defined.

Panel field	Parameter name	Type	Pop-Up
HC Type	hc_types_n	input	

HC type of the nth set of house connections. All HCs of this type will be represented according to the values of the other fields in this set (row). HC types are defined in the drainage design strings. There are only 6 different HC types used in 12d Model.

HC Type label	hc_type_text_n	input
----------------------	----------------	-------

text label to be associated with the HC type of the nth set of house connections.

Label HC Type	hc_type_tp_n	tick box
----------------------	--------------	----------

label the types of the HCs of the nth set of house connections. Depending on the HC type, it may not be desired to label the type.

Label HC IL	hc_type_il_n	tick box
--------------------	--------------	----------

label the ILs of the HCs of the nth set of house connections. Depending on the HC type, it may not make sense to label the IL.

Label HC Chainage	hc_type_ch_n	tick box
--------------------------	--------------	----------

label the chainages of the HCs of the nth set of house connections. Depending on the HC type, it may not make sense to label the chainages.

Label HC Additional text hc_type_at_n tick box

label the Additional text of the HCs of the nth set of house connections. Depending on the HC type, it may not be desired to label the Additional text.

Drainage_Plan_Plot_House_conections_HC_type_labels

HC type labels

Panel field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Text size	hc_type_size	input	
------------------	--------------	-------	--

text size of the HC type labels. The labels will only be created if the size is greater than zero and the parameter hc_type_tp_n is set to "on" for the nth set of house connections. The HC type labels are associated with the HC types are defined by the parameter set hc_type_text_n.

Text offset	hc_type_offset	input	
--------------------	----------------	-------	--

distance to move the HC type labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.

Text rise	hc_type_rise	input	
------------------	--------------	-------	--

distance to move the HC type labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.

Text colour	hc_type_colour	colour	available colours
--------------------	----------------	--------	-------------------

colour of the HC type labels.

Text style	hc_type_textstyle	textstyle	available fonts
-------------------	-------------------	-----------	-----------------

font of the HC type labels.

Text string name	hc_type_name	input	
-------------------------	--------------	-------	--

string name of the HC type labels.

Drainage_Plan_Plot_House_conections_HC_IL_labels

HC IL labels

Panel field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Text size	hc_il_size	input	
------------------	------------	-------	--

text size of the HC IL (Invert Level) labels. The labels will only be created if the size is greater than zero and the parameter hc_type_il_n is set to "on" for the nth set of house connections.

Text offset	hc_il_offset	input	
--------------------	--------------	-------	--

distance to move the HC IL labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.

Text rise	hc_il_rise	input	
------------------	------------	-------	--

distance to move the HC IL labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.

Text colour	hc_il_colour	colour	available colours
--------------------	--------------	--------	-------------------

colour of the HC IL labels.

Text style	hc_il_textstyle	textstyle	available fonts
	<i>font of the HC IL labels.</i>		
Pre text	hc_il_pre	input	
	<i>text to be placed before the IL in the HC IL labels.</i>		
Post text	hc_il_post	input	
	<i>text to be placed after the IL in the HC IL labels.</i>		
Units factor	hc_il_factor	input	
	<i>multiplier of IL values. A Units factor of 3.281 will result in the ILs being labelled in feet.</i>		
Decimal places	hc_il_decimals	input	
	<i>number of decimal places in labelled IL values.</i>		
Text string name	hc_il_name	input	
	<i>string name of the HC IL labels.</i>		

Drainage_Plan_Plot_House_connections_HC_chainage_labels

HC chainage labels

Panel field	Parameter name	Type	Pop-Up
Chainage mode	hc_chain_mode	choice box	hc lot offset running chainage previous chainage next chainage

determines what chainage values will be labelled at the HCs. The "running chainage" option refers to the start of the drainage design string. The "previous chainage" and "next chainage" options refer to the previous and next MHs respectively. The "hc lot offset" option is a special one that looks for a user-defined attribute called "<hc_name> hc lot offset" in the house connections along the drainage design strings. If the attribute is found, its value is set as the HC chainage label. If the attribute is not found, the value of the HC chainage label is set to a default HC Lot Offset of 5.0.

Text size	hc_chain_size	input	
------------------	---------------	-------	--

text size of the HC chainage labels. The labels will only be created if the size is greater than zero and the parameter hc_type_ch_n is set to "on" for the nth set of house connections.

Text offset	hc_chain_offset	input	
--------------------	-----------------	-------	--

distance to move the HC chainage labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.

Text rise	hc_chain_rise	input	
------------------	---------------	-------	--

distance to move the HC chainage labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.

Text colour	hc_chain_colour	colour	available colours
--------------------	-----------------	--------	-------------------

colour of the HC chainage labels.

Text style	hc_chain_textstyle	textstyle	available fonts
-------------------	--------------------	-----------	-----------------

font of the HC chainage labels.

Pre text	hc_chain_pre	input	
-----------------	--------------	-------	--

text to be placed before the chainage in the HC chainage labels.

Post text	hc_chain_post	input	
	<i>text to be placed after the chainage in the HC chainage labels.</i>		
Units factor	hc_chain_factor	input	
	<i>multiplier of chainage values. A Units factor of 3.281 will result in the chainages being labelled in feet.</i>		
Decimal places	hc_chain_decimals	input	
	<i>number of decimal places in labelled chainage values.</i>		
Text string name	hc_chain_name	input	
	<i>string name of the HC chainage labels.</i>		

Drainage_Plan_Plot_House_conections_HC_additional_text_labels

HC additional text labels

Panel field	Parameter name	Type	Pop-Up
Additional text	hc_text	input	
	<i>the additional text to place near the HCs.</i>		
Text size	hc_text_size	input	
	<i>text size of the HC additional text labels. The labels will only be created if the size is greater than zero and the parameter hc_type_at_n is set to "on" for the nth set of house connections.</i>		
Text offset	hc_text_offset	input	
	<i>distance to move the HC additional text labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.</i>		
Text rise	hc_text_rise	input	
	<i>distance to move the HC additional text labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.</i>		
Text colour	hc_text_colour	colour	available colours
	<i>colour of the HC additional text labels.</i>		
Text style	hc_text_textstyle	textstyle	available fonts
	<i>font of the HC additional text labels.</i>		
Text string name	hc_text_name	input	
	<i>string name of the HC additional text labels.</i>		

Bubbles

Drainage_Plan_Plot_Bubbles

Panel field	Parameter name	Type	Pop-Up
Draw bubbles	bubble_draw_mode	tick box	
	<i>draw bubbles (circles) around the MH name labels.</i>		
Bubble colour	bubble_colour	colours	available colours
	<i>colour of the bubbles.</i>		
Bubble factor	bubble_factor	input	
	<i>the initial radius of the bubble is calculated as half the text length of the MH name label. The bubble</i>		

factor is used to multiply the initial radius to give the final bubble radius. Factors greater than 1 will increase the bubble size.

Bubble string name	bubble_name	input
---------------------------	-------------	-------

string name of the bubbles.

Flow arrows

Drainage_Plan_Plot_Flow_arrows

Panel field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Draw flow arrows	flow_arrow_mode	tick box
-------------------------	-----------------	----------

draw flow arrows near the pipe diameter labels, showing the direction of flow in the pipes.

Arrow colour	flow_arrow_colour	colour box
---------------------	-------------------	------------

colour of the flow arrows.

Arrow length	flow_arrow_length	input
---------------------	-------------------	-------

length of the flow arrows. Setting the length to a negative number will place the arrow on the other side of the pipe (whilst still maintaining the correct arrow direction).

Arrow string name	flow_arrow_name	input
--------------------------	-----------------	-------

string name of the flow arrows.

Plot Frame and PPF Editor

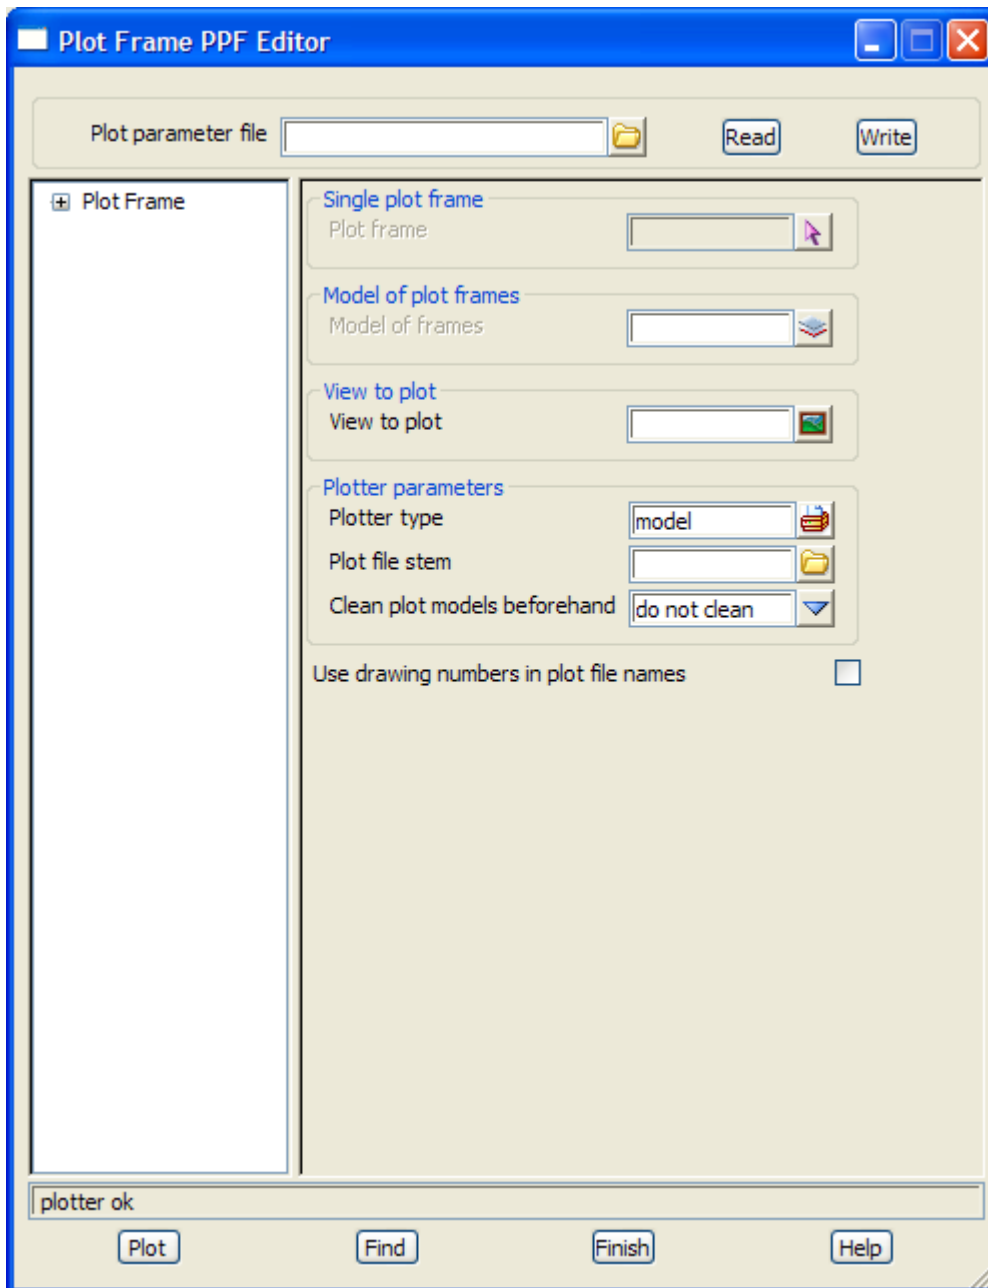

Plot_Frame_PPF_Editor

Position of option on menu: Plot =>Plot Frame and PPF Editor

The **Plot frame ppf editor** is for creating and/or editing a (binary) plot frame ppf file and for creating a cross section plot.

Note: binary ppf's are stored *within* the project (not in the folder containing the project as the ascii ppf's were).

On selecting the Plot frame and ppf editor option, the **Plot Frame PPF Editor** panel is displayed.

Panel field	Type
Plot parameter file	file box

name for the binary plot parameter file to read in or write out.

Read button

read the given plot parameter file in.

Write button

write out the plot parameters to the given plot parameter file. An ascii ppf file is also written out.

Plot button

use the plot parameters from the panel to create the plot.

Find button

brings up a search box. If a valid parameter name is keyed in followed by the enter key, the cursor will be placed in the appropriate field on the appropriate page.

Plot Frame

Plot_Frame

Plot frame

Section: Single Plot Frame

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Plot frame	single_frame	string	select box

select the plot frame to be plotted.

Section: Model of Plot Frames

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Model of frames	model_of_frames	model	box

model of plot frames to plot.

Section: View To Plot

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
View to plot	view_name	model	box

view in which data to plot resides.

Section: Plotter parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Plotter type	plotter_type	plotter	box

a valid plotting option is selected.

Plot file stem	plot_stem	plotter	box
-----------------------	-----------	---------	-----

plot file name. The appropriate extension is added dependant on the plotter type selected.

Clean plot models beforehand

plot_model_clean	choice box	do not clean prompt for clean always clean
------------------	------------	--

whether to clean (delete the elements in) any resultant plot models that may already exist, before generating the plot(s). This parameter is only applicable if plotting to a model or models. Note that if the models are cleaned using this parameter, any non-plot or locked elements found in the models will not be cleaned from the models, and the plot job will be cancelled.

Title Block

Plot_Frame_Title_block

Common title block parameters

Panel field	Parameter name	Type

Convert Ascii PPF to Binary

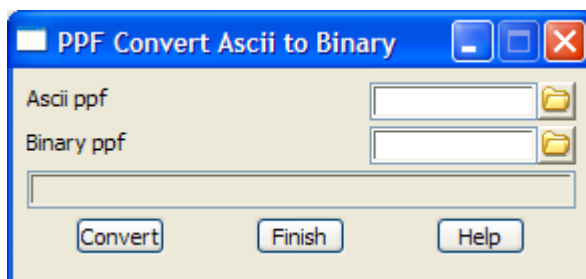

ppf_convert_ascii_to_binary

Position of option on menu: Plot =>Plot and PPF Editors =>PPF Convert Ascii to Binary

The **convert ascii ppf to binary** option is for converting the old ascii plot parameter files to the new binary plot parameter file format.

Note: binary ppf's are stored *within* the project (not in the folder containing the project as the ascii ppf's were).

On selecting the ppf convert ascii to binary option, the **ppf Convert Ascii to Binary** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Ascii ppf	file box		
<i>name of the ascii plot parameter file to convert.</i>			

Binary ppf	button		
<i>convert the ascii ppf to the equivalent binary ppf. The binary ppf file will be stored in the current project.</i>			

Convert	button		
<i>convert the ascii ppf to a binary ppf.</i>			

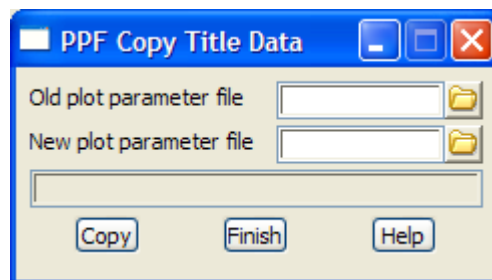

Copy Title Data

ppf_copy_title_data

Position of option on menu: Plot =>Plot and PPF Editors =>Copy title data

The **copy title data** option is for copying the title data in one binary plot parameter to another binary plot parameter file format.

On selecting the Copy title data option, the **PPF Copy Title Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old plot parameter file	file box		
<i>name of the plot parameter file to copy the title data from.</i>			
New plot parameter file	button		
<i>name of the plot parameter file to copy the title data to.</i>			
Copy	button		
<i>copy the title data from one ppf file to another.</i>			

25 Reports

reports

Position of menu: It is on the main menu as Report

The Reports menu contains options to report on the strings in a model, polygon details (area, centroid), string set outs, string names, crest and sag points and x-falls.

The Reports menu is

on Main menu

create floating *Reports* menu

Edit edit a .rpt file
Strings report on strings, crest/sag points, names
Functions report on functions
Length/Area length, area, centroid of strings
Set-out point and string set-out information
Quantities calculations of quantities
Xfall/offset report x-fall between two strings
QA Reports QA reports
More further reports

on 12d Model menu and floating menu

For the option/menu *Edit*, go to the section "Edit"

<i>Strings</i>	"Strings"
<i>Functions</i>	"Functions"
<i>Length/area</i>	"Length and Area"
<i>Set-out</i>	"Set-Out Reports"
<i>Quantities</i>	"Quantities"
<i>X-fall</i>	"X-Fall and Offset Report"
<i>QA reports</i>	"QA Reports"
<i>More</i>	"More Reports"

Each menu option will now be discussed.

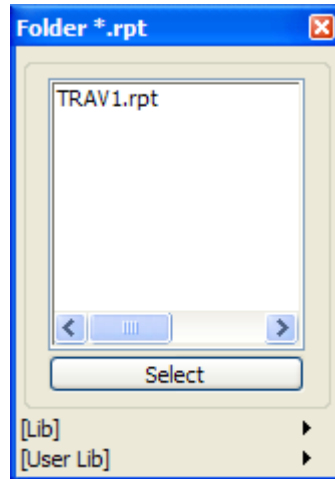

Edit

edit_a_file__rpt

Position on menu: Report =>Edit

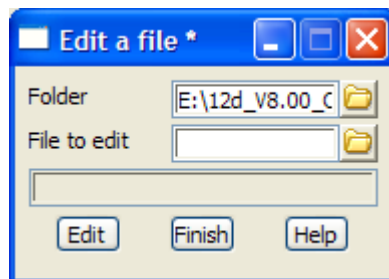

The Edit option is used to edit any (printer) reports ending in *.rpt.

On walking right on *Edit*, the list of files ending in *.rpt are displayed.

Double clicking on the report name will bring up the report in the system editor.

Clicking on the *Edit* at the top of the menu brings up the **Edit a file** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>the folder to look for the report file.</i>	folder box	current folder	folder browser
File to edit <i>name of the file to bring up in the system editor.</i>	file box		*.rpt

Strings

string_reports

Position of menu: Report =>Strings

The Strings menu contains options to report on selected strings, report the crest/sag points for a string and create a list of all the unique string names in a model or view.

The Strings walk-right menu is

For the option *Coords/Brg-Dst*, go to the section

Crest/sag points

Names

Super alignment

Super strings

More

"Coordinates or Bearing-Distance" .

"Crest/Sag Points" .

"Names" .

"Super Alignment"

"Report for Super Strings"

"More Strings Reports" .

Coordinates or Bearing-Distance

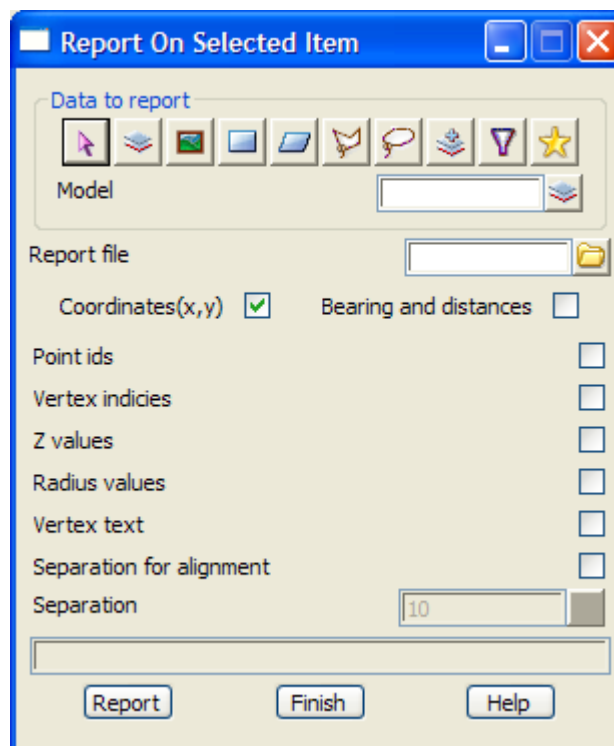

report_on_selected_item

Position of option on menu: Report =>Strings =>Coords/Brg-Dst

The **Coords/Brg-Dst** option is used to generate a report on selected items defined by a source box. The report can be of the form of coordinates of each point of a string, or the co-ordinates of the first point of a string and the bearings and distances from each other point of the string to the first point of the string.

For an alignment string it will report on the HIP's and VIPS. If there is a non-zero separation value, then at each chainages that are multiples of the separation value, the report also includes the chainage, x, y, z, bearing for horizontal and chainage, height (z), grade for vertical.

On selecting the Coords/Brg-Dst option, the **Report on Selected Item** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Report file	input		*.rpt
<i>name of the file to report to.</i>			
Coordinates(x,y)	tick box	tick	
<i>if tick, the coordinate report parameters will be displayed which will determine what other information as well as the coordinate values will be placed in the report. NOTE: If an alignment string is part of the selection, the report will include all relevant details about the alignment. In this case the report will not use the coordinate report parameters as specified, for the alignment string.</i>			

Bearing and Distances tick box

if tick, the bearing and distance report parameters will be displayed which will determine what other information as well as the bearing and distance values will be placed in the report.

Coordinate report parameters

if the Coordinates(x,y) option is selected, the following parameters will be displayed

Point ids tick box

if selected, any valid point ids will be shown in the report.

Vertex indices tick box

if selected, vertex indices will be shown in the report.

Z Values tick box

if selected, any valid z values will be shown in the report.

Radius values tick box

if selected, any valid radius values will be shown in the report.

Vertex Text tick box

if selected, any valid vertex text values will be shown in the report.

Separation for Alignment tick box

if selected, the separation for alignment box will be enabled.

Separation input box 10

if enabled by ticking the previous tick box, the alignment string information will be reported at a chainage interval given by the separation value.

Report button

run the option and create the report.

Crest/Sag Points

string_crest_sag_points_report

Position of option on menu: Report =>Strings =>Crest sag points

The crest/sag points option is used to generate a (printer) report on the crests and sags points of a string.

A number of strings can be reported on by selecting them in turn

On selecting the crest/sag points option, the **string crest/sag points report** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Report file <i>name of the file to contain the reports on the crest and sag points of strings.</i>	input		*.rpt

Pick & Report button
*as strings are selected, the crest and sag points report is generated and appended to the report file.
 The cycle is terminated by clicking RB to raise the pick ops menu and selecting cancel from it.*

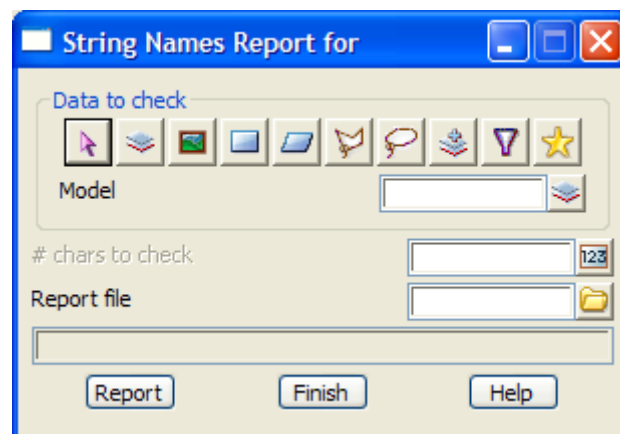

Names

string_names_report_for

Position of option on menu: Report =>Strings =>Names

The names option is used to report on all the unique strings in a model or on a view.

Selecting Names displays the **String Names Report for** panel.

If the **report** button is selected, then all the strings in the model/view given by the model/view to report field will be checked and all unique names, plus a frequency count, will be written to the report file.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source			
<i>type of data source.</i>			
# chars to check	input		
<i>if non blank, the number of characters to be used in the string name when checking for uniqueness. If blank, then the entire string name is used.</i>			
Report file	file box		*.rpt files
<i>name of the file for the report.</i>			
Report	button		
<i>report on all the unique string names in model/view.</i>			

Super Alignment

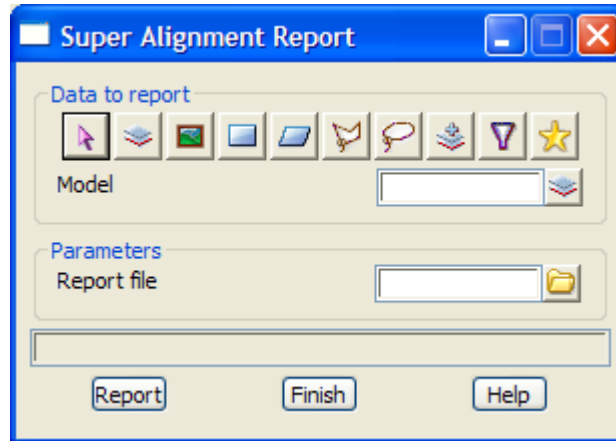

super_alignment_report

Position of option on menu: Report =>Strings =>Super alignment

Report on the super alignment that gives information on the horizontal and vertical components.

This option is under development.

On selecting the Super alignment option, the **Super Alignment Report** panel is displayed.

The fields and buttons used in this panel have the following functions.

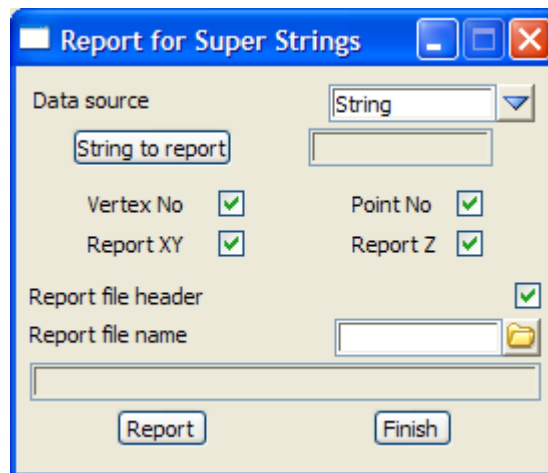

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source			
<i>type of data source.</i>			
Report file	input		*.rpt
<i>name of the file to report to.</i>			
Report	button		
<i>run the option and create the report.</i>			

Report for Super Strings

report_super_string_panel

Position of option on menu: Report =>Strings =>Super strings

This option reports on information in the super string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source			
<i>type of data source.</i>			
Vertex index	tick box	tick	
<i>if tick, vertex indices are reported.</i>			
Point id	tick box	tick	
<i>if tick, point ids are reported.</i>			
Report XY	tick box	tick	
<i>if tick, x and y values are reported.</i>			
Report Z	tick box	tick	
<i>if tick, z values are reported.</i>			
Report file header	input box	tick	
<i>if tick, a header including the date and model name and string names is included.</i>			
Report file name	input box		
<i>name of the report.</i>			
Report	button		
<i>Run the option.</i>			

More Strings Reports

`more_string_reports`

There are currently no options on this menu.

Functions

function_reports

Position of menu: Report =>Functions

A report can be made on a function. The function walk-right menu is

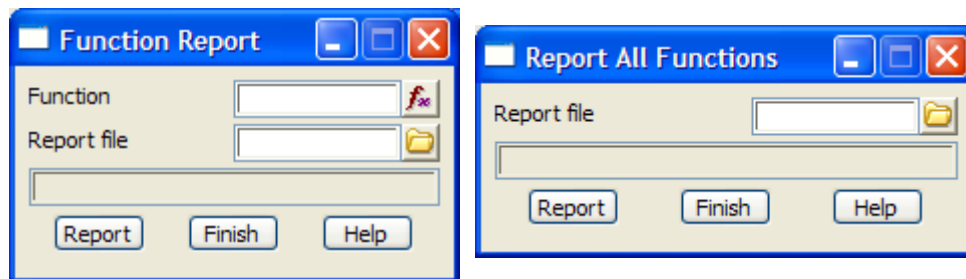

Report a Function, Report all Functions

report_all_functions function_report

Position of option on menu: Report =>Functions =>One

Position of option on menu: Report =>Functions =>All

On selecting the report or report all option, the **function report/ report all functions** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the function to be reported.</i>	function box		available functions
Report file <i>name of the file to write the report to.</i>	file box		*.rpt files
Report <i>after selecting this button, a report on the function/ all functions is produced.</i>	button		

Length and Area

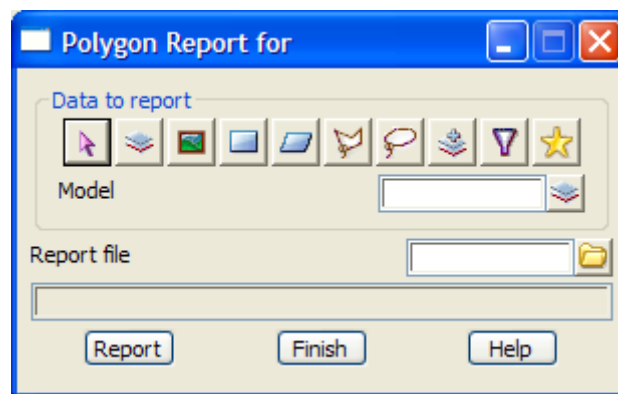

polygon_report_for

Position of option on menu: Report =>Length/Area

The Length/area (Polygons) option creates a report containing the following information for each selected string:

- ▲ string name
- ▲ if the string is closed or not
- ▲ length of the string
- ▲ area of the string (if not closed, join first and last points)
- ▲ centroid co-ordinates

On selecting the Length/Area option, the **Polygon Report for** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source			
<i>type of data source.</i>			
Report file	input		*.rpt
<i>file for the polygon reports.</i>			
Report	button		
<i>produce a polygon report for all strings selected in the Data source.</i>			

Set-Out Reports

set_out_report

Position of menu: Report =>Set-out

The Set out report options are for reporting the bearing and distance from a selected instrument station to individual points, strings, models of strings or views of strings.

In the *Setout report*, a backsight stations can be selected and the bearing of the **line** from the instrument station to the backsight station reported. Individual backsight points or strings of backsight points can be selected for reporting.

In the *Radial report*, the report can be sorted by point number, bearing or distance.

The set outs walk-right menu is

old set out report fro V5.0

set out report for strings

set out report sorted by name, distance or bearing

For the option *Old setout report*, go to the section "Old Setout Report"

Setout report

"Setout Report"

Radial report

"Radial Report"

The menu options will now be discussed.

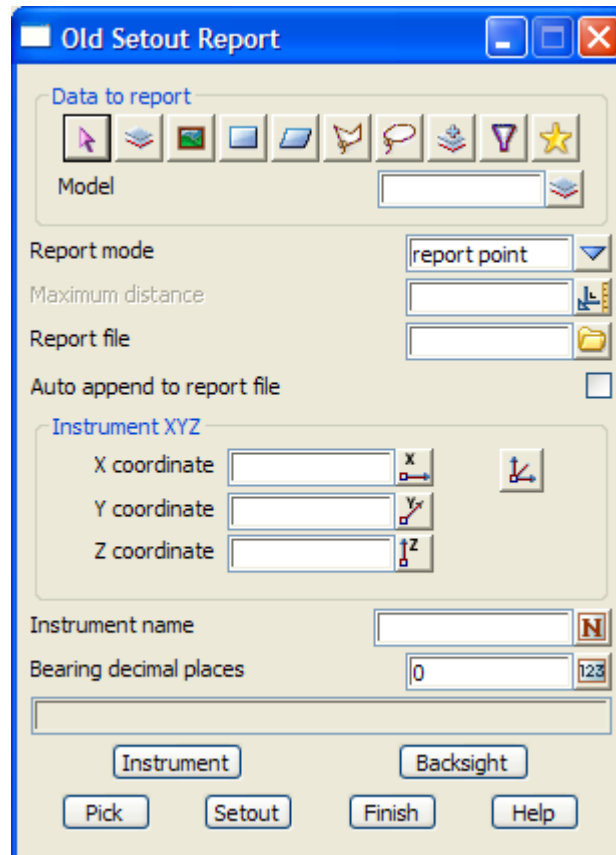

Old Setout Report

old_setout_report

Position of option on menu: Report =>Set out =>Old setout report

The setout report from 12d Model V5. This option has been rewritten for 12d Model V6 and is called **Setout Report**.

On selecting the **Old setout report** option, the **Old Setout Report** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source			
--------------------	--	--	--

type of data source.

Report mode	input		report points, report string
--------------------	-------	--	------------------------------

*if **report points**, report selected points. Otherwise report on all points in the selected string.*

Maximum distance	input		
-------------------------	-------	--	--

*if **non-blank**, any points further than the maximum distance from the instrument station will not be reported on. If **blank**, all selected points will be reported on*

Report file	input		
--------------------	-------	--	--

file for the backsight and setout reports

Instrument XYZ/name	output		
----------------------------	--------	--	--

co-ordinates/name of the current instrument station

Bearing decimal places input
number of decimal places to report the bearings to

Instrument button
the required instrument station is selected and its name and position are reported in the instrument XYZ and instrument name panel fields.

Backsight button
a backsight is selected and written to the report file.

Pick button
*After pick is chosen, a set out report is written to the report file for any selected strings. If the report mode is **report point**, only the individual point is reported. If the report mode is **report string**, all the points in the string are reported.
The cycle is terminated by clicking RB to raise the **pick ops** menu and selecting **cancel** from it.*

Setouts button
produce a set out report for all the strings in the model/view given in the model/view field.

How to Use the Panel and Panel Messages

- (a) Enter the report file name and maximum distance.
- (b) The instrument station is chosen by activating the **station** button and selecting the required station point. It will then be reported in the file
- (c) Any backsight points to be reported can then be chosen by picking the **backsight** button and selecting the backsight point.
- (d) To report on individual strings or points, set the report mode to either point or string. The **pick** button is then activated and the individual points or strings selected. The cycle is terminated by clicking RB to raise the **pick ops** menu and selecting **cancel** from it.
To report on all the strings in a model/view, give the model/view in the model/view field, and select the **setout** button.

Note

The instrument station can be changed at any time by selecting the **station** button and picking the new station.

All backsight and set outs will then be taken from the new instrument station.

Setout Report

setout_report

Position of option on menu: Report =>Set out =>Setout report

In the *Setout report*, a backsight stations can be selected and the bearing of the **line** from the instrument station to the backsight station reported. Individual backsight points or strings of backsight points can be selected for reporting.

The instrument station can be changed at any time and new backsight and set outs reported.

The set out option prints the following information:

instrument station

string name, point number, x, y, z

backsight point

string name, point number, x, y, z, bearing to the line joining the instrument and backsight, horizontal distance, height difference between instrument station and the backsight

point set-out point

string name, point number, x, y, z, bearing, horizontal distance, height difference between instrument station and the point

On selecting the Setout report option, the **Setout Report** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up

X-Fall and Offset Report

x_fall_report

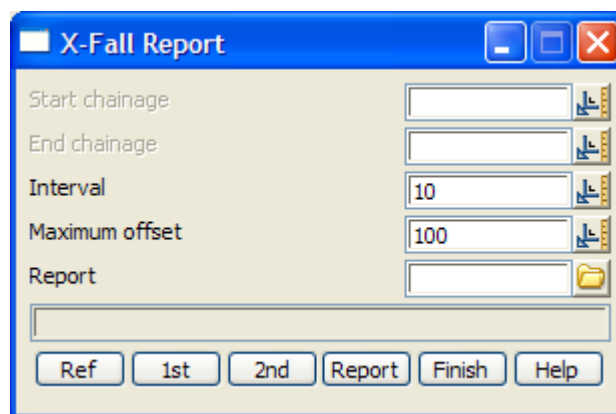

Position of option on menu: Report =>Xfall/offset

The x-fall report option reports on the horizontal and vertical offsets and the cross-fall between two strings.

The offsets are calculated as follows:

- a reference string is selected which is used to define chainages.
- lines perpendicular to the reference string are taken at regular chainages and intersected (in plan) with the first and second strings.
- the horizontal and vertical offsets and the cross-fall between the two strings is calculated at the intersection points.

On selecting the X-fall option, the **X-Fall Report** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Start/End chainage <i>if blank, the start/end chainage of the reference string is used. if non-blank, the given chainage is used as the start/end chainage.</i>	input		
Interval <i>chainage interval to calculate values at.</i>	input	10	
Maximum offset <i>if non-blank, the maximum distance to search from the reference string to find the 1st and 2nd strings.</i>	input	100	
Report file <i>file for the x-fall report</i>	file box		*.rpt
Ref/1st/2nd <i>select the reference/first/second string.</i>	button		
Report <i>produce a offset and x-fall report between the first and second strings.</i>	button		

QA Reports

qa_reports

Position of menu: Report =>QA Reports

The QA options are for checking surveyed strings against design strings or tins.

For *Check asbuilt string vs design string*, go to the section "Check Asbuilt String vs Design String"

Check asbuilt string vs wall tin

"Check Asbuilt String vs Wall Tin"

Check points above tin

"Check Points Above a Tin"

"Check Points vs Tin"

Check survey points vs design points

"Check Survey Points vs Design Points" .

Check survey points vs design points (2)

"Check Survey Points vs Design Points

(2)" .

The menu options will now be discussed.

Check Asbuilt String vs Design String

asbuilt_vs_design_h_z_dif_panel

Position of option on menu: Report =>QA Reports =>Check asbuilt string vs design string

This panel is used to check the horizontal and vertical differences between two strings (usually “as built” and design). A control string is selected to provide the chainage and line to cut the two strings and calculate the difference along. The control string can be one of the two strings.

Selecting the Check asbuilt string vs design string brings up the **Check As Built String vs Design String** panel.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
As built string <i>string to compare</i>	string select		
Design string <i>string to compare</i>	string select		
Control string <i>string to use to define chainage and right angles. The line at right angles cuts the “as built” and “design” strings and is used to calculate the horizontal and vertical differences.</i>	string select		
Report horizontal difference <i>if tick, the horizontal differences are reported.</i>	tick box	tick	
Report vertical difference <i>if tick, the vertical differences are reported.</i>	tick box	tick	
Report at as built string’s vertices	tick box	tick	

if tick, the differences are reported at the vertices of the as built string.

Report at regular control line interval **tick box tick**

if tick, the differences are reported at the chainage interval given in the "Report interval" box.

Report interval

chainage interval of the control string to report the differences at.

Start chainage

start chainage of the control string to start reporting differences.

End chainage

end chainage of the control string to stop reporting differences.

Report file

name of the report file.

Report

run the option.

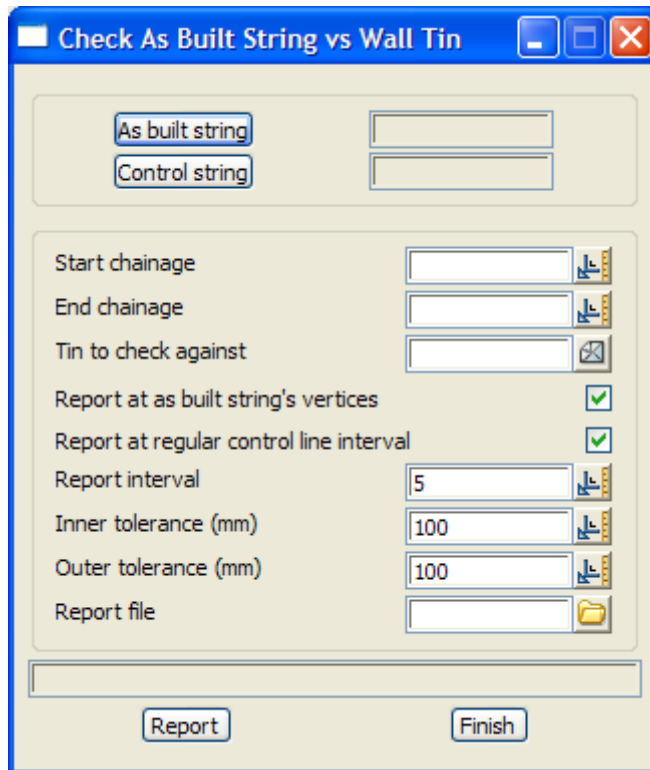

Check Asbuilt String vs Wall Tin

asbuilt_vs_tin_h_dif_panel

Position of option on menu: Report =>QA Reports =>Check asbuilt string vs wall tin

This panel is used to check the horizontal difference between a string (usually the “as built”) and a tin (usually a wall tin). A control string is selected to provide the chainage and bearing to project a horizontal line to cut the string and the tin and calculate the horizontal difference along. The control string can be the “as built” string.

Points that are different by a given inner and outer tolerance are flagged in the report.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
As built string <i>string to compare against the wall tin.</i>	string select		
Control string <i>string to use to define chainage and right angles. The horizontal line at right angles cuts the “as built” string and “tin to check against” tin that is used to calculate the horizontal differences.</i>	string select		
Start chainage <i>start chainage of the control string to start reporting differences.</i>	input box		
End chainage <i>end chainage of the control string to stop reporting differences.</i>	input box		
Tin to check against <i>tin to compare the as built string with.</i>	input box		available tins
Report at as built string’s vertices <i>if tick, the differences are reported at the vertices of the as built string.</i>	tick box	tick	

Report at regular control line interval tick box tick

if tick, the differences are reported at the chainage interval given in the "Report interval" box.

Report interval input box 5

chainage interval of the control string to report the differences at.

Inner tolerance (mm) input box 100

if the inner horizontal distance between the string and the wall is greater than this value (in units times 1000) then it is flagged in the report.

Outer tolerance (mm) input box 100

if the outer horizontal distance between the string and the wall is greater than this value (in units times 1000) then it is flagged in the report.

Report File input box

name of the report file.

Report button

run the option.

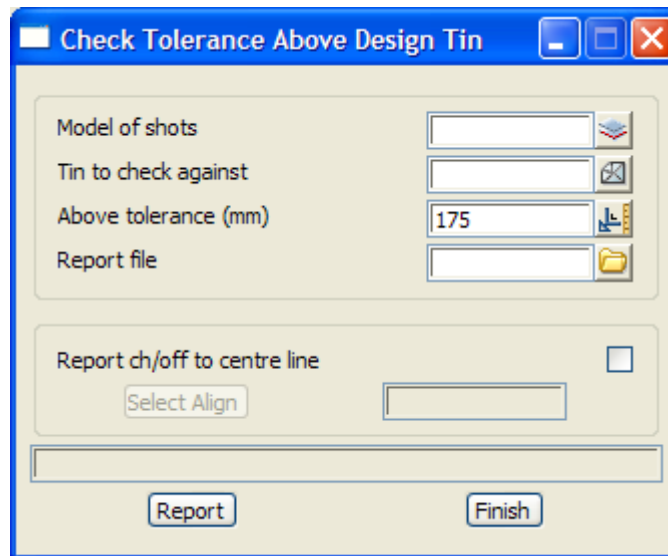

Check Points Above a Tin

Position of option on menu: Report =>QA Reports =>Check points above tin

This panel is used to check the z-value of points against the z-value of a tin at the same (x,y) locations and only report on those above the tin. To check points above and below a tin, go to the next section "Check Points vs Tin".

A z-tolerance above the tin is given and all points above the tin and outside the tolerance are especially flagged in the report.

Optionally the report can also include the chainage and offset of the points from a selected alignment string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of shots <i>model of points to check the z-value against the tin.</i>	model box		
Tin to check against <i>tin to check the z-values against</i>	tin box		
Above tolerance (mm) <i>if the z-value of the point is above the tin and the difference of the z-value of the point and the tin (times 1000), is greater than this amount then it is flagged in the report.</i>	input box	175	
Report file <i>name of the report file.</i>	file box		
Report ch/off to centre line <i>if tick, the chainage and offset of the points from the selected alignment string are included in the report.</i>	linetick box		
Select align <i>select the alignment string to calculate offset and chainage from.</i>	string select		
Report <i>run the option.</i>			

Check Points vs Tin

points_vs_tin_z_dif_panel

Position of option on menu: Report =>QA Reports =>Check points vs tin

For Check points above tin, go to "Check Points Above a Tin" .

This panel is used to check the z-value of points against the z-value of a tin at the same (x,y) locations, or if a **Layer depth** is given, the z-values of points are checked against the tin *minus* the layer depth.

Separate z-tolerances are supplied for **above** and **below** the tin and points outside either tolerance are especially flagged in the report.

Optionally the report can also include the chainage and offset of the points from a selected alignment string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of shots <i>model of points to check the z-value against the tin.</i>	model box		
Tin to check against <i>tin to check the z-values against</i>	tin box		
Above tolerance (mm) <i>if the z-value of the point is above the tin and the difference of the z-value of the point and the tin (times 1000), is greater than this amount then it is flagged in the report.</i>	input box	175	
Below tolerance (mm) <i>if the z-value of the point is below the tin and the absolute value of the difference of the z-value of the point and the tin (times 1000), is greater than this amount then it is flagged in the report.</i>	input box	175	
Layer depth <i>this value is subtracted form the z-value of the tin before the comparison is made with the z-value of the point.</i>	input box	0	
Report file	file box		

name of the report file.

Report ch/off to centre line tick box

if tick, the chainage and offset of the points from the selected alignment string are included in the report.

Select align string select

select the alignment string to calculate offset and chainage from.

Report

run the option.

Check Survey Points vs Design Points

survey_qa_panel

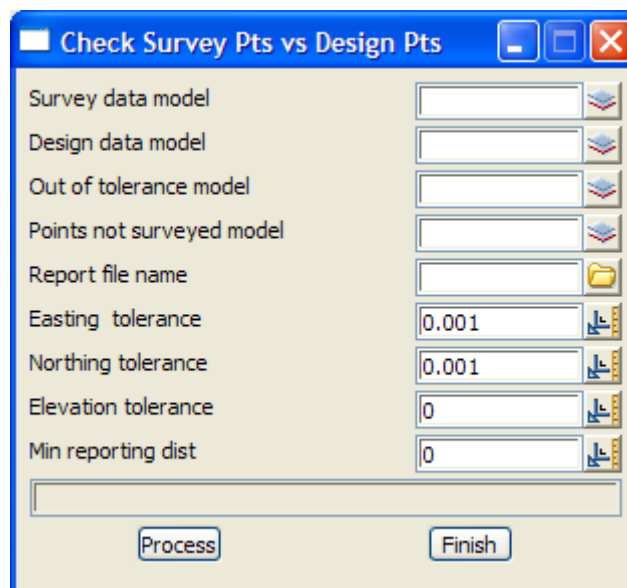

Position of option on menu: Report =>QA Reports =>Check survey points vs design points

This option is used to check surveyed points against the design points.

Separate tolerances are given for Eastings (x), Northings (y) and Elevations (z).

Any design points that have not been surveyed are noted and copies of points out of tolerance and/or points not surveyed can be automatically made.

NOTE - if a **radial** search distance is required in (x,y), go to the next section "Check Survey Points vs Design Points (2)".

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Survey data model <i>model of points to be compared against the design points.</i>	model box		available models
Design data model <i>points to be compared against.</i>	model box		available models
Out of tolerance model <i>copies of any points out of tolerance are added to this model.</i>	model box		available models
Points not surveyed model <i>copies of any points from the design model that have not been surveyed.</i>	input box		
Report file name <i>name of the report.</i>	input box		
Easting tolerance <i>tolerance in the x direction.</i>	input box	0.001	
Northing tolerance <i>tolerance in the y-direction.</i>	input box	0.001	
Elevation tolerance	input box	0	

tolerance in the z-direction.

Min reporting dist input box 0
xxxxx

Process button
run the option.

Check Survey Points vs Design Points (2)

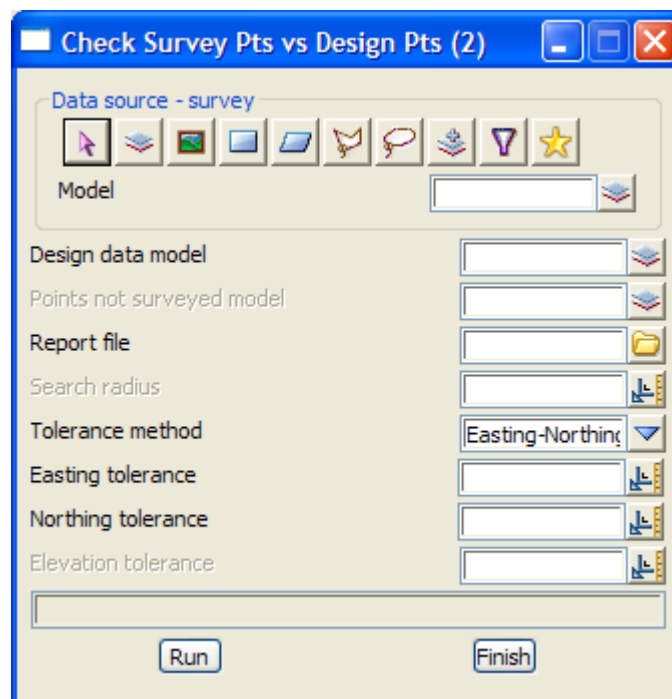

survey_qa_panel

Position of option on menu: Report =>QA Reports =>Check survey points vs design points (2)

This option is used to check surveyed points against the design points.

The (x,y) search distance can be either one radial distance or a separate x and y distance.

Any design points that have not been surveyed are noted and can be optionally copied to a model.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Design data model	model box		available models
<i>points to be compared against.</i>			
Points not surveyed model	input box		
<i>copies of any points from the design model that have not been surveyed.</i>			
Report file name	file box		
<i>name of the report.</i>			
<i>copies of any points from the design model that have not been surveyed.</i>			
Tolerance method	check box	Easting-Northing	Easting-Northing, Distance
<i>if Easting-Northing, separate Easting (x) and Northing (y) tolerances are given to check against.</i>			
<i>If Distance, the test is for a radial distance, not a separate Easting (x) and Northing (y) tolerances.</i>			
if Easting-Northing			

Easting tolerance input box 0.001
tolerance in the x direction.

Northing tolerance input box 0.001
tolerance in the y-direction.

if Distance

Distance tolerance input box 0.001
radial tolerance for (x,y).

Elevation tolerance input box 0
tolerance in the z-direction.

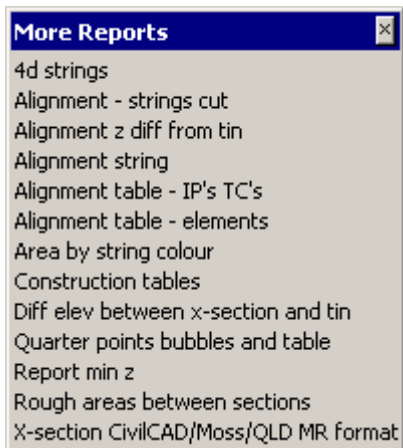

Process button
run the option.

More Reports

more_reports

Position of menu: Report =>More

More miscellaneous reports.

report on 4d strings
 report the strings that an alignment cuts
 give the differences from a tin to a string
 report on an alignment string
 create alignment report and/or table giving IP's and CT's
 create alignment report and/or table giving elements
 give plan areas summed by string colour
 give the differences from the points on a section to a tin
 report and/or table of quarter points for an arc
 report the minimum values on a x-section
 report of areas between sections
 report of a super string
 write out x-sections in a variety of formats

For the option/menu *4d string*, go to the section "Report for 4d Strings"

<i>Alignment - strings cut</i>	"Alignment - Strings Cut"
<i>Alignment z diff from tin</i>	"Report Z Differences from Alignment to Tin"
<i>Alignment string</i>	"Alignment Report"
<i>Alignment table - IP's TC's</i>	"Tabulate Alignment - IP's and CT's" in chapter "Drafting"
<i>Alignment table - elements</i>	"Tabulate Alignment - Elements" in chapter "Drafting"
<i>Area by string colour</i>	"Total of Plan Area by String Colour"
<i>Diff elev between x-sections and tin</i>	"Report Z Differences From X-Sections to a Tin"
<i>Quarter points bubble and table</i>	"Setout Lip Line" from the chapter "Survey"
<i>Report min z</i>	"Report Minimums Z-Value on a Cross Section"
<i>Rough areas between sections</i>	"Report Rough Areas"
<i>Super string</i>	"Report for Super Strings"
<i>X-section CivilCAD/Moss/QLD MRD format</i>	"X-Sections Report"

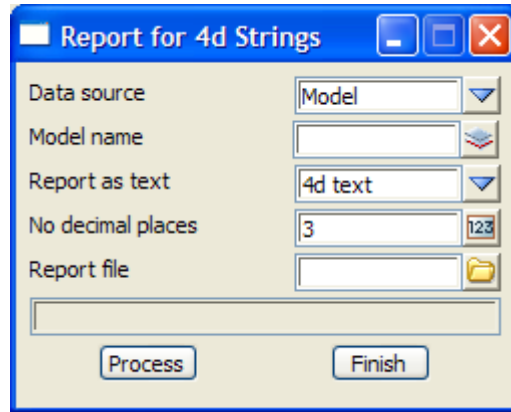

The menu options will now be discussed.

Report for 4d Strings

report_4d_panel

Position of option on menu: Report =>More =>Report for 4d strings

This panel is used to create a report for 4d strings where the x y and z values are printed out for each point plus either the 4d text for the point or the name of the string (repeated for each point).

The fields and buttons used in this panel have the following functions:

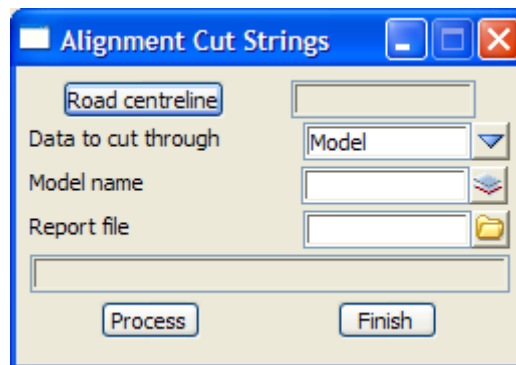

Field Description	Type	Defaults	Pop-Up
Data source <i>data source type.</i>	choice box	model	string, model, view
Model/View/String <i>Data source to do report of 4d strings on.</i>	data source		
Report as text <i>if 4d text, the 4d text for the point is written out after the x, y and z values. If string name, the string name is written out after the x, y and z values.</i>	file	4d text	string name 4d text
No decimal places <i>number of decimal places to use in the x, y and z values.</i>	input	3	
Report file <i>name of the report file.</i>	file		
Process <i>run the option.</i>	button		

Alignment - Strings Cut

alignment_cut_strings_panel

Position of option on menu: Report =>More =>Alignment - strings cut

This option is used to create a report of the position and angle that strings make where they cut a selected alignment string.

The fields and buttons used in this panel have the following functions:

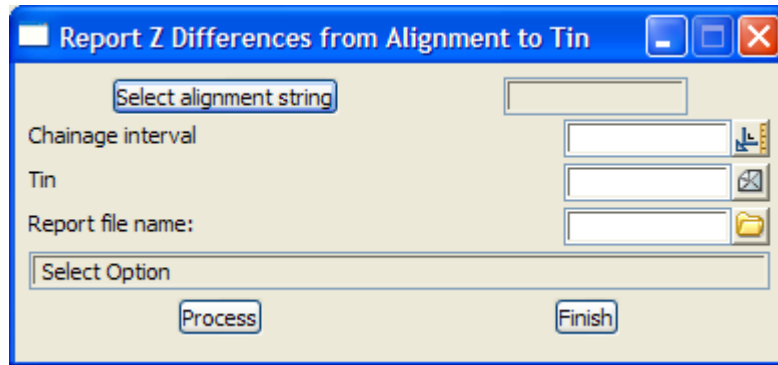

Field Description	Type	Defaults	Pop-Up
Road centreline <i>select the alignment string to report the cuts for.</i>	string select		
Data source <i>source of the data</i>	choice box	Model	String/Model/View
Data <i>method a specifying data</i>			
Report file <i>name of the report file.</i>	input box		*.rpt files
Process <i>run the option.</i>	button		

Report Z Differences from Alignment to Tin

aligndiff_panel

Position of option on menu: Report =>More =>Report z differences from alignment to tin

This panel is used to create a report of the difference in z-values between an alignment string and a tin. The differences are reported at a given chainage interval along the alignment string.

The fields and buttons used in this panel have the following functions:

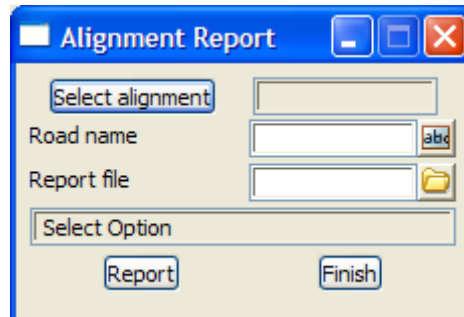

Field Description	Type	Defaults	Pop-Up
Select alignment string <i>select the alignment string to report z-differences for.</i>	string select		
Chainage interval <i>interval to report on.</i>	input box		
Tin <i>tin to get z-values from.</i>	input box		available tins
Report file name <i>name of the report file.</i>	input box		*.rpt files
Process <i>run the option.</i>	button		

Alignment Report

align_report_panel

Position of option on menu: Report =>More =>Alignment string

This panel is used to report the tangent points and centres of arcs for an alignment string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select alignment string <i>select the alignment string to report on.</i>	string select		
Report file name <i>name of the report file.</i>	input box		
Report <i>run the option.</i>	button		

Alignment Table - IP's, TC's

Position of option on menu: Report =>More =>Alignment table - IP's and TC's

Create table of IP and CT points for an alignment string.

This panel has already been documented.

See "Tabulate Alignment - IP's and CT's" in chapter "Drafting"

Alignment Table - Elements

Position of option on menu: Report =>More =>Alignment table - elements

Create table of horizontal elements for an alignment string.

This panel has already been documented.

See "Tabulate Alignment - Elements" in chapter "Drafting"

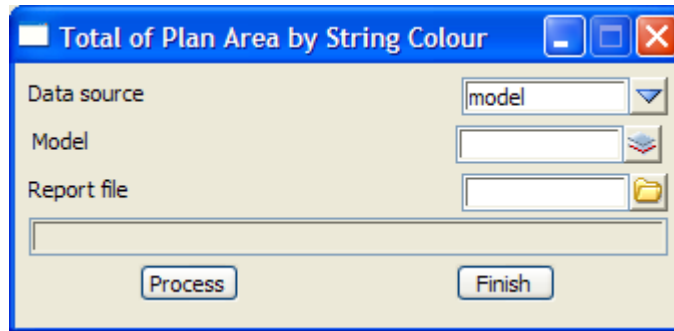

Total of Plan Area by String Colour

plan_areas_panel

Position of option on menu: Report =>More =>Area by string colour

This panel is used to calculate the sum of the plan area of all strings of the same colour. This is especially useful for calculating the plan areas of faces produced for slope areas, volumes etc.

A report giving the total plan area for each different colour is produced.

The fields and buttons used in this panel have the following functions:

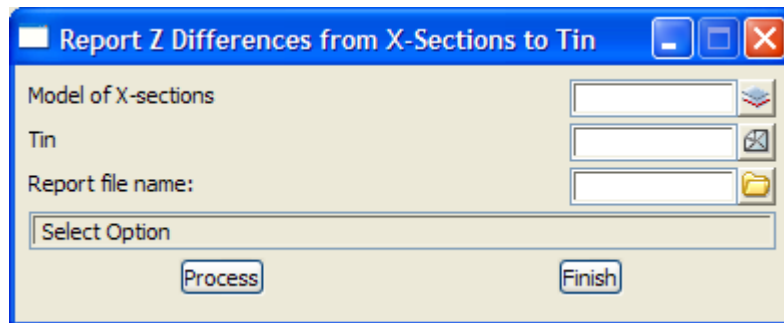

Field Description	Type	Defaults	Pop-Up
Data source <i>Type of data to calculate areas for.</i>	data source	model	model, view
Model/View <i>Data source to calculate the areas and sum by colour.</i>	data source		
Report file <i>Report giving the total plan areas of the strings for each colour.</i>	input box		
Process <i>Run the option</i>	button		

Report Z Differences From X-Sections to a Tin

xdiff_panel

Position of option on menu: Report =>More =>Diff elev between x-section and tin

This panel is used to report the z differences between the points on cross sections and the corresponding z-values from a tin.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of X-Sections <i>model of cross sections to report on.</i>	model box		available models
Tin <i>tin to get z-values from.</i>	tin box		
Report file name <i>name of the report file.</i>	file box		
Process <i>run the option.</i>	button		

Quarter Points Report

Position of option on menu: Report =>More =>Quarter points bubbles and table

This option is used to create bubbles and/or a report for the critical horizontal and vertical points and quarter points (by chord or by chainage) for any arcs in an alignment string.

This option has already been documented as

Survey =>Setout =>Setout lip line

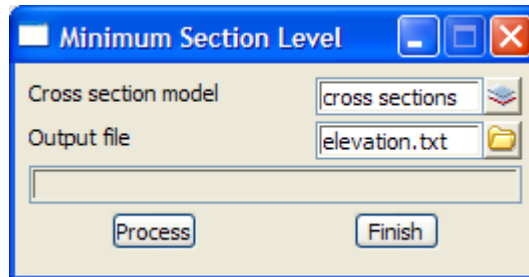

in the section "Setout Lip Line" of the chapter "Survey" .

Report Minimums Z-Value on a Cross Section

minimum_section_level_panel

Position of option on menu: Report =>More =>Report min z

This panel creates a report giving the minimum z-value on a cross section.

The fields and buttons used in this panel have the following functions:

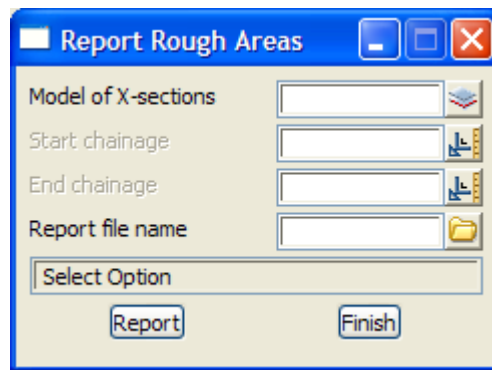

Field Description	Type	Defaults	Pop-Up
Cross section model <i>model of cross sections to report on.</i>	model box		
Output file <i>file to write section names and minimum z-values to.</i>	file box		*.txt files
Process <i>run the option.</i>	button		

Report Rough Areas

rough_area_panel

Position of option on menu: Report =>More =>Rough areas between sections

This panel is used to

The fields and buttons used in this panel have the following functions:

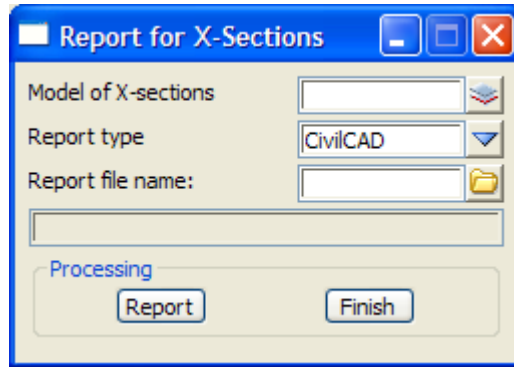

Field Description	Type	Defaults	Pop-Up
Model of x-sections xxxxx	input box		
Start chainage xxxxx	input box		
End chainage xxxxx	input box		
Report file name <i>name of the report file.</i>	input box		
Report <i>run the option.</i>	button		

X-Sections Report

xreport_panel

Position of option on menu: Report =>More =>X-section CivilCAD/Moss/QLD MR format

This panel is used to write out cross sections in a variety of formats.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of x-sections <i>model of cross sections to write out.</i>	input box		available models
Report type <i>format of the report.</i>	file box	CivilCAD	CivilCAD, Moss MainRoad Qld, Brief
Report file name <i>name of the report file.</i>	input box		
Report <i>run the option.</i>	button		

26 Utilities

utilities

Position of menu: It is on the main menu as Utilities

The utilities menu contains a collection of useful operations that don't easily fit under any of the other menus.

For ease of selection, the frequently used utilities are placed on the first level of the menu. All the other utilities are split alphabetically between two walk-right menus - the utilities walk-right menus for A-G and H-Z.

on Main menu

create floating Utilities menu
snaps

edit, create, delete etc. for chains
edit, create, delete etc. for functions
compiling and running macros.
measure distances, angles etc.
re-calc functions

find inside and outside of a polygon
super string options
utilities from A to G
utilities from H to Z

on 12d Model menu
and floating menu

Snaps

snaps_ops

Position of menu: Utilities =>Snaps

The snaps option allows the user to set snapping modes for use during pick operations. The snapping modes have been discussed in detail in the “Snaps” section in the chapter “Tools and Concepts” .

The Snaps walk-right menu provides a full snap menu, abbreviated snap menus laid out either horizontally or vertically, and a snaps cogo menu for creating special point positions using coordinate geometry commands.

full snaps menu
brief snaps laid out vertically
snaps cogo
under development

For the option *Snaps*, go to the section “Snaps” .

Snaps (Vert) “Snaps (Vert)” .

Cogo “Snaps Cogo” .

Snaps

snaps

Position of option on menu: Utilities =>Snaps =>Snaps

The Snaps menu provides tick boxes to turn the various snap modes on or off and options to set tin, string and model names. Any combination of snap modes and names can be set.

point snap on/off
line snap on/off
text snap on/off
grid snap on/off
allow cursor point on/off
ask for z value at each point in edits
name of tin to snap to
tin snap on/off
turn segment snap on/off
restriction on string names
restriction on model names
set snap tolerance
set point snap tolerance
bring up info panel on/off
turns data tips on/off
turns fast pick on/off

The snaps point, line, grid, cursor, tin and info are all set on or off using the tick boxes.

The *snap tolerance* is displayed on the Tolerance line on the menu.

The *point snap tolerance* is displayed on the Pt tolerance line on the menu.

For more information on snaps, go to the “Snaps” section in the chapter “Tools and Concepts” .

snap_tin

Tin Snap

Tin snap means that when an (x,y) point is selected, the z-value for the point is taken to be the z-value on the tin at the same (x,y) position.

To use tin snap, the name of the tin to snap to must first be set. Then, snapping to that tin is controlled by the state of the tin snap tick box.

If the tick box is **on** (a tick), snapping to the tin is used. If the tick box is **off** (a cross or nothing), no tin snaps are used.

The name of the tin to snap to is set by selecting the tin option and entering the tin name in the **Snap Tin** panel and selecting the **set** button.

When a name is set, the tin tick box is automatically set to on.

For more information on snaps, go to the “Snaps” section in the chapter “Tools and Concepts” .

snap_name

snap_model

Name and Model Snap

The user can restrict the snap to specific strings and/or models by selecting the name or model option. This brings up the **snap name** or **Snap Model** panel. The string name (model name) used to restrict the snap is entered into the name (model) field. The values are then set by selecting the **set** button.

When **12d Model** creates a new project, **line** and **point** snap are set to **on** and all other snaps set off.

For more information on snaps, go to the “Snaps” section in the chapter “Tools and Concepts” .

point_snap_tolerance

Point Snap Tolerance

Point snap tolerance is not a tick box but a menu item. The point snap tolerance value is the

distance to be used for considering vertices over anything else when point snap is on.

The point snap tolerance distance is given in screen units (pixels). There are one thousand pixels per screen width, hence a point snap tolerance of say 10 means that the point snap distance about a vertex is one hundredth of the screen width.

The *point snap tolerance* is given in terms of screen units rather than world units because it is a distance on the screen, independent of any co-ordinate system being used in a view.

The current point snap tolerance value is displayed as **Pt tolerance** on the *Snap* menu.

The *Point snap tolerance* is modified by selecting the Pt tolerance item on the Snaps menu to bring up the **Point Snap Tolerance** panel.

The **point snap tolerance** to be used to restrict the point snap is entered into the panel and then the **Set** button selected. The default tolerance is 10.

For more information on snaps, go to the “Snaps” section in the chapter “Tools and Concepts” .
[snap_tolerance](#)

Snap Tolerance

Snap tolerance is not a tick box but a menu item. The snap tolerance value is the distance to be used for considering data when snaps are on.

The snap tolerance distance is given in screen units (pixels). There are one thousand pixels per screen width, hence a snap tolerance of say 50 means that the snap distance about a point, line etc. is one twentieth of the screen width.

Snap tolerance is given in terms of screen units rather than world units because it is a distance on the screen, independent of any co-ordinate system being used in a view.

The current snap tolerance value is displayed as **Tolerance** on the *Snap* menu.

The *Snap tolerance* is modified by selecting the Tolerance item on the Snaps menu to bring up the **Snap Tolerance** panel.

To change the snap tolerance, type a new value into the Tolerance panel field and then click LB on the **Set** button.

For more information on snaps, go to the “Snaps” section in the chapter “Tools and Concepts” .

Info Snap

If info snap is set, then the information panel comes up whenever a string is picked.

Summarising, the available snap modes are

- ▲ point - diamond cursor
- ▲ line - square
- ▲ grid - circle
- ▲ cursor - circle
- ▲ tin - squiggles under a line
- ▲ name
- ▲ model
- ▲ info

On starting up a new project, point and line snap are on, all others off and tolerance is set to 50.

When an existing project is saved, the snap settings, snap tolerance and positions of any snaps menus on the screen, are also saved.

For more information on snaps, go to the “Snaps” section in the chapter “Tools and Concepts” .

Snaps (Vert)

h vertical_snaps

Position of option on menu: Utilities =>Snaps =>Snaps (Vert)

The snaps (vert) menu provides the same tick boxes as the snaps menu to turn the various snap modes on or off, however the snap descriptions are abbreviated to one character to reduce the menu size.

The Snaps and Snaps (vert) menu are

The Snaps are

- P** Point snap (on)
- L** Line snap (on)
- X** Text snap (off)
- G** Grid snap (off)
- C** Cursor snap (on)
- H** Height snap (off)
- T** Tin snap (off)
- S** Segment snap (off)
- I** Info snap (on)
- D** Data tip (off)
- F** Fast accept (on)
- A** Fast accept (off)
- K** Construction snap (on)

For more information on snaps, go to the “Snaps” section in the chapter “Tools and Concepts” .

Snaps Cogo

`snaps_cogo`

`snap_create`

`snap_fillet`

`snap_locate`

`snap_divide`

`snap_intersect`

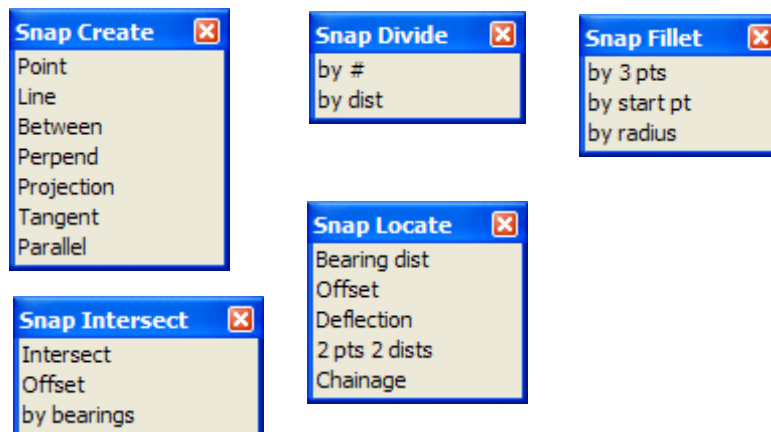

Position of menu: Utilities =>Snaps =>Cogo

The snaps cogo options are used to create the point required for any 12d Model select operation. For example, selecting the next point in **append** in an editor. The result of the snaps cogo is returned to the **select operation** as the selected point.

Walking right on the cogo option brings up the snaps cogo menu

and the walk-right menus for each of the snaps cogo menu items are

Note on Combining Snaps Cogos

When using a snaps cogo option, another select is often required and it is permissible to use other snaps cogo option to create the point for that select.

For example, the required point is the point halfway between two other points **dropped perpendicularly** onto an arc.

Such a combined result can be achieved using snaps cogo however the order of selecting the snaps cogo options may at first seem to be the reverse of what is required.

For the above example, the snaps cogo perpen must be selected before the between option.

This is because when the perpen snap cogo option is selected, it asks the user to **select** the point to drop and it is then that the snaps cogo between option is used to find the midpoint of two selected point. The result of the between then becomes the point to drop for the perpen.

If the between option had been selected first, the resultant midpoint would have been returned

as the selected point and that select completed.

Snaps New

xtra_snaps

Position of menu: Utilities =>Snaps =>New

The xtra snaps menu is currently under development.

Chains

chains

Position of menu: Utilities =>Chains

A *Chain* is a list of items that are run in the order that they appear in the list.

Things that can be run in a *Chain* are:

- (a) functions
- (b) other chains
- (c) super alignment resolves
- (d) plot parameter files
- (e) some 12d Model options
- (f) some screen layout files
- (g) macro that don't have a panel
- (h) an external command line
- (i) some special hardwired commands such as delete a tin, delete all tins, delete a model, delete all models, clean a model, delete a file, compare files, redraw all views, comments

So in its simplest form, a *chain* can run a user specified list of functions.

The Chains walk-right menu is

For the option *Create*, go to the section "Create/Edit a Chain"

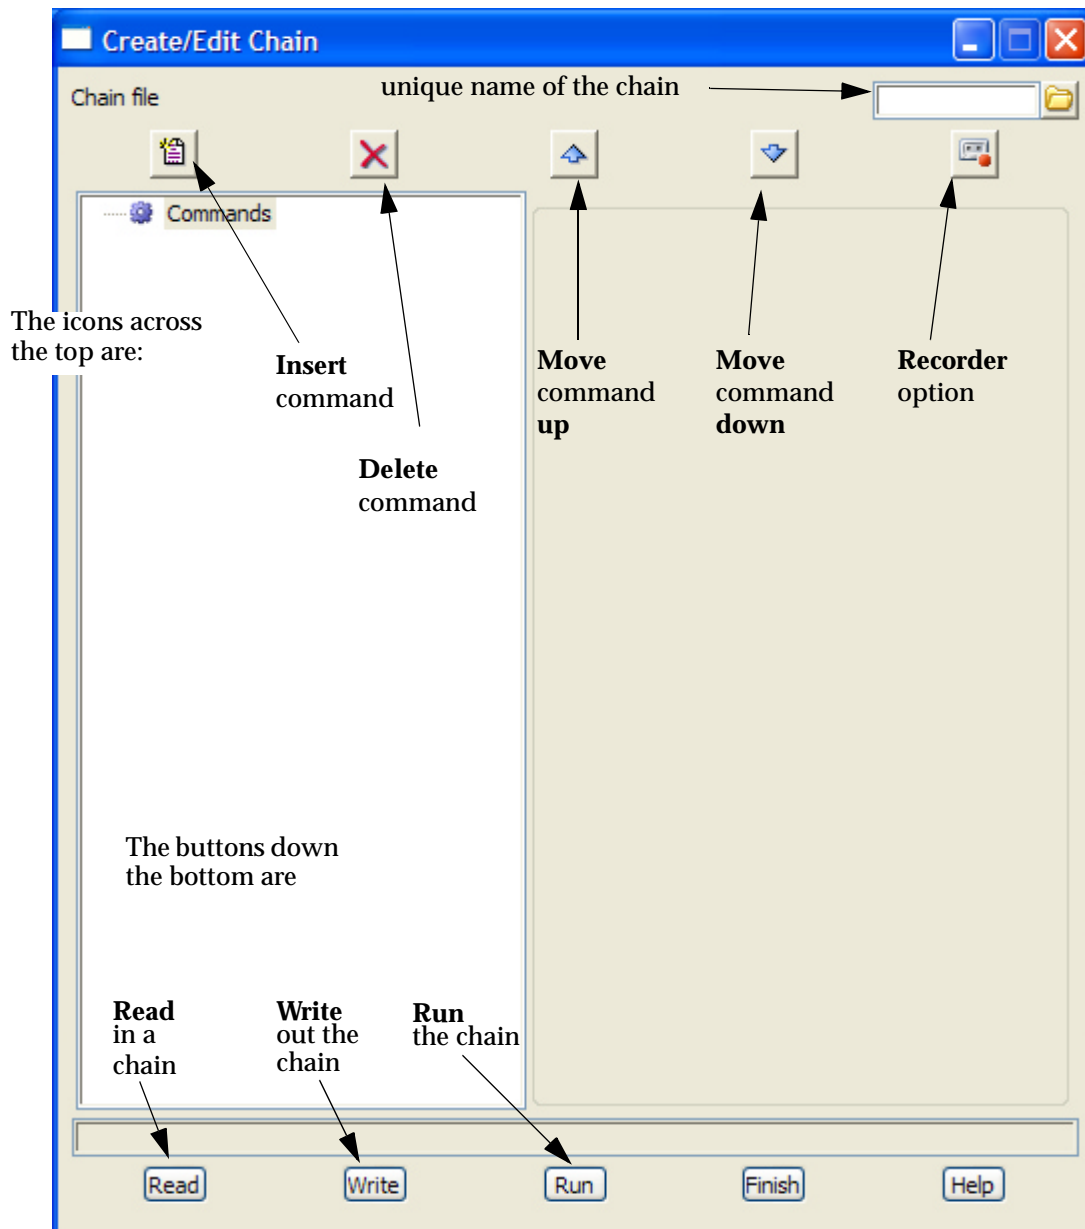

<i>Edit</i>	"Edit a Chain"
<i>Copy</i>	"Copy a Chain"
<i>Rename</i>	"Rename Chains"
<i>Run</i>	"Run a Chain"
<i>Delete</i>	"Delete a Chain"

Create/Edit a Chain

Position of option on menu: Utilities =>Chains =>Create

`create_edit_chain`

Selecting Create brings up the **Create/Edit Chain** panel which is used to create, edit and run chains.

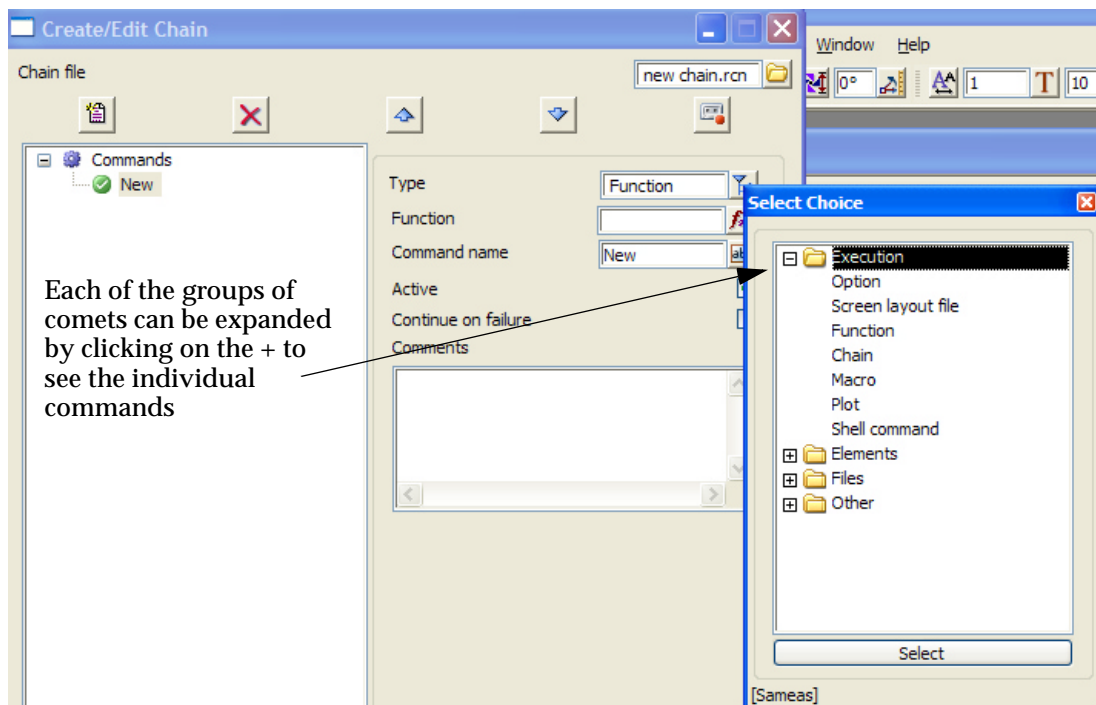

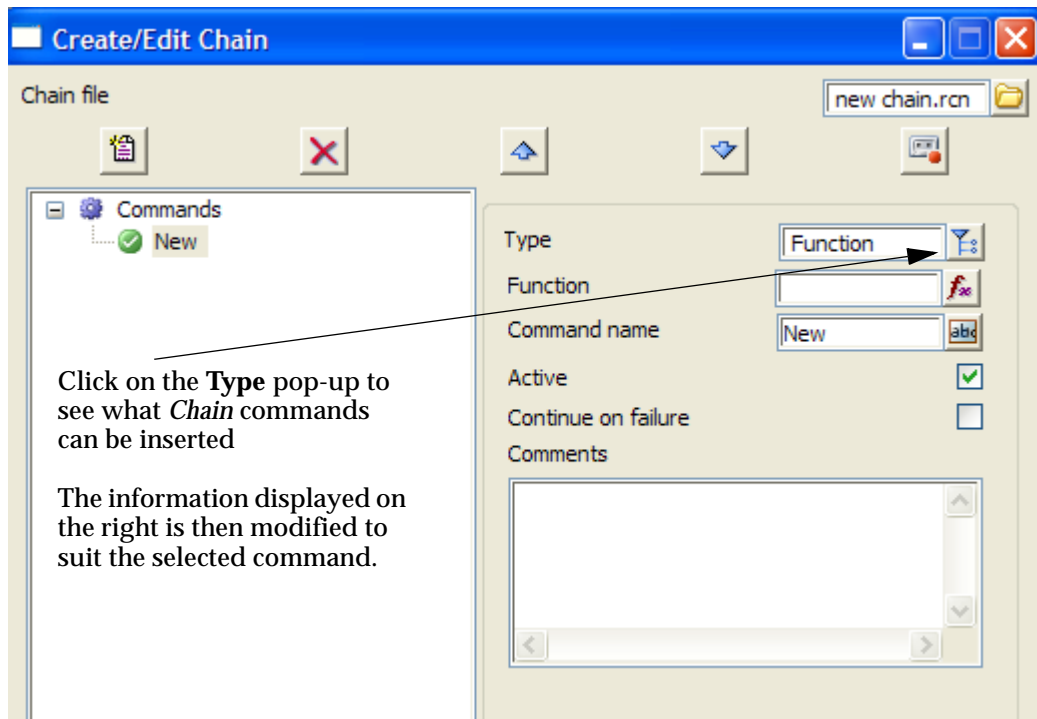

To create a new chain, a unique name is typed into the **Chain file** box (say *new chain*) and the **Write** button selected.

The chain is then built up by *inserting commands* using the **Insert** icon.

Inserting a Command:

Clicking on the **Insert** icon insert a new command into the chain and on the right hand side of the panel, has the information for defining the new command.

The **Chain** commands are:

Under **Execution**

Option – run a *12d Model* option. **Note** - only some options can be run.

Screen layout file – run an existing screen layout file. **Note** - only some slf's can be run.

Function – recalc a 12d function

Chain – run an existing chain

Macro – run a 12d Model macro that doesn't have a panel

Plot - run a plot parameter file

Shell command - run an external program, Microsoft command line etc.

Under **Elements**

Resolve SA – resolve a selected super alignment

Clean model

Delete tin

Delete model

Delete all tins

Delete all models

Delete all templates

Delete all empty models

Under **Files**

Delete file

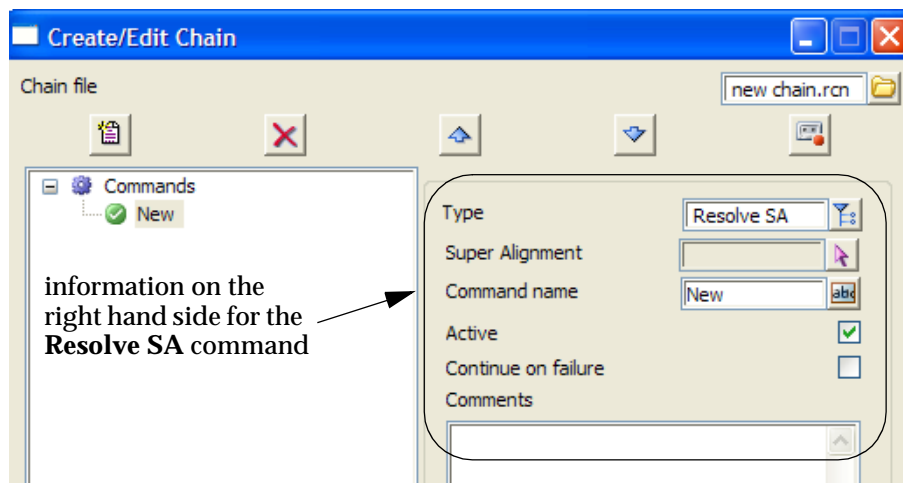

Compare - compare two text files

Under **Other**

Comment

Redraw all views

Selecting a command will update the right hand side of the panel with information for that particular command. For example, for the **Resolve SA** command

The common fields used in the right hand side are:

Command name - each command is given a default *Command name* composed of the command and the extra information such as the name of the super alignment. The *Command name* does not have to be unique and can be changed at any time.

Active - if ticked on then the command is run when the chain is run. If not ticked, the command is not run.

Continue on failure - if ticked **on**, the chain will continue running if an error occurs with this command. If not ticked, the chain will stop running if an error occurs in this command.

Comments - comments recorded for the options.

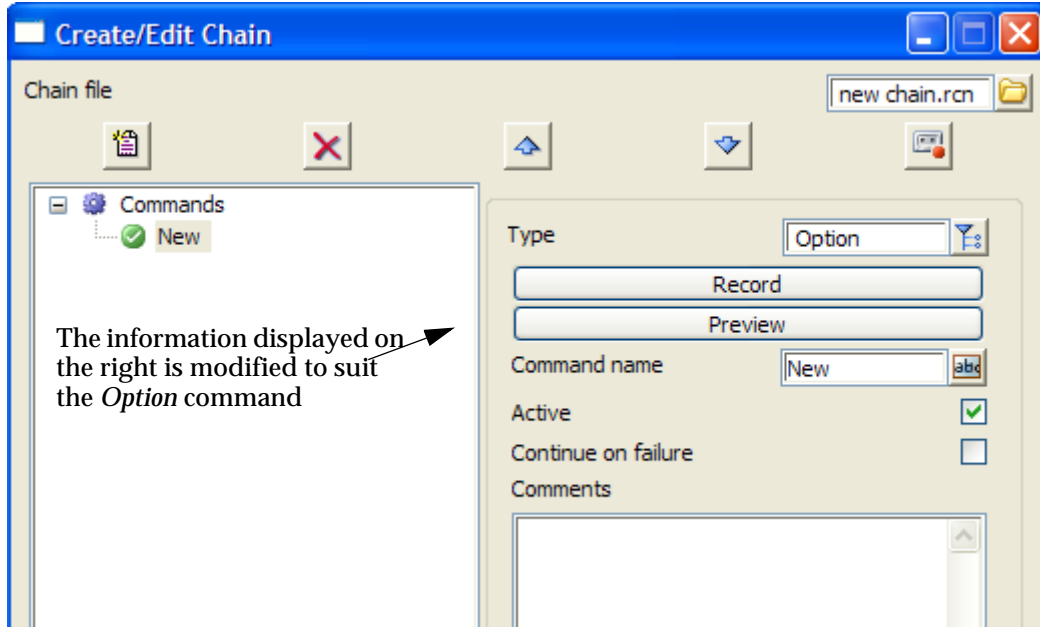

When a chain is running, message and error messages are written to the **Output window**.

Important Note - each time a command is inserted or modified, the **Write** button must be clicked to write out the modified chain.

Special Chain Commands

Option

Selecting the Option command modifies the information on the right side of the panel to suit the Option command.

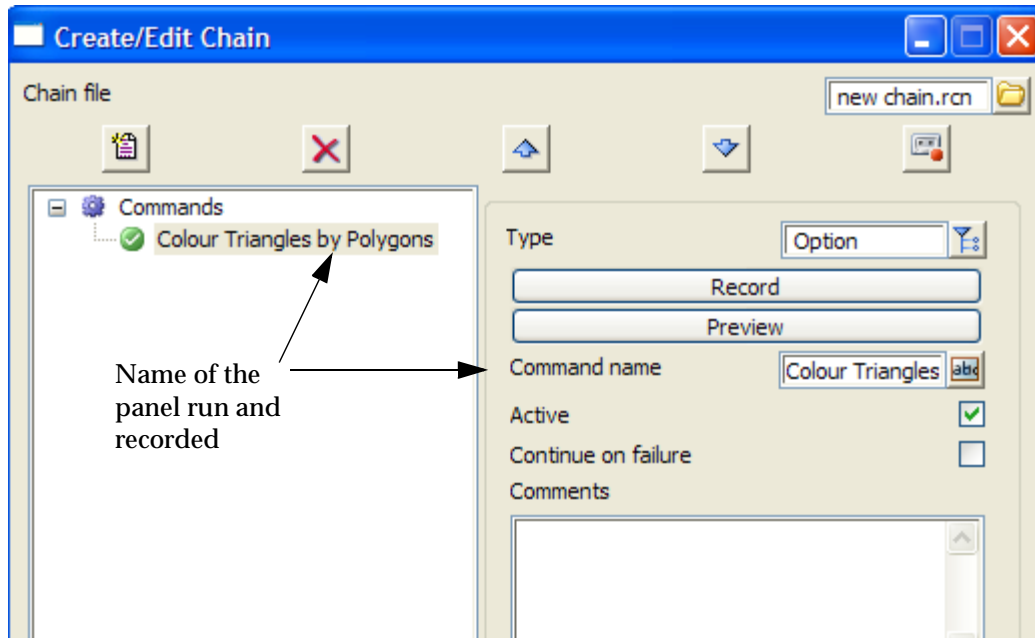

Clicking on the **Record** button starts a “one option” record cycle.

The **Recorder** panel is placed on the screen and you **run** the 12d Model panel option that you wish to record (not 12d macro options, user macros or CAD commands)

Once the option is run, the **Recorder** panel is automatically removed and the **Option** in the **Create/Edit Chain** panel given the name of the 12d Model panel that was run.

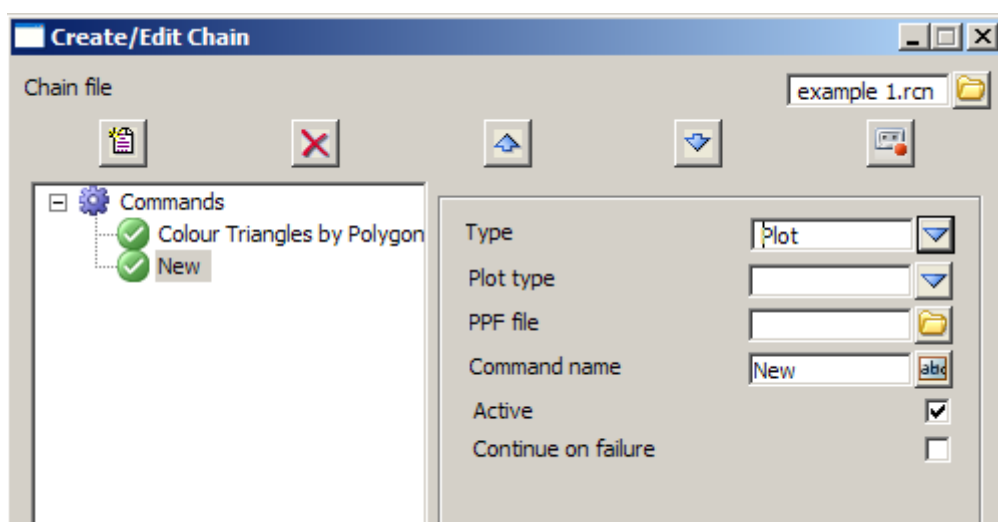

Click on the **Write** button at the bottom of the **Create/Edit Chain** panel to update the chain information.

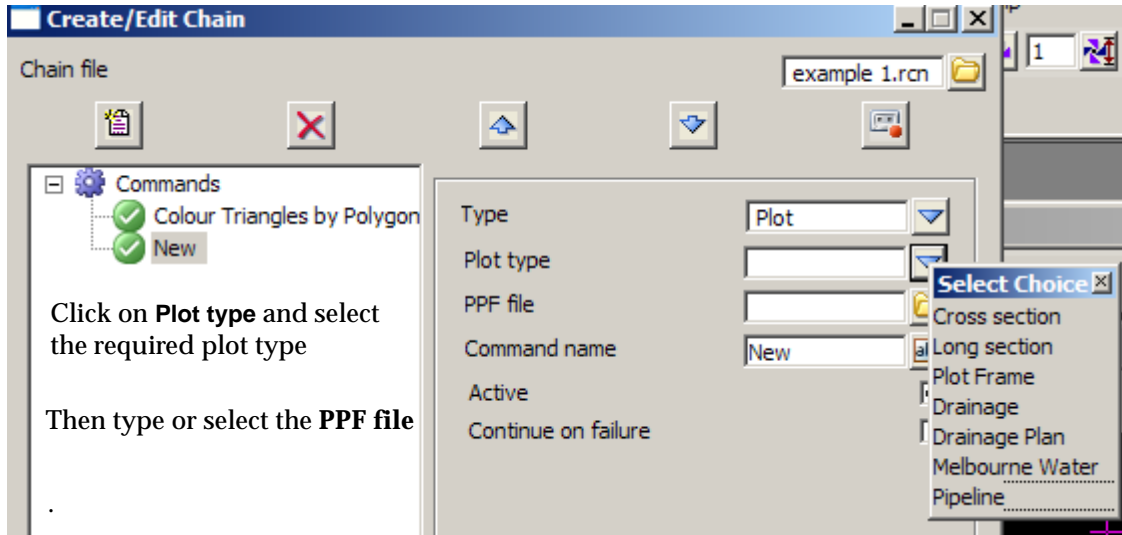

Important Note - the **Preview** button brings up the recorded panel with all the information filled in *that can be validated by the panel fields*. So sometimes **Preview** can not display the recorded information. Also **Preview** is for display only and can't be used to modify **Option**.

Important Fudge - often this will work to change the information in **Option**. Select **Preview** to bring up the recorded panel with all the information filled in. Then hit the **Record** button on the **Option**, make the changes you want and run the panel. This will record the new information in place of the existing information.

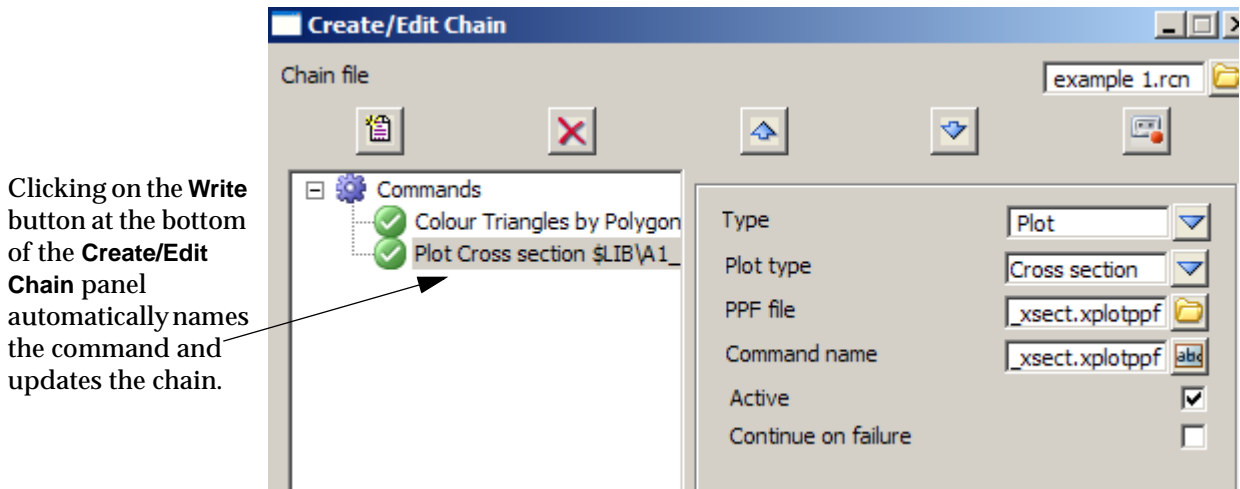

Plot

Selecting the **Plot** command modifies the information on the right side of the panel to suit the **Plot** command.

Clicking on the **Write** button at the bottom of the **Create/Edit Chain** panel names the command and updates the chain information.

Clicking on the **Write** button at the bottom of the **Create/Edit Chain** panel automatically names the command and updates the chain.

How to use the Recorder Icon

The **Recorder** option is like the *Macro* option in Word – it records the running of many 12d Model panel options so that they can be replayed. Note that it **can not** record running 12d Macros or CAD commands. The **Recorder** creates an **Option** command for each 12d Model option recorded

Clicking on the **Recorder** icon brings up the **Recorder** toolbar with icons to **Pause**, **Stop** and **Cancel** the recording.

Simply **run** the 12d Model panel options that you wish to record (not 12d macro options, user macros or CAD commands) until you hit the **Stop** icon. Each 12d Model option that is run will be added as a Run Option command to current chain.

Important Notes

1. Macros or CAD commands **can not** be recorded, and not all non-macro 12d panel options can be recorded. For example, if a screen layout file can not be created for an option, then it can't be recorded.
2. When recording, the *12d Model* panel option must be filled in and run. This may restrict what can be done.

Saving a Chain

After each item is added to the chain, click on **Write** to save the chain.

Running a Chain

There is a **Run** button on the **Create/Edit Chain** panel to run a chain.

However a chain can also be run simply by clicking on the **name** of the chain in the list created by walking right on

Recalc =>Run chain

Similarly editing an existing chain can easily be done by clicking on the name of the chain in the list created by walking right on

Recalc =>Edit chain

This brings up the **Create/Edit Chain** panel with the selected chain in the editor.

Aside - the Recalc Chain Panel

recalc_chain

The **Recalc Chain** panel comes up if you click on **Utilities =>Chains =>Edit** without walking right or **Utilities =>Recalc =>Edit chain** without walking right.

to **create** a chain, type in a new name for the chain (the **.rcn** will automatically be added)

and then click on **Edit**.

This will bring up the **Create/Edit Chain** panel.

Special Notes on Recording Options

1. Use Unique String Names for String Selects

String selects on panels record the id and the name of the string, and the model id and the name of the model containing the string.

When the option is run in the chain, the string is first searched for using the model and string id's but if that fails then a string of the recorded name is searched for in the recorded model name.

If the string name is unique in the model then the correct string will be selected. If there is more than one string with the same name in the model, then the first string of that name that is found will be used.

2. Polygon Selects

String selects can be recorded for a *Polygon box* but *Rectangle*, *Parallelogram* or *Lasso* can not be recorded.

- ← string select - will record
- ← rectangle - **won't** record
- ← parallelogram - **won't** record
- ← lasso - **won't** record

Edit a Chain

Position of option on menu: Utilities =>Chains =>Edit

The Edit walk-right menu displays all the chains in the project and double clicking on a chain in the list will bring up the **Create/Edit a Chain** panel (see "Create/Edit a Chain").

Run a Chain

Position of option on menu: Utilities =>Chains =>Run

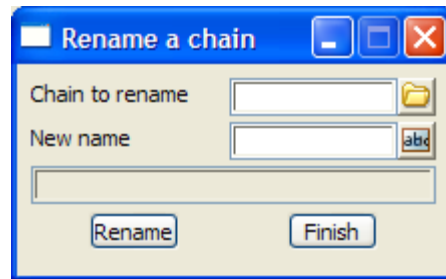

The Run walk-right menu displays all the chains in the project and double clicking on a chain in the list will run the chain.

Rename Chains

rename_a_chain

Position of option on menu: Utilities =>Chains =>Rename

On selecting the Rename option, the **Rename a Chain** panel is displayed and is used to change the names of existing chains.

The fields and buttons used in this panel have the following functions.

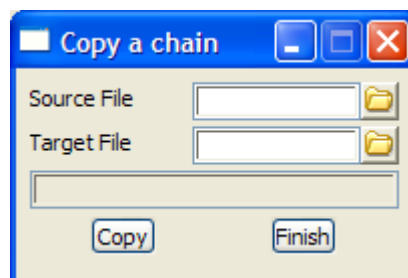

Field Description	Type	Defaults	Pop-Up
Chain to rename <i>chain to be renamed.</i>	folder box		available *.rcn files
New name <i>new name for the chain</i>	input		
Rename <i>Change the name of the chain</i>	button		

Copy a Chain

copy_a_chain

Position of option on menu: Utilities =>Chains =>Copy

On selecting the Copy option, the **Rename a Chain** panel is displayed and is copy chains.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chain to copy <i>chain to be renamed</i>	folder box		available *.rcn files
New name <i>new name for the chain</i>	input		
Copy <i>Copy the chain</i>	button		

Delete a Chain

delete_a_chain

Position of option on menu: Utilities =>Chains =>Delete

On selecting the Delete option, the **Delete a Chain** panel is displayed and is used to delete chains.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chain to delete <i>name of the chain to delete</i>	folder box		available *.rcn files
Delete	button		
<i>Delete the chain given in the Chain to delete field.</i>			

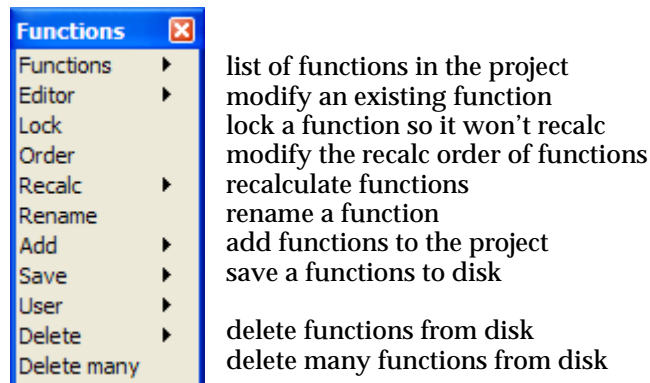

Functions

functions

Position of menu: Utilities =>Functions

Functions are used in the template and interface options to collect special data together. This allows 12d Model to recognize when some of the data has been modified and that some of the data is no longer valid. It is then possible to re-run the functions (re-calc the functions) and update the modified data.

The functions walk-right menu is

The Functions walk-right simply lists all the functions that have been defined in the project. The other options in this menu will now be described in more detail.

For the option <i>Editor</i> , go to the section	"Editor"
<i>Lock</i>	"Lock"
<i>Order</i>	"Order"
<i>Recalc</i>	"Recalc"
<i>Rename</i>	"Rename"
<i>Add</i>	"Add"
<i>Save</i>	"Save"
<i>Delete</i>	"Delete"

Editor

On walking right on the editor menu option, a list of defined functions appears.

By selecting the highlighted name of a function to be edited, the appropriate function panel filled with the information from the selected function, is displayed

The information in the selected function can then be modified.

Important Note

The defined functions menu also has a [Same as] option which is used to select the function to be edited by simply picking **any string** that was created by the function.

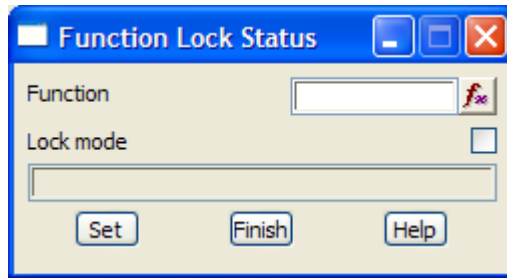

Lock

function_lock_status

Position of option on menu: Utilities =>Functions =>Lock

The function lock option is used to *lock* a function so that it can't be re-calculated.

On selecting the lock option, the **function lock status** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the function to lock/unlock.</i>	input		available functions
Lock model <i>display and modifies the lock status for the given function. If tick, the function is locked an won't re-calculate.</i>	tick box		
Set <i>set the lock mode for the selected function.</i>	button		

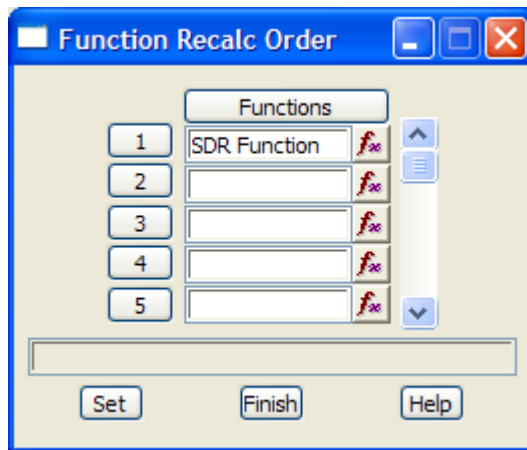

Order

function_recalc_order

Position of option on menu: Utilities =>Functions =>Order

The default recalculation order for functions is the order in which the functions were created however the order option is used to **modify** the function recalc order.

On selecting the order or option, the **function recalc order** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Functions <i>list of functions in their recalculation order. Functions should only appear once in the list.</i>	table		available functions
Set <i>record the order of functions in the table.</i>	button		

Note - all functions must still exist somewhere in the re-arranged recalc order.

Recalc

Position of option on menu: Utilities =>Functions =>Recalc

The recalc menu is the same as the menu.

Utilities =>Recalc

For more information, please go to the section “Recalc” of this chapter.

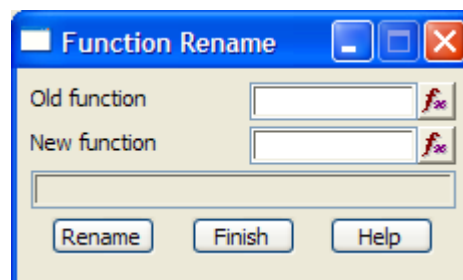

Rename

function_rename

Position of option on menu: Utilities =>Functions =>Rename

On selecting the rename option, the **function rename** panel is displayed.

This panel can be used to change the names of existing functions

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old function <i>name of the function to be renamed.</i>	input		available functions
New function <i>new name for the function</i>	input		
Rename <i>Change the name of the function in the old function field to the name given in the new function field.</i>	button		

Add

function_adds

Position of menu: Utilities =>Functions =>Add

The function add option brings up the walk-right menu, function adds

add_all_functions_to_project

Position of option on menu: Utilities =>Functions =>Add =>Add all to project

On selecting the add all to project option, the **add all functions to project** panel is displayed.

This panel is used to add all removed functions to the project.

Save

function_saves

Position of menu: Utilities =>Functions =>Save

Functions can be saved on disk so that they can be used for future project work.

The function save walk-right menu is

Note - Modified or new functions are automatically saved when a project is saved.

Save a Function

save_function

Position of option on menu: Utilities =>Functions =>Save =>Save a function

On selecting the save a function option, the **save function** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the function to be saved.</i>	input		available functions
Save <i>after selecting this button, the function given in the function field will be saved to disk.</i>	button		

Save All Functions

save_all_functions

Position of option on menu: Utilities =>Functions =>Save =>Save all functions

On selecting the save all option, the **save all functions** panel is displayed.

By selecting the **save** button, all functions in the working project will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

Delete

function_deletes

Position of menu: Utilities =>Functions =>Delete

Using the delete option, functions can be deleted from disk so that they no longer can be accessed or take up disk space.

To help protect the user against disasters, when a function is selected for deletion, a yes-no pop-up menu is used to confirm that the user did intend deleting the function.

If deletion is confirmed, the selected function is removed from the project and deleted from the disk. The function delete walk-right menu is

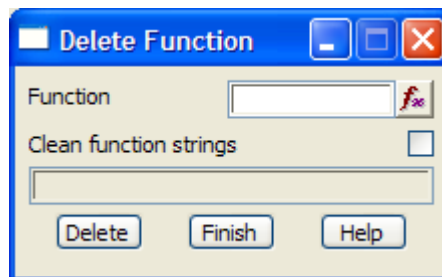

Delete a Function

delete_function

Position of option on menu: Utilities =>Functions =>Delete =>Delete a function

The delete a function option can be used to delete a function in the working project.

On selecting the delete a function option, the **delete function** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the function to be deleted.</i>	function box		all project functions
Clean function strings <i>if tick, delete all the strings created by the function</i>	tick box		
Delete <i>after selecting this button, the function given in the function field will be deleted from the computer disk. A yes-no pop-up is used to confirm that deletion is required.</i>	button		

Delete All Functions

delete_all_functions

Position of option on menu: Utilities =>Functions =>Delete =>Delete all functions

The delete all functions option will delete all of the functions in the working project.

On selecting the delete all functions option, the **delete all functions** panel is displayed.

Clean function strings tick box

if tick, delete all the strings created by all the function

After selecting the **Delete** button, a yes-no pop-up is used to confirm that deletion is required. If it is, all functions in the working project will be deleted from disk and unless an error occurs, the panel will be removed.

Delete Many Functions

delete_many_functions

Position of menu: Utilities =>Functions =>Delete many

The Delete many option deletes one or more functions in the working project.

Selecting the Delete many, displays the **Delete Many Functions** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Delete <i>if tick, delete the selected function listed after the tick</i>	tick box		
Function <i>name of all the functions in the project</i>	input		all project functions
Delete function strings <i>if tick, delete all the strings created by the selected functions</i>	tick box		
Delete <i>delete all the ticked functions in the function field</i>	button		

Macros

macros

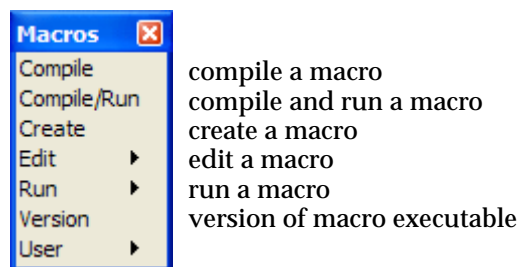

Position of menu: Utilities =>Macros

The 4D Solutions Macro Language (4DML) is a powerful programming language designed to run from within 12d Model. Its main purpose is to allow users to enhance the existing 12d Model package by writing their own programs (4DML's or macros).

4DML's can be compiled from within or outside 12d Model but can only be run from within 12d Model.

The macros menu has options to compile macros, compile and run macros or just run macros. A full description of macros is given in the 12d Model Macro Language manual.

The macros walk- right menu is

For the option *Compile*, go to the section “Compile”

<i>Compile/run</i>	“Compile and Run”
<i>Create</i>	“Create”
<i>Edit</i>	“Edit”
<i>Run</i>	“Run”
<i>Version</i>	“Version”

The options will now be described.

Compile

compile_a_macro

Position of option on menu: Utilities =>Macros =>Compile

The compile option is used to compile the macro source code into a executable program which can then be run from within 12d Model.

On selecting the option, the **compile a macro** panel is placed on the screen.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Macro source <i>the name of the macro source file.</i>	input		*.4dm files
Compile <i>compile the code file given in the macro source field.</i>	button		

Compile and Run

compile_run_a_macro

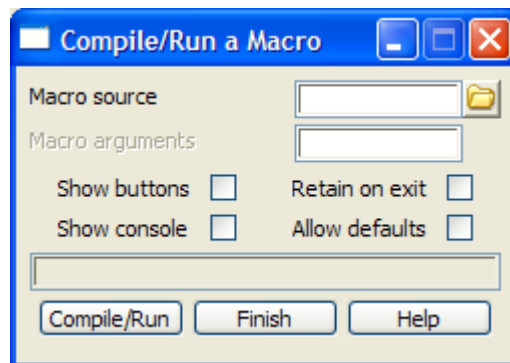

Position of option on menu: Utilities =>Macros =>Compile/Run

The compile and run option compiles the macro source code into a executable program, and if there are no errors, runs the program.

When a macro is run, a **macro console** panel is placed on the screen to provide an i/o and message area for the macro. It is possible to bring up the macro console with or without the **restart**, **abort** and **finish** buttons.

When the macro finishes, the macro console can be left on the screen or removed.

Selecting the **compile & run** menu option, brings up the **compile/run a macro** panel:

The fields and buttons used in these panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Macro source <i>the name of the macro source file.</i>	input		*.4dm files
Macro arguments <i>if non-blank, a text line which is passed to the program as an argument line.</i>	input		
Show buttons <i>if tick, the macro console panel has abort, restart and finish buttons on it.</i>	tick box		
Retain on exit <i>if tick, the macro console panel remains on the screen after the macro has finished running.</i>	tick box	tick	
Show console <i>if tick, the macro console panel is placed on the screen. if non-tick, the macro console panel is not displayed - used mainly with panels.</i>	tick box	tick	
Allow defaults <i>if tick, the default value for a prompt is displayed in the macro console panel.</i>	tick box		
Compile/Run <i>compile the code file given in the macro source field and if the compile is successful, run the program.</i>	button		

Create

create_macro_file__4dm

Position of option on menu: Utilities =>Macros =>Create

The macros=>create option is used to create macro files (*.4dm) with the editor pointed to by the EDIT_4D environment variable.

Selecting macros=>create brings up the **create macro file *.4dm** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder to create the .4dm file in.</i>	input	current folder	
File to create <i>name of the file, in folder, to create.</i>	input		*.4dm files
Create <i>create the file given by the folder and file to create panel fields. A macro header is set up in the file.</i>	button		

Edit

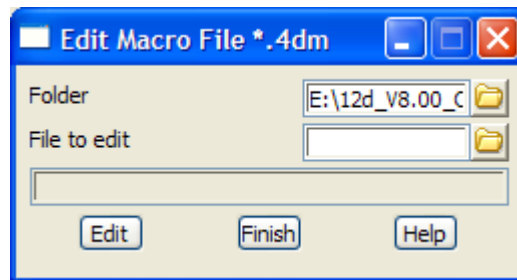

`edit_macro_file__4dm`

Position of option on menu: Utilities =>Macros =>Edit

The macros=>edit option is used to edit macro files (*.4dm) with the editor pointed to by the EDIT_4D environment variable.

The macros=>edit option has two modes of operation - selecting the macros=>edit itself, or by activating the macros=>edit option's walk-right menu, **folder *.4dm**.

Selecting macros=>edit itself brings up the **edit macro file *.4dm** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder for the .4dm file.</i>	input	current folder	
File to edit <i>name of the file, in folder, to edit.</i>	input		*.4dm files
Edit <i>edit the file given by the folder and file to edit panel fields. If the file given in the file to edit field does not exist, then a new file is created which already has each of the macro header set up.</i>	button		

The macros=>edit walk-right menu provides a list all the many template files (files ending in .mtf) in the current folder. When a file is selected from the list, it is automatically loaded into the editor.

Run

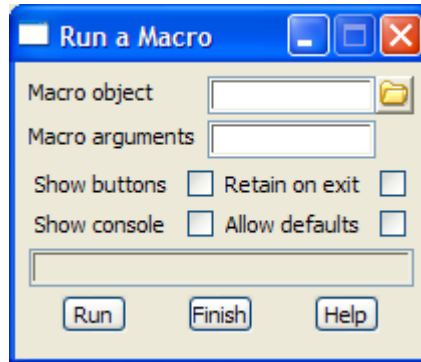

run_a_macro

Position of option on menu: Utilities =>Macros =>Run

The run option runs an existing macro executable program (produced by the compile process).

Like the **compile and run** option, the run options can run the macro executable with or without buttons on the macro console, and leave or remove the macro console once the macro has been executed.

Selecting the **run** menu option, brings up the **run a macro** panel:

The fields and buttons used in these panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Macro object <i>the name of the macro object or executable program.</i>	input		*.4dm files
Macro arguments <i>if non-blank, a text line which is passed to the program as an argument line.</i>	input		
Show buttons <i>if tick, the macro console panel has abort, restart and finish buttons on it.</i>	tick box		
Retain on exit <i>if tick, the macro console panel remains on the screen after the macro has finished running.</i>	tick box		tick
Show console <i>if tick, the macro console panel is placed on the screen. if non-tick, the macro console panel is not displayed - used mainly with panels.</i>	tick box	tick	
Allow defaults <i>if tick, the default value for a prompt is displayed in the macro console panel.</i>	tick box		
Run <i>run the executable given in the macro object field.</i>	button		

Version

macro_version

Position of option on menu: Utilities =>Macros =>Version

The **version** option simply brings up a panel giving information about the macro process.

Measure

measure

Position of menu: Utilities =>Measure

The measure menu contains two options to display the

delta x, delta y, horizontal distance, angle and bearing

between points, and for a section view, the

delta chainage, delta height, slope distance and % grade

between points are calculated and displayed.

There are also options to calculate the plan area of polygons, the surface area of a tin within a polygon, run measures and dynamic measures and dynamically calculate and display the x-fall between two strings.

The measure walk- right menu is

measure angle by 3 points
distance/bearing with scale option
plan areas
surface area for a tin
any measures
dynamic x-fall between strings

Note

The measure option has another mode of operation. Rather than moving onto the walk-right arrow, if LB is clicked when the measure button is highlighted on the 12d Model=>utilities menu, the **distance/bearing** panel is displayed on the screen.

For the option *Angle x 3 pts*, go to the section "Angle by 3 Points"

Bearing/distance

"Bearing and Distance"

Plan area

"Plan Area"

Surface area

"Surface Area" in the chapter "Triangles"

Value

"Value"

Xfall by strings

"X Fall by Strings"

The options in the menu will now be described.

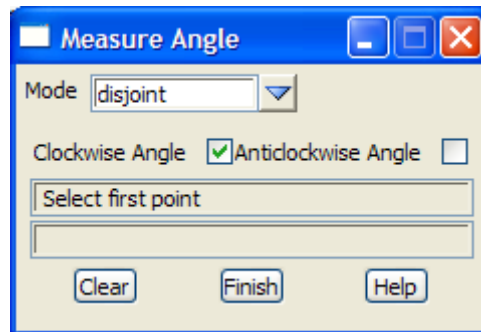

Angle by 3 Points

measure_angle

Position of option on menu: Utilities =>Measure =>Angle x 3 pts

The angle by 3 pts option is used to calculate the angle formed by selected three positions. the angle can be expressed as a clockwise or anti-clockwise angle.

On selecting the angle x 3 pts option, the **measure angle** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous

In disjoint mode, only the angle between the three selected positions is reported. After the angle is reported, the user can select the 1st point in the sequence.

In continuous mode, after the initial reporting of the angle, the user is prompted for the 3rd point of the new angle to be measured. By default, the previous 2nd point becomes the first point and the previous 3rd point becomes the 2nd point. This allows just one point (the third point) to be selected and the angle reported will change accordingly.

Clockwise angle tick box
if tick, then the angle is measured in the clockwise (forward) direction.

Anti-clockwise angle tick box
if tick, then the angle is measured in the anti-clockwise direction.

Clear button
when this button is selected, the sequence is re-initialised.

Note - after two positions are selected, the angle to the cursor position is dynamically calculated and displayed as the cursor moves around the view.

Bearing and Distance

measure_bearing_distance

Position of option on menu: Utilities =>Measure =>Bearing/Distance

The distance/bearing option is used to calculate the

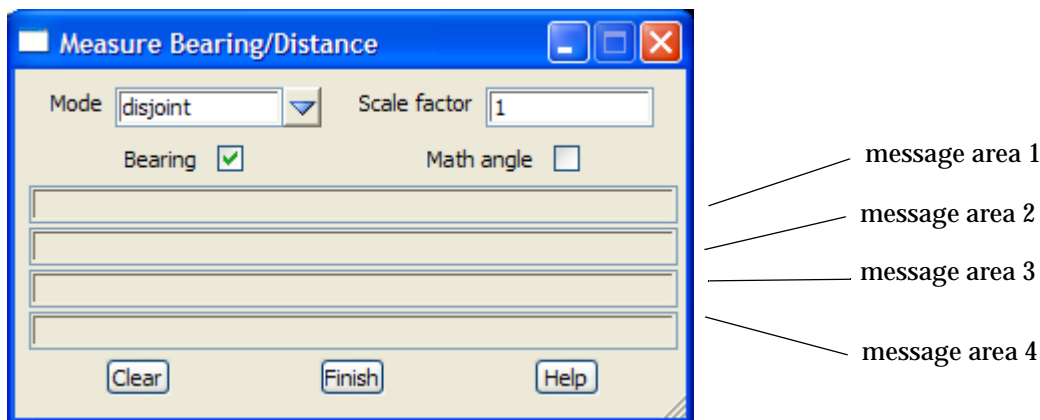

(a) the bearing measured in a clockwise direction between the positive y-axis and the (imaginary) line joining two selected points (when the bearing tick box is selected)

or

the bearing measured in an anticlockwise direction between the positive x-axis and the (imaginary) line joining two selected points (when the math angle tick box is selected)

(b) the distance between two user selected points.

On selecting the distance/bearing option, the **measure distance/bearing** panel is displayed.

This panel is principally used to display the distances between, and bearing of the line joining, pairs of user selected points.

message area 1 : brg = plane dist = ellipsoid dist =

where brg is the angle measured clockwise from north and is calculated using the coordinate values (Inverse value)

plane dist is the distance calculated using the coordinate values (Inverse value)

ellipsoid dist is the distance calculated by dividing the plane distance by the current scale factor

message area 2: dx = dy = dht = (if applicable)

where dx is the difference in x value between the two coordinates

dy is the difference in y value between the two coordinates

dz is the difference in z value between the two coordinates

If valid height values exist for two consecutive points the grade and slope is also reported

message area 3: grade % = slope =

If the measurement mode is set to continuous, the sum distances will be shown for the route taken

message area 4: Sum plane dist = Sum ellip dist =

where Sum plane dist, is the accumulative length of the route taken calculated using plane distances.

Sum ellip dist, is the Sum plane dist / scale factor.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous
<i>In disjoint mode, only the distance between the two points and the bearing (in degrees, minutes and seconds) of the (imaginary) line connecting the two points are displayed.</i>			
<i>In continuous mode, after the initial reporting of the bearing/distance, the user is prompted to select the next point (2nd point). In this case the previously selected second point becomes the first point.</i>			
Scale	input/output	1.0	
<i>the scale factor which will be used to convert plane distances to ellipsoid distances. i.e ellipsoid distance = plane distance / scale factor</i>			
Bearing	tick box	ticked	
<i>if ticked, the measured vectors can be displayed as bearings (angles measured from north, clockwise)</i>			
Math angle	tick box	un-ticked	
<i>if ticked, the measured vectors can be displayed as a mathematical angle (measured from east in a anti-clockwise direction).</i>			
Clear	button		
<i>when this button is selected, the selection sequence is re-initialised.</i>			

Plan Area

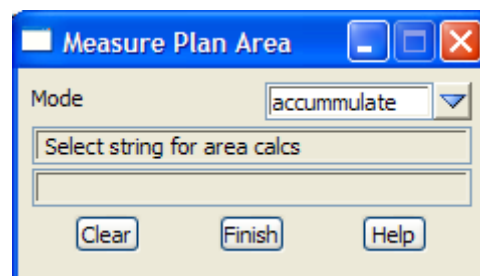

measure_plan_area

Position of option on menu: Utilities =>Measure =>Plan area

The plan area option is used to calculate the plan areas enclosed by strings.

If a string is not closed, the first and last points are considered to be connected to form a polygon.

On selecting the option, the **measure plan area** panel is placed on the screen.

This panel is principally used to display the plan areas of strings selected by the user.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous
<i>If disjoint, only the area of the selected string is displayed. If continuous, the total of the areas is also displayed.</i>			
Clear	button		
<i>when this button is selected, the total-to-date of the area is reset to zero and the selection sequence begun.</i>			

How to Use the Panel and Panel Messages

The measure area cycle consists is as follows:

- (a) the string is selected with the mouse.

message area 1 select string for area calcs
 message area 2

(b) repeat step (a) to find more areas and accumulate them. If the accumulator is to be zeroed, simply select the **clear** button again.

The area of the selected string is displayed in message area 2.

If the mode is set to continuous, the accumulated areas (sum) of the selected strings is also displayed.

message area 1 select string for area calcs
 message area 2 area = *value* sum = *value*

The cycle can then be repeated for as many strings as needed without leaving the option.

The accumulated total is reset to zero (cleared) by selecting the **clear** button again.

Surface Area

Position of option on menu: Utilities =>Measure =>Surface area

The surface area option calculates and reports the surface area of a tin restricted to a user specified polygon.

This option has already been documented as Tins=>Tin analysis=>Surface area.

See the section “Surface Area” n the chapter “Triangles” .

Value

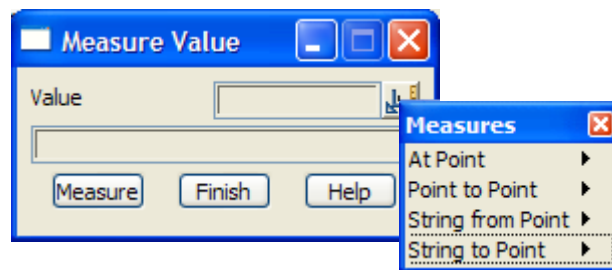

measure_value

Position of option on menu: Utilities =>Measure =>Value

The value option is used to calculate and display any of the measures available in the measures pop-up menu.

The **measures** are documented under “Measures” in the chapter “Tools and Concepts” .

On selecting the option, the **measure value area** panel and the **measures** menu is placed on the screen.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Value	output		
<i>the value calculated by the selected measure option.</i>			

X Fall by Strings

[xfall_between_2_strings_inquire](#)

Position of option on menu: Utilities =>Measure =>XFall by strings

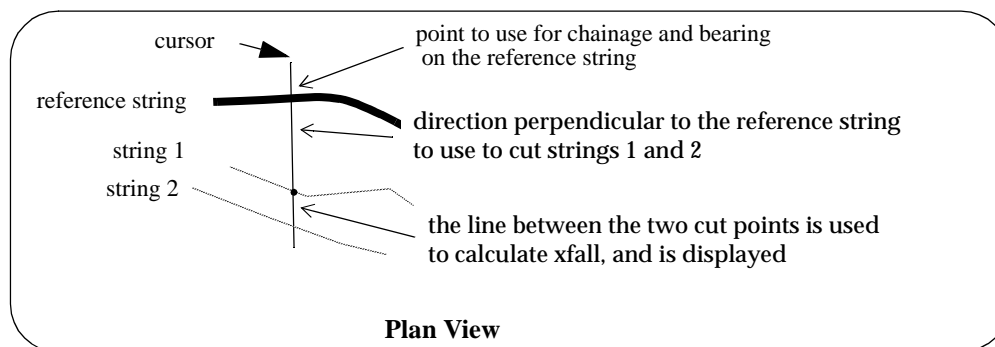

In this option, the user selects a reference string to define what is meant by chainage and right angles, and then selects two strings to calculate the x-fall between.

Once the three strings are selected, as the cursor moves around in a plan view, the cursor position is dropped perpendicularly onto the reference string.

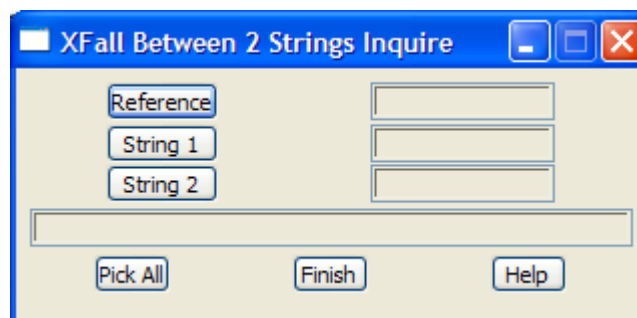

At the dropped chainage, a line is taken at right angles to the reference point and extended until it cuts the two selected strings. The xfall is then calculated between the cut points on the strings.

Then the chainage and the xfall are dynamically displayed in the panel message area.

The line joining the two strings is dynamically displayed on the plan view.

On selecting the Xfall by strings option, the **xfall between 2 strings inquire** panel is displayed.

The fields and buttons used in the two panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Reference	string-select		
------------------	---------------	--	--

the selected string is used to defined the meaning of chainage and bearing for the inquire. The cursor is dropped perpendicularly onto the reference string and at the dropped chainage, a line is taken at right angles to the reference point and extended until it cuts string 1 and string 2. The xfall is then calculate and displayed for the two cut points.

String 1/2	string-select		
-------------------	---------------	--	--

the two strings to calculate x-fall between.

Pick all	button		
-----------------	--------	--	--

if pick all is selected, the user is asked to sequentially select the three strings: reference string, string 1 and string 2. The strings are automatically assigned to the appropriate string-select panel fields.

Recalc

recalc

Position of menu: Utilities =>Recalc

Once a function has been applied, the calculated information is only correct whilst the initial data is not modified in any way. If any modifications are made to the data, then the function must be re-run and all the associated information recalculated and redrawn, and any perspective views associated with the function set with the new eye and target positions, and redrawn.

There are date and time stamps for all string, tin and template information in 12d Model and this enables 12d Model to determine what information has been modified since a function was last run and what re-calculations are required.

The recalc option is designed to **re-run** functions

If LB is clicked whilst the recalc menu option is highlighted, all the template functions with **auto recalc** set **on**, and that have had their initial data modified since their last re-run, will be recalculated and all appropriate information updated. The data will be redrawn on any views that is was on before the recalc.

The Recalc walk-right menu has four options:

For the option <i>Auto</i> , go to the section	"Auto"
<i>Editor</i>	"Editor"
<i>Edit data</i>	"Edit Data from String"
<i>Recalc</i>	"Recalc"
<i>Recalc all</i>	"Recalc All"
<i>Edit chain</i>	"Edit Chain"
<i>Run chain</i>	"Run Chain"

Auto

function_auto

Position of option on menu: Utilities =>Recalc =>Auto

The auto option allows the user to specify whether a function is automatically recalced if another function, tin, template or string that it depends upon, is modified or recalced.

Individual functions or all functions can have auto-recalc mode turned on or off and the default for a new function is **off**.

The function auto menu is

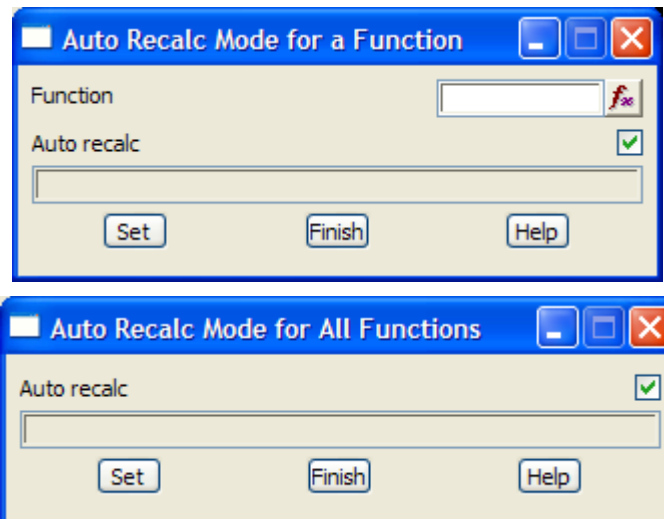

auto_recalc_mode_for_a_function auto_recalc_mode_for_all_functions

Position of option on menu: Utilities =>Recalc =>Auto =>Auto

Position of option on menu: Utilities =>Recalc =>Auto =>Auto all

The **auto** and **auto all** menu options bring up the **auto recalc mode for a function** and **auto recalc mode for all functions** panels respectively.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the function to be have auto recalc mode set on/off.</i>	input		available functions
Auto recalc <i>if tick, the function is set to auto-recalculate. Otherwise auto recalc is set off.</i>	tick box	tick	
Set <i>Set the auto recalc mode for the selected function/all functions.</i>	button		

Editor

edit_function

Position of option on menu: Utilities =>Recalc =>Editor

The recalc=>editor option is used to edit function.

The recalc=>editor walk-right menu provides a list all the defined functions in the project.

When a function is selected from the list, it is automatically loaded into the appropriate function panel for the selected function, and displayed

The information in the selected function can then be modified.

Important Note

The defined functions menu also has a [Same as] option which is used to select the function to be edited by simply picking **any string** that was created by the function. This is documented in the

next section “Edit Function from String”

Edit Function from String

edit_function_from_string

Position of option on menu: Utilities =>Recalc =>Editor =>[Same as]

Position of option on menu: Utilities =>Recalc =>Recalc =>[Same as]

The Edit Function from String option allows the user to start up the *Function editor* by simply selecting a string that was created by the function.

On selecting the option, the **Edit Function from String** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick Edit	button		

select data that was created by a function and the appropriate function editor is then opened.

Edit Data from String

edit_MTF_survey_function_data

Position of option on menu: Utilities =>Recalc =>Edit data

The Edit data option allows the user to start up the *MTF editor* by simply selecting a string that was created using an Apply Templates function (and hence an MTF file). The MTF file used in the *Apply Templates* function is automatically loaded into MTF editor (go to “MTF Edit”).

Similarly the Edit data option also allows the user to start up the *Survey Field Data editor* by simply selecting a string that was created using a *Survey Data Reduction* function. All the data produced by the *Survey Data Reduction* function is automatically loaded into the *Survey Field Data* editor (go to the section “Survey Field Data Editor”).

On selecting the Edit data option, the **Edit MTF/Survey Function Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick Edit	button		

select data that was created by applying an MTF file or a Survey Data Reduction function. The

appropriate MTF editor or Survey Field Data editor that created the selected data, is then opened.

For information on the *Survey Field Data Editor*, go to the section “Survey Field Data Editor” .

For information on the *MTF Editor*, go to “MTF Edit” .

Recalc

recalc_function

Position of menu: Utilities =>Recalc =>Recalc

The Recalc option is used to recalculate a user selected function, and all functions that depend on the function that have auto recalc set on.

The Recalc walk-right menu lists all the existing functions and by selecting a function name, the function will be forced to re-run and all appropriate information and views for that function will be updated.

The existing functions menu also has a [Changed] option which recalcs all changed functions.

The existing functions menu has a [Same as] option which is used to select the function to be recalced by simply picking **any string** that was created by the function. This is documented in the next section “Recalc Function from String”

Recalc Function from String

recalc_function_from_string

Position of option on menu: Utilities =>Recalc =>Recalc =>[Same as]

The Recalc Function from String option allows the user to recalcd a function by simply selecting a string that was created by the function.

On selecting the option, the **Recalc Function from String** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick Edit	button		

select data that was created by a function and the appropriate function will be recalced.

Recalc All

recalc_all_functions

Position of option on menu: Utilities =>Recalc =>Recalc all

The recalcd all option re-runs all functions regardless of their date and time stamps.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Ignore auto recalc	tick box		
<i>if not tick, all functions that have the auto-recalc flag set on are re-calculated.</i>			
<i>If tick, the auto-recalc flag is ignored and all functions are re-calculated.</i>			

Edit Chain

folder__rcn folder__rcn

Position of option on menu: Utilities =>Recalc =>Edit chain

The Recalc=>Edit chain option is used to edit chains.

The Recalc=>Edit chain walk-right menu provides a list all the defined chains in the project.

When a chain is selected from the list, it is automatically loaded into the **Edit/Create Chain** panel ready for editing.

Run Chain

Position of option on menu: Utilities =>Recalc =>Run chain

The Recalc=>Run chain option is used to run chains.

The Recalc=>Run chain walk-right menu provides a list all the defined chains in the project.

When a chain is selected from the list, it is automatically run.

Fence

fence

Position of menu: Utilities =>Fence

It is often necessary to divide strings into those parts that are within a certain region and those parts that are outside the region. In 12d Model, the fence option is the method of achieving this result.

Given a string to be used as a fence, the 12d Model fencing options will process strings in a model/view against the fence and break the strings into the parts inside the fence string and those parts outside the fence string.

Any 2d, 3d or interface line-strings that cut the fence polygon will have points inserted at the intersections with the fence polygon. The z-value at the intersection point will be interpolated from the adjacent points in the line-string.

Point strings do not have any extra points added to them.

Restrictions

- ▲ only 2d, 3d and interface strings can be split using the fence option.
- ▲ 4d strings are treated as though they were point strings.
- ▲ arcs are considered to be **inside** the fence if the minimum bounding rectangles of the fence and arc overlap.
- ▲ alignment, pipeline, drainage, sewer strings are not processed by the fence option

Notes

1. if the fence string is not closed, the first and last points are joined together to form a closed polygon as the fence.
2. a string may be broken into a number of pieces if it wanders in and out of the fence string.
3. the fence string is not processed against itself even if it is in the model or view being fenced.
4. unpredictable results will occur if any strings being fenced lie on top of the fence. If problems occur, parallel the fence in or out by a millimetre.

The fence options allows the user to choose a single string to be used as the polygon fence or a number of strings to be used as polygons and process the data against all the strings in one operation.

The fence walk-right menu is

For the option <i>Fence</i> , go to the section	"Fence"
<i>Fence stem</i>	"Fence Stem"
Multi fence	"Multi Fence"
Multi fence stem	"Multi Fence Stem"

Fence

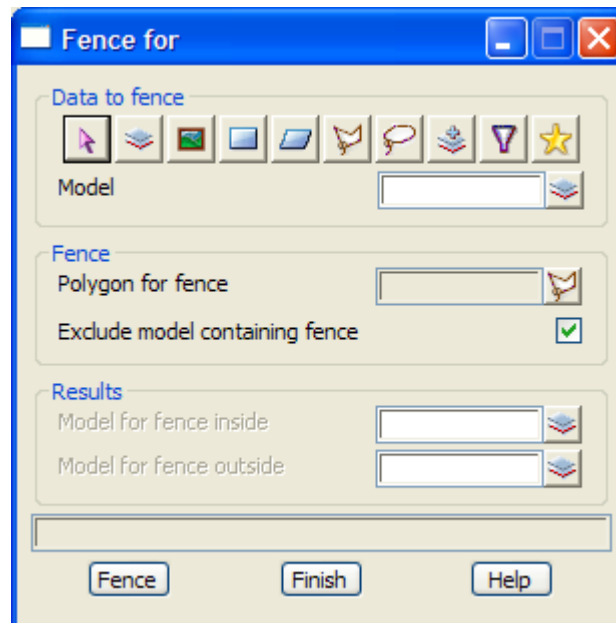

fence_for

Position of option on menu: Utilities =>Fence =>Fence

In this option, the user selects a single string to be used as a polygon fence. If the string is not closed, the first and last points are joined together to form a polygon.

The Fence option will process a selected string or all the strings in a model/view/string against this fence and break the strings into the parts inside the fence string and those parts outside the fence string.

On selecting the Fence option and then the appropriate **Data Source** in the panel, the **Fence for** panel is displayed.

The fields and buttons used in the two panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source

data source for strings to fence.

Polygon for fence string-select

the selected string will be used as the polygon to act as a fence to separate data into an inside and an outside.

Exclude model containing fence tick box tick

if tick, no data in the model containing the fence string will be fenced.

if not tick, all the appropriate data in the model containing the fence string will be fenced.

Model for fence inside input

available models

if non-blank, name of the model to contain the data inside of the fence string.

If blank, then no fence inside will be calculated.

Model for fence outside input

available models

if non-blank, name of the model to contain the data outside of the fence string.

If blank, then no fence outside will be calculated.

Fence button

on selecting **fence**, the appropriate strings in the data source will be divided by the fence string (selected by the **poly** button) into the parts of the strings inside the fence string and the parts of the string outside the fence string. Any line-strings that cut the fence string will have a point inserted at the intersection with the fence string and the z-value for this point interpolated from the points on either side of it in the line-string.

How to Use the Panel and Panel Messages

- (a) Select a fence polygon string by choosing **Polygon to fence**
- (b) Fence processing begins on selecting the **Fence** button.

Progress messages - sent to the panel message area

calculating inside-outside

calculating inside

calculating outside

fencing *string name*

Completion message - sent to the panel message area

finished fence

<esc> can be used to abort the fence option.

Fence Stem

fence_stem

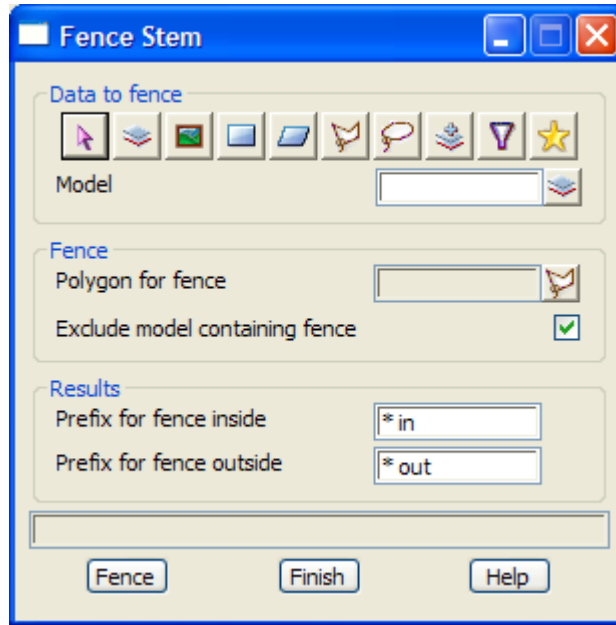

Position of option on menu: Utilities =>Fence =>Fence stem

As for the Fence option, the user selects a single string to be used as a polygon fence. If the string is not closed, the first and last points are joined together to form a polygon.

The Fence Stem option will process a selected string or all the strings in a model/view against this fence and break the strings into the parts inside the fence string and those parts outside the fence string. The inside and outside will then be put into models of the same name as the original model modified by a prefix and/or postfix.

This means that unlike the fence option, when fencing a view with the Fence Stem option, the inside/outside for each model on the view goes to distinct models using the prefix/postfix for the inside/outside model names.

On selecting the **Fence Stem** option and then the appropriate **Data Source** in the panel, the **Fence Stem** panel is displayed.

The fields and buttons used in the two panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			

Data source
data source for strings to fence.

Prefix for fence inside	input		available models
<i>if non-blank, prefix*postfix to adjust the data model name to be the model to contain the data inside of the fence string.</i>			
<i>If blank, then no fence inside will be calculated.</i>			

Prefix for fence outside	input		available models
<i>if non-blank, prefix*postfix to adjust the data model name to be the model to contain the data outside of the fence string.</i>			
<i>If blank, then no fence outside will be calculated.</i>			

Polygon for fence	string-select		
<i>the selected string will be used as the polygon to act as a fence to separate data into an inside and an outside.</i>			

Exclude model containing fence	tick box	tick	
<i>if tick, no data in the model containing the fence string will be fenced.</i>			
<i>if not tick, all the appropriate data in the model containing the fence string will be fenced.</i>			

Fence	button		
<i>on selecting Fence, the appropriate strings in the data source will be divided by the fence string into the parts of the strings inside the fence string and the parts of the string outside the fence string. Any line-strings that cut the fence string will have a point inserted at the intersection with the fence string and the z-value for this point interpolated from the points on either side of it in the line-string.</i>			

<esc> can be used to abort the fence option.

Multi Fence

multi_fence

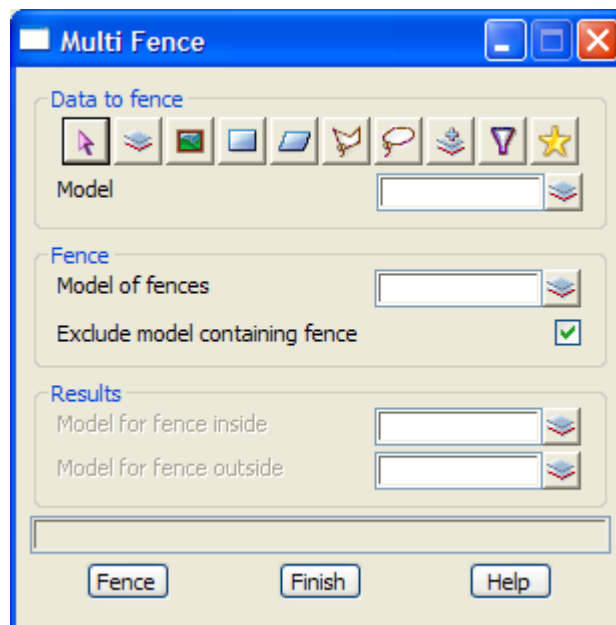

Position of option on menu: Utilities =>Fence =>Multi fence

It is often necessary to fence data against more than one polygon.

In the Multi-fence option, the user provides a model containing all the polygons to be used as fences. The Multi-fence option will process the selected string or all the strings in a model/view against all the polygons in the polygon model.

The data will be clipped and the **outside** is considered to be those bits are **outside all** of the polygons and the inside is the remainder, i.e. the bits **inside any one** of the polygon.

On selecting the Multi fence option and then the appropriate **Data Source** in the panel, the **Multi Fence String/Model/View** panel is displayed.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source			
<i>data source for strings to fence.</i>			
Model of fences	input		available models
<i>name of the model that contains the polygons to be used as fences.</i>			
Model for fence inside	input		available models
<i>name of the model to contain the data that is inside any one of the fences. If this field is blank, then no fence inside will be calculated.</i>			
Model for fence outside	input		available models
<i>name of the model to contain the data outside all of the fences. If this field is blank, then no fence outside will be calculated.</i>			
Exclude model containing fence	tick box	tick	
<i>if tick, no data in the model containing the fence string will be fenced.</i>			
<i>if not tick, all the appropriate data in the model containing the fence string will be fenced.</i>			

Fence button

the appropriate strings in the data source will be divided by the fence polygons (from the model of fences) into the parts of the strings inside any one fence and the parts of the string outside all of the fences. Any line-strings that cut the fences will have a point inserted at the intersection with each fence and the z-value for this point interpolated from the points on either side of it in the line-string.

<esc> can be used to abort the multi- fence option.

Multi Fence Stem

multi_fence_stem

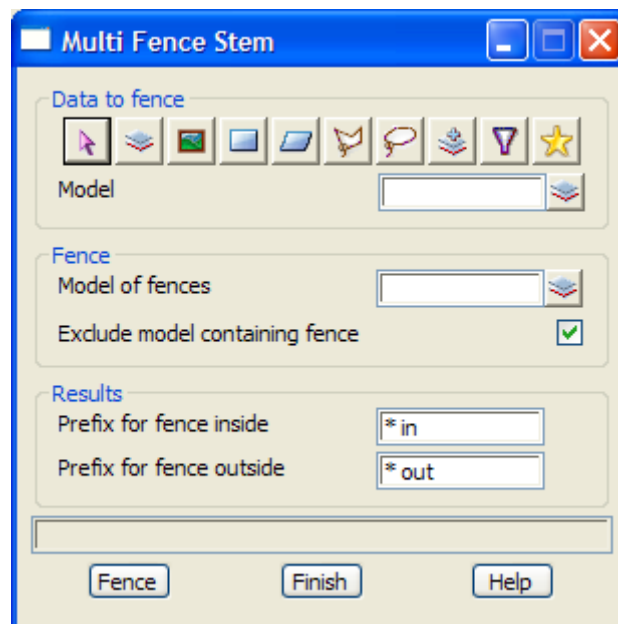

Position of option on menu: Utilities =>Fence =>Multi fence stem

It is often necessary to fence data against more than one polygon.

In the multi-fence stem option, the user provides a model containing all the polygons to be used as fences. The multi-fence stem option will process selected strings or all the strings in a model/view against all the polygons in the polygon model.

The data will be clipped and the **outside** is considered to be those bits are **outside all** of the polygons and the **inside** is the remainder, i.e. the bits **inside any one** of the polygon.

On selecting the Multi fence stem option and then the appropriate **Data Source** in the panel, the **Multi Fence Stem String/Model/View** panel is displayed.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>		Model	
Data source <i>data source for strings to fence.</i>			
Model of fences <i>name of the model that contains the polygons to be used as fences.</i>	input		available models
Prefix for fence inside <i>if non-blank, prefix*postfix to adjust the data model name to be the model to contain the data inside of the fence string. If blank, then no fence inside will be calculated.</i>	input		available models
Prefix for fence outside <i>if non-blank, prefix*postfix to adjust the data model name to be the model to contain the data outside of the fence string. If blank, then no fence outside will be calculated.</i>	input		available models

Exclude model containing fence tick box tick

*if **tick**, no data in the model containing the fence string will be fenced.*

*if **not tick**, all the appropriate data in the model containing the fence string will be fenced.*

Fence button

the appropriate strings in the data source will be divided by the fence polygons (from the model of fences) into the parts of the strings inside any one fence and the parts of the string outside all of the fences. Any line-strings that cut the fences will have a point inserted at the intersection with each fence and the z-value for this point interpolated from the points on either side of it in the line-string.

<esc> can be used to abort the multi- fence option.

2D Affine

affine_2d

Position of option on menu: Utilities =>A-G =>Affine

A affine transformation is a two dimensional linear transformation consisting of a 2D-translation (shift) of the data, a rotation and scaling of the data in two perpendicular directions. Hence there are six parameters to be specified.

The most frequent method of defining an affine transformation is not by explicitly giving the affine transformation parameters but by specifying the final (transformed) and existing (observed) coordinates for three or more user selected points. The six parameters are then calculated using least squares.

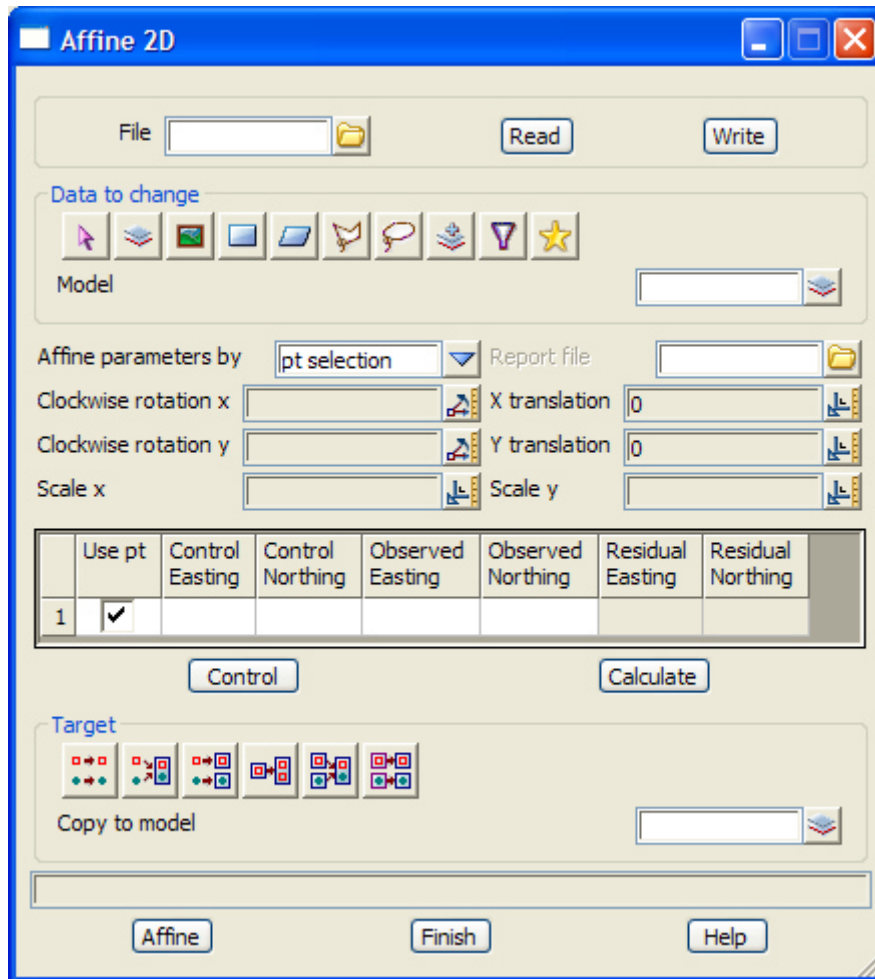

These special user selected points **in the final co-ordinate system** are known as **control points** and **observed points** in the un-transformed system.

The affine transformation (for going from the observed points to the control points) can be calculated and used to convert the existing co-ordinates of items to their new transformed co-ordinates.

IMPORTANT NOTE - make certain that the control and observed points are not selected so that all the control points are not on a straight line or all the observed points are not on a straight line.

On selecting **Affine**, the **Affine Transformation of** panel is displayed.

The main purpose of this panel is to display the affine transformation parameters. The fields and buttons used in the **Affine Transformation of** panel will be discussed after describing how to select the affine control points.

After selecting **Affine** option, the **Affine Transformation of** panel is placed on the screen and the option then sits waiting for the user to define how the affine parameters will be determined. The user selects the **Affine parameters by** choice box to choose if entry is by way of selecting points (default) or if the parameters are to be entered manually.

If the pt selection option is chosen, the user can start the selection of points by selecting the **Control** button. The selection should start with the control point, accepting that point then selecting the corresponding observed point. The control points are shown as triangles and the observed points are shown as circles. Lines are drawn between the control-observed pair for clarity.

Accepting the 2nd point (observed point) re-initialises the selection sequence so any further sets of points can be selected by selecting a control point and so on. The co-ordinates of the control points and observed points are added to the grid on the selection of two valid points. The use pt field is ticked by default.

The **calculate** button calculates the affine transformation parameters based all the control points in the grid control with the use pt field tick box ticked on. The residuals are then placed into the grid. The calculated parameters are placed into the parameters section of the panel.

If the direct entry method is chosen, the grid will disappear leaving only the parameter section. The user then fills out the relevant information.

The affine parameters are

- the x-scale factor for the existing co-ordinates with respect to the new coordinates
- the y-scale factor for the existing co-ordinates with respect to the new coordinates
- the rotation of the x-axis of the existing co-ordinates to align it with the new x co-ordinates axis
- the rotation of the y-axis of the existing co-ordinates to align it with the new y co-ordinates axis
- the x and y translation of the existing co-ordinates after the scalings and rotations have been applied

The fields and buttons in the panel have the following functions

Field Description	Type	Defaults	Pop-Up
File <i>a filename can be specified for reading or writing a file.</i>	file box		*.aaf files

Affine

button

apply the affine transformation to the data specified in the source box, and put it into the appropriate target area.

Cartographic Projections

Position of option on menu: Utilities =>A-G =>Cartographic

The **Cartographic** option is used to transform data based on the same datum between

- (a) two different cartographic projections (based on the same datum)
- (b) longitude and latitude and a cartographic projection (based on the same datum)
- (c) a cartographic projection and longitude and latitude (based on the same datum).

The *Cartographic* option has already been documented in the section “Cartographic” in the chapter “Survey”

Change

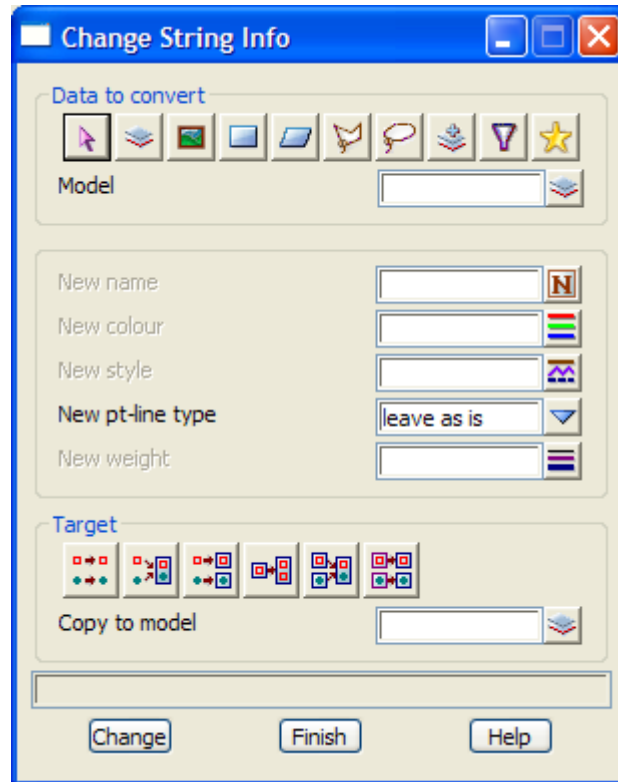

change_string_info

Position of option on menu: Utilities =>A-G =>Change

This Change option is similar to the Change option from the Strings edits menu.

For the selected strings, Change can modify the colour, name, breakline type, style and model of each string.

On selecting the Change option, the **Change string info** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up

	<i>convert all the selected strings to the type given in the New type field.</i>			

2d to 3d

convert_2d_to_3d_strings_in

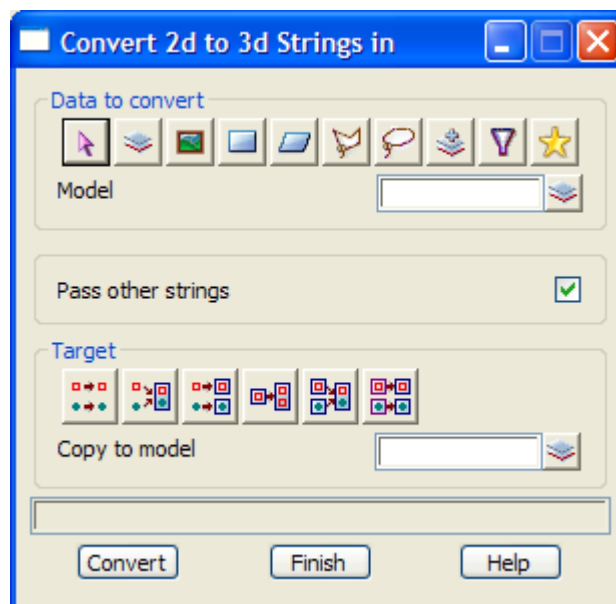

Position of option on menu: Utilities =>A-G =>Convert =>2d to 3d

The main difference between a 2d and a 3d string is that all the points in a 2d string have the same height. Hence to modify the z-values at individual points, a string must be 3d.

The 2d to 3d option is used to turn 2d (contour) strings into 3d strings.

This option is especially useful when a large number of strings have been read in with constant z-values (for example, cadastre) and the user then wants to modify the heights at each point on the string.

On selecting 2d to 3d and then the appropriate **Data Source** in the panel, the **Convert 2d to 3d Strings in** panel is displayed.

The fields and buttons in this panel are used as follows

Field	Description	Type	Defaults	Pop-Up
Data source type				Model

data selection type - for a full description go to “Data Source” in the chapter “Tools and Concepts”

Data source input

3d to 2d

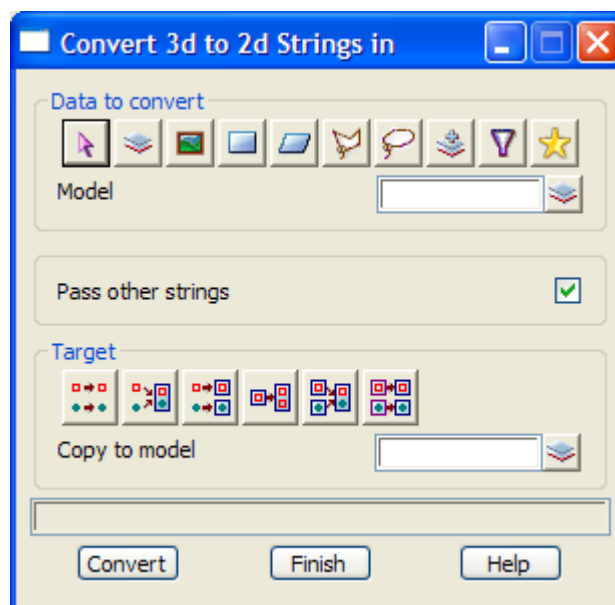

[convert_3d_to_2d_strings_in](#)

Position of option on menu: Utilities =>A-G =>Convert =>3d to 2d

The difference between a 3d and a 2d string is that all the points in a 2d string have the same height. The 3d to 2d option turns 3d string with a constant height into 2d strings. That is, it only converts 3d strings that have the **same** height at each point.

This option is useful when contours strings have come from another system as 3d strings, not 2d strings.

On selecting 3d to 2d and then the appropriate **Data Source** in the panel, the **Convert 3d to 2d Strings in** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up

4d to 3d

convert_4d_to_3d_strings_in

Position of option on menu: Utilities =>A-G =>Convert =>4d to 3d

The difference between a 4d and a 3d string is that a 4d string can have a text label at each point on the string. The 4d to 3d option turns 4d string into 3d strings by stripping off the text labels at each point of the 4d string.

On selecting 4d to 3d and then the appropriate **Data Source** in the panel, the **Convert 4d to 3d Strings** in panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type Model
data selection type - for a full description go to “Data Source” in the chapter “Tools and Concepts”

Data source input
source of data is to be processed.

Pass other strings tick tick
if tick, copy all other strings and pass them through to the model for 3d strings

Target type
data target type - for a full description go to “Data Target” in the chapter “Tools and Concepts”

Target info input
extra information required for the target.

Convert button
convert all the 4d strings in the model/view to 3d strings.

Text to 3d

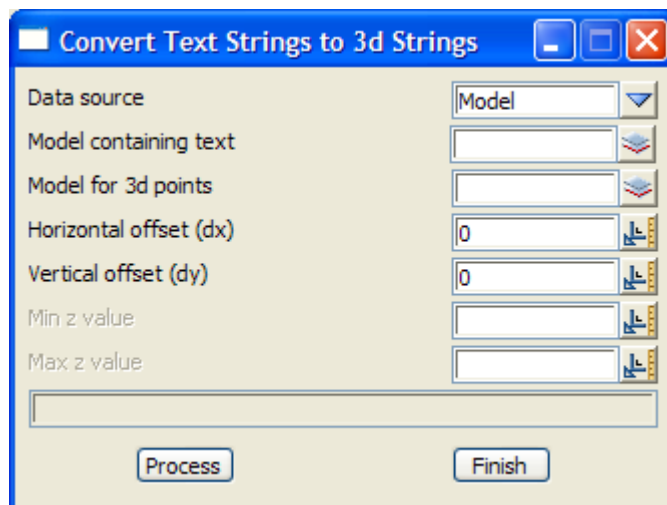

text_to3d_panel

Position of option on menu: Utilities =>A-G =>Convert =>Text to 3d

Sometimes when data for points is received from a CAD systems, all that is received is the text of the z-value of the point and no actual point.

The *Text to 3d* option will find text representing a z-value and create a new point using the justification point of the text as the (x,y) position and the value of the text as the z-value.

On selecting Text to 3d, the **Convert Text Strings to 3d Strings** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data of the text to be processed.

Model for 3d points	model box		available models
----------------------------	-----------	--	------------------

model to place the 3d points in.

Horizontal offset (dx)	input	0	
-------------------------------	-------	---	--

the x-value for created point is the text justification point less the horizontal offset.

Vertical offset (dy)	input	0	
-----------------------------	-------	---	--

the y-value for created point is the text justification point less the vertical offset.

Min z value	input		
--------------------	-------	--	--

if non-blank, only convert text with z-value greater than Min z value.

Max z value	input		
--------------------	-------	--	--

if non-blank, only convert text with z-value less than Max z value.

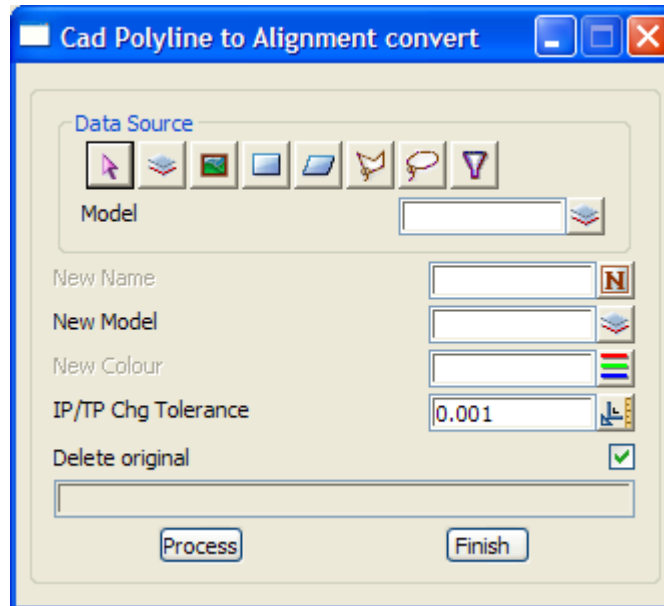

Process button
convert all the selected text strings to 3d strings.

Poly to Alignment

Cad_polylines_to_alignment_convert

Position of option on menu: Utilities =>A-G =>Convert =>Poly to alignment

Selecting Poly to alignment brings up the **CAD Polyline to Alignment Convert** panel.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data of the text to be processed.</i>			
New name	name box		available names
<i>if non blank, new name for the converted strings</i>			
New model	model box		available models
<i>new model for the converted strings</i>			
New colour	colour box		available colours
<i>if non blank, new colour for the converted strings</i>			
IP/TP chg tolerance	input	0.001	0.001
Delete original	tick box		tick
<i>if tick, the original strings are deleted.</i>			
Process	button		
<i>convert all the selected alignments.</i>			

Same Start/End Point Strings

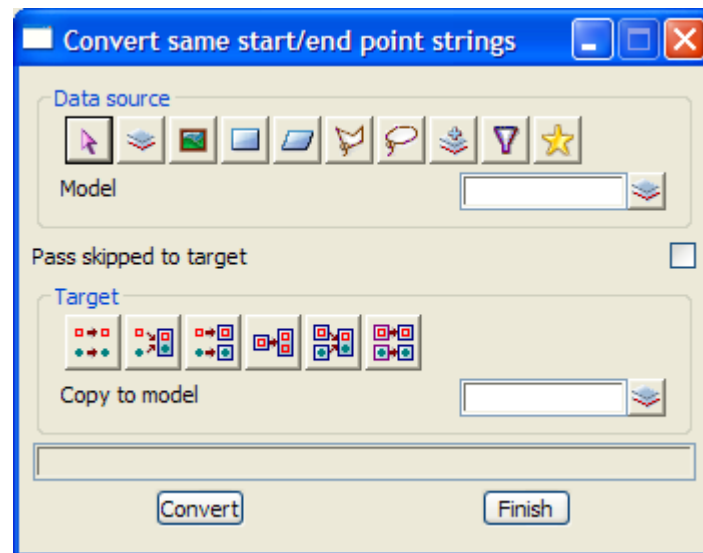

convert_same_start_end_point_strings

Position of option on menu: Utilities =>A-G =>Convert =>Same start/end point strings

When non super string strings are closed, an extra vertex identical to the first vertex is added to the end of the string. For super strings, there is a **closed string** flag and no duplication of the first and last vertices is required.

This options converts closed non super strings to closed super strings and deletes the duplicated vertex.

Selecting Same string/end point strings brings up the **Convert Same Start/End Point Strings** panel.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source input

source of data is to be processed.

Pass other strings tick tick

if tick, copy all other strings and pass them through to the target model

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Convert button

convert all the closed strings to closed super strings.

Cuts

cuts

Position of menu: Utilities =>A-G =>Cuts

The cuts option is used to create intersections through string data rather than tins.

That is, it calculates the cuts that a plan string makes with each of the strings in a model or view, and creates cut points with the z-value from the cut strings.

The cut points that the plan string creates are connected as a 4d string - the x-section of cuts through a model or view - with the z value coming from the cut string, and the text at the point being the name of string that was cut.

There are two methods for generating the cuts x-sections

- (a) by taking sections along selected strings or all the strings in a model or view
- (b) by taking sections at regular intervals and perpendicular to a selected centre line string.

The cuts walk-right menu contains these two methods

For the option *by strings*, go to the section "Cuts by Strings".

by centreline

"Cuts by Centreline".

Cuts by Strings

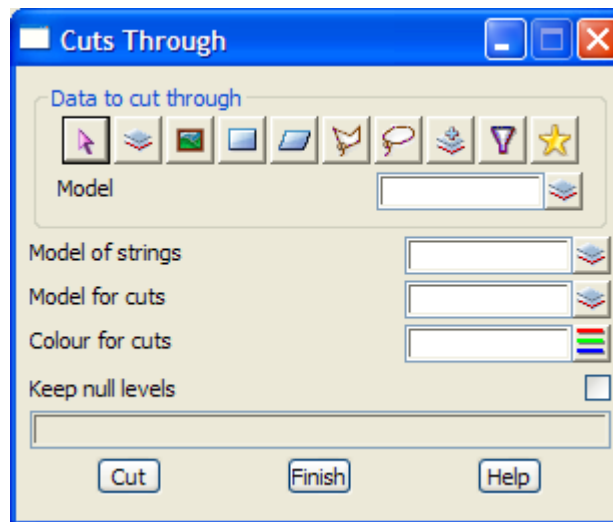

cuts_through

Position of option on menu: Utilities =>A-G =>Cuts =>by strings

For this method of generating cuts through strings, either individual strings are selected or a model or view of strings is specified by the user. These strings are then

For each of the selected strings, the plan representation of the string is cut through the model or view of strings to generate cut x-sections.

On selecting the **by strings** option and then the appropriate **Data Source** in the panel, the **Cuts Through** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Model of strings	input		available models
<i>each string in this model will be processed against all the strings in the view/model to cut through. Not used with the pick button.</i>			
Model for cuts	input		available models
<i>model to place the cut x-sections into.</i>			
Colour for cuts	input		available colours
<i>colour for the cut x- section strings</i>			
Cut	button		
<i>each string in the model of strings is processed against all the strings in the view/model to cut through. The 4d strings of cuts are placed in the model for cuts.</i>			

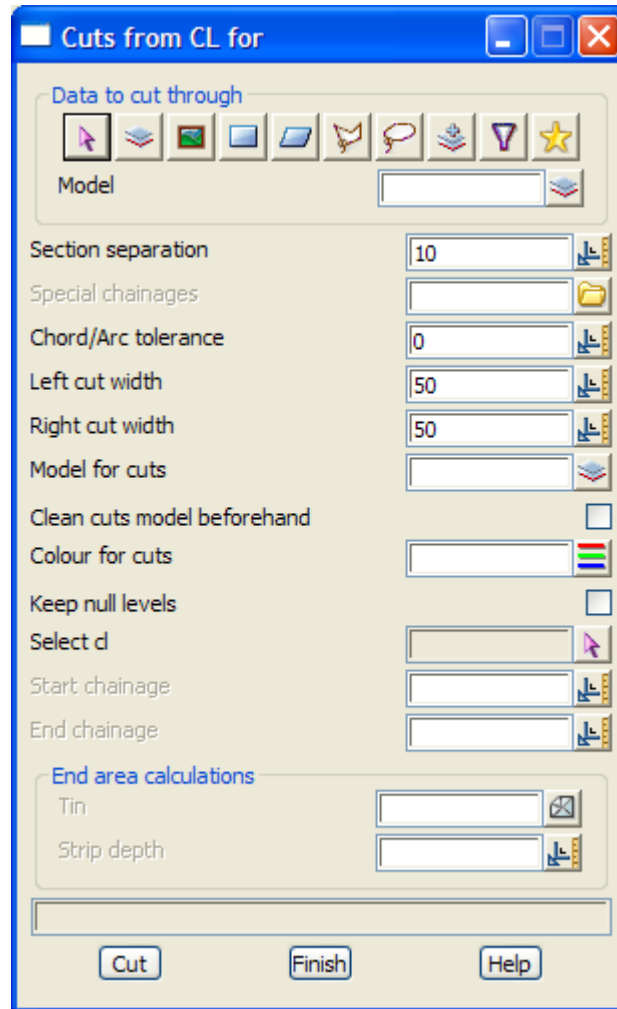

Cuts by Centreline

cuts_from_cl_for

Position of option on menu: Utilities =>A-G =>Cuts =>by centreline

For by centreline, a centre line string is selected by the user and section lines are created in plan at regular intervals perpendicular to the selected string. Cut x-sections are then generated for the plan section lines by taking cuts through the model or view of strings, by the plan sections.

On selecting the by centreline option, the **Cuts from CL for** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Section separation	input	10.0	
<i>the distance along the selected centre line to generate plan section lines to be used to cut through the model or view.</i>			
Special chainages	input		*.spf files
<i>a file containing chainages, one per line, that are also used as chainages to create cross sections at.</i>			

Chord/arc tolerance input default chord/arc tolerance
the chord to arc tolerance to use on the selected string for determining how many plan sections are created around horizontal curves.

Left/Right cut width input 50
the left/right distance to go out from the centre line for creating a section to cut through the strings.

Model for cuts input available models
model to place the cut x-section strings into.

Clean cuts model beforehand tick box
if tick, the model is cleaned of all data before new sections are created.

Colour for cuts colour box available colours
colour for the cut section strings

Keep null levels tick box
if tick, then if a null level exists on the string being cut, then a null level point is created.

Select cl string-select
the selected cl string is used to create plan section lines at regular intervals and perpendicular to the centre line string. These strings are cut through the model/view of strings.

Start/End chainage input
if non-blank then sections for the cuts are restricted to between the given start and end chainage of the selected cl string.

End Area Calculations

Tin tin box available tins
if non-blank, the cut and fill areas for the section against the tin are calculated and added as attributes to the section.

Strip depth input
if non-zero, then a strip depth is removed from the tin before the cut and fill areas for the section against the tin are calculated.

Cut button
each plan section line generated down the selected centre line string is processed against all the strings in the view/model. The 4d strings of cuts are placed in the model for cuts.

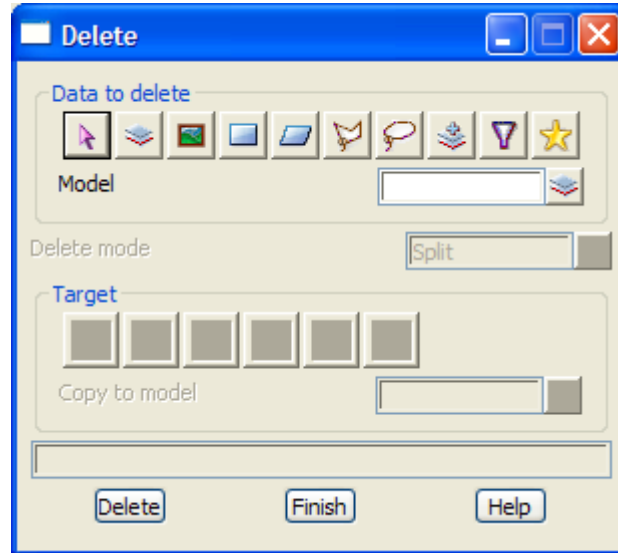

Delete

delete

Position of option on menu: Utilities =>A-G =>Delete

The Delete option deletes all the selected strings.

On selecting the Delete option, the **Delete** panel is displayed.

The fields and buttons in this panel are used as follows

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source

input

source of data is to be processed.

Delete

button

delete the selected strings.

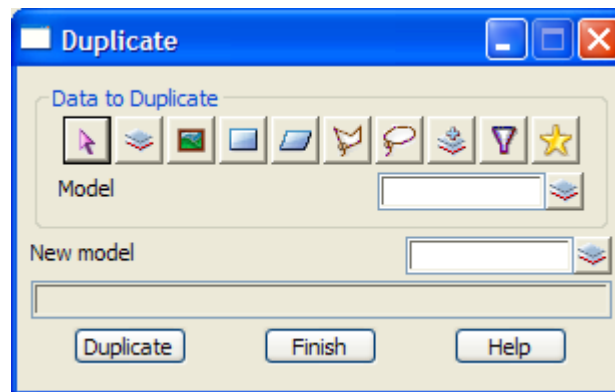

Duplicate

duplicate

Position of option on menu: Utilities =>A-G =>Duplicate

The duplicate option is used to make a duplicate of a string, an entire model or duplicates of all the models on a view.

On selecting **Duplicate** and then the appropriate **Data Source** in the panel, the **Duplicate** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
New model	input		available models
<i>name of the model to place the duplicated strings into.</i>			
Duplicate	button		
<i>duplicate all the strings in the model/view given in the model/view field and add them to the model given in the new model field.</i>			

<esc> can be used to abort the duplicate option.

Explode

explode_strings_in

Position of option on menu: Utilities =>A-G =>Explode

The explode option is used to explode line strings and polylines into two point lines and polylines and point strings into individual points. Alignment, pipeline, sewer and drainage strings are not exploded.

The option can be used in three ways - an individual string can be selected for exploding, the name of the model to be exploded can be entered or a view name entered and all the models in the view will be exploded and placed in one new model.

On selecting **Explode** and then the appropriate **Data Source** in the panel, the **Explode Strings in** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Pass other strings	tick box	tick	
<i>if tick, copies of all other strings and passed through to the exploded model.</i>			
Target type			
<i>data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"</i>			
Target info	input		
<i>extra information required for the target.</i>			
Explode	button		
<i>explode all the strings in the data source and process them according to the target box.</i>			

Explode Text

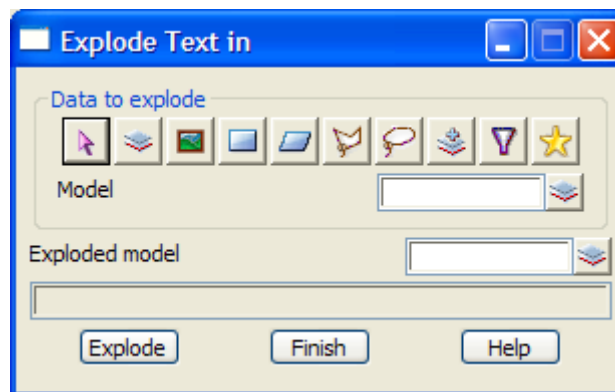

explode_text_in

Position of option on menu: Utilities =>A-G =>Explode (text)

The explode text option is used to explodes text in text strings and the text from 4d strings, into its component arcs and lines.

Like explode, the option can be used in three ways - individual strings can be selected for exploding, the name of the model to be exploded can be entered or a view name entered and all the models in the view will be exploded and placed in one new model.

On selecting Explode Text and then the appropriate **Data Source** in the panel, the **Explode Text in** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Exploded model	input		available models
<i>name of the model to place the exploded text strings and text of 4d strings into.</i>			
Explode	button		
<i>explode all the selected text and add them to the model given in the exploded model field.</i>			

Factor

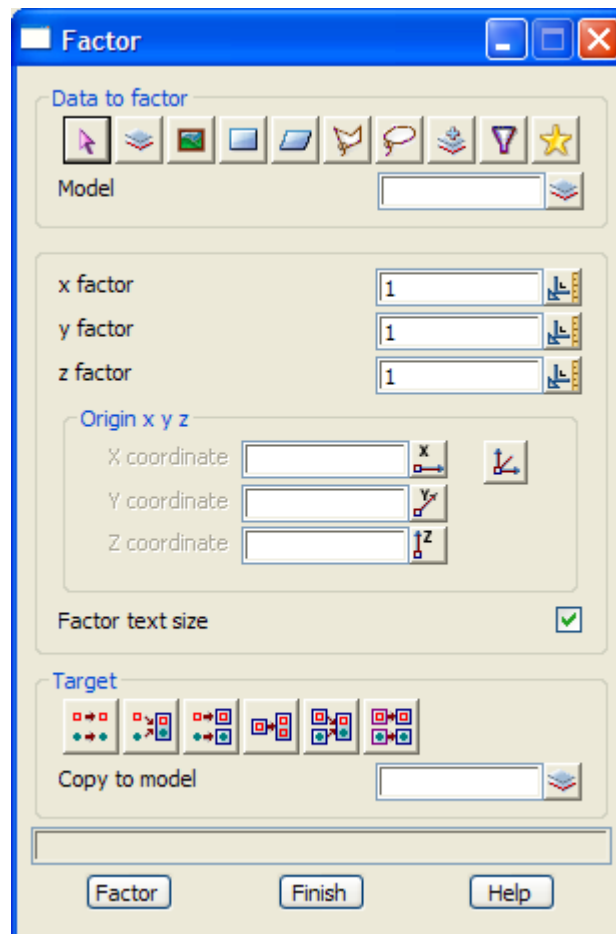

factor

Position of option on menu: Utilities =>A-G =>Factor

The factor option is used to multiply the x,y and z values of a selected string, or for all the strings in a given model or view, by user supplied factors.

The option is useful for changing the units of any data in a model (e.g. imperial to metric).

On selecting Factor and then the appropriate **Data Source** in the panel, the Factor panel is displayed.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
x/y/z factor	input	1.0	
<i>factor to multiply the x/y/z-values of a string by.</i>			
Origin x y z	input		xyz ops menu
<i>field with x y z value to be used as (x,y,z) origin for the factor. if blank, an origin of (0,0,0) is used.</i>			
Factor text size	tick box	tick	
<i>if tick, the size of text is factored.</i>			

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Factor button

multiply the (x,y,z) values of the selected strings by the x,y and z factors given in the appropriate panel fields.

WARNING - if the x factor and y factor are not equal, then arcs in arcs, circles, alignment and polyline strings can not be factored. For these cases, the y factor will be set the x-factor and then applied to the arcs.

Filter

filter

Position of menu: Utilities =>A-G =>Filter

The filter options are used to remove surplus points from strings. Three types of filters are currently supported in 12d Model

- ▲ a string filter, which removes points from 2d and/or 3d line strings that do not deviate by more than a specified offset tolerance from straight lines joining successive string points (in three dimensions for 3d strings)
- ▲ a vertex-filter which removes adjacent vertices closer than a given user defined (x,y) and z distance
- ▲ a z-filter which eliminates points not contained within a specified z-range

The filter walk-right menu is

filter 2d and 3d strings
removes close adjacent vertices
filter z values

For the option *String filter*, go to the section "String Filter".

Vertex filter

"Vertex Filter".

z filter

"Z Filter".

String Filter

filter_strings_in

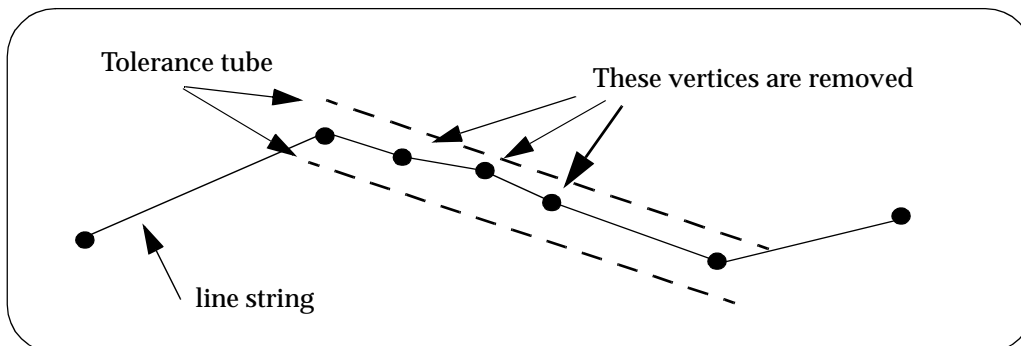

Position of option on menu: Utilities =>A-G =>Filter =>String filter

The String filter option is used to remove surplus vertices from 2d strings (contours) and 3d strings.

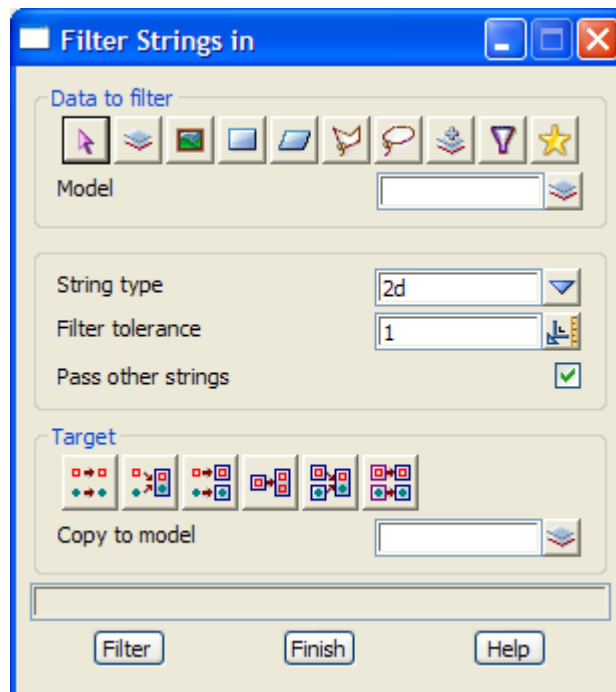

Using a user defined tolerance, string vertices that are within an offset tolerance (in three dimensions) of straight lines are removed. The tolerance value used normally depends on the data set and the job that the data is being used for.

That is, the string filter removes vertices from 2d and/or 3d line strings that do not deviate by more than a specified offset tolerance from straight lines joining successive string vertices (in three dimensions for 3d strings)

NOTE - string filter does not apply to point strings.

On selecting String filter the Filter **Strings in** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
String type	input	2d	2d, 2d & 3d
<i>string types to be filtered</i>			
Filter tolerance	input	1	
<i>tolerance to be used in filtering</i>			
Pass other strings	tick box	tick	
<i>if tick, pass all other strings through to the model for filtered strings</i>			
Target type			
<i>data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"</i>			
Target info	input		
<i>extra information required for the target.</i>			
Filter	button		
<i>filter all the selected strings.</i>			

Vertex Filter

filter_adjacent_vertices_in

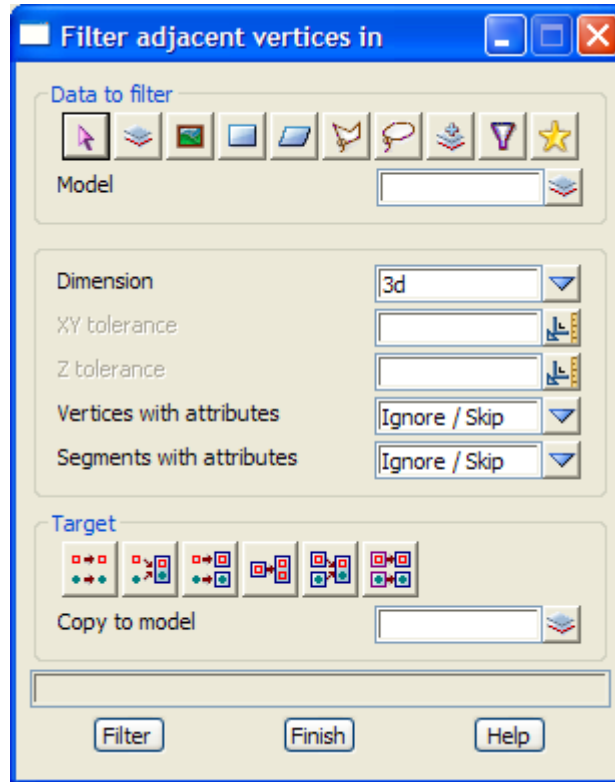

Position of option on menu: Utilities =>A-G =>Filter =>Vertex filter

The Vertex filter option is used to remove close adjacent vertices from selected strings. The strings

can be *point* or *line* strings.

The option can remove adjacent string vertices that are equal to a given tolerance either in plan position only (i.e. have similar x and y co-ordinates) or equal to a given tolerance for x, y and z co-ordinates.

On selecting **Vertex filter** the **Filter Adjacent Vertices in** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Data source type <i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>		Model	
Data source <i>source of data is to be processed.</i>	input		
Dimension <i>if 2d, adjacent string vertices with equal x and y co-ordinates are filtered. If 3d, adjacent string vertices with equal x, y and z co-ordinates are filtered.</i>	input	2d	2d,3d
xy tolerance <i>the distance to use for checking if adjacent vertices are too close in (x,y)</i>	input		
z tolerance <i>the delta-z to use for checking if adjacent vertices are too close in z</i>	input		
Vertices with attributes <i>if Ignore/skip, don't drop any vertices with attributes. If Merge attributes, merge the attributes from a dropped vertex with the kept vertex. If Lose attributes, drop the attributes from a dropped vertex.</i>	choice box	Ignore/skip	Ignore/skip, Merge attributes Lose attributes
Segments with attributes	choice box	Ignore/skip	Ignore/skip, Merge attributes Lose attributes

*if **Ignore/skip**, don't drop any vertices of segments with attributes.*

*If **Merge attributes**, merge the attributes from a dropped segment with the kept segment.*

*If **Lose attributes**, drop the attributes from a dropped segment.*

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Filter button

filter the selected strings.

Z Filter

z_filter_strings_in

Position of option on menu: Utilities =>A-G =>Filter =>Z filter

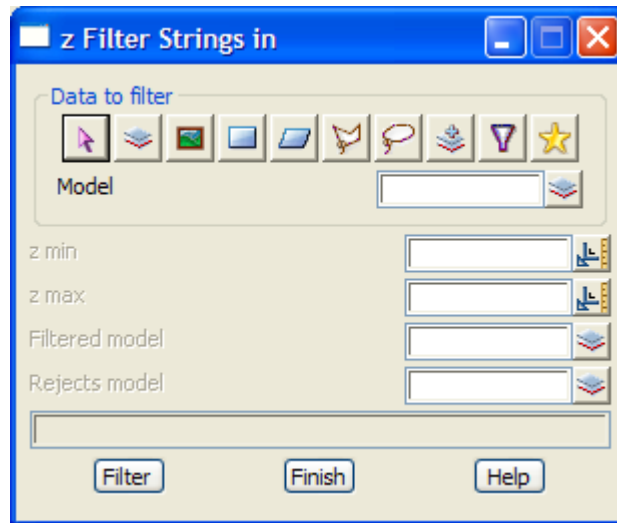

It is often necessary to remove data which is not within a certain z range. For example, all points with z-values below 0.0. The z filter option allows the user to define a z-range by specifying a minimum and maximum z value.

Strings of type 2d, 3d and 4d can then be processed against the z-range and new strings created containing only those points that are

- (a) within the z-range - accepted points
- or
- (b) outside the z-range - rejected points

For all other string types, the entire string is accepted if any part of the string is within the z-range, otherwise it is rejected.

On selecting Z filter and then the appropriate **Data Source** in the panel, the Z Filter **Strings in** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
z min	input		
<i>minimum z value to be accepted, If this field is blank, all string z-values pass the minimum test.</i>			
z max	input		
<i>maximum z value to be accepted, If this field is blank, all string z-values pass the maximum test.</i>			
Filtered model	input		available models
<i>if non-blank, the name of the model to place the accepted string points in. The string has the same name as the original string. If blank, the accepted point strings are not saved.</i>			
Rejects model	input		available models
<i>if non-blank, then strings containing the rejected points are placed in this model. The strings of rejected points have the same name as the original strings. If blank, the rejected point strings are not saved.</i>			

Filter button

z, filter the selected strings by the *z* minimum and *z* maximum values.

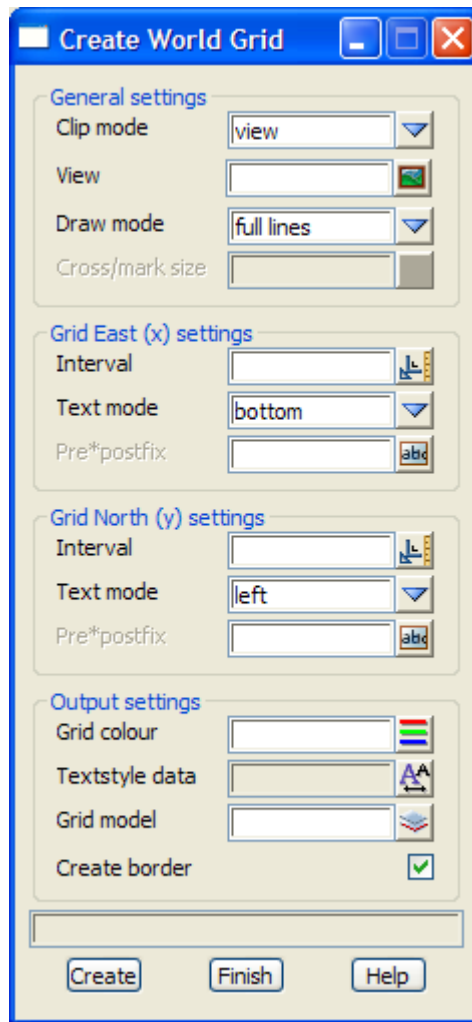

Create Grid

create_world_grid

Position of option on menu: Utilities =>A-F =>Create grid

Create Grid is used to create the line work for a grid in world units. Mainly used for output to other packages that don't create grids.

Selecting Create Grid brings up the **Create World Grid** panel.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Clip mode	choice box	View	View, Rectangle
<i>if View, a view is used to define extents of the grid.</i>			
<i>If Rectangle, a rectangle is drawn and used to define extents of the grid.</i>			
Draw mode	choice box	full lines	full lines, crosses, marks
<i>type of line work for the grid</i>			
Grid East (x) settings:			
Interval	input		
<i>x-delta to use for the grid lines</i>			
Text mode	choice box	bottom	off, bottom, top, top & bottom

if off, no text is created for the x-grid lines.

If bottom, text is created only at the bottom of the x-grid lines.

If top, text is created only at the top of the x-grid lines.

If top & bottom, text is created at the top and bottom of the x-grid lines.

Pre*postfix text

*if non blank, pre*post text to use for the labels on the x-grid lines*

Grid North (y) settings:

Interval input

y-delta to use for the grid lines

Text mode choice box left off, left, right, left & right

if off, no text is created for the y-grid lines.

If left, text is created only at the left of the y-grid lines.

If right, text is created only at the right of the y-grid lines.

If left & right, text is created at the left and right of the y-grid lines.

Pre*postfix text

*if non blank, pre*post text to use for the labels on the y-grid lines*

Head to Tail

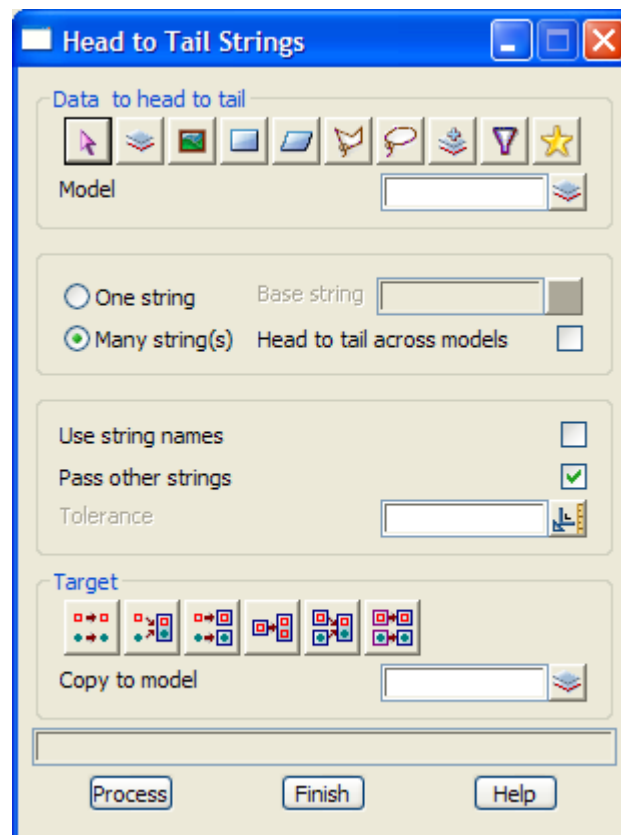

head_to_tail_strings

Position of option on menu: Utilities =>H-Z =>Head to tail

The head to tail option is used to process a model or view of strings and join strings with common end points together.

If requested, strings are only joined if they have matching names as well as matching end points.

On selecting the **Head to tail** and then the appropriate **Data Source** in the panel, the **Head to Tail Strings** in panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

One string or Many strings	radio button		
-----------------------------------	--------------	--	--

*if **One String** is selected, then a Base string is selected and only the head-to-tailed string containing the Base string is created.*

*If **Many strings** is selected, then head to tailing occurs for all the strings in the Data source.*

Head to tail across models	tick box		
-----------------------------------	----------	--	--

*if **tick**, then strings can be created from head to tailing strings from any of the selected models.*

*If **not tick**, then strings will only be head to tailed with strings from the same model.*

Use string names tick box

*if **tick**, the string names must also match for the strings to be joined.*

Pass other strings tick box tick

*if **tick**, any string not joined will also copied to the joined model.*

Tolerance input 0.0005

If the distance between two end points is less than tolerance, then the points are considered the same and the strings may be joined.

Target type

data target type - for a full description go to “Data Target” in the chapter “Tools and Concepts”

Target info input

extra information required for the target.

Process button

*check all the strings in the given model/view and join them together if they have common end points and, if use string names is **tick**, the same name.*

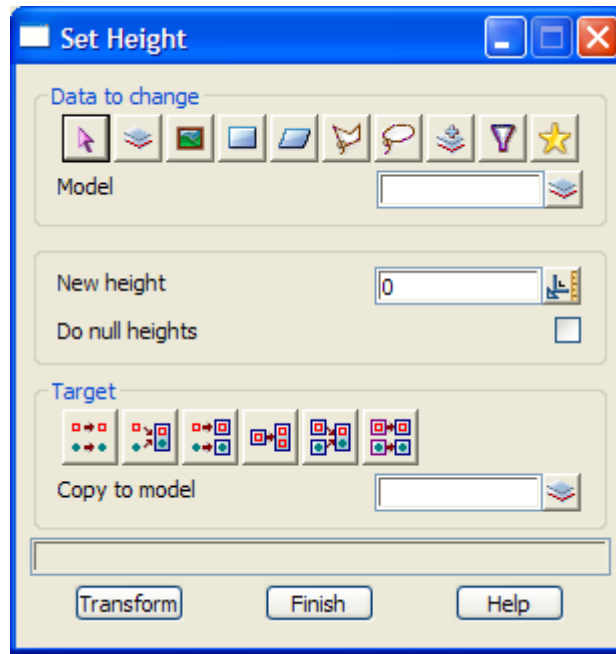

Set Height

set_height

Position of option on menu: Utilities =>H-Z =>Height

For the selected strings, Height will set all the z-values to the given height.

Selecting Height displays the **Set Height** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source

input

source of data is to be processed.

New height

input

0

the new height to set all the z-values in the selected strings to.

Do null heights

tick box

if tick, null heights are set to the new height.

If not tick, null heights are not modified.

Target info

input

extra information required for the target.

Set

button

process the selected string

2D Helmert

helmert_2d

Position of option on menu: Utilities =>H-Z =>Helmert 2D

A Helmert transformation is a two dimensional linear transformation consisting of a scaling, rotation and translation (shift) of data. This type of transformation is often required for converting data between a local and another co-ordinate system.

The most frequent method of defining a Helmert transformation is not by explicitly giving the Helmert transformation parameters but by specifying the final (transformed) and existing (observed) coordinates for two or more user selected points.

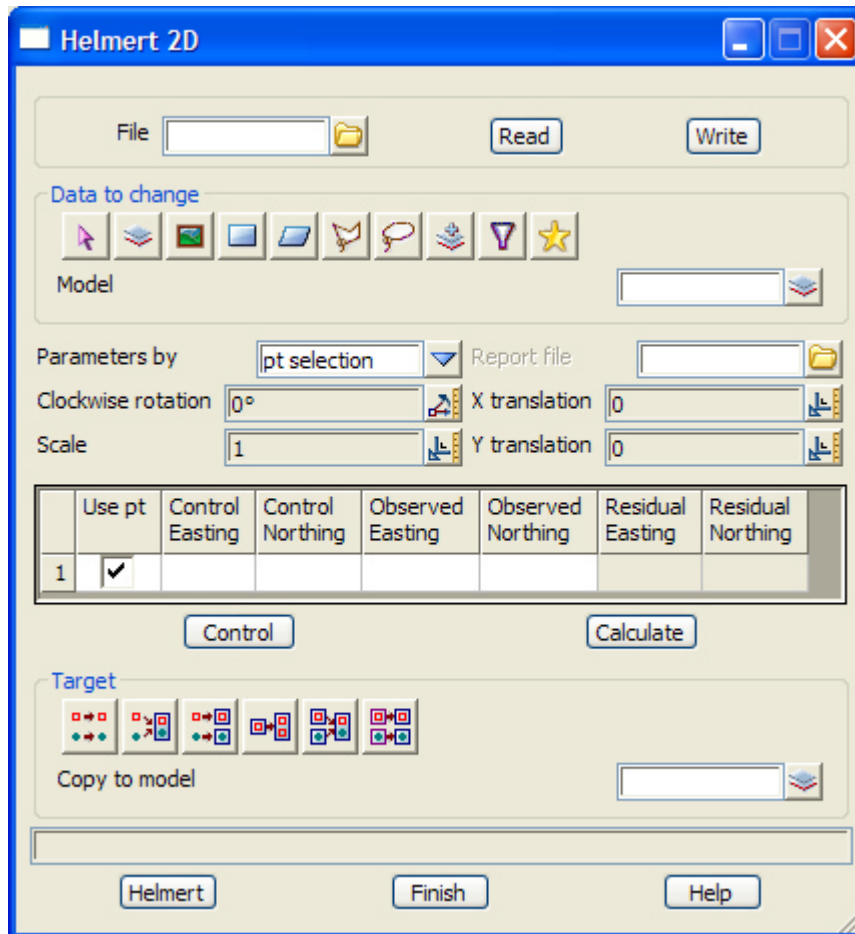

These special user selected points in the final co-ordinate system are known as **control points** and **observed points** in the un-transformed system.

The Helmert transformation (for going from the observed points to the control points) can be calculated and used to convert the existing co-ordinates of items to their new transformed co-ordinates

See example after the panel description.

On selecting the Helmert option, the Helmert 2D panel is displayed.

The main purpose of this panel is to display the helmert transformation parameters. The fields and buttons used in the **Helmert 2D** panel will be discussed after describing how to select the helmert control points.

After selecting Helmert 2D option, the **Helmert 2D** panel is placed on the screen and the option then sits waiting for the user to define how the helmert parameters will be determined. The user selects the **parameters by** choice box to choose if entry is by way of selecting points (default) or if the parameters are to be entered manually.

If the pt selection option is chosen, the user can start the selection of points by selecting the **Control** button. The selection should start with the control point, accepting that point then selecting the corresponding observed point. The control points are shown as triangles and the observed points are shown as circles. Lines are drawn between the control-observed pair for clarity.

Accepting the 2nd point (observed point) re-initialises the selection sequence so any further sets of points can be selected by selecting a control point and so on. The co-ordinates of the control points and observed points are added to the grid on the selection of two valid points. The use pt field is ticked by default.

The **calculate** button calculates the helmert transformation parameters based all the control points in the grid control with the use pt field tick box ticked on. The residuals are then placed into the grid. The calculated parameters are placed into the parameters section of the panel.

If the direct entry method is chosen, the grid will disappear leaving only the parameter section. The user then fills out the relevant information.

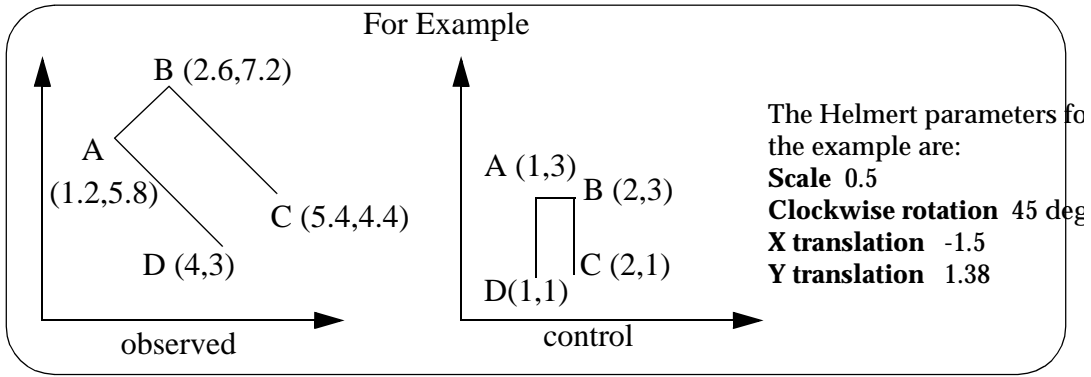

The helmert parameters are

- (a) the scale factor for the existing co-ordinates with respect to the new coordinates

- (b) the rotation of the existing co-ordinates to align it with the new co-ordinates axis
- (c) the x and y translation of the existing co-ordinates after the scalings and rotations have been applied

The fields and buttons in the panel have the following functions

Field Description	Type	Defaults	Pop-Up
File <i>a file name can be specified for reading or writing a file.</i>	file box		*.hel files
Read <i>if a valid file exists, the file contents can be loaded into the panel.</i>	button

Inquire

inquire

Position of option on menu: Utilities =>H-Z =>Inquire

The Inquire option simply highlights all the selected strings.

On selecting the Inquire option, the **Inquire** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

Target type			
--------------------	--	--	--

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info	input		
--------------------	-------	--	--

extra information required for the target.

Map

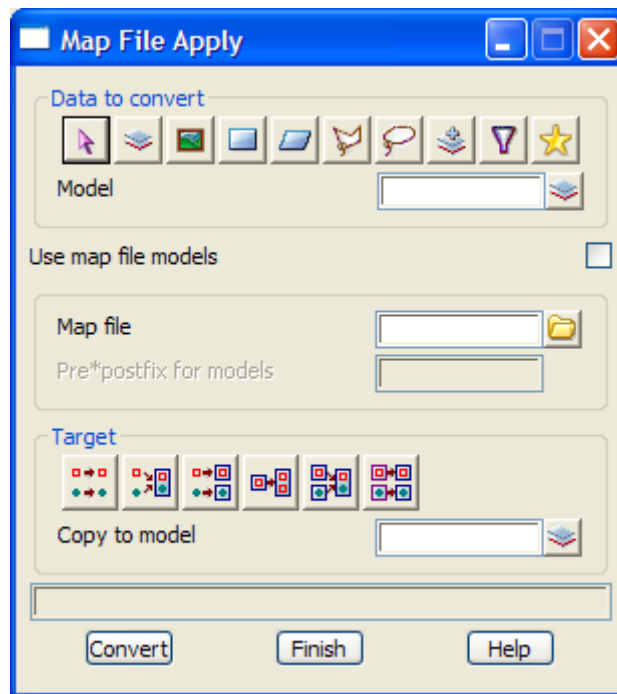

map_file_apply

Position of option on menu: Utilities =>H-Z =>Map

The map option applies a 12d Model input mapping file to the selected strings. The map file can be used to change string attributes such as string names, models, colours, breakline type and style, apply extrudes, apply polygon fills etc.

The layout and operation of a mapping file is described in the section “Map File” in the chapter “File I/O” .

Selecting Map displays the **Map File Apply** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to “Data Source” in the chapter “Tools and Concepts”</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Use map file models	tick box		
<i>if tick, use the models from the map file.</i>			
<i>If not tick, use the models from the Target.</i>			
Map file	map file box		*.mf files
<i>the map file to use.</i>			
Prefix for models	input		available models
<i>If non-blank, the prefix for models field gives the characters to be prepended and appended to the model names given in the mapping file. The prepended and appended characters are entered into the prefix for models field, separated by a *. For example, pre*pos would add pre before each model name and pos after each model name. For prepend only, no * is required.</i>			

Target type

Null Heights

null_height_ops

Position of option on menu: Utilities =>H-Z =>Null heights

A null value is used as a z-value (height) when no actual z-value exists at the point. That is, the point has valid x and y co-ordinates but no valid z-value.

The null heights walk-right menu is

For the option *Height*, go to the section "Heights" .

Height range "Height Range" .

Null to height "Null to Height" .

Heights

null_height_of

Position of option on menu: Utilities =>H-Z =>Null heights =>Height

The null heights option is used to set z-values of a user given value to 12d Model's null value. It can be applied to all the strings in a given model or view.

On selecting **Heights** and then the appropriate **Data Source** in the panel, the **Null Heights of** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

Height to null input
height value to set to the null value.

Target type
data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input
extra information required for the target.

Null button
test all the z-values in the selected strings and if the value is equal to the height to null value, set the z-value to null.

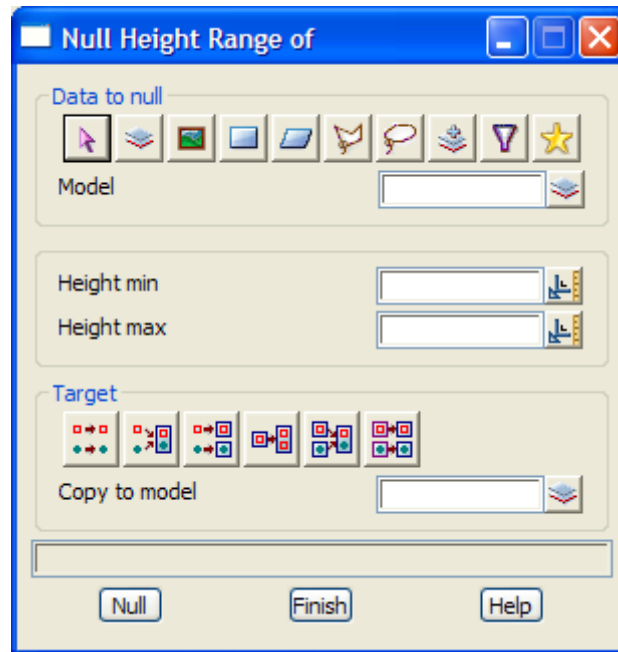

Height Range

null_height_range_of

Position of option on menu: Utilities =>H-Z =>Null heights =>Null range

The null height range option is used to set z-values within a user given range to 12d Model's null value. It can be applied to selected strings, or all the strings in a given model or view.

On selecting Height range and then the appropriate Data Source in the panel, the Null Height Range of panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Height min	input		
<i>minimum value of the heights to be set as null values.</i>			
Height max	input		
<i>maximum value of the heights to be set as null values.</i>			
Target type			
<i>data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"</i>			
Target info	input		
<i>extra information required for the target.</i>			
Null	button		
<i>test all the z-values in the selected strings and if the value is between the height min and height max value, set the z-value to null.</i>			

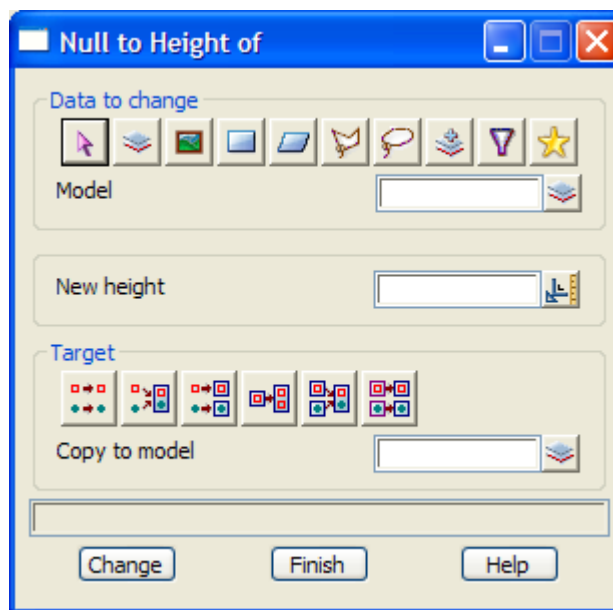

Null to Height

null_to_height_of

Position of option on menu: Utilities =>H-Z =>Null heights =>Null to height

The null to height option is used to set null z-values to a user given value. It can be applied selected strings or to all the strings in a given model or view.

On selecting **Null to height range** and then the appropriate **Data Source** in the panel, the **Null to Height of** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

New height	input		
-------------------	-------	--	--

height value to change null values to.

Target type			
--------------------	--	--	--

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info	input		
--------------------	-------	--	--

extra information required for the target.

Change	button		
---------------	--------	--	--

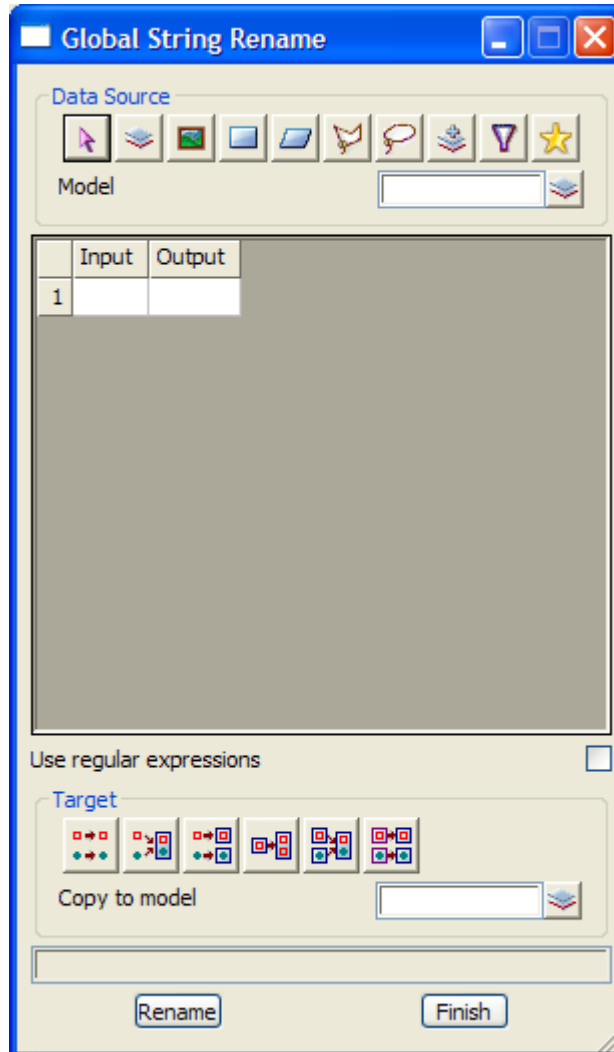

Change all the null z-values in all the strings in the model/view given in the model/view to change field to the value given in the new height field.

Rename Strings

global_string_rename

Position of option on menu: Utilities =>H-Z =>Rename strings

Selecting Rename strings brings up the **Global String Rename** panel.

The fields and buttons used in the rotate panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

Input			
--------------	--	--	--

method of selecting strings

Output			
---------------	--	--	--

method of changing strings

Use regular expressions	tick box		
--------------------------------	----------	--	--

if tick, Input is a regular expressions.

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Rename button

rename the selected data.

Rotate

rotate

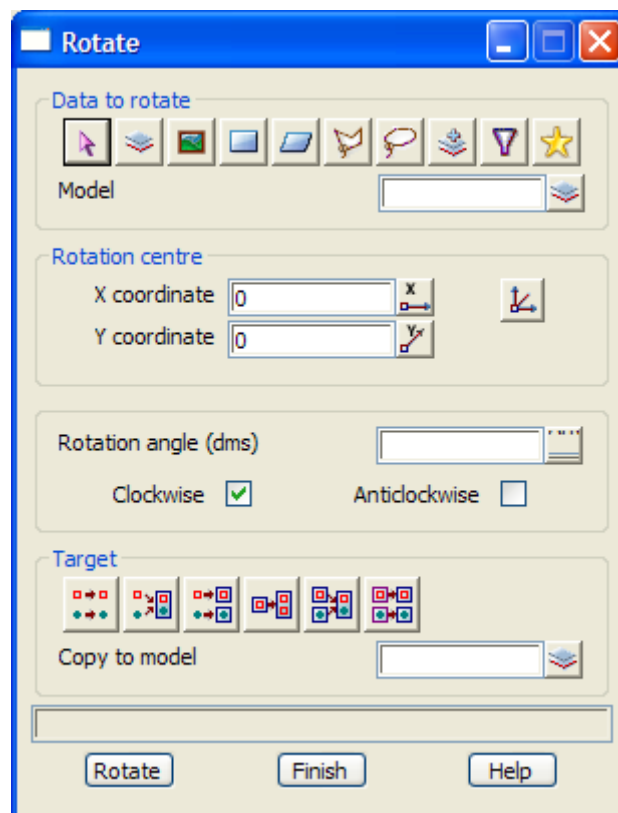

Position of option on menu: Utilities =>H-Z =>Rotate

The rotate option is used to rotate all the strings in a model or on a view about a central point (the rotation centre). The strings are rotated through a user supplied angle and can be moved or copied to their new rotated position.

The difference between a copy and a move is that if a string is copied, a copy of the string is rotated and the original string left untouched, whereas for a move, the actual string is moved from its original position to the new rotated position.

The rotated strings can either be placed in their original models, or moved/copied to a new model.

On selecting **Rotate** and then the appropriate **Data Source** in the panel, the **Rotate String/Model/View** panel is displayed.

The centre of the rotation is defined by selecting the **Centre** button and picking a point as the new centre. The centre can be changed at any time by using the **Centre** button to select another centre.

The fields and buttons used in the rotate panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Rotation centre			xyz ops
<i>select the centre of the rotation. The centre can be changed at any time.</i>			

Rotation angle (dms) angle box

the angle in degrees to rotate the string through. The angle is measured about the rotation centre point in either a clockwise or anticlockwise direction.

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Rotate button

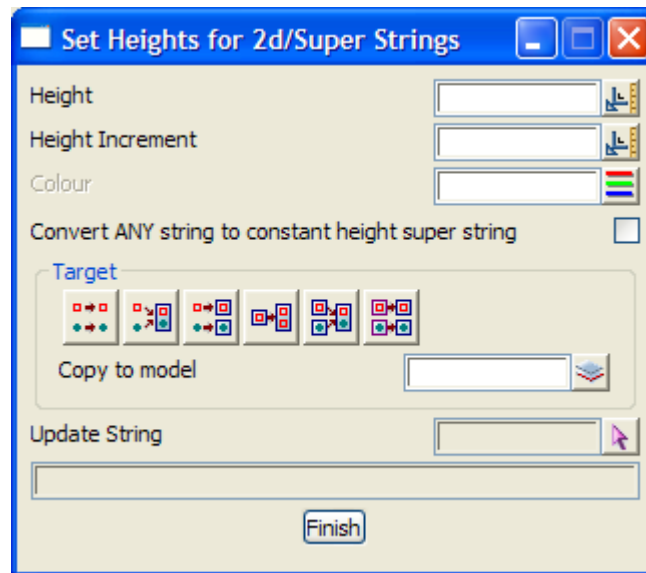

rotate the selected data.

Set Heights for 2d/Super Strings

set_heights_for_2d_super_stringsl

Position of option on menu: Utilities =>H-Z =>Set heights for 2d/super strings

This panel is used to quickly change the height of 2d strings or 2d super strings (super strings with a constant z value). An initial height and increment is given. As each string is processed, it is given the height and the height then incremented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Height	input		
---------------	-------	--	--

Height to use for the next selected string. This is incremented by the "Height increment" after each string is accepted.

Height increment	input		
-------------------------	-------	--	--

As each string is accepted, the "Height" value is incremented by this value.

Colour	input		available colours
---------------	-------	--	-------------------

If non-blank, the selected strings are given this colour when their z-value is changed.

Target type			
--------------------	--	--	--

place to put the processed string. Data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info	input		
--------------------	-------	--	--

extra information required for the target.

Update string	string select		
----------------------	---------------	--	--

After clicking on the select arrow, 2d strings are selected and when accepted, have their z-value changed to the value in the Height field. The height value is then automatically incremented. The next string is then selected and accepted (without needing to click on Pick again). This continues until Cancel is selected from the "Pick Ops" menu.

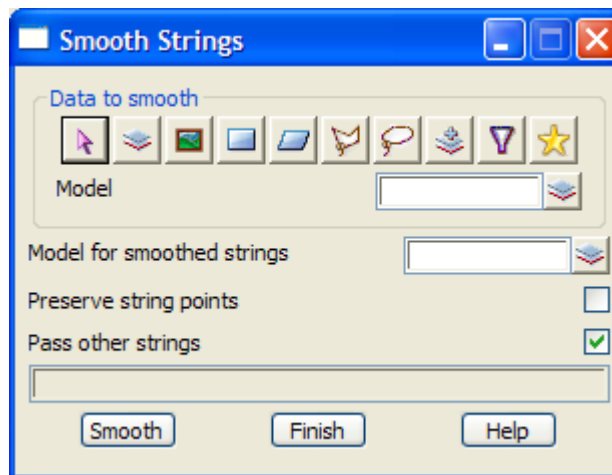

Smooth Strings

smooth_strings

Position of option on menu: Utilities =>H-Z =>Smooth strings

The smooth options are used to add extra points into 2d or 3d strings to make a smoother string.

On selecting Smooth strings and then the appropriate **Data Source** in the panel, the Smooth Strings panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>			
Data source	input		
<i>data source to be smoothed.</i>			
Model for smoothed strings	input		available models
<i>model for the smoothed strings to go to</i>			
Preserve string points	tick box		
<i>if tick, the smoothed strings will still contain all the original points.</i>			
<i>if not tick, the smoothed strings may deviate from the original string points</i>			
Pass other strings	tick box	tick	
<i>if tick, any strings that can't be smoothed are copied and added to the smoothed strings model.</i>			
Smooth	button		
<i>smooth the selected strings.</i>			

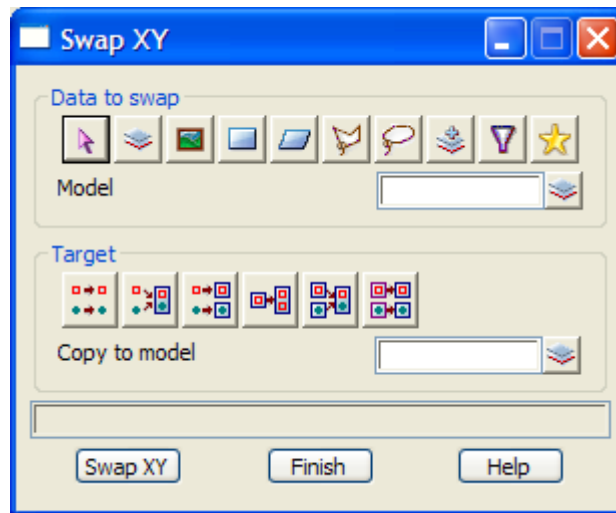

Swap XY

swap_xy

Position of option on menu: Utilities =>H-Z =>Swap XY

The swap xy option is used to swap the (x,y) co-ordinates of selected strings, or all strings in a model or view.

On selecting **Swap XY** and then the appropriate **Data Source** in the panel, the **Swap XY String/Model/View** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source

input

source of data is to be processed.

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info

input

extra information required for the target.

Swap XY

button

swap the selected strings and add them to the target.

Text

change_text_info

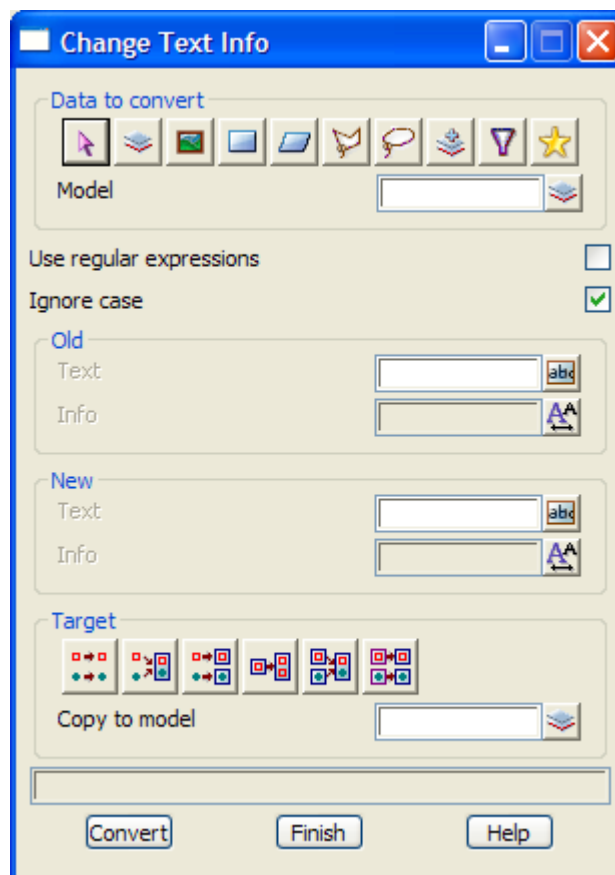

Position of option on menu: Utilities =>H-Z =>Text

The Text option is used to change the text style, units, height, offset, justification, angle and text for text, 4d strings and super strings.

For this option the selection process is extended.

After the data is selected as defined by the Data source, the two extra parameters, Old text and Old info, are used to further specify which text is to be modified.

On selecting the Text option, the **Change Text Info** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type
Data source type	Model
<i>data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"</i>	
Data source	input
<i>source of data is to be processed.</i>	
Old text	input
<i>if the old text field is non-blank, then any text in 4d or text strings will be checked for a match against this value. Wild cards and characters can be used.</i>	
Old text info	input
<i>if non-blank, then only strings with matching text info will be selected.</i>	
New text	input

if non-blank, then any selected text the selected strings will be modified to this value. Wild cards and characters can be used.

New text info input

if non-blank, then the select text on the selected strings will be set the given text info.

Target type

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input

extra information required for the target.

Convert button

run the option and change the selected text.

Translate

translate

Position of option on menu: Utilities =>H-Z =>Translate

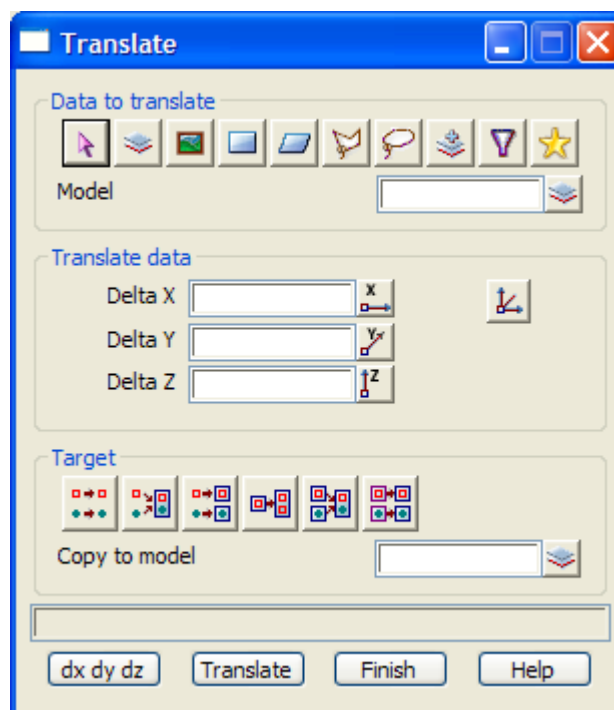

The translate option is used to translate through a user supplied translation vector (dx,dy,dz) any selected strings, or all the strings in a model or on a view.

The strings can be translated in the x,y and z directions and be moved or copied to their new translated positions.

The difference between a copy and a move is that if a string is copied, a copy of the string is translated and the original string left untouched, whereas for a move, the actual string is moved from its original position to the new translated position.

The translated strings can be left in their original models, or moved/copied to a new model.

On selecting Translate, the **translate** panel is displayed.

The translation (dx dy dz) can be typing into the dx dy dz field or by picking the **dx dy dz** button and then selecting two points with the cursor. When two points are selected, the difference vector of the two selected points is taken as the translation vector (dx,dy,dz). The (dx,dy,dz) value is piped into the dx dy dz field.

The fields and buttons used in the translate panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to "Data Source" in the chapter "Tools and Concepts"

Data source	input		
--------------------	-------	--	--

source of data is to be processed.

dx dy dz	input		
-----------------	-------	--	--

the translation vector (dx,dy,dz). This vector is added to all points in the strings.

Target type			
-------------	--	--	--

data target type - for a full description go to "Data Target" in the chapter "Tools and Concepts"

Target info input
extra information required for the target.

dx dy dz button
after selecting dx dy dz, two points are selected by the uses and the difference between the points is placed in the dx dy dz field.

Translate button
translate the selected strings and add them to the model given in the new model field.

How to Use the Panel

- (a) Enter the Data source for the strings are to translated.
- (b) Define the translation vector (dx dy dz) by either typing the value into the dx dy dz field or by selecting the **dx dy dz** button and picking two points to define the translation vector. The resulting (dx dy dz) values are piped into the dx dy dz field.
- (c) Select the target mode.
- (d) Selecting the **Translate** button then does the required translations (moves or copies).

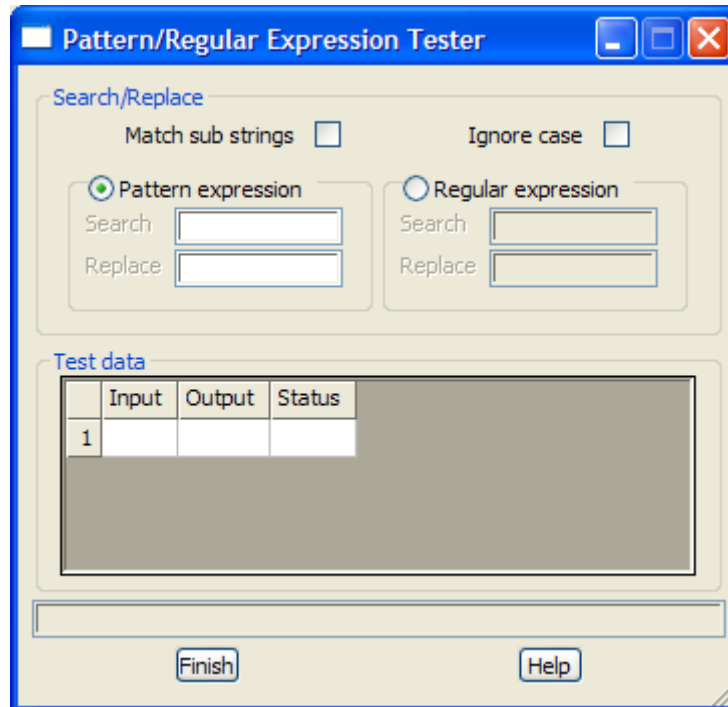

Test Wildcards

`pattern_regular_expression_tester`

Position of option on menu: Utilities =>H-Z =>Test wildcards

The test wildcards option is used to test the effect of pattern expressions and regular expressions on text.

On selecting the Test wildcards option, the **Pattern/Regular Expression Tester** panel is displayed.

The *Search/Replace* criteria and the *Pattern expression* or *Regular expression* is applied to the data in the *Input* column and the results are placed in the *Output* column.

27 User

User Defined Menus

The User walk-right menu is

on Main menu

create floating User menu
miscellaneous macros
beta macros
console macros
polygon macros

on 12d Model

User floating me

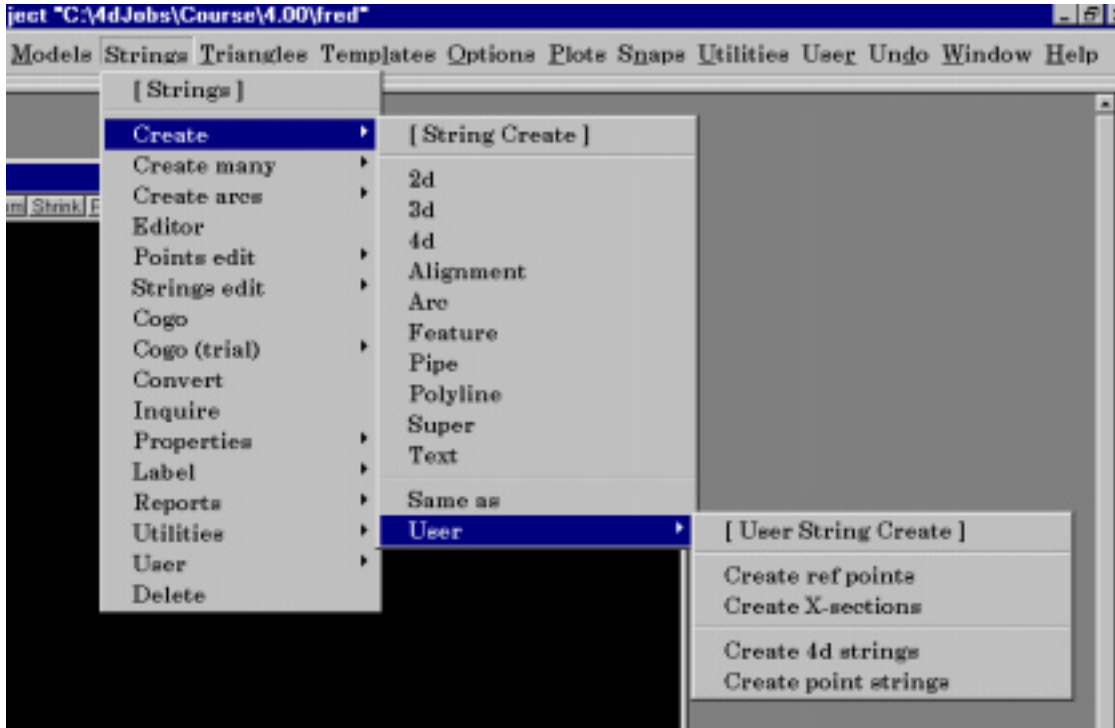

To help customise 12d Model, there is a pull down menu User on the Main menu and User menus on many of the pull down menus on the Main menu. All the User menus are totally defined from the files *Usermenu.4d*, created by the user, and *Xtramenu.4d*, supplied by 12D Solutions.

The User menus can run 12d Model macros, external programs, and bring up 12d Model screen layout files, panels and menus.

The User menus can have their own walk-right menus, with walk-rights menus etc. and so can be used to build sophisticated tailored additions to 12d Model. Each of the user defined menus are floating (tear away) menus.

The User menus are divided in two with any menu options supplied by the user (in *Usermenu.4d*) on the top with the 12D Solutions options (in *Xtramenu.4d*) underneath.

All the options under User and User menus are either customers own macros or unsupported macros from 12D Solutions which may not be documented.

The default name for the user definition file for User is

usermenu.4d

which is searched for in the standard set up areas (local, USER_4D, user, set_ups etc.) or set by the environment variable

```
USER_OPTIONS_4D    file    // Customers User menu definition
```

The format for the user defined menu is given in the Appendix, **Function Keys, Menus**.

The default name for the 12D Solutions definition file which includes some macro for User is

xtramenu.4d

which is also searched for in the standard set up areas (local, USER_4D, user, set_ups etc.) or set by the environment variable

```
EXTRA_OPTIONS_4D  file    // 12D Solutions User menu definitions
```

The format for the user defined menu is also given in the Appendix, **Function Keys, Menus**.

Important Note

The file *xtramenu.4d* is for use by 12D Solutions only. Please do not modify it because it may be over written in future updates. The file *usermenu.4d* is for Customer use.

For quick reference, most of the unsupported macros provided by 12D Solutions on any of the User menus are on the menu User =>Miscellaneous on the main menu.

All the options under User and User menus are either customers own macros or unsupported macros from 12D Solutions which may not be documented.

XXX New Name

newname_panel

Position of option on menu: User =>A to C =>Change name of strings

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source		Model	string, model, view
Model/View/String of circles			
<i>type of source of the data to process.</i>			
Model for centres	model box		available models
<i>source of data to process.</i>			
Name stem	input		
Process	button		

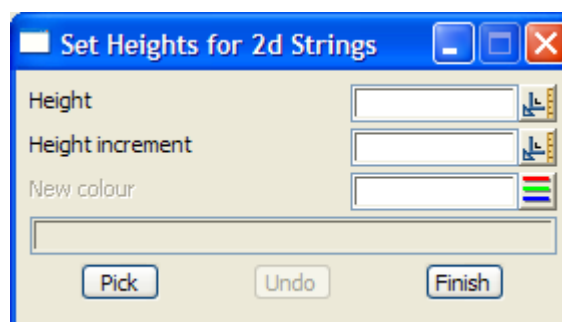

Set Heights for 2d (contour) Strings

contour_levels_panel

Position of option on menu: User =>A to C =>Contour levels

Note - This is an unsupported option which may not be fully documented.

This panel is used to quickly change the height of contour strings. An initial height and increment is given. As each string is accepted, it is given the height and the height then incremented.

The fields and buttons used in this panel have the following functions:

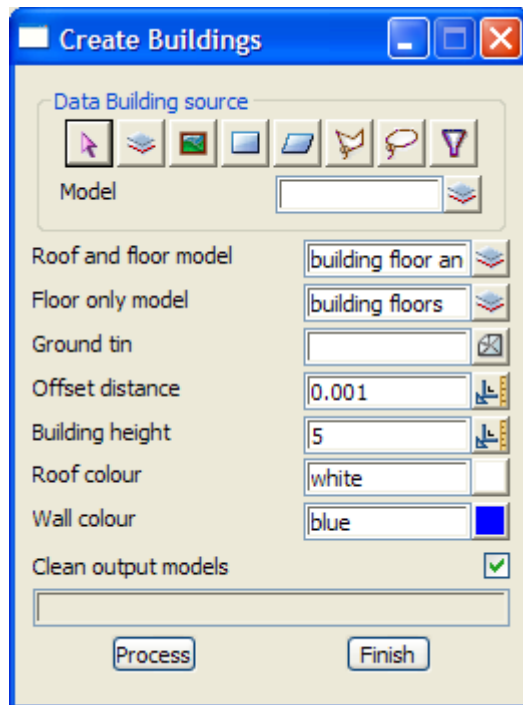

Field Description	Type	Defaults	Pop-Up
Height <i>Height to use for the next selected string. This is incremented by the "Height increment" after each string is accepted.</i>	input		
Height increment <i>As each string is accepted, the "Height" value is incremented by this value.</i>	input		
New colour <i>If non-blank, the selected strings are given this colour when their z-value is changed.</i>	input		available colours
Pick <i>After clicking on Pick, 2d strings are selected and when accepted, have their z-value changed to the value in the Height field. The height value is then automatically incremented. The next string is then selected and accepted (without needing to click on Pick again). This continues until Cancel is selected from the "Pick Ops" menu.</i>	input		
Undo <i>Undo the last height change. This can be selected up to 200 times.</i>	button		

XXX Create Building for a Tin

buildings_panel

Position of option on menu: User =>A to C =>Create buildings for tin

-------------------	------	----------	--------

Length in 3d

length_3d_panel

Position of option on menu: User =>D to K =>Get length in 3d

Note - This is an unsupported option which may not be fully documented.

This panel is used to calculate the 3d length of a selected string.

The fields and buttons used in this panel have the following functions:

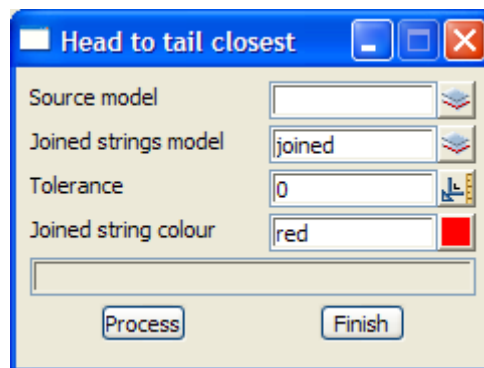

Field Description	Type	Defaults	Pop-Up
Pick	button		
<i>select the string to calculated the 3d length for.</i>			

XXX Head to Tail Closest Points

head_to_tail_closest_panel

Position of option on menu: User =>D to K =>Head to tail closest points

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

XXX Label Alignment

Position of option on menu: User =>L to Q =>Label alignment

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

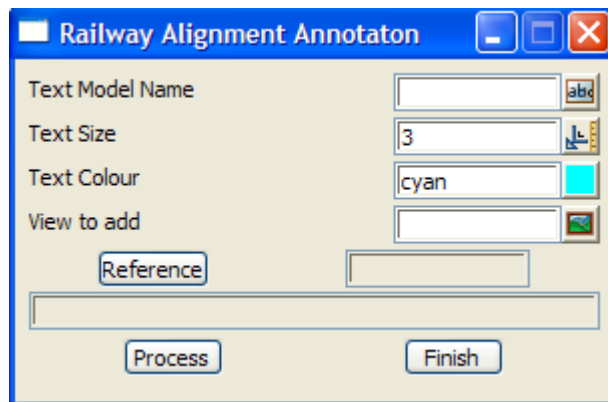

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Label Alignment Radius

rail_align_panel

Position of option on menu: User =>L to Q =>Label alignment radius/ip (rail)

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

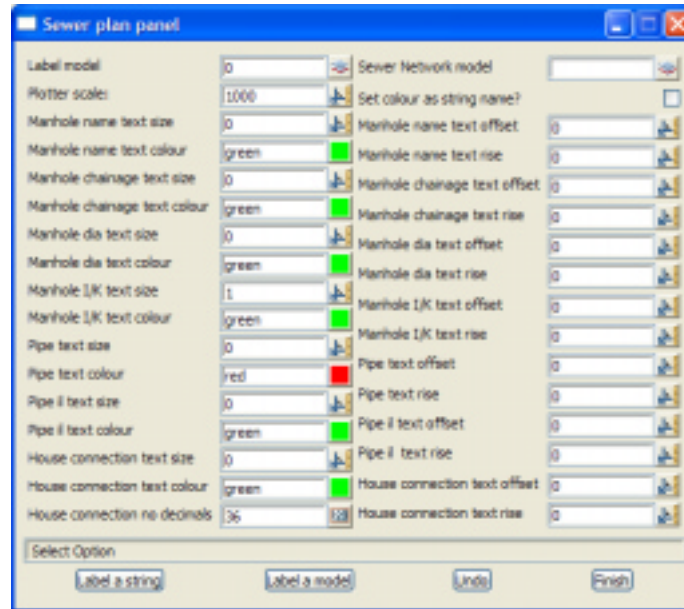

XXX Label Sewer Plan (old)

sewer_plan_panel

Position of option on menu: User =>L to Q =>Label sewer plan

Note - This is an unsupported option which may not be fully documented.

This option has been superseded.

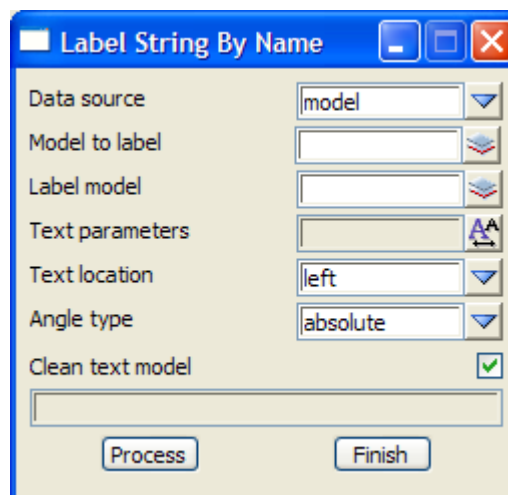

XXX Name Strings by Nearby Text

[label_string_by_name_panel](#)

Position of option on menu: User =>L to Q =>Label strings with name

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

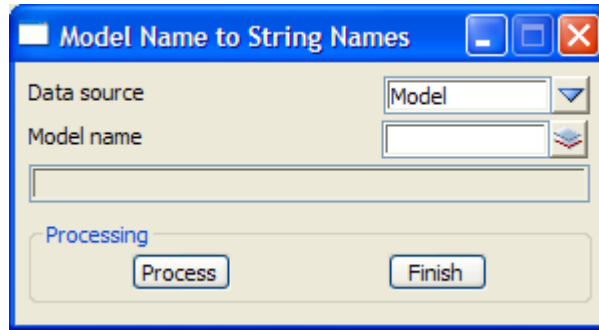

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Name Strings by Model Name

[model_to_name_panel](#)

Position of option on menu: User =>L to Q =>Model to name

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

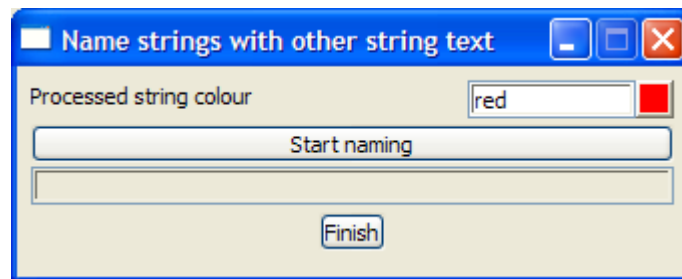

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Name Section Strings by Picking Text

[string_names_from_strings_panel](#)

Position of option on menu: User =>L to Q =>Name strings using text strings

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Pavement Overlay Optimiser

Position of option on menu: User =>L to Q =>Overlay optimiser

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

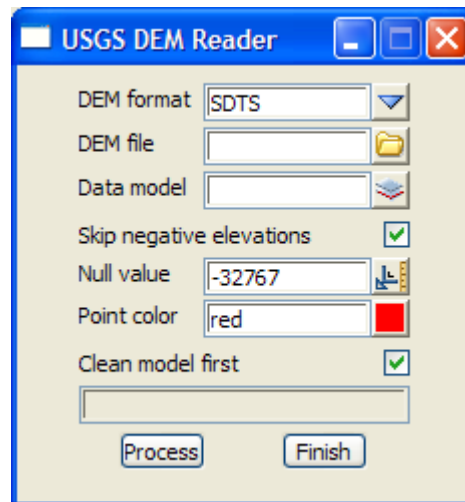

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Read USGS DEM Data

[rivers_dem_reader_panel](#)

Position of option on menu: User =>R to Z =>Read USGS DEM data

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

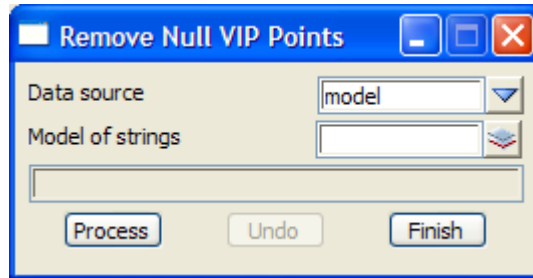

Remove Null VIP Points

remove_null_vips_panel

Position of option on menu: User =>R to Z =>Remove null VIP's

Note - This is an unsupported option which may not be fully documented.

This option is used to remove any null vertical intersection points from alignment strings.

The fields and buttons used in this panel have the following functions:

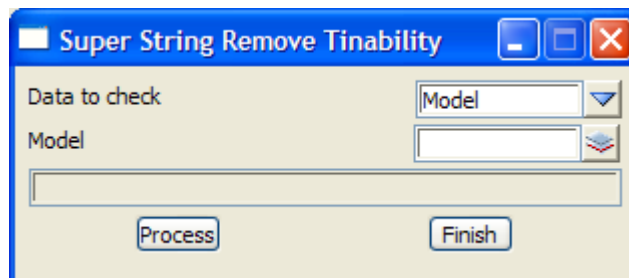

Field Description	Type	Defaults	Pop-Up
Data source <i>Type of data to remove null vips for.</i>	data source	Model	String, Model, View
Model/View/String <i>Data source for all the alignment strings to remove all null vips from.</i>	data source		
Process <i>Run the option.</i>	button		

XXX Remove Tinability

super_remove_tinability_panel

Position of option on menu: User =>R to Z =>Remove tinability

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

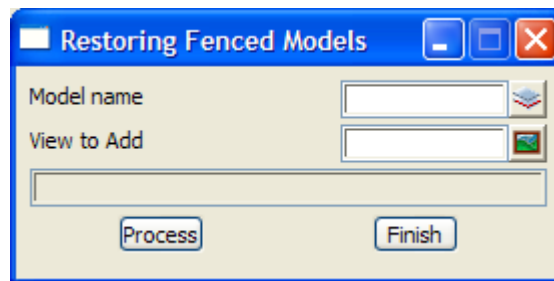

Field Description	Type	Defaults	Pop-Up

XXX Restore Fenced Model

mod_res_panel

Position of option on menu: User =>R to Z =>Restore fenced model

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

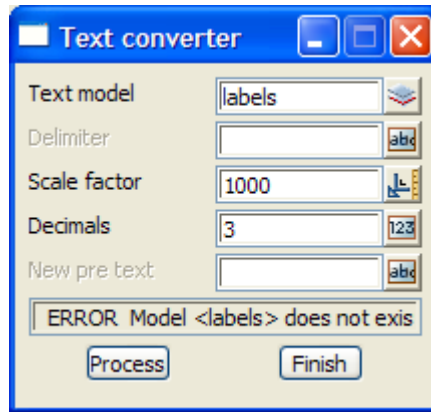

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Scale Text Values

text_convert_panel

Position of option on menu: User =>R to Z=>Scale text values

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

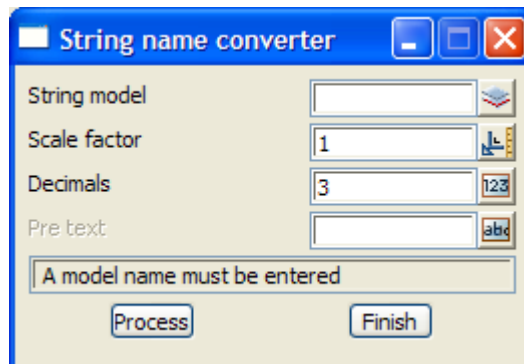

Field Description	Type	Defaults	Pop-Up
Text model xxxxx	input box	labels	
Scale factor xxxxx	input box	1000	
Decimals xxxxx	input box	3	
Process xxxxx	button		

XXX Scale String Names

string_name_convert_panel

Position of option on menu: User =>R to Z=>Scale string names

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

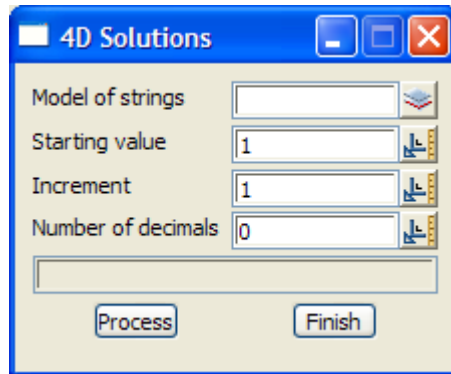

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Set String Names by Number

[string_name_by_number_panel](#)

Position of option on menu: User =>R to Z=>Set string names by number

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

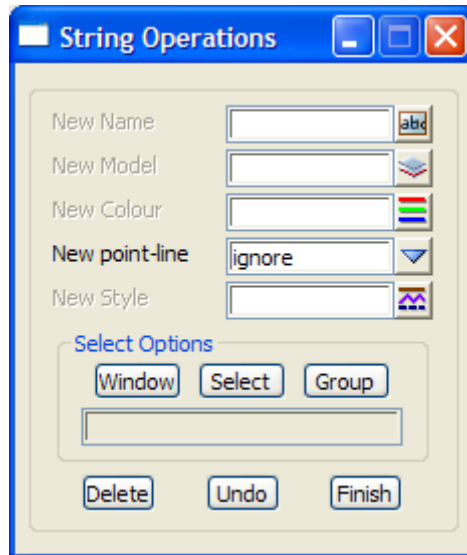

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX String Operations

string_ops_panel

Position of option on menu: User =>R to Z=>Set string properties

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
new name xxxxx	input box		
new model xxxxx	input box		
new colour xxxxx	input box		
new-point-line xxxxx	input box	ignore	
new style xxxxx	input box		
window xxxxx	button		
select xxxxx	button		
group xxxxx	button		
delete xxxxx	button		
window xxxxx	button		

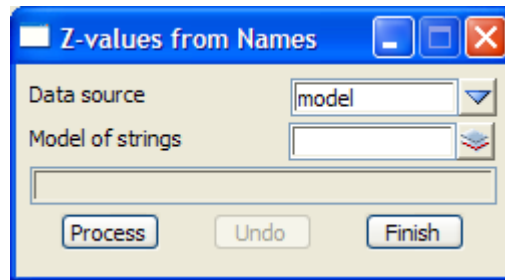

Set Contour Levels from String Names

level_from_name_panel

Position of option on menu: User =>R to Z=>Set contour level from contour name

Note - This is an unsupported option which may not be fully documented.

This operates on contour strings and sets the contour z-value to be the value of the name of the contour string. The z-values may need to be factored to bring them into the correct units.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>Type of data to set contour z-values for.</i>	data source	Model	Model, View
Model/View <i>Data source to of contours to set z-values for.</i>	data source		
Process <i>Run the option</i>	button		
Undo <i>Undo the last set of contours labelled since the panel was up.</i>	button		

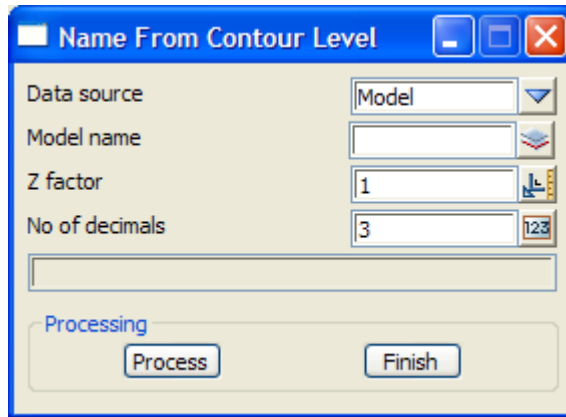

Set Contour Names From Contour Levels

name_contour_panel

Position of option on menu: User =>R to Z=>Set contour names from contour levels

Note - This is an unsupported option which may not be fully documented.

This option operates on contours only and sets the string name to be the contour z value multiplied by the given factor.

The fields and buttons used in this panel have the following functions:

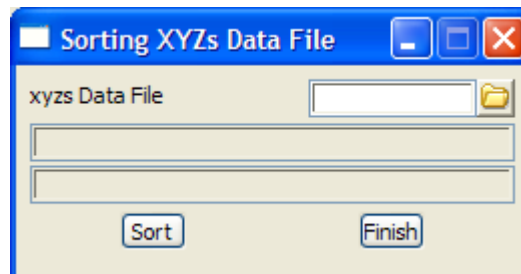

Field Description	Type	Defaults	Pop-Up
Data source <i>Type of data to label contours strings for.</i>	data source	Model	String, Model, View
Model/View/String <i>Data source to calculate label the contours for.</i>	data source		
Z factor <i>Value to multiply the z values by before creating the string name.</i>	input	1	
No of decimals <i>Number of decimals places to use in the string name.</i>	input	3	
Process <i>Run the option.</i>	button		

XXX Sort XYZs Data File

[xyzs_sort_panel](#)

Position of option on menu: User =>R to Z=>Sort xyz data file

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

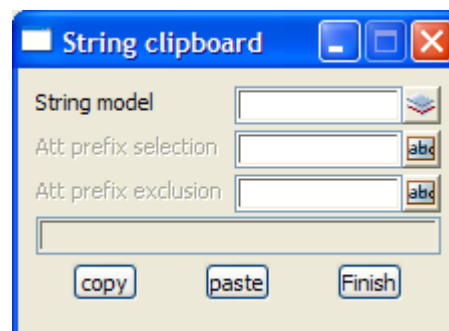

Field Description	Type	Defaults	Pop-Up
Xyzs data file xxxxx	input box		
Sort xxxxx	button		

XXX String Attributes To-From Clipboard

[string_to_panel](#)

Position of option on menu: User =>R to Z =>String attributes to-from clipboard

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
String model	input box		
Att prefix selection	input box		
Att prefix exclusion	input box		
copy	button		
paste	button		
Finish	button		

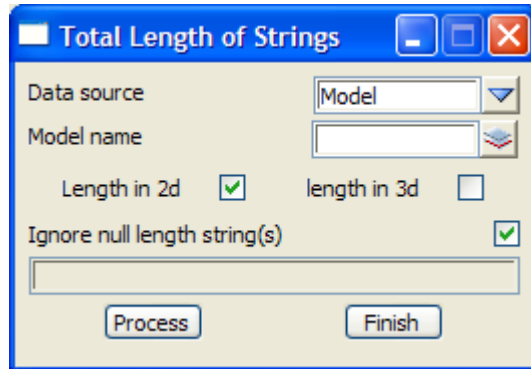

Total Length of Strings

totallengths_panel

Position of option on menu: User =>R to Z=>Sum length of all strings

Note - This is an unsupported option which may not be fully documented.

This panel is used to calculate the total length of the strings in a selected model or view.

The fields and buttons used in this panel have the following functions:

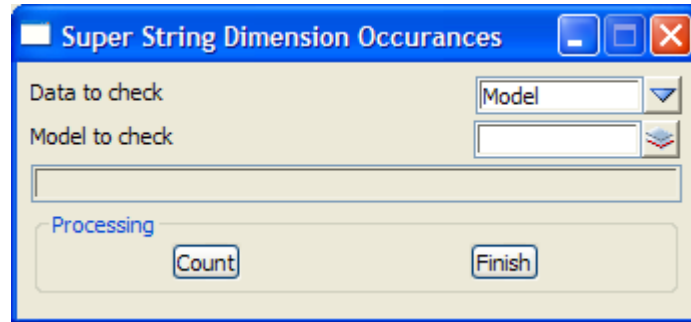

Field Description	Type	Defaults	Pop-Up
Data source <i>data source type</i>			model, view, string
Data source <i>data source to calculate lengths for.</i>			
Length in 2d/3d <i>if 2d, the lengths are only calculated in 2d. If 3d, the lengths are calculated in 3d.</i>	radio button	2d	
Ignore null length string(s) <i>if tick, strings of null length are ignored in the string count and hence don't affect the average length.</i>	tick box	tick	
Process <i>run the option</i>	button		

XXX Super String Dimension Occurrences

super_remove_radius_panel

Position of option on menu: User =>R to Z=>Super string dimension occurrences

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
data to check xxxxx	input box		
model to check xxxxx	input box		
count xxxxx	button		

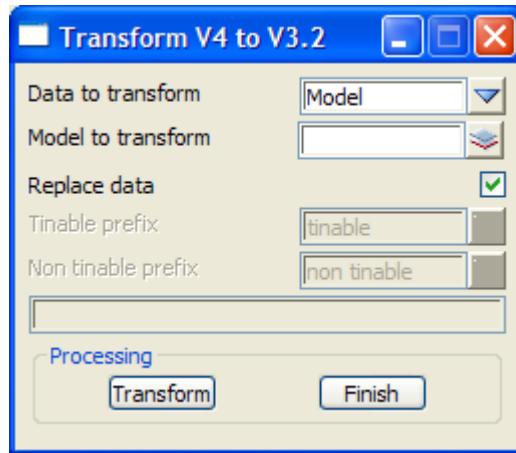

XXX Transform V4 to V3.2

super_to_v32_panel

Position of option on menu: User =>R to Z=>Super string to V3.2 strings

Note - This is an unsupported option which may not be fully documented.

This panel convert a super string from 12d Model V4.0 format to V3.2 strings.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data to transform xxxxx	input box	model	
Model to transform xxxxx	input box		
Replace data xxxxx	tick box	tick	
Tunable prefix xxxxx	input box	tunable	
Non tunable prefix xxxxx	input box	non tunable	
Transform xxxxx	button		

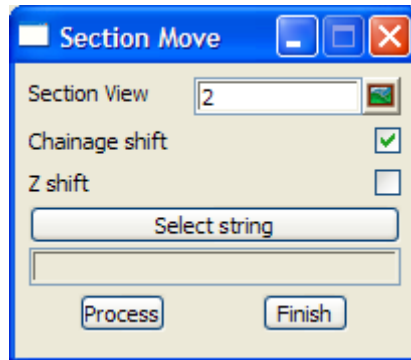

XXX Section Move

section_move_panel

Position of option on menu: User =>R to Z=>Translate string in section view

Note - This is an unsupported option which may not be fully documented.

This panel is used to translate a string on a section view.

The fields and buttons used in this panel have the following functions:

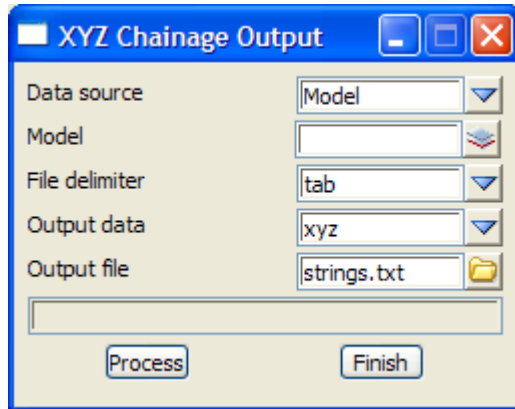

Field Description	Type	Defaults	Pop-Up
section view xxxxx	input box	2	
chainage shift xxxxx	tick box	tick	
z shift xxxxx	tick box		
select string xxxxx	button		
process xxxxx	button		

XXX Output XYZ and Chainage

xyz_chainage_output_panel

Position of option on menu: User =>R to Z=>XYZ chainage

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

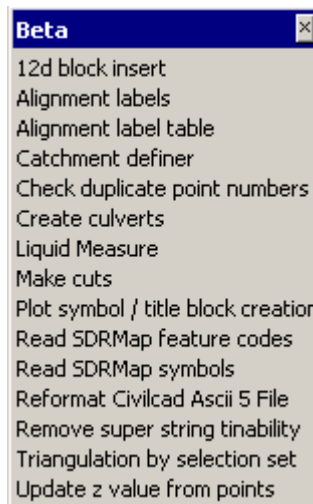

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Beta

beta

All the options under User and User menus are either customers own macros or unsupported macros from 12D Solutions which may not be documented. For more information on *User* menus, go to “User Defined Menus”

The walk rights Beta menu is:

For *Alignment labels*, go to the section “XXX Alignment Labels”

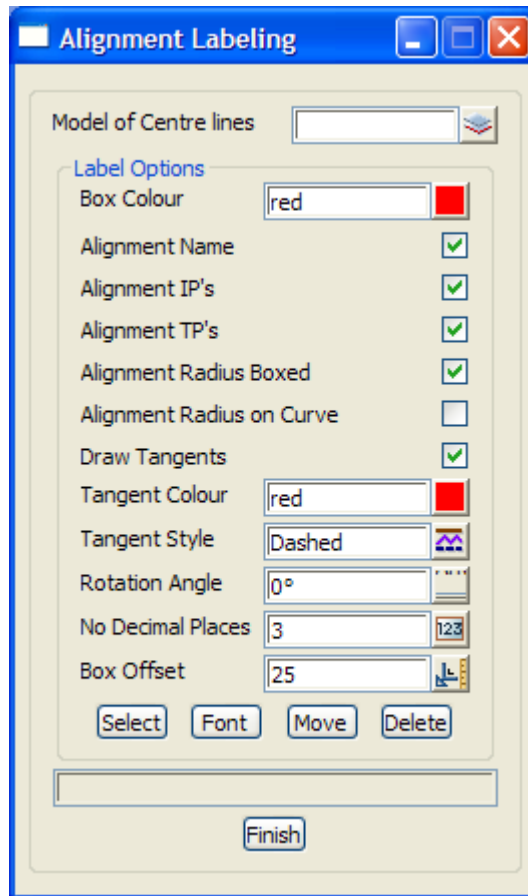

<i>Alignment label table</i>	“XXX Table of Alignment Labels”
<i>Catchment definer</i>	“XXX Catchment Definer”
<i>Check duplicate point numbers</i>	“XXX Check Duplicate Point Numbers”
<i>Create culverts</i>	“XXX Create Culvert”
<i>Liquid measure</i>	“XXX Liquid Measure”
<i>Make cuts</i>	“XXX Make Cuts Through Strings”
<i>Plot symbol/title block</i>	“XXX Plot Symbol and Title Block Creation (old)”
<i>Read SDRMap feature codes</i>	“XXX Read SDRMap Feature Code”
<i>Read SDRMap symbols</i>	“XXX Read SDRMap Symbols”
<i>Reformat CivilCAD Ascii 5 file</i>	“XXX Reformat CivilCAD Ascii 5 file”
<i>Remove super string tinability</i>	“XXX Remove Super String Tinability”
<i>Triangulate by selection set</i>	“XXX Triangulate by Selection Set”
<i>Update z values from points</i>	“XXX Update Z Values from Points”

XXX Alignment Labels

align_label_panel

Position of option on menu: User =>Beta =>Alignment labels

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

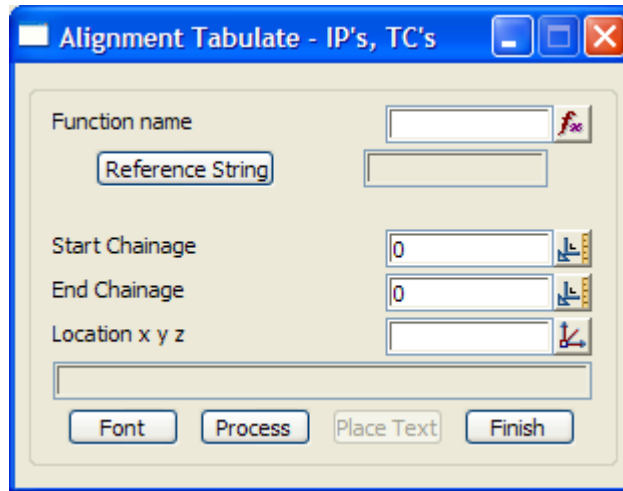

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Table of Alignment Labels

Align_label_table_panel

Position of option on menu: User =>Beta =>Alignment label table

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

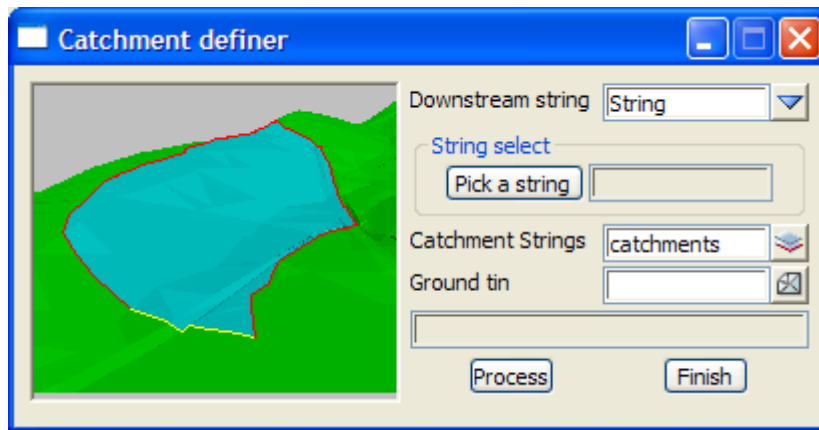

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Catchment Definer

Catchment_areas_panel

Position of option on menu: User =>Beta =>Catchment definer

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

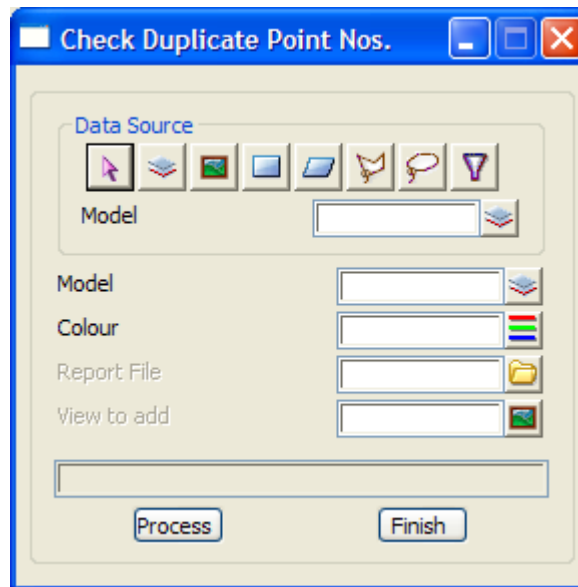

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Check Duplicate Point Numbers

Dup_pt_nos_panel

Position of option on menu: User =>Beta =>Check duplicate point numbers

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

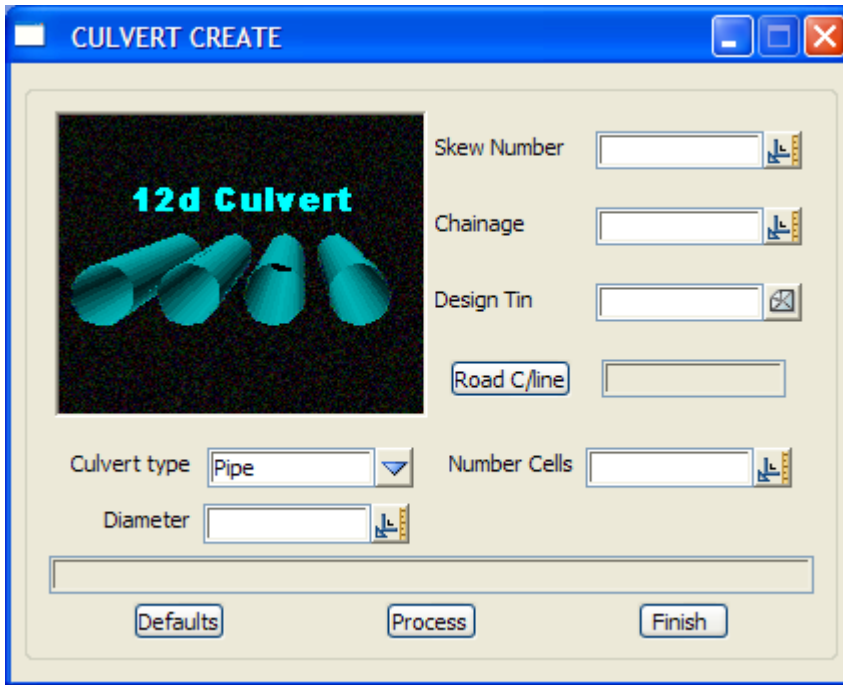

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Create Culvert

3d_culvert_panel

Position of option on menu: User =>Beta =>Create culvert

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Liquid Measure

liquid_meas_panel

Position of option on menu: User =>Beta =>Liquid measure

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

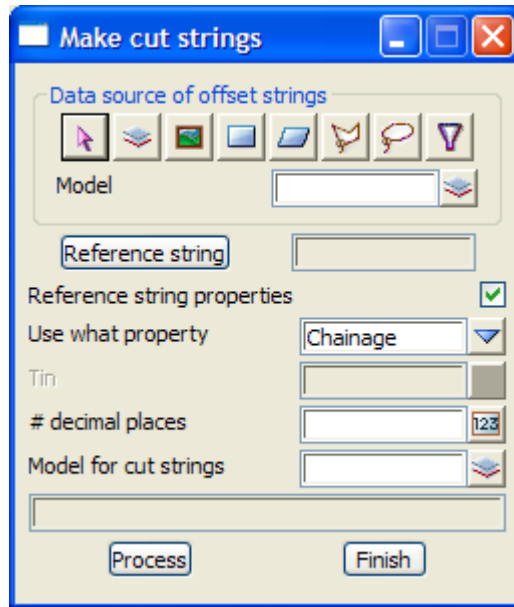

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Make Cuts Through Strings

Make_Cuts_panel

Position of option on menu: User =>Beta =>Make cuts

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

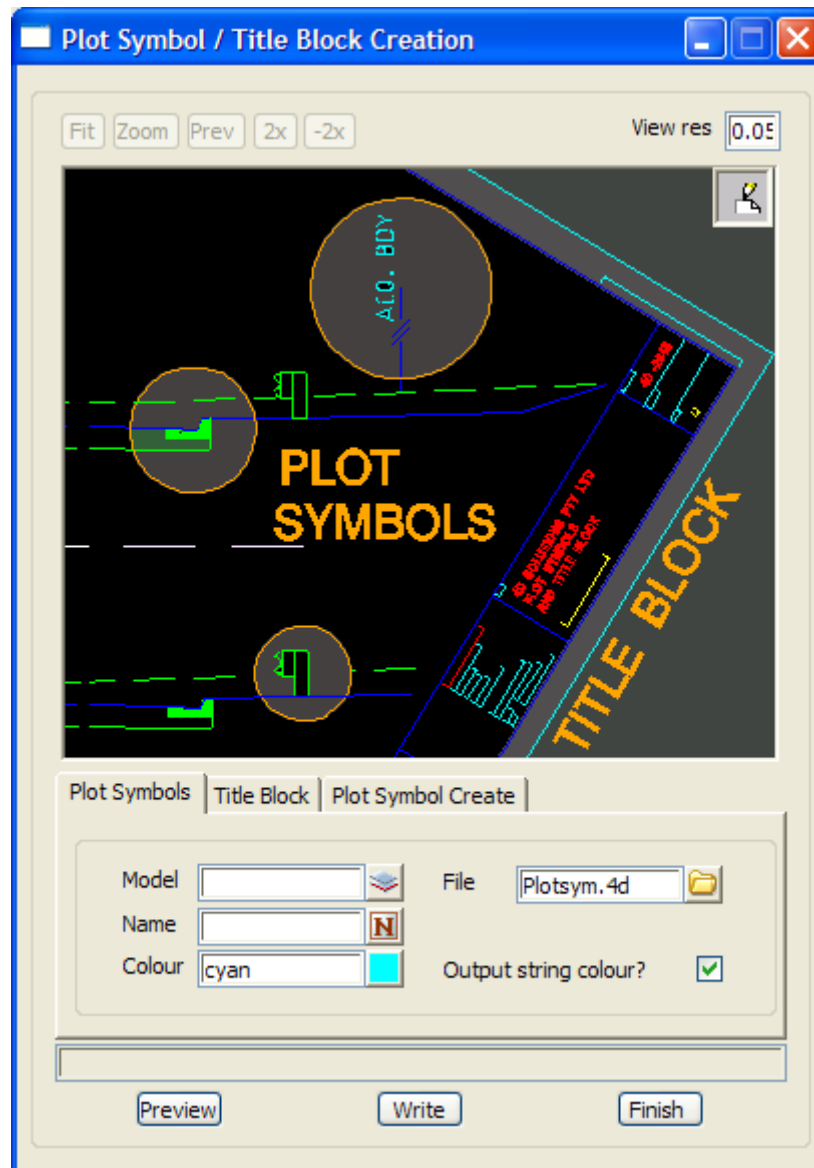

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Plot Symbol and Title Block Creation (old)

`psym_drawbox_panel`

Position of option on menu: User =>Beta =>Plot symbol/title block creation

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

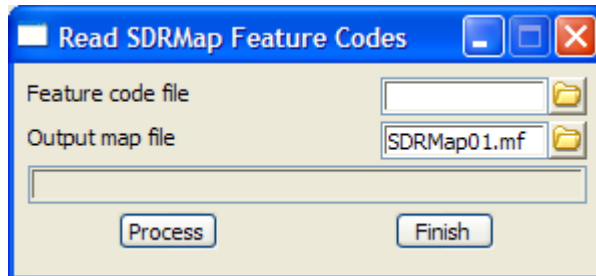

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Read SDRMap Feature Code

SDRMap_Read_Feature_Codes_panel

Position of option on menu: User =>Beta =>Read SDRMap feature codes

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

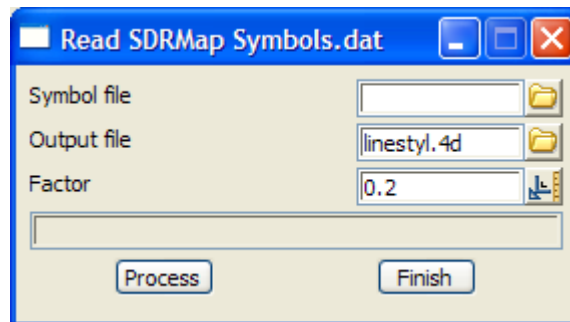

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Read SDRMap Symbols

SDRMap_Read_Symbols_panel

Position of option on menu: User =>Beta =>Read SDRMap symbols

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

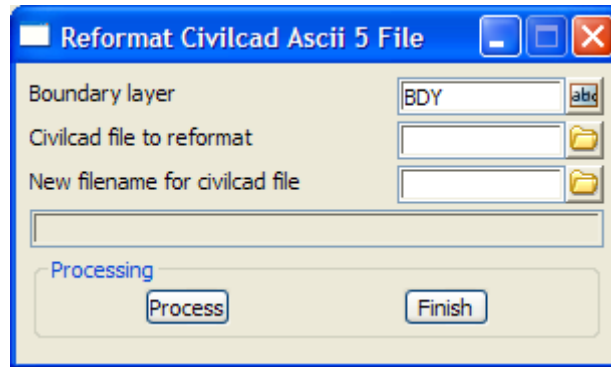

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Reformat CivilCAD Ascii 5 file

reformat_as5_panel

Position of option on menu: User =>Beta =>Reformat CivilCAD Ascii 5 file

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

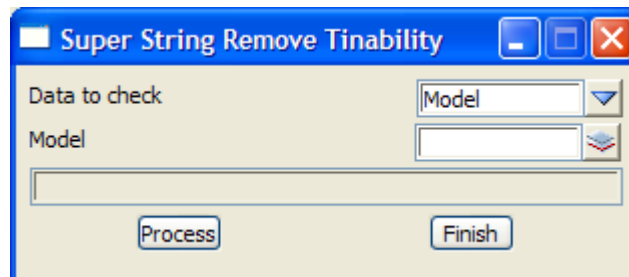

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Remove Super String Tinability

`super_remove_tinability_panel`

Position of option on menu: User =>Beta =>Remove super string tinability

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

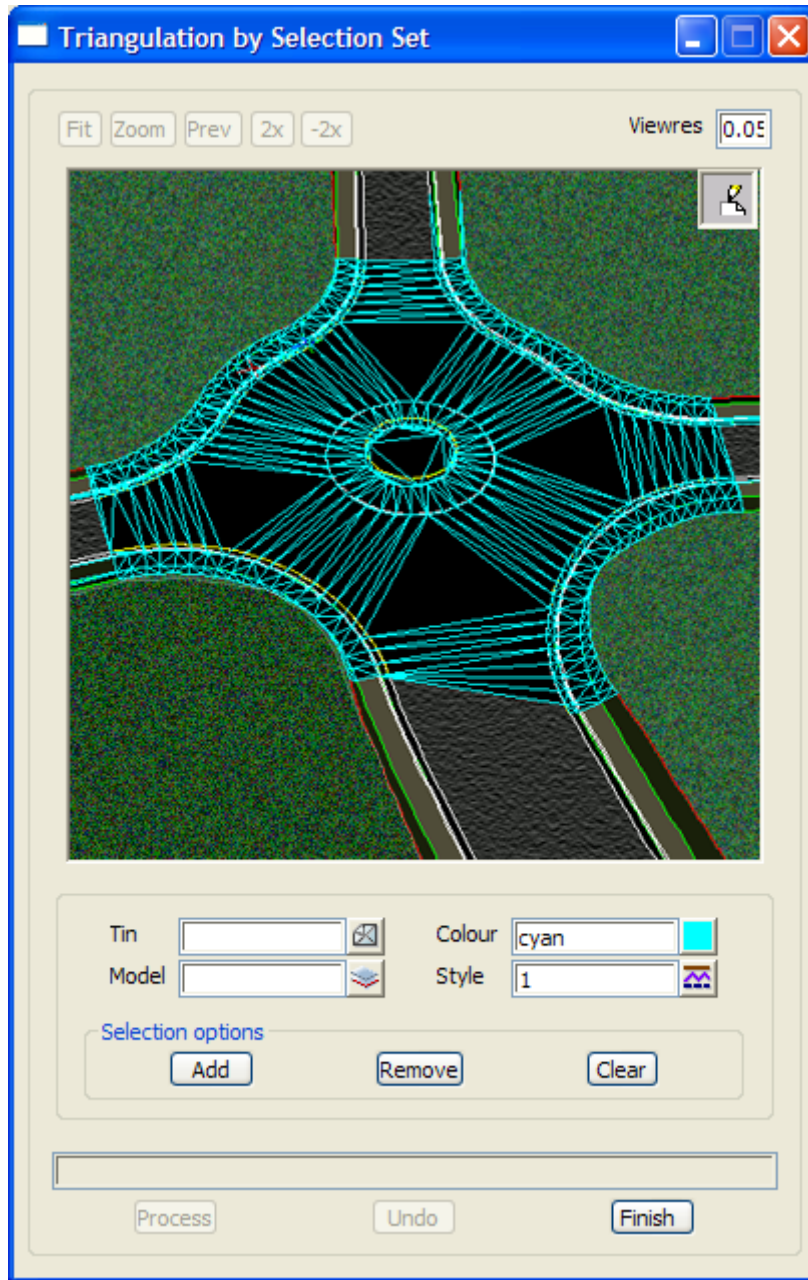

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Triangulate by Selection Set

tri_drawbox_panel

Position of option on menu: User =>Beta =>Triangulation by selection set

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

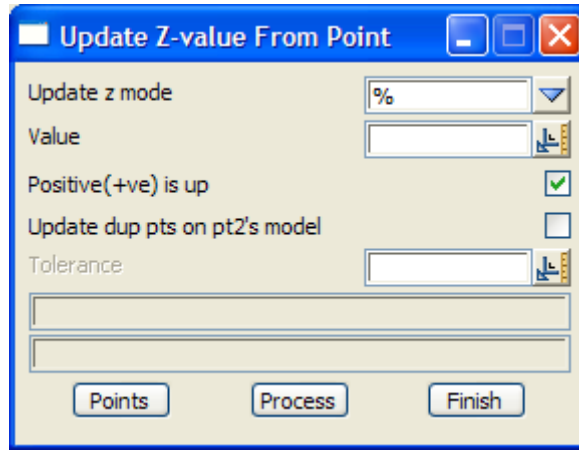

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

XXX Update Z Values from Points

Update_z_value_from_point_panel

Position of option on menu: User =>Beta =>Update z value from points

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Console

console

All the options under User and User menus are either customers own macros or unsupported macros from 12D Solutions which may not be documented. For more information on *User* menus, go to “User Defined Menus”

All the macros on the Console menu only use the console panel and so do not support a F1 key for help.

The User =>Console rights menu is:

Polygon

The Polygon walk-right menu is

create polygon by picking point inside
 create polygon by picking sides
 colour polygon by range file
 remove polygon colour
 road polygons

and each option in this menu will now be discussed.

For the option *Create polygon by picking point inside area*, go to the section “Surrounding Polygon” in the chapter “Strings”

For the option *Create polygon by picking sides*, go to the section “Create Polygon by Picking Sides”

Colour polygons from range file

“Colour Polygons by Range File”

Remove polygon colour

“Remove Polygon Colour”

Road polygons

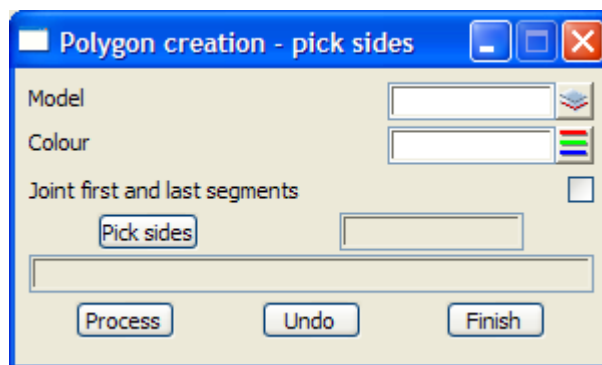

“Road Polygons” in the chapter “Design”

Create Polygon by Picking Sides

polygon_creation_pick_panel

Position of option on menu: User => Polygon => Create polygon by picking sides

This option creates a polygon by a picking each segment in its order (and with direction) around the polygon. Segments will be automatically extended or clipped to form the polygon.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for polygon <i>model for the created polygon</i>	model box		available models
Lot colour <i>colour for the created polygon</i>	colour box		available colours
Join first and last segment <i>if tick, join the end of the last selected segment to the start of the first selected segment to form the final</i>	tick box		

side of the polygon. The segments may be automatically trimmed/extended.

Pick sides string select

pick, with direction, the segments to be joined together to form the sides of the polygon.

Process button

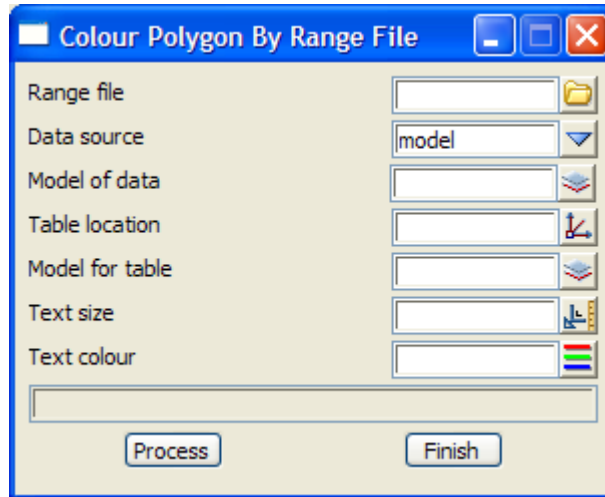

create the polygon from the selected segments.

Colour Polygons by Range File

colour_polygon_by_range_file_panel

Position of option on menu: User =>Polygon =>Colour polygons by range file

This option creates a polygon by a picking each segment in its order (and with direction) around the polygon. Segments will be automatically extended or clipped to form the polygon.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Range file <i>range file for colouring polygons.</i>	file box		*.lrf
Data source type <i>data source type.</i>		model	model, view
Data source <i>data source for polygons to be coloured.</i>			
Table location <i>position of the table.</i>	position select box		
Model for table <i>model for the table of statistics on the polygon areas.</i>	model box		available models
Text colour <i>colour of the text.</i>	colour box		available colours
Text size (w) <i>size of the text for the table.</i>	double box		
Process <i>select all the polygons given by the Data source and colour them according to the lot range file.</i>	button		

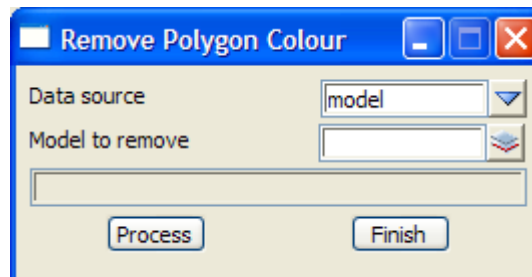

Remove Polygon Colour

`remove_polygon_colour_panel`

Position of option on menu: Design =>Estate/Lots =>Lot utilities =>Remove polygon colour

Note - This is an unsupported option which may not be fully documented.

This option removes the colour of all the selected polygons.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>		model	model, view

Data source

data source for polygons to have their colour removed.

Process

button

select all the polygons given by the Data source and remove the polygon colour.

The options on a **User** menu are either customer's macros or unsupported macros from 12D Solutions and may not be documented.

28 Window

Window

window

The **12d** Model window menu contains options to cascade, tile horizontally and vertically.

The **Output window** can also be toggled on and off.

The Window on main menu and walk-right menus are

on Main menu

cascade the non-minimized views

horizontally tile the non-minimized views

vertically tile the non-minimized views

place all minimized view icons at the bottom of the views area

toggle the output window on/off

list of existing views

29 Help

help

Position of menu: It is on the main menu as Help

From *12d Model V5.0* onwards, the two-volume paper Reference Manual has been replaced by electronic help accessed from within 12d Model.

The entire 12d Model Help manual can be accessed by selecting *12d Model* on the Help menu item on the main *12d Model* menu.

Alternatively, individual topics for a panel or menu can be invoked by pressing the F1 key whenever the focus is on the menu or panel, or by clicking on the *Help* button on any 12d Model panel.

The **12d** Model help menu contains options to access Microsoft's Help on Microsoft's Help, the 12d Model Help and the 12d Model Macro Programming Language Help, plus links to the 12D Solutions web site www.12d.com.

The help on main menu and walk-right menus are

on Main menu

create floating Help menu
help on Microsoft's help system
contents of 12d Model help
help on 12d macro programming language
links to www.12d.com
dongle number, 12d Model modules
email information about 12d Model to 12D Solutions
dongle testing panel

floating Help menu

For the option *On help*, go to the section

12d Model
12d Macro manual
12d on the web
About 12d Model
Email info to 12d

"On Help" .

"12d Model Contents" .
"12d Model Macro Manual" .
"12d on the Web" .
"About 12d Model" .
"Email Info to 12d" .

More information on the Help system will now be given.

On Help

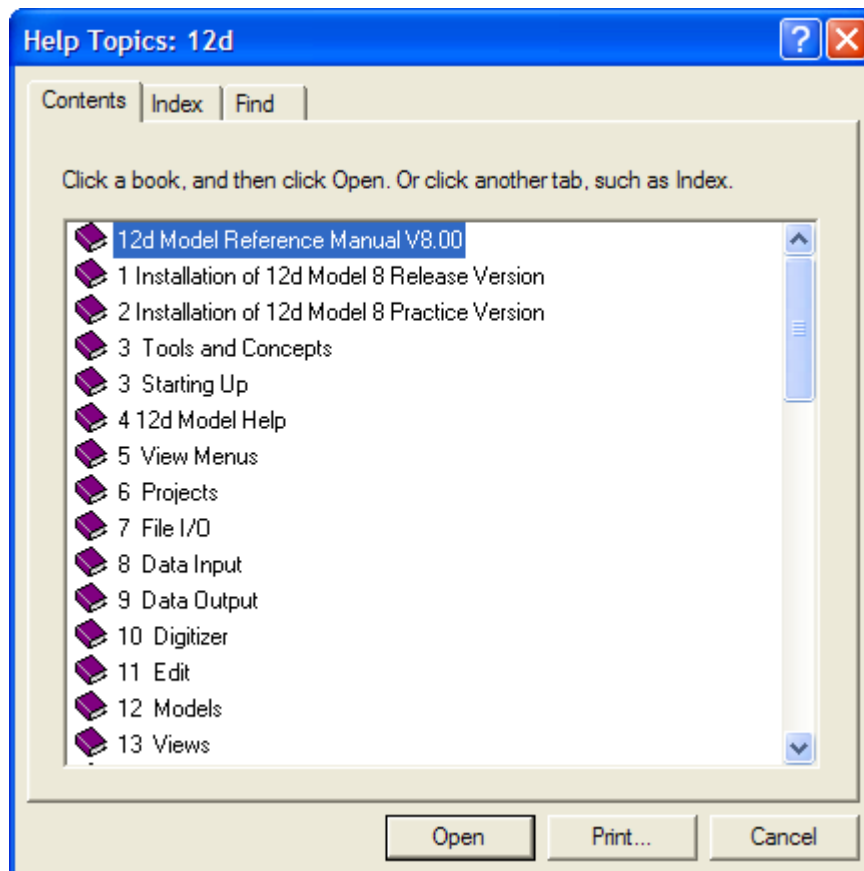

Position of option on menu: Help =>On help
Help on Microsoft's *Help* system.

Please continue to the next section "12d Model Contents" .

12d Model Contents

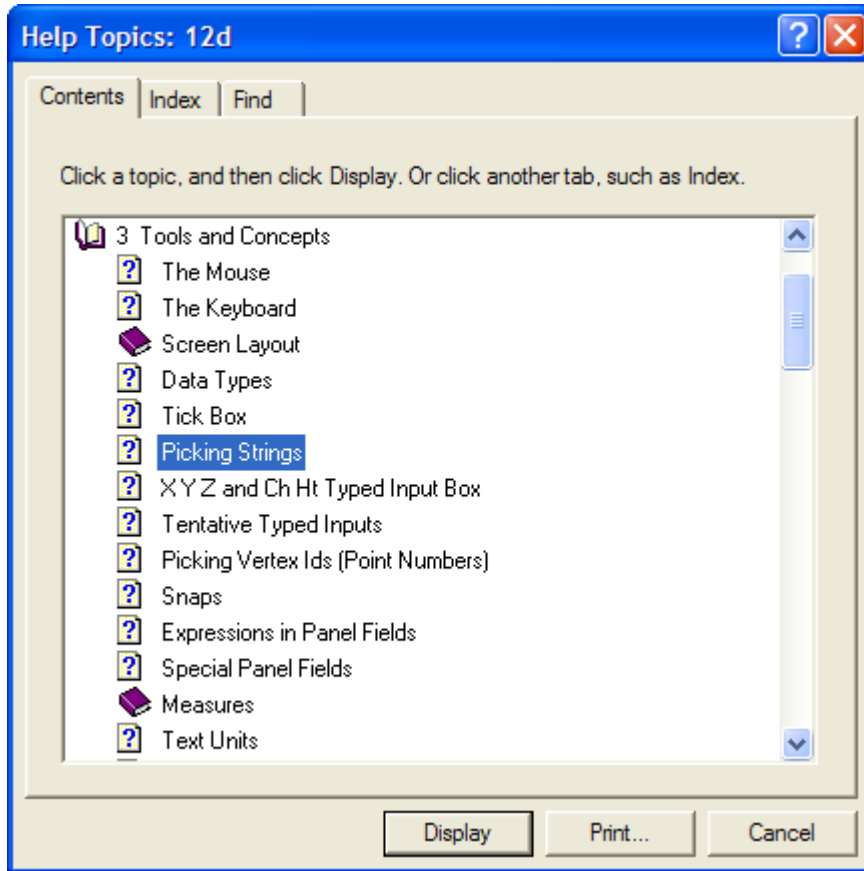

Position of option on menu: Help =>12d Model

The **12d Model** option allows you to look at the overall structure of the 12d Model Help and access any part of it.

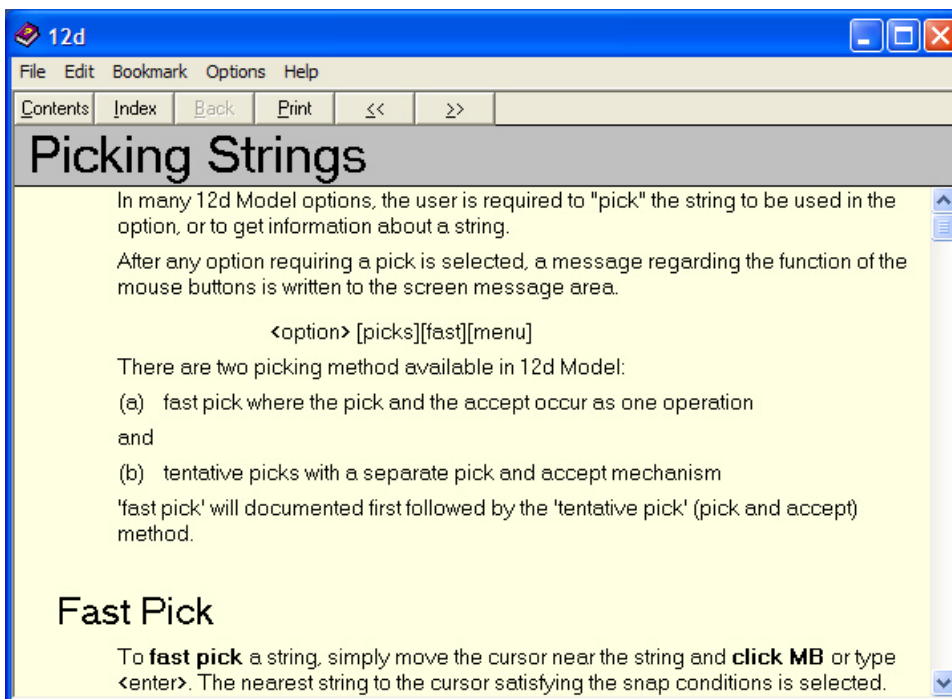

Warning - only *topics* in the Help can be accessed through the *Contents* list so any folders in the Content folders must be expanded until topics are displayed. *Topics* can be easily identified because they have a question mark beside them indicating that Help is available.

For example, double clicking on '*Tools and Concepts*' expands the next level of '*Tools and Concepts*'.

Double clicking on the topic 'Picking Strings' will then display the topic in the Help. The *Contents* then disappear leaving *Help* open at the selected topic.

Double clicking on 'Contents' on the top of the Help will bring the Contents listing back up.

For information on the **Index** tab, please continue to the next section "Index" .

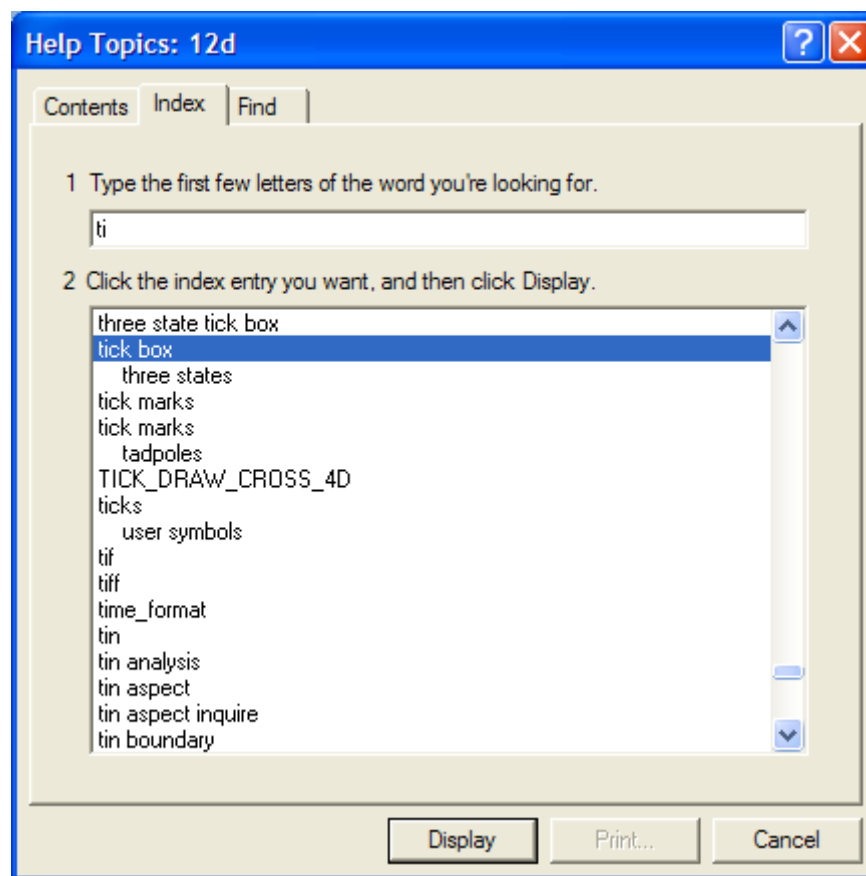

For information on the **Find** tab, please continue to the next section "Find" .

For information on the **Help** button on a panel, please continue to the section "Panel Help Button" .

Index

The *Index* option searches through all entries in the Index of the Help.

As the first few characters of the required entry are typed in, the matching index entries are displayed.

Double clicking on the displayed entries will go to the topic in the Help containing the selected index entry. If more than one topic includes the index entry, then the list of topics is displayed.

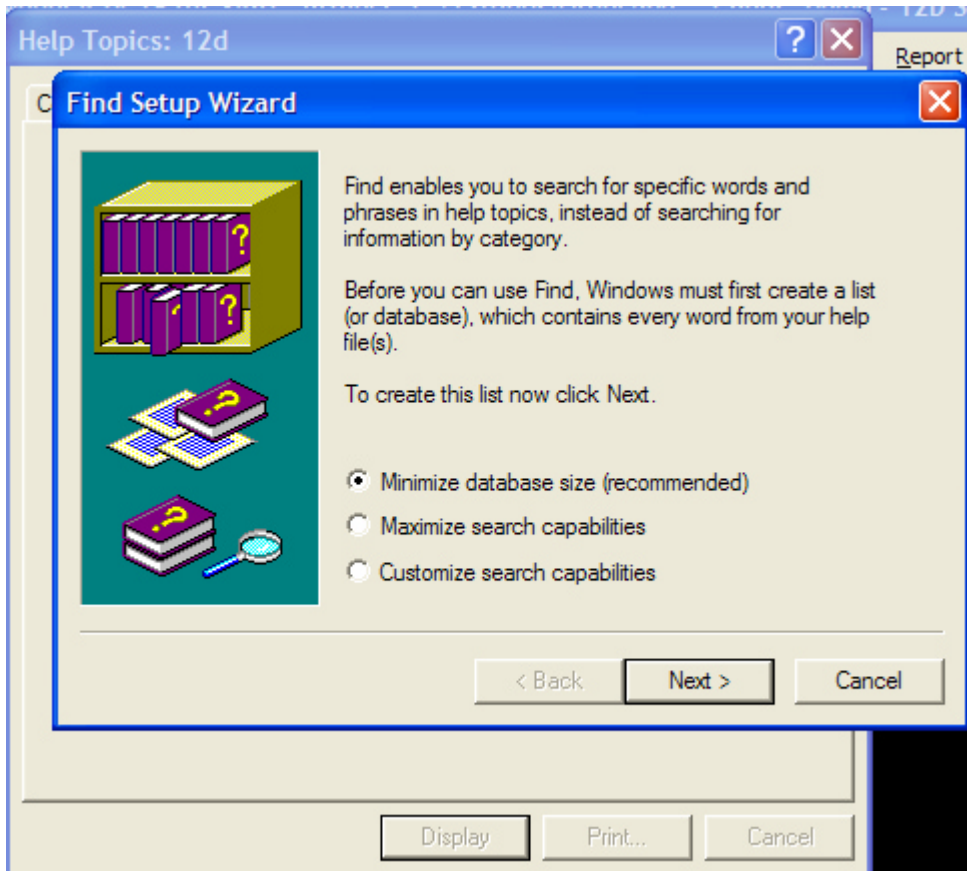

If the index has sub-indices, they can be searched by first typing in the main index followed by a comma, then a space and the first few characters of the sub-index.

For information on the **Find** tab, please continue to the next section "Find" .

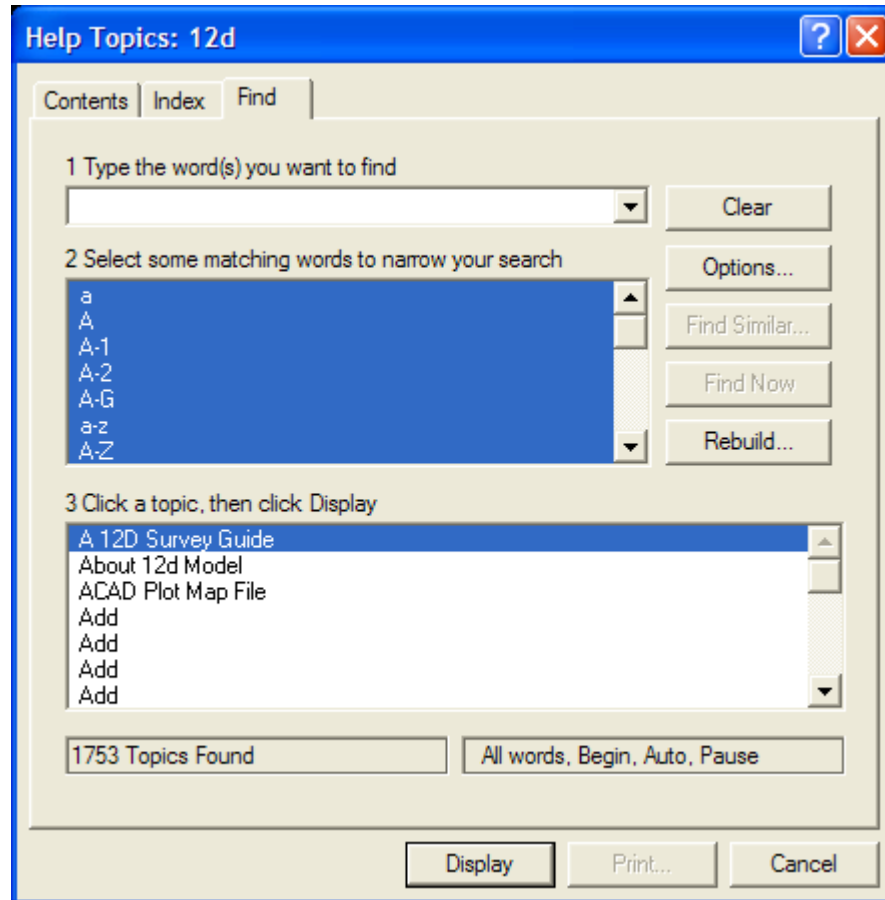

Find

The most powerful searching method for the Help system is *Find*.

Simply click on the *Find* tab to search for words or phrases that may be contained in a Help topic. If *Find* is being invoked for the first time, the 'Find Setup Wizard' runs to create an index of every word in the Help.

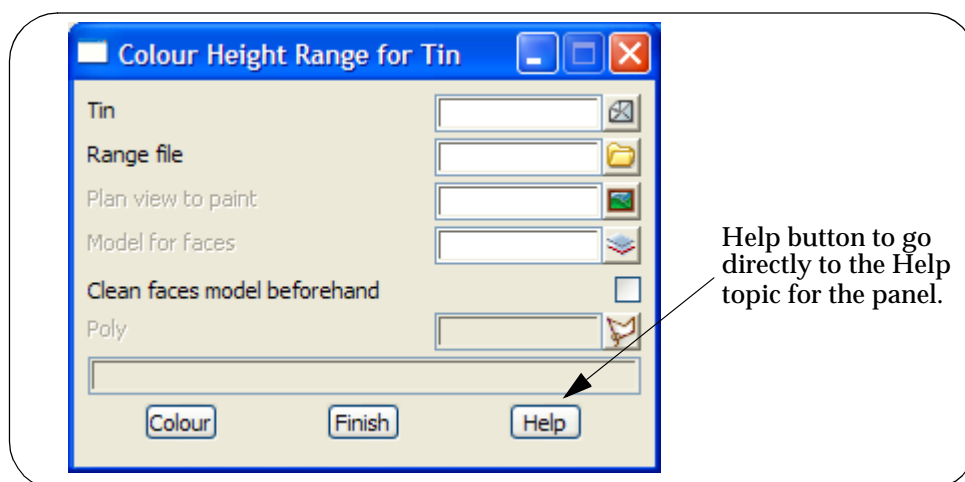

From then on, selecting the *Find* tab goes straight to the *Find* screen.

Please continue to the next section “Panel Help Button” .

Panel Help Button

Every panel has a Help button which when selected goes to the *topic* describing that panel.

Please continue to the next section “F1 Key” .

F1 Key

Another method of invoking *Help* is by using the F1 key as follows:

when a menu or panel is on the screen and has focus (the menu or panel title area will be highlighted), pressing F1 will bring up the help for that menu or panel.

Warning - some of the items on the *Strings* menu automatically start up a string select and change the focus from the panel to a View. This means that pressing F1 will bring up the *Help* for the View and not the Help for the panel.

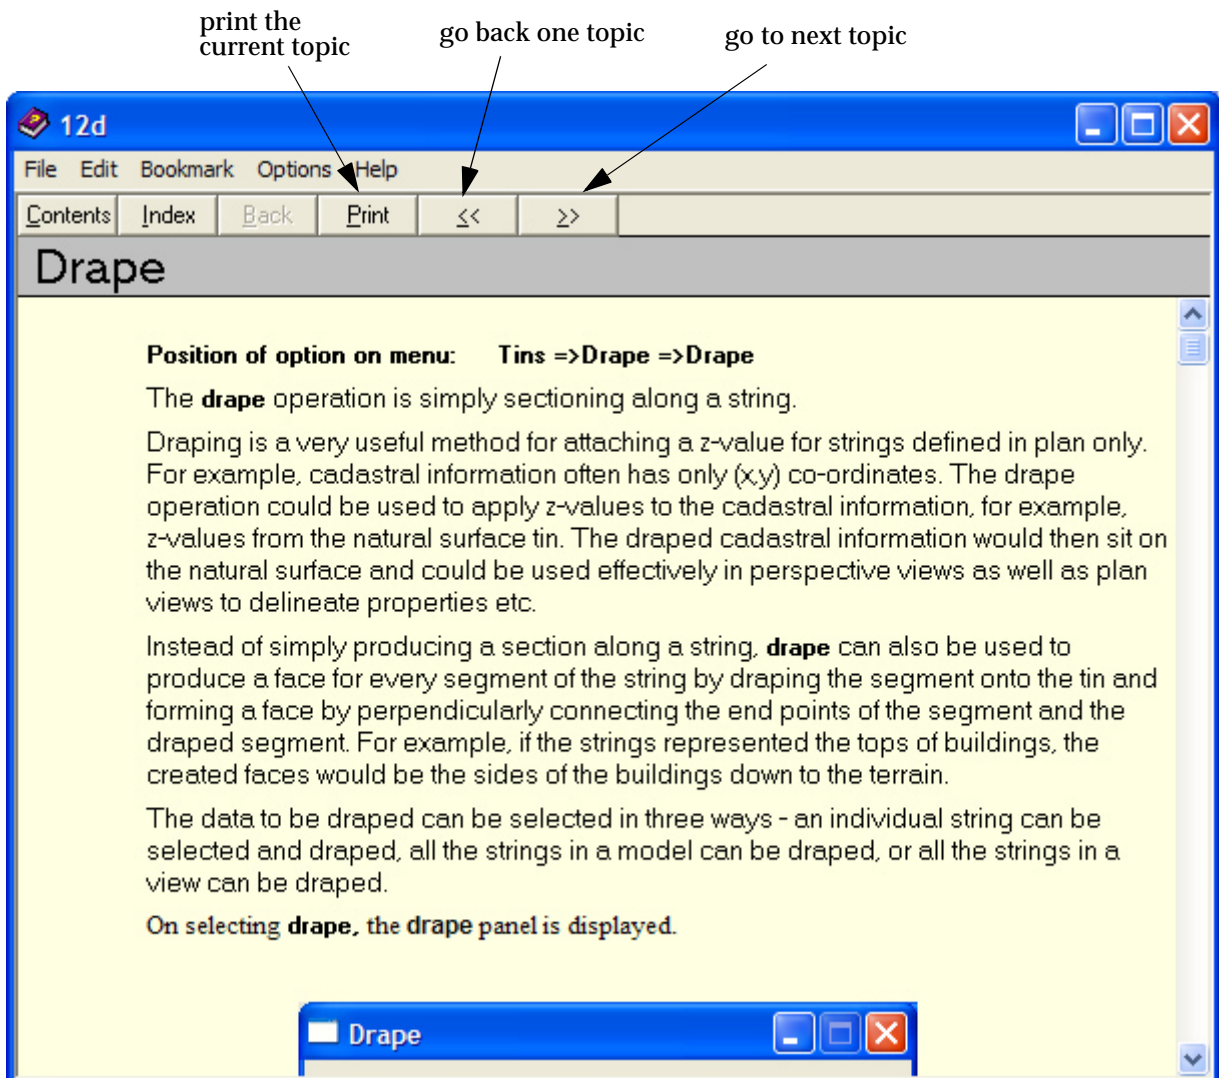

To get Help for such a panel, click on the panel to bring the focus back to the panel before pressing F1. The top of the panel will highlight showing that it has focus.

Please continue to the next section “Navigating in Help” .

Navigating in Help

Once at a *topic* in the Help, the << and >> buttons at the top of the Help topic will go to the previous and next Help topics respectively.

Individual Help topics can be printed by clicking **Print** at the top of the Help page.

Because it is difficult to print large sections in Microsoft's Help system, a PDF file of the entire 12d Model Reference Manual has been created and can be used to print out large sections of the manual.

The *12d Model Reference Manual* PDF file is on the 12d Model Installation CD in the folder *Documentation\Reference_Manual*.

12d Model Macro Manual

Position of option on menu: Help =>12d Macro manual

12d Model includes a powerful programming language (macro language 4DML).

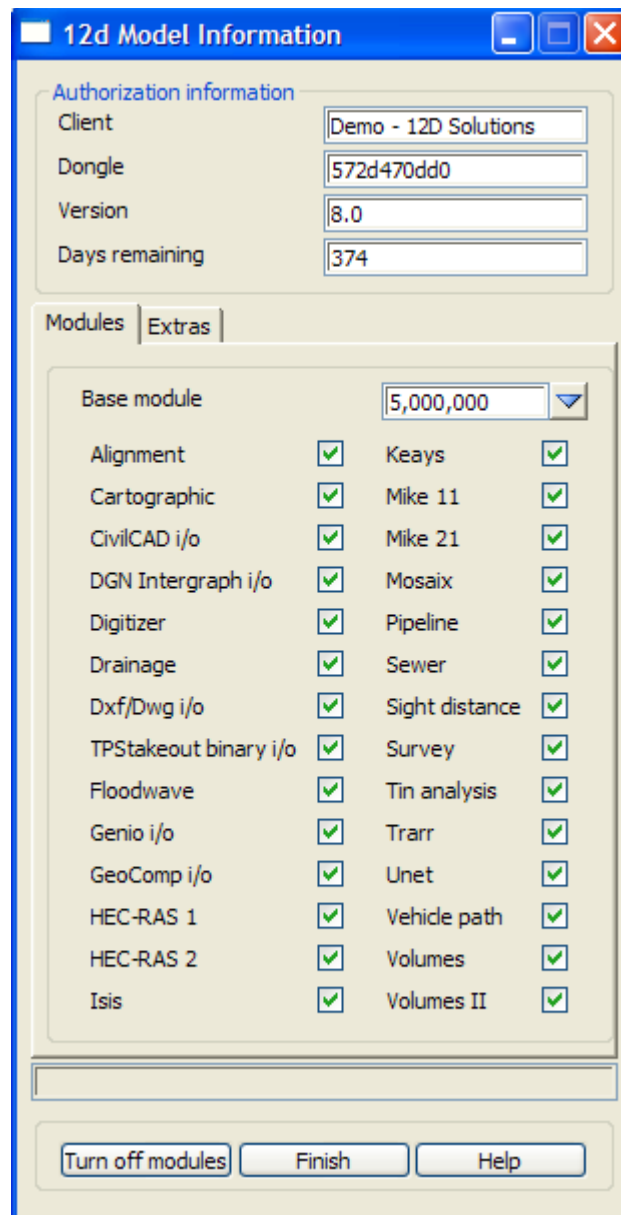

About 12d Model

12d_model_information

Position of option on menu: Help =>About 12d Model

The About 12d Model option displays information about the current authorization 12d Model such as the Client name, dongle number and authorized modules.

On selecting the About 12d Model option, the **12d Model Information** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Client

name of the authorized client.

Dongle

number of the dongle.

Version

12d Model version number.

Days remaining

number of days left for the authorisation.

Module information

Base module

number of allowed points in the base module.

Alignment

tick box

if tick, the Alignment design module is authorized.

...

Email Info to 12d

[email_information_on_12d_model_to_12d_solutions](#)

Position of option on menu: Help =>Email info to 12d

The Email info to 12d option emails information about the current version of 12d Model to 12d Solutions Pty Ltd. This is usually used for debugging authorization problems.

On selecting the Email info to 12d option, the **12d Model Information** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

First name/Last name/Company name

information about the user and the Company owning the license of 12d Model.

Email button

try to send an email containing information about 12d Model and the user to 12d Solutions Pty Ltd.

Save button

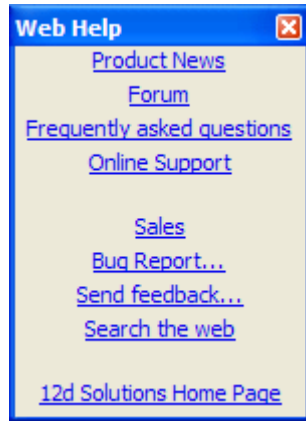

*if the **Email** button does not send an email, the **Save** button can be used to write the information out to a file called **12d_auth.txt**. This file can then be emailed to **support@12d.com**.*

30 Save and Exit

save_project_reminder

Save and Exit are available from both the Main Menu under Project or on the floating 12d Model menu.

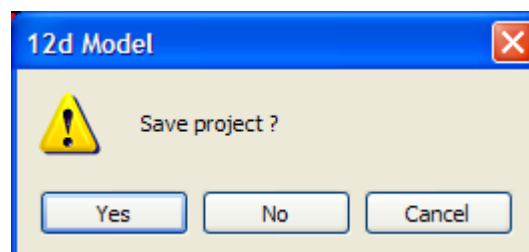

Save and Exit from Main Menu

Selecting Save from the Main Menu=>Projects menu simply saves all data in the project modified since the last save.

When Exit is selected from the bottom of the Main Menu=>Projects menu and a save is not needed, 12d Model exits the project.

If Exit is selected from the bottom of the Main Menu=>Projects menu and a save is needed, then the **Save Project ?** yes-no panel is placed on the screen.

If **Yes** is selected, then 12d Model saves the project and exits.

If **No** is selected, then 12d Model does not save the project and exits.

If **Cancel** is selected, then the Exit is aborted and 12d Model stays in the project.

Note: when exiting 12d Model, the user is reminded if any *mtf* files modified by the 12d Model *mtf editor* have not been saved, or any string editors are still running.

Save and Exit from 12d Model Menu

`exit_12d_model`

When Save is selected from the left hand side of the bottom of the 12d Model menu (Save / Exit menu option), all the information modified since the last save is written to disk.

When Exit is selected from the right hand side of the bottom of the 12d Model menu (Save / Exit menu option), an **Exit12d Model** panel is fired up.

Selecting **No** removes the **yes-no** pop-up and leaves the user in 12d Model.

If **Yes** is selected and a modification to the project has been made since the last project save, a **Save Project** panel is fired up.

If **yes** is selected, the project is **saved** and 12d Model terminates.

If **no** is selected, the project is **not saved** and 12d Model terminates.

If **cancel** is selected, the exit option is **aborted** and the user is left in 12d Model.

Note: When exiting 12d Model, the user is reminded if any *mtf* files modified by the 12d Model *mtf editor* have not been saved, or any string editors are still running.

Advanced Usage

31 Advanced Design

mtf_edit

12d Model uses templates as a quick and easy method for defining design details along a string. The **apply** options are used to create strings and sections using the **reference** string to define the chainage and what is perpendicular at each chainage, and a **hinge** string from where the template links are defined. The template defines a point name and colour for each template link. Cross sections can be created with point names corresponding to the template links, and strings formed by joining the same named points from consecutive cross sections.

For simple work, the Design=>Apply=> Apply option cuts a left and right template into a surface to produce a design.

For more complex work, the Design=>Apply=> Apply many option allows more detailed control over the design process. In fact, it is actually string design and it is not necessary to have any templates at all for apply many.

The **apply many** option uses a **file** (the **many templates file** or **mtf**) to describe

- which templates are applied to the left and right side of the hinge string (with linear interpolation between templates and gaps allowed)
- special chainages for creating extra cross sections
- hinge modifiers for adjusting the hinge string
- template modifiers for extra adjustment of the points created by the templates
- stripping depths
- boxing
- width to define the limit of searches for strings
- modify the z-values of strings

The **mtf** can be created and edited **interactively** from within **12d** Model or it can be created and edited from a text editor such as PFE, or any combination of the two methods.

A simple method for creating and/or editing an **mtf** is from the **apply many** option itself.

Once the **apply many** option has been selected and the **Apply Templates Function** panel is on the screen, simply enter the name of the mtf file into the *templates file* field of the **Apply Templates Function** panel, click on [+] to bring up the pop-up menu and select [Edit] from the pop-up.

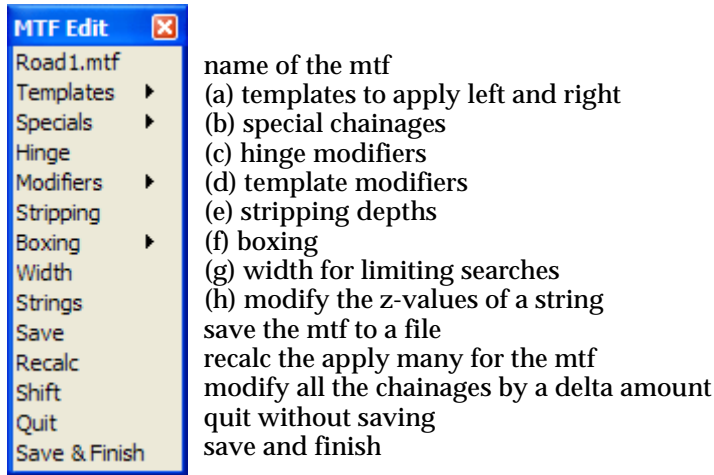

If the **mtf** file does not exist, then the **Create MTF File** panel (with the mtf file name already filled in) is placed on the screen and the user simply selects the **Create** button.

Alternatively, an mtf can be created inside **12d** Model using the **Create MTF File** panel and edited

using the MTF Edit menu.

Finally, a text editor such as PFE can be used to create and/or edit an mtf.

When interactively creating the **mtf**, the **mtf** edit menu contains all the options for (a) to (h). For example, the MTF Edit menu for the mtf file "Road1.mtf" is:

The documentation order will be the same as the order on the above MTF Edit menu.

The **interactive commands** for each of (a) to (h) will be described in the following sections.

The format of the **text version** of the MTF file is given in the section "Text Version of the MTF" . Unlike the interactive commands, the text form of the MTF file allows substitutions (see the section "Substitutions in the Many Templates File").

For documentation on the option/menus on the MTF Edit menu:

for	<i>Templates</i> ,	go to the section "Templates"
	<i>Specials</i>	"Specials"
	<i>Hinge</i>	"Hinge Modifiers"
	<i>Modifiers</i>	"Template Modifiers"
	<i>Stripping</i>	"Stripping"
	<i>Boxing</i>	"Boxing"
	<i>Width</i>	"Width"
	<i>Strings</i>	"String Modifiers"
	<i>Shift</i>	"Shift"

Following the documentation of the MTF editor, the full definition of boxing is given in the section "Full Definition of Boxing" and the full definition of the Decisions button on **Template Create/Edit** panel is given in the section "Full Definition of Template Decisions"

Please continue to the next section "Templates" .

Templates

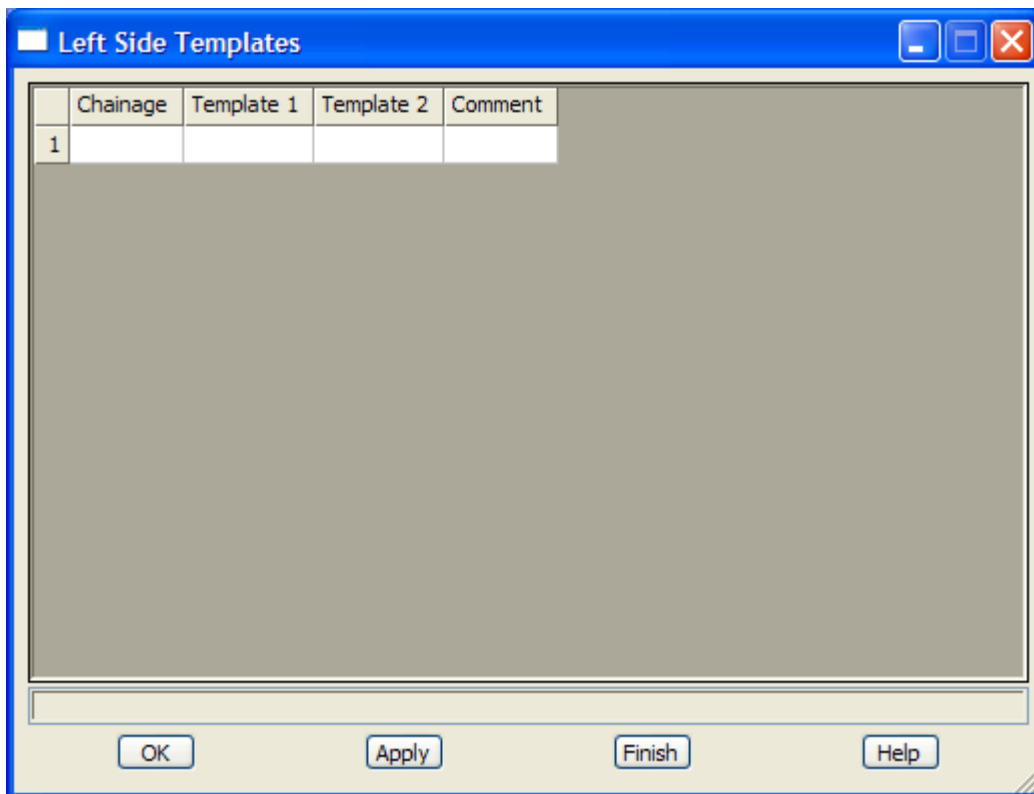

mtf_edit_templates

The templates walk-right brings up the templates menu with options to create the left_side and right_side sections of the mtf file.

mtf_edit_templates

Selecting the left side or right side option brings up the left side templates or left side templates panels respectively.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chainage	column header		sort by chainage for the field - measure
<i>list of chainages for applying templates on the left/right hand side of the hinge string.</i>			
Template 1	column header		for the field - available templates
<i>template to start applying at the chainage on the same row. If template 2 is blank, then template 1 is applied until the next chainage in the chainage column.</i>			
Template 2	column header		for the field - available templates

*template to linearly interpolate to and finish with at the next chainage in the chainage column.
In the file, the two templates will be separated by a comma.*

Note - template 2 must have the same number of fixed and variable links as template 1 otherwise a gap of the section separation length will be left between the end of template 1 and the start of template 2.

Comment column header

comment to add to the end of the line. In the file, the comment will be preceded by //.

OK/Apply button

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

Please continue to the next section "Specials" .

Specials

mtf_edit_special_chainages

The **apply many** option automatically creates sections at a number of chainages including the supplied chainage interval, horizontal critical points and template change points.

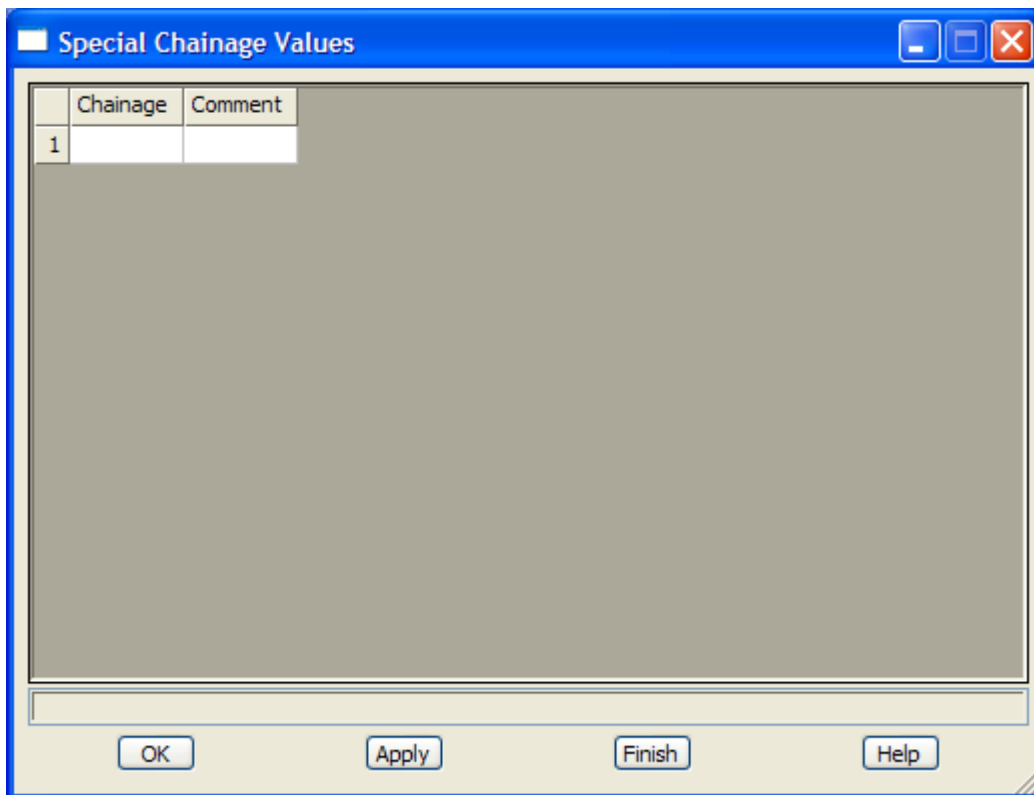

However it is also possible to add extra sections at special chainages using the **specials** keyword in the many template file or the specials option from the mtf edit menu.

Walking right on the specials menu brings up the special chainages walk-right menu:

mtf_edit_special_chainage_values

Selecting the values option brings up the **special chainage values** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Special chainages	column header		sort by chainage for the fields - measure

list of special chainages for creating sections at.

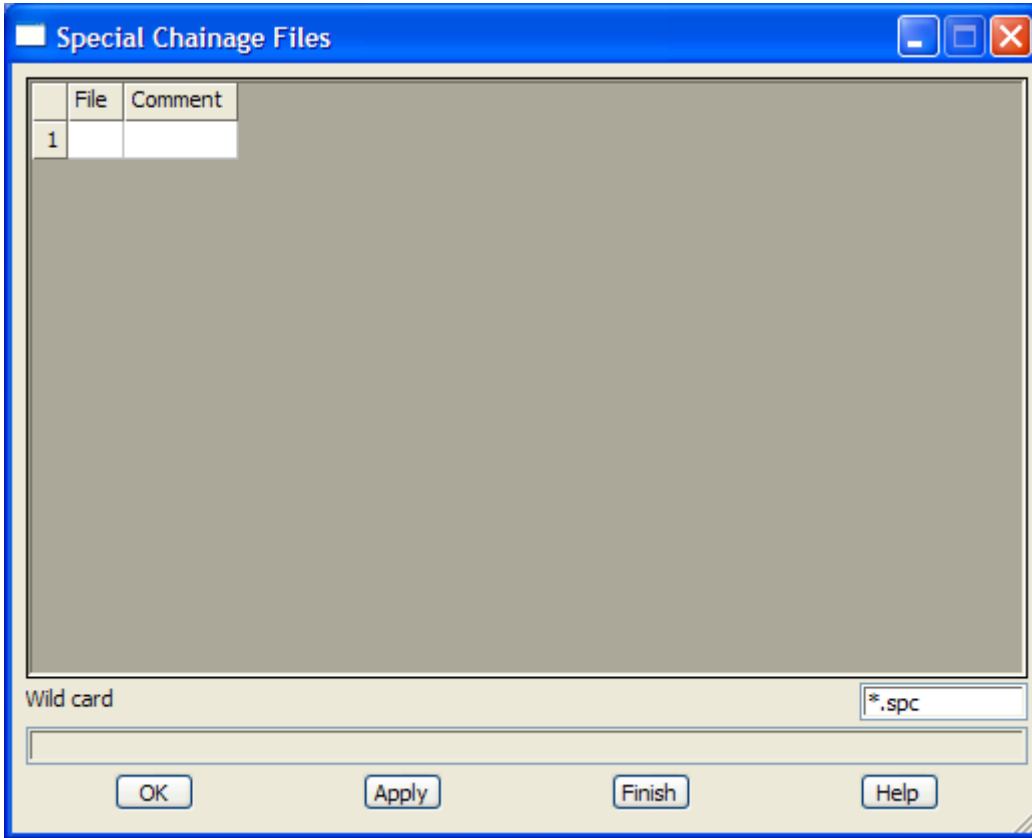

Comment	column header
<i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>	

OK/Apply	button
-----------------	--------

OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

mtf_edit_special_chainage_files

Selecting the files option brings up the **special chainage files** panel

The fields and buttons used in this panel have the following functions.
